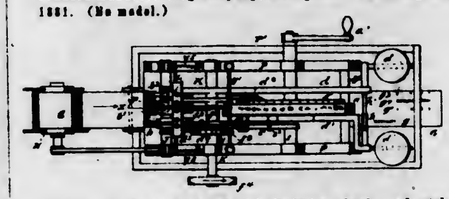
5. The combination, with the bedstead E, of the ice-box A,

the drip-pan K, and the tubes M and N, substantially as herein shown and described, and for the purpose set forth.

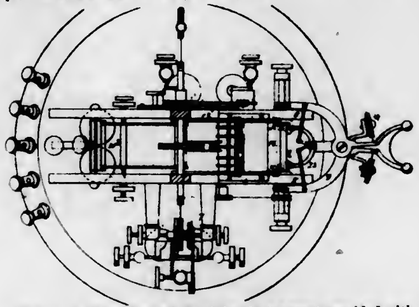


6. The combination, with the bedstead E, of the ice-box A and the drip-pan K, provided with inwardly and downwardly projecting flanges I, substantially as herein shown and described, and for the purpose set forth.

253,060. SECRET-MESSAGE TELEGRAPH. ALBERT F. JOHNSON and FRANK B. JOHNSON, Brooklyn, N. Y., assignors to the Johnson Manufacturing Company, same place. Filed Aug. 16, 1881. (No model.)

Claim.—The system of mechanism herein described for automatically transmitting secret telegraphic dispatches, consisting of, first, a preparing-machine for impressing the message in unintelligible characters upon a strip of paper, G, said machine consisting of a series of impressing-rods, $b\ b'\ b^2\ b^3$, operated by levers $d\ d'\ d^2\ d^3\ d^4$, in connection with a letter-wheel, *a*, to produce three or more separate series of indentations, $g\ g'\ g^2\ g^3$, upon said strip G, and a feeding device, constructed as described, to feed forward said strip while the indentations are being made; secondly, a transmitting-machine consisting of a drum, E, over which said strip is passed, and a series of levers or circuit-closers, $l\ l'\ l^2\ l^3$, operated automatically by said indentations $g\ g'\ g^2\ g^3$, respectively, for the purpose of opening and closing electric circuits with the receiving-machine through the medium of line-wires and batteries forming properly-arranged electric circuits, as described; and, thirdly, a receiving-machine on which the message is printed in alphabetical characters, having a series of magnets, $o\ o'\ o^2\ o^3$, which are brought into circuit by means of the indentations $g\ g'\ g^2\ g^3$, respectively, and which operate the printing-wheel *t* and message-strip G' through the medium of the mechanism connected with each of them, as shown and described, the said receiving-machine being also provided with devices for concealing the message while it is being printed and devices for sealing the same, as described, the whole being constructed to operate as set forth.

253,061. APPARATUS FOR PREPARING AND TRANSMITTING SECRET TELEGRAPHIC MESSAGES. ALBERT F. JOHNSON and FRANK B. JOHNSON, Brooklyn, N. Y., assignors to the Johnson Manufacturing Company, same place. Filed Aug. 16, 1881. (No model.)

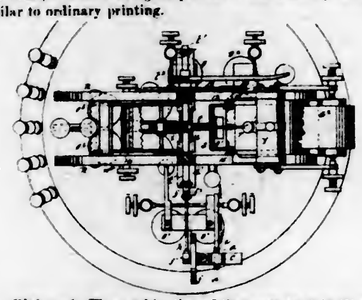


Claim.—1. In combination with the letter-wheel *a* and ratchet-wheel *f*, the levers $d\ d'\ d^2\ d^3\ d^4$, pivoted arms $e\ e'\ e^2\ e^3$, punching-rods $b\ b'\ b^2\ b^3$, and toothed wheels f' and f^2, constructed and operated as described, the whole being constructed and arranged to operate substantially as described, for the purpose of making indentations or bosses on the strip G, which indicate the subject and import of the message, as set forth.

2. In combination with the pivoted arms $e\ e'\ e^2\ e^3$, operated as described, the frame I, provided with the set-screws *j j j j j*, and arms a^2, carrying the dogs *w*, roller *a'*, dog *w'*, and springs y' and y^2, as shown and described, for the purpose of feeding forward the strip G.

253,062. SECRET-PRINTING TELEGRAPH. ALBERT F. JOHNSON and FRANK B. JOHNSON, Brooklyn, N. Y., assignors to the Johnson Manufacturing Company, same place. Filed Aug. 16, 1881. (No model.)

Brief.—The message is printed upon a strip of paper, which is concealed from view as fast as printed and rolled up on a quill held between a pair of spring-pressed arms, a rotary motion being given to the quill by mechanism connected to the type mechanism. After the message is completed it is sealed and the strip cut off by a knife, the address being left exposed.



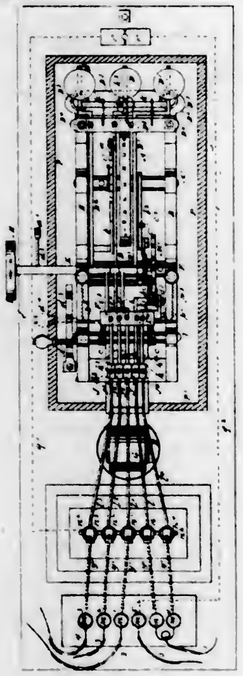
Claim.—1. In a telegraph receiving-instrument provided with mechanism, as described, for feeding a strip of paper through the same, the combination of a shield or plate arranged in such manner as to conceal the said strip from view while it is being passed through the machine, a quill or cylinder upon which the said strip is received and wound as the message is printed thereupon, and mechanism, as described, for rotating said quill and winding the message thereon, substantially as herein set forth.

2. In a telegraph receiving-instrument, the following elements in combination, viz: mechanism, as described, for feeding a strip of paper longitudinally through the instrument, a type or printing wheel arranged and operated to print a message upon said strip in transverse lines, a shield or plate for concealing the printed portion of the strip from view, a quill or cylinder upon which the said strip is received, wound, and sealed, and mechanism, as described, for rotating said quill and winding the message thereon, substantially as herein set forth and described.

258,063. SECRET-PRINTING TELEGRAPH. ALBERT F. JOHNSON and FRANK B. JOHNSON, Brooklyn, N. Y., assignors to the Johnson Manufacturing Company, same place. Filed Nov. 3, 1881. (No model.)

Brief.—The message is printed on a strip of paper, and a second strip is reeled over it in such a manner as to conceal it from

view. A traveling type-wheel oscillates from right to left and vice versa, and the message is printed in horizontal parallel lines similar to ordinary printing.



Claim.—1. The combination of the message-strip G' and second strip of paper, G², the feed-rollers q' q^2, operated, as described, by the armature of the magnet *o*, the impressing-roller *u* and printing-wheel *t*, both constructed to operate, as described, through the medium of electric impulses, and the fountain Y and sponge *z*, as and for the purpose set forth.

2. In combination with the message-strip G', fed longitudinally through the instrument by means of the mechanism described, operated by the armature of the magnet *o*, the printing-wheel *t*, having both a rotary and a transverse movement, and operated by the mechanism connected with the armatures of the magnets o' and o^2, as described, the strip G², the feed-rollers q' and q^2, and the plate *i*, all constructed to operate as described, for the purpose set forth.

3. In a telegraphic receiving-instrument, the combination, with the magnet o' and its armature, of the pawl or click *e*, ratchet-wheel *a*, crank-wheel *f*, rod *h*, and shaft *t'*, carrying the printing-wheel *t*, all arranged and operated substantially as described, for the purpose set forth.

253,064. INSTRUMENT FOR PREPARING AND TRANSMITTING SECRET TELEGRAPH MESSAGES. ALBERT F. JOHNSON and FRANK B. JOHNSON, Brooklyn, N. Y., assignors to the Johnson Manufacturing Company, same place. Filed Nov. 8, 1881. (No model.)

Brief.—A letter-wheel carrying on its face the characters or letters actuates when rotated a punch, which perforates a single row of perforations for operating the step-by-step mechanism at the receiving-station. Three levers and punches are operated at proper intervals to perforate individual sets of perforations in rows parallel to the first row, the functions of said perforations being to operate through proper circuits, first, the printing-lever; second, the paper-feed; and, third, the side feed of the paper by devices which form parts of the receiving apparatus, but being no part of this application.

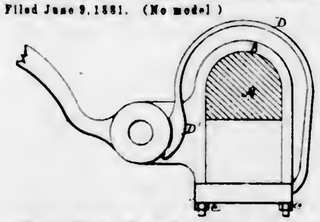
Claim.—1. The levers D D' D², levers h h' h^2 h^3 h^4, provided respectively with the rods l l' l^2 l^3, toothed wheels M' and b', arm b^2, provided with the pawl *c*, bar p^3, provided with the detent p', pin c^2, and pawl b^3, in combination with the posts n n' n^2 n^3 n^4 and m m' m^2 m^3 m^4 m^5 and connecting-wires y', line-wires 1 2 3 4, and battery-wire 5, switch *r*, and wires q' and q^2, all constructed and arranged substantially as described, to operate in the manner set forth.

2. The punching-rods n n' n^2 n^3, strip G, plate w, and feed-rollers f f', operated, as described, in combination with the levers D D' D², levers h h' h^2 h^3 h^4, toothed wheels M' and b', arm b^2, provided with the pawl c', bar p^3, provided with detent p', pin c^2, and pawl b^3, all constructed and arranged to operate substantially as described, for the purpose of indenting the message.

3. The feeding device composed of the frame F, provided with the set-screws i i' i^2 i^3 i^4, and with the arms *c* *c*, ratchet-wheels *c* feed-rollers f f', and plates w w^2, as shown and described.

4. In combination with the mechanism herein shown and described for operating the levers h h' h^2 h^3 h^4, as set forth, the letter-wheel A, rotated by the ratchet-wheel C and pawl *a*, the pointer a^3, secured to the shaft E, and the index *x*, operated by the rod x^2 on the hub of the wheel b', all as shown and described, for the purposes set forth.

5. In combination with the mechanism herein shown and described for operating the levers h h' h^2 h^3 h^4 in the manner set forth, the rods *d*, eccentrics d^2, and pawls *d*, as and for the purpose set forth.



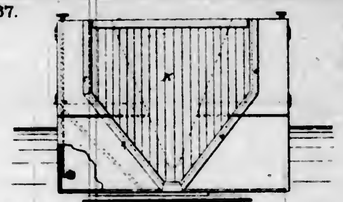
253,065. TOOTH FOR CLEANING ROLLERS OF CARDING-MACHINES. THOMAS KERSHAW and HERMON E. CUNNINGHAM, Philadelphia, Pa. Filed June 23, 1881. (No model.)

Brief.—The teeth are bent or coiled midway of their length or coiled at the base, whereby their elasticity is increased.

Claim.—The combination of the roller A with a series of teeth, each of which is coiled or otherwise bent at or above the base, whereby its elasticity is increased, substantially as set forth.

253,066. THILL-COUPLING. HENRY F. KIPP, Buffalo, N. Y. Filed June 9, 1881. (No model.)

Claim.—In a thill-coupling, the double clips B B and the spring D in combination therewith, the spring constructed with the cup-shaped end D', partly inclosing the rear end of the thill *e*, substantially as and for the purpose specified.



253,067. COFFER-DAM. HENRY P. KINGHAM, Brooklyn, N. Y. Filed Nov. 30, 1881. (No model.)

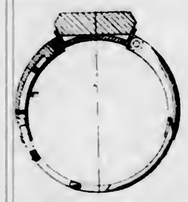
Brief.—A conical opening at one end of the dam has hinged doors, upon which fits a sliding door, which closes the opening and also keeps the hinged doors closed.

Claim.—1. A coffer-dam with a conical opening at one end provided with hinged doors, substantially in the manner shown and described.

2. In a coffer-dam provided with an opening at one end having folding doors, a removable sliding gate, whereby the opening in the end of the dam may be closed and the hinged doors kept closed, substantially as is shown and described.

253,067.

253,068. WINDOW-CORNICE. CHRISTIAN P. KLINGENBERG, Toledo, Ohio, assignor to Osborne Cornice Company, same place. Filed Sept. 5, 1881. (No model.)



Brief.—The tenon on the return-piece is inserted in the mortise on the cornice and held by a wedge.

Claim.—The combination of the return-piece having the tenon, the side molding having the mortise, and the wedge.

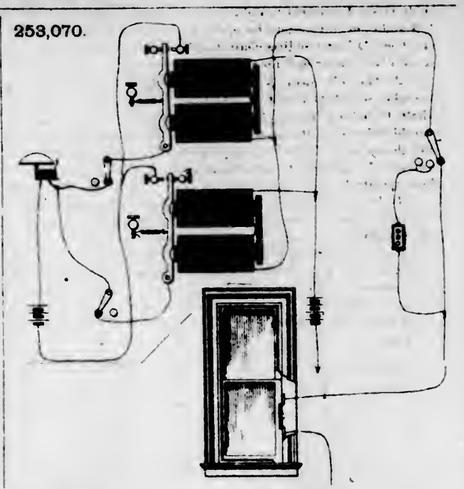
253,069. FINGER AND SCARF RING. ROBT. J. LA GRANGE, Philadelphia, Pa. Filed Nov. 30, 1881. (No model.)

Brief.—The ring is expanded or contracted by means of the pivoted and sliding segments.

Claim.—1. The ring having a head with grooved or hollow segments hinged or pivoted thereto and an expansible and contractile segment fitted into the former segments, substantially as and for the purpose set forth.

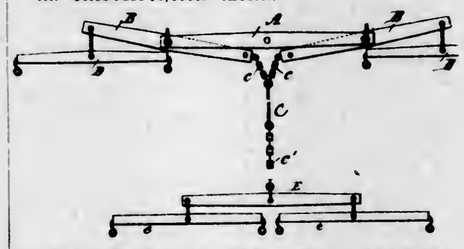
2. The ring having hinged segments, an expansible and contractile segment, and spring fastening-plate C therefor, substantially as and for the purpose set forth.

253,070. BURGLAR-ALARM. STEPHEN D. LAKE, Jersey City, N. J., assignor of one-half to Asa W. Dickinson, same place. Filed Dec. 10, 1881. (No model.)



Brief.—Two relays are arranged in multiple arc in the main line and their armature-levers in multiple arc in the local line, which also includes an alarm. The main circuit is normally closed, the local normally open. Any interruption or change in resistance of the main circuit actuates one or the other of the relays and causes an alarm.

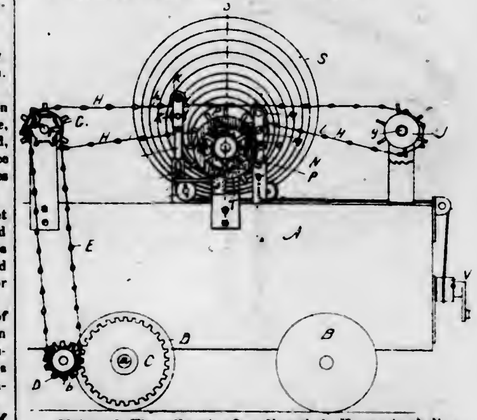
Claim.—1. The combination, substantially as hereinbefore set forth, of a main battery, a main circuit, two relays included in said main circuit, a local battery, a local circuit having two branches connected respectively to the front contact-stop of one of said relays and the rear contact-stop of the other, and a signaling or alarm apparatus.



2. The combination, substantially as hereinbefore set forth, of a main battery, a main circuit, two relays included in said main circuit, a local battery, a local circuit having two branches connected respectively to the front contact-stop of one of said relays and the rear contact-stop of the other, a signaling or alarm apparatus, and a switch adapted to open or close said branch circuits.

3. The combination, substantially as hereinbefore set forth, of a main line, a main battery, two relays having their respective electro-magnets included in multiple arc with said battery and their circuit-breaking armature-levers respectively included in two branches of a local circuit, a local battery, means for adjusting the retractile force exerted upon said armature-levers, and contact-stops for closing the local circuit through a signaling apparatus by the movement of either of said armature-levers.

253,070.



253,071. DRAFT-EQUALIZER. JOS. M. LANGSTON, Waverly, Ill. Filed June 18, 1881. (Model.)

Claim.—The herein-described equalizer, consisting of the double-tree A, the intermediate centrally-pivoted bars, B, the single-trees D, the chains *c c'*, the rod C, the double-tree E, and single-trees *e*, substantially as and for the purpose set forth.

253,072. SPRING-MOTOR FOR CARS. WILLIAM T. LARIMORE, St. Louis, Mo. Filed Nov. 25, 1881. (No model.)

Claim.—1. The coil-spring S, endless chain H, running in line with sprocket-wheels G, P, Q, and J, of which two, I' Q, are upon a common shaft, O, in combination with the posts L N and their connections for operating the same, and with sprocket-wheels D F and endless chain E, connected to a car-axle, all substantially as described, for the purpose specified.

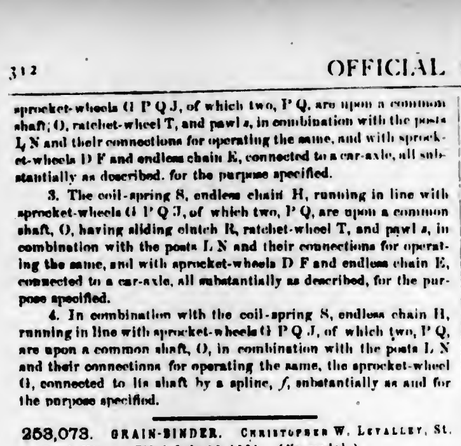
2. The coil-spring S, endless chain H, running in line with

sprocket-wheels G P Q J, of which two, P Q, are upon a common shaft; O, ratchet-wheel T, and pawl *s*, in combination with the posts L N and their connections for operating the same, and with sprocket-wheels D F and endless chain E, connected to a car-axle, all substantially as described. for the purpose specified.

3. The coil-spring S, endless chain H, running in line with sprocket-wheels G P Q J, of which two, P Q, are upon a common shaft, O, having sliding clutch R, ratchet-wheel T, and pawl *s*, in combination with the posts L N and their connections for operating the same, and with sprocket-wheels D F and endless chain E, connected to a car-axle, all substantially as described, for the purpose specified.

4. In combination with the coil-spring S, endless chain H, running in line with sprocket-wheels G P Q J, of which two, P Q, are upon a common shaft, O, in combination with the posts L N and their connections for operating the same, the sprocket-wheel G, connected to its shaft by a spline, *f*, substantially as and for the purpose specified.

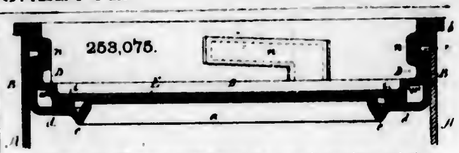
253,073. GRAIN-BINDER. CHRISTOPHER W. LEVALLEY, St. Paul, Minn. Filed July 22, 1881. (No model.)



Claim.—1. In a grain-binder, the combination, with the needle-shaft *m*, of the clutch-plate *m' m²*, fast thereon, and the segment *L'*, adjustable to each other by means of bolts and slots arranged upon opposite sides of the needle shaft, whereby the segment *L'* is secured to the clutch-plate independently of said shaft, substantially as set forth.

2. The combination, with the needle-shaft *m*, of the clutch-plate *m' m²*, fast thereon, and the segment *L'*, provided with the adjusting-slots and the clamping-bolts *m²*, substantially as set forth, whereby the segment *L'* is rigidly secured to the clutch-plate independently of said shaft.

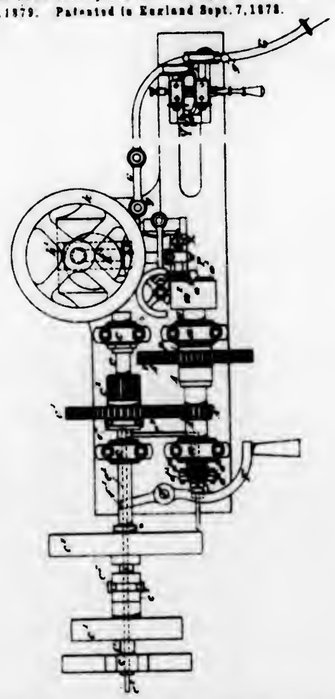
253,074. APPARATUS FOR PRESERVING EGGS. KELLOGG E. LOOMIS, New York, N. Y., assignor to John Van Nest, same place. Filed Sept. 13, 1881. (No model.)



Brief.—A partial vacuum is formed in the chamber and the silicate fluid admitted from below. The deflecting-plate causes this to be thrown in the form of spray. When sufficiently covered the cocks are opened and the fluid runs off to the reservoir beneath.

Claim.—1. In an apparatus for preserving or sealing eggs, an air-tight reservoir having a perforated injecting-pipe, a deflecting-disk, and an egg-receptacle, substantially as specified.

2. In an apparatus for preserving or sealing eggs, the combination of a deflecting-disk and an egg rack or tray, the latter consisting of a number of concentric rings or hoops, and a series of smaller rings located between the same, substantially as shown and described.



253,075. CAP FOR CANS. CHARLES W. LYON, Philadelphia, Pa. Filed Dec. 5, 1881. (No model.)

Claim.—1. The combination of the can A, the internal ring, B, having lugs *m*, and the sunken cover D, having slots or recesses *n*, and an annular groove, *w*, as set forth.

2. The combination of the can A, the internal ring, B, having a flange, *d*, with annular groove *e*, the disk E, the sunken cover D, and the packing-ring *i*, as set forth.

253,076. AUGER-MAKING MACHINE. PETER MACKAY, Glasgow, County of Lanark, Scotland, assignor to himself and Bennet Bruce Burley and Robert Hoyt, same place. Filed Nov. 8, 1879. Patented in England Sept. 7, 1878.

Claim.—1. The machine for turning and preparing the points or ends of augers and for cutting the entering screw thread or threads thereon, consisting of the driving-shaft C and differential driving-gear c' c^2 C' C^2 A' A^2 and parts in connection therewith, the mandrel A, with screw *d* and parts in connection therewith, and shaper P, also these parts in combination with the tools or apparatus X and Y.

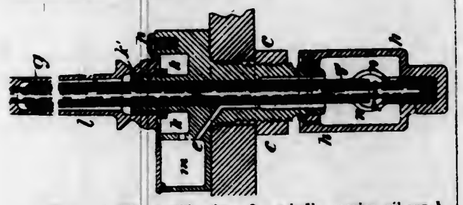
2. The apparatus marked X in Figs. 1 and 2 and further illustrated in Figs. 7, 8, 9, and 10, for turning and preparing the ends of augers preparatory to cutting the entering screw thereon.

3. The lever N, arm a', screw *b*, and parts in connection therewith for effecting the movements of the upper part, M, of the apparatus X.

4. The apparatus marked Y in Figs. 1 and 2 and further illustrated in Figs. 3 to 6, for cutting the entering screw thread or threads and the entering point on the ends of augers.

5. The block J' and connections for adjusting the angle of the screw-cutting disks

---

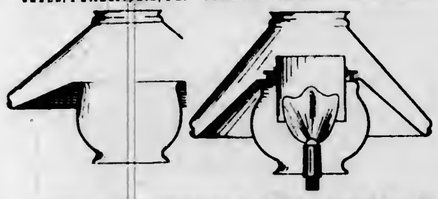


253,077. WAGON-SPOKE. JAMES MARIS, Wilkesville, Ohio. Filed Aug. 4, 1881. (No model.)

Claim.—A wood spoke having a strengthening tongue or tongues, pin or pins, of superior wood, inserted in or combined with the end or ends thereof, substantially as specified.

253,078. SPINDLE AND BEARING THEREFOR. JAMES MASON and JAMES A. MASON, Ashton-under-Lyne, County of Lancaster, England, assignors of one-half to Thomas Henry Rushton and Benjamin Alfred Dobson, Bolton, England. Filed May 23, 1881. (No model.) Patented in England Mar. 17, 1880, in France Sept. 28, 1880, in Belgium Sept. 30, 1880, and in Germany Oct. 3, 1880.

Brief.—At the upper end of the bolster is a bushing composed of anti-friction metal, provided with a spiral slot, which allows the oil conducted to said bushing to overflow and pass into a receiver in the bolster-carrier, from whence it is conducted to the footstep. The interior of the shoulder of the receiver is lined with anti-friction metal, against which the lower end of the sleeve bears when an excessive strain is put thereon.



Claim.—1. The combination of a spindle, carrier, oil-cup *h*, and footstep-bearing, with a bolster having a bush, *g*, at its upper end, provided with a spiral slot, and having at its lower end an opening to admit oil from the cup to the spindle above the bearing, all substantially as set forth.

2. The combination of the spindle, oil-cup *h*, and footstep-bearing, with bolster, leaving a communication between the oil-chamber and spindle, and a bolster-carrier provided with ducts *e*, and a sediment-collector communicating with said ducts.

3. The combination of the spindle, bolster, and footstep-bearing, with oil-cup *h*, and carrier, having oil-chambers *k* and *m*, and oil-ducts *e*, substantially as described.

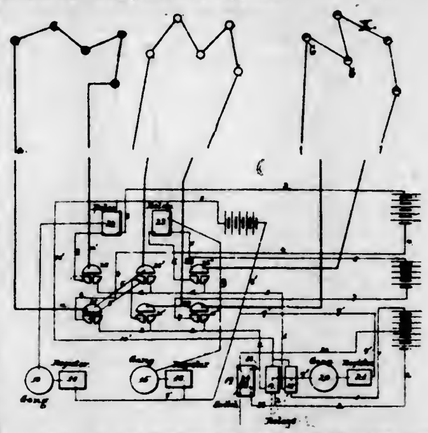
4. The combination of the spindle, footstep-bearing, bolster, and bearing at the upper end of the bolster, with a sleeve, *l*, and whirl, and the carrier having a shoulder, *k'*, provided with a bushing for the sleeve to bear against, substantially as set forth.

253,079. SHADE AND CHIMNEY FOR LAMPS. WM. H. MARSHALL, Philadelphia, Pa. Filed Oct. 10, 1881. (No model.)

Claim.—1. The combination of a chimney of flint glass having a depressed reflector silvered or coated with metal and an opal or other shade supported thereon, substantially as set forth.

2. The combination of a chimney of flint glass having a shoulder at the top, a reflector silvered or coated with metal set on the chimney, and an opal or other shade set on the reflector, substantially as set forth.

3. The combination of a chimney having a depressed reflector and a shade supported thereon, substantially as set forth.



4. The combination of a chimney, a depressed reflector having a heat-non-conducting support, and a shade supported on the reflector, substantially as set forth.

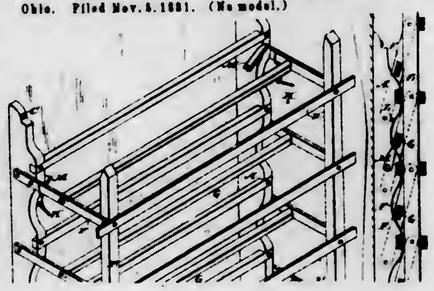
5. The combination of a chimney, a depressed reflector supported on the chimney, a shade supported on the reflector, and a cylinder inside of the chimney to reflect the light and steady the flame from a lamp or gas burner, substantially as set forth.

6. The combination of a flint-glass chimney, a cylinder of mica, a reflector, and a shade, substantially as set forth.

253,080. DISTRICT-TELEGRAPH SYSTEM. CHAUNCEY F. MCCULLOH, Baltimore, Md. Filed Oct. 25, 1881. (No model.)

Brief.—An arrangement whereby breaks in the line are prevented from rendering a circuit inoperative. Each circuit of a district system is normally closed through an independent battery and relay at the central station, which controls a local circuit operating a gong and register. A break or a ground at any point is announced by the gong and an operator manipulates a switch in such a manner as to ground the circuit through relays on either side of a central-station battery, said relays being provided with front and back contacts and switch-plugs, which operate to close a local circuit to the signaling gong and register. Each signaling-box puts on a local ground when operating.

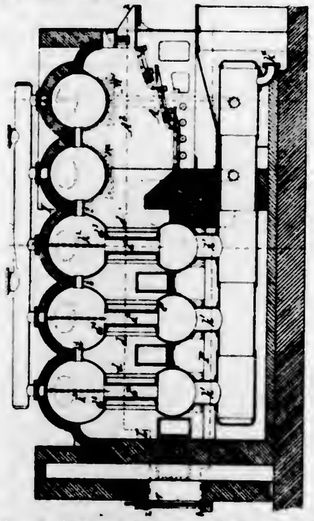
Claim.—1. In a district or analogous telegraph system, a continuous metallic circuit connecting the several stations with the central office, a battery adapted to be grounded in the center, and a switch for shunting said battery into circuit, in combination with a relay intermediate each pole of said battery and the termini of the circuit, said relays working a local-circuit register and gong, and having means for changing their stroke from forward to backward, whereby, in the event of the breaking of the main line, the contingency of the grounding of either end of the line is provided for, as and for the purpose set forth.



2. In combination with the conventional district-telegraph plant, a normally-open ground-connection for each box, and means for closing such connection, a central office having a ground-connection from an extra battery, arranged to be shunted into circuit, and having a register and gong, and relays 17 18, having means for reversing their stroke, and the switch 19, as set forth.

3. In combination with the main-line wires of the closed metallic circuit, the extra battery 12, having ground-wire 30, and the relays 17 and 18, having disks 32 33 34, plugs 31, and connections from said disks with the local battery, and the insulated pins and frame of the relays, as set forth, whereby provision is made for every possible contingency in the event of a break in the line with respect to the grounding of either end.

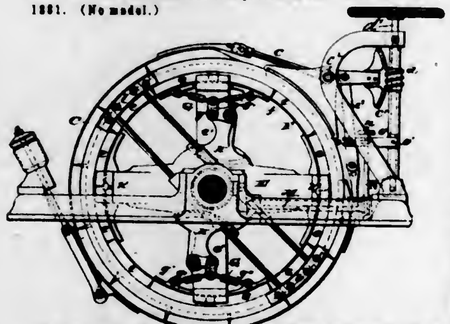
4. In combination with the main line and battery 12, the relays 17 18, on opposite sides of the battery, the double-lever switch 19, having ground 30 from the center of the battery, the relays 17 18, and wires 37 38, as set forth.



5. The box mechanism herein described, consisting of the notched disk J' and smaller toothed disk J, concentric therewith, lips *k k'*, and main line and ground connections, as set forth.

253,081. CLOTHES-RACK. WILLIAM H. MCKENSIE, Waverly, Ohio. Filed Nov. 5, 1881. (No model.)

Claim.—In a clothes-drier constructed substantially as described, the combination of the uprights A, having aperture L, pivoted buttons M, and pins K, flexibly attached thereto, with the upper bars, F, apertured near the end and pivoted to uprights, whereby the hinged frames may be adjustably supported, as described.



253,082. STEAM-BOILER. JULIUS H. MEISSNER, Philadelphia, Pa. Filed Sept. 10, 1881. (No model.)

Claim.—1. A steam-boiler composed of a series of sections, having an upper and lower shell or drum and horizontal connections, substantially as shown, said shells or drums being connected by water-tubes *d*, of a length less than the space within the walls of the shells or drums, whereby the tubes may be put in place or withdrawn from the inside of the drum, as hereinbefore set forth.

2. The combination, in a steam-boiler composed of an upper and lower section or drum connected by water-tubes the length of which is less than the space within the walls of the drum, said tubes being thus adapted to be placed or withdrawn from within the drum, of outer circulating and connecting tubes for staying and supporting the drums, as hereinbefore set forth.

253,083. FRICTION CLUTCH AND BRAKE FOR HOISTING, &c. DANIEL H. MERRITT, Marquette, Mich. Filed Nov. 29, 1881. (No model.)

Claim.—1. The combination, with the friction-rim, of the movable or sliding starting-gear, having cross-bars provided with friction-blocks *l*, adapted to engage the side of said rim for the purpose of stopping said gear, substantially in the manner as and for the purpose herein shown and described.

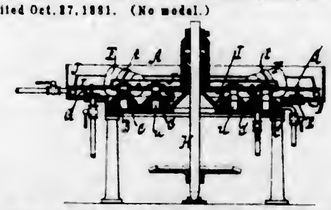
2. The combination, with the friction-rim B' and the internal clutch-band, F, of the movable or sliding starting-gear having cross-bars provided with friction-blocks *l*, adapted to engage the side of said rim, and intermediate mechanism for connecting said gear with the internal clutch-band, all substantially in the manner as and for the purpose herein shown and described.

3. The combination, with the friction-rim and clutch-band and a revolving starting-gear adapted to be stopped in its rotation, of mechanism connecting said band with the starting-gear, consisting of the toggle G and pivoted toothed segment, all substantially in the manner as and for the purpose herein shown and described.

4. The combination, with the friction-rim and clutch-band, of the pivoted toothed segments, mechanism, substantially as described, for connecting said segments with the clutch-band, movable or sliding and rotating starting-gear, and means for throwing it into mesh with said segments and stopping its rotation, all substantially in the manner as and for the purpose herein shown and described.

5. The combination, with the friction-rim on the drum and internal clutch-band, F, of the toggles G G, having adjustable sectional bars *g' g'*, toothed segments H, fulcrumed on the driver and connected to said toggles, and a movable or sliding and rotating starting-gear, and means, substantially as described, whereby said gear is adapted to mesh with said toothed segments and be stopped in its rotation, substantially in the manner as and for the purpose specified.

6. The combination, with the friction-rim on the drum and the internal clutch-band, F, of the toggles G G, toothed segments fulcrumed on the driver and connected to said toggles, and a movable or sliding starting-gear having cross-bars provided with friction-blocks *l*, adapted to engage said rim, substantially in the manner as and for the purpose herein shown and described.



7. The combination, with the friction-rim on the drum and an internal sectional clutch-band, F, of toggles G G, connecting the ends of said sectional brake-band, and retracting spring or springs K, connected to said band, substantially as and for the purpose herein shown and described.

8. The combination, with the friction-rim on the drum and an internal sectional clutch-band, F, of toggles G G, connecting the ends of said sectional brake-band, and having adjustable sectional bars *g' g'* and retracting spring or springs K, connected to said band, substantially as and for the purpose herein shown and described.

9. The combination, with the friction-rim B' and external and internal brake and clutch bands and levers for operating said bands, of the intermediate connecting and adjusting mechanism, consisting of the pivoted lever O and adjusting-rod N, provided with small adjusting-wheel *n*, substantially as and for the purpose herein shown and described.

10. The combination, with the friction-rim B', of external and internal brake and clutch bands, C F, and a sliding sleeve or starting-gear having cross-bars provided with friction-blocks *l l*, adapted to engage the side of said rim, substantially as and for the purpose herein shown and described.

253,084. AMALGAMATOR. WILLIAM MOLLER, New York, N.Y. Filed Oct. 27, 1881. (No model.)

Claim.—1. The combination of the pan A, having its bottom constructed with circular concentric troughs C, and the mullers B, overlapping the two adjacent troughs and resting on the bottom of the pan, and provided with two sets of teeth, projecting respectively into the said troughs, substantially as described.

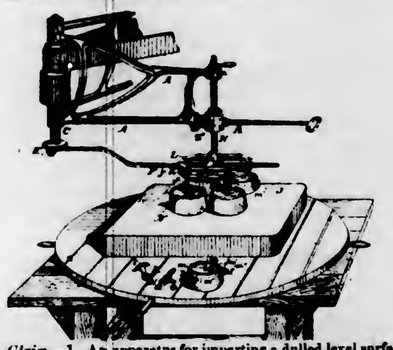
2. The combination of the pan A, having its bottom constructed with a circular concentric trough, C, and provided with a raised border, D, having a circular trough, E, the vertical shaft H, radial arms I, mullers B, having teeth *r*, and rakes G, both the rakes and the mullers being connected with the radial arms, substantially as described.

3. The combination of the pan A, having a raised border, D, the vertical shaft H, the radial arms I, the mullers B and rakes G, the rings J, carried by the radial arms, and the crushing-rollers journaled in the rings, substantially as described.

4. The combination, substantially as hereinbefore set forth, of the pan having its bottom constructed with a raised border and with a circular concentric trough in such border, and the crushing-rollers (one or more) traveling on the raised border and having a circumferential flange projecting into such trough, for the purpose specified.

5. The combination of the pan A, having its bottom provided with a circular concentric trough, C, and provided with a raised border, D, having a circular concentric trough, E, and the mullers B and rake G, both provided with teeth, projecting respectively into the troughs in the pan and raised border, substantially as described.

253,085. VEHICLE. GEORGE M. F. HOLLINGWORTH Bideford, County of Devon, England. Filed Sept. 23, 1881. (No model.) Patented in England Aug. 20, 1880.



Claim.—1. In an omnibus or vehicle for use on common roads, the combination, with the coach-body A, of the platform B and extensions B', carrying the bent rod D, said rod and extensions forming a frame-work, within which the small wheels, with their carriage and accessories, are free to revolve and swivel as far as may be expedient, substantially as and for the purposes set forth and shown.

2. In an omnibus or vehicle for use on common roads, the combination, with the coach-body A, platform B, and extensions B', of the lower steps, C, intermediate platform, C', carrying the driver's seat, and upper steps, C', substantially as and for the purposes set forth and shown.

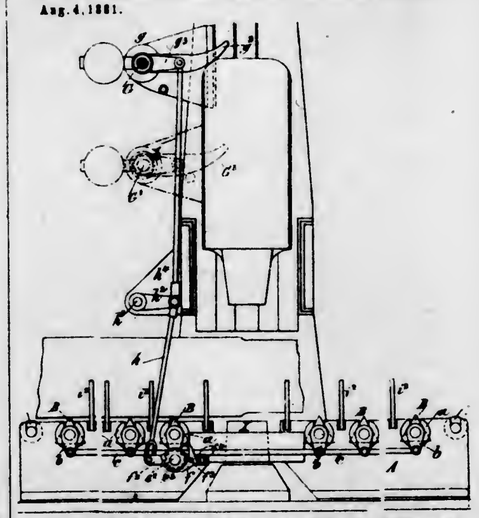
3. In a vehicle of the class described, the combination, with the body A, of the main carrying-wheel axle, located centrally, or nearly centrally, of the longer axis of the vehicle, the main springs F, and the auxiliary springs F', arranged for operation substantially as and for the purposes shown and described.

253,086. GRAINING DEVICE. CHARLES W. HOBART, Cincinnati, Ohio. Filed Sept. 3, 1881. (No model.)

Claim.—1. An apparatus for imparting a dulled level surface to lithographic slabs, &c., consisting of one or more flat-bottomed grainers, vertical shafts adapted to oscillate the grainers, driving-bar engaging with the said vertical shafts, a supporting-frame for the shafts, and pintle C, having wrist-pin E, and rotated by suitable mechanism, as set forth.

2. In a graining apparatus, one or more separable grainers capable of resting by their flat bottoms upon the work, and having central perforations, *m*, and notched lugs *m''*, in combination with oscillating driver J N, upheld in folding crane A *a* B, and driven by an oscillating connection with reciprocating bar F upon eccentric E in said crane, substantially as set forth.

3. A power-driven grainer separable from the driving mechanism, capable of resting by its proper weight by one flat end upon and of being oscillated in the plane of the work, and having in its crown the central perforation, *m*, raised margin *m'*, and notched lugs *m''*, substantially as set forth.



4. The combination of one or more grainers having vertical projections, the folding bearing-crane A B, rotating pintle C, prolonged downward, wrist-pin E, reciprocating bar, supporting-frame, and vertical shafts J, each shaft having an arm at top and a cross-bar at bottom, the said arms being engaged by the reciprocating bar, and the cross-bar engaging with the projections on the grainers, as and for the purpose set forth.

253,087. ADVERTISING DEVICE. EDWARD L. MORRIS, Boston, Mass. Filed June 9, 1881. (No model.)

Claim.—An advertising device consisting of the mirror B, frame D, and base A, having thereon an advertisement, in combination with the statue C, arranged to be reflected within the mirror, substantially as described, and for the purpose set forth.

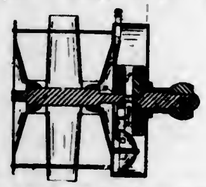
253,088. DEVICE FOR PRESENTING FORGINGS TO STEAM-HAMMERS. ANDREW MUNN, Glasgow, County of Lanark, Scotland. Filed Dec. 16, 1881. (No model.) Patented in England Aug. 4, 1881.

Claim.—1. In machinery for moving and holding forgings or ingots under steam-hammers or other hammering apparatus, the carriers B, of a form and operated in a manner to form a resting-surface for the ingot or forging during hammering, and to lift and feed the said ingot or forging under the hammer between the strokes, as described.

2. In machinery for moving and holding forgings or ingots under steam-hammers or other hammering apparatus, the combination, with the carriers B, of the means for operating the same, consisting of the wiper g^3, acted upon by the hammer, the shaft G, arm g^3, rod *h*, pawl-lever f^4, pawl *f*, and ratchet-wheel e^3, and

shaft c^1 and transmitting-wheels d e, as hereinbefore described, and illustrated in the accompanying drawings, and the combination, with these parts, of the extra shaft G^2 and tappet G^3 and clutch G^4, as and for the purpose described.

3. In machinery for moving and holding forgings or ingots under steam-hammers or other hammering apparatus, the combination, with the carriers B, of the means for turning and supporting the ingot or forging, consisting of the arms b^1 b^2 b^3 b^4, shafts k k and i i i i, and arms i^2 i^2, and their connections, as hereinbefore described, and illustrated in the accompanying drawings.



253,089. WRENCH. WM. O'CONNELL, Jr., Pittsfield, Mass. Filed Dec. 13, 1881. (No model.)

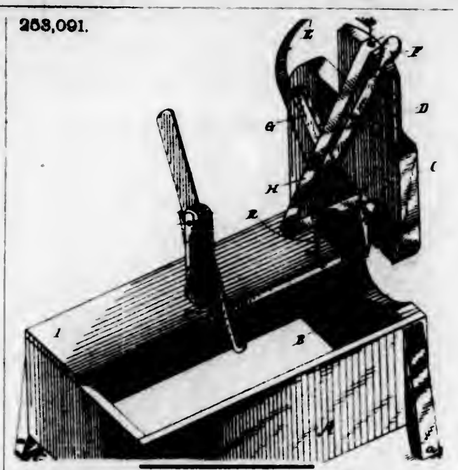
Claim.—1. The combination, with the lever A, provided with the jaw C and slots E, the latter approximating a circle in form, of the movable jaw D, having the arms F, adapted to embrace the lever A, and supporting the fulcrum-pin G, the latter being constructed with a short diameter to adapt the pin for insertion in said slots, and with a longer diameter to lock the pin against removal, substantially as set forth.

2. The combination, with the lever A, having the jaw C and slots E, of the removable jaw D, provided with the arms F, adapted to embrace the lever, the fulcrum-pin G, constructed to be inserted and turned within said slots, and thus locked therein, and the spring H, secured at one end to the jaw D, while its opposite end bears upon the lever A, substantially as set forth.

253,090. FISHING-REEL. WARREN OSAYDE and TAYLOR O'BANNON, Indianapolis, Ind., assignors to the American Reel Company, same place. Filed Nov. 14, 1881. (No model.)

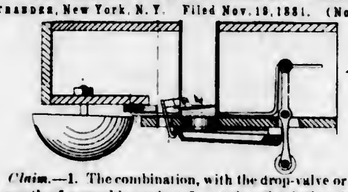
Claim.—1. The combination, in a fishing-reel, with the gear-wheels thereof, one of which is mounted on the spool-shaft and another on the crank-shaft without any direct connection between them, of a crank and a crank-shaft, the latter of which is mounted in a single bearing directly in line with the bearings of the spool-shaft, but entirely separated therefrom, substantially as shown and specified.

2. The combination, in a fishing-reel, with a bell, of a bell-hammer, a lever which is adapted to throw said hammer into or out of operative position, a wheel, and studs on said wheel, which operate to vibrate the bell-hammer when in operative position, and thereby ring the bell, all substantially as set forth.



253,091. CORN-HUSKING MACHINE. FERDINAND ORMARY, Saginaw, Mich. Filed Oct. 29, 1881. (No model.)

Claim.—1. The combination, with the standard and stationary knife, of a plunger provided with a cutter, a spring for retracting the plunger, an operating-lever, and a triangular bracket carrying the adjustable arm, substantially as set forth.



2. The combination, with the box, partial cover, and cutting devices, of a standard having a longitudinal slit and a pivoted hook-lever, substantially as set forth.

3. The combination, with the box A, end B, and standard C, the latter being recessed and grooved, as described, of the stationary cutter, the plunger D, sliding in the grooves of the standard, the cutter I', triangular bracket H, arm B, lever F, link G, and the spring E, substantially as set forth.

253,091.

253,092. SPEAKING-TUBE ANNUNCIATOR. WILLIAM R. OSTRANDER, New York, N. Y. Filed Nov. 19, 1881. (No model.)

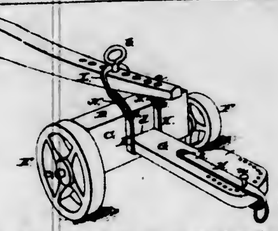
Claim.—1. The combination, with the drop-valve or cover for the mouth of a speaking-tube, of a catch or latch therefor, a trip-plate which swings in said speaking-tube and trips the catch for the purpose of automatically releasing the valve, substantially as shown and described.

2. The combination, with the pivoted catch or latch for the drop-valve, of a plate which swings vertically in the speaking-tube, so as to interrupt an air-current therein, and is adapted to act on said catch for raising it, and thereby releasing the valve automatically, as hereinbefore set forth.

3. The combination, with the gravity drop-valve catch, pivoted as shown, of the trip-plate K, which swings in the speaking-tube and is provided with the vertical extension or finger d, for acting on the catch to raise it for the purpose of releasing the valve, as set forth.

4. The combination, with the drop-valve catch and the swinging trip-plate, which are hinged independently within the fixed speaking-tube, of a detachable mouth-piece or tube whose diameter is less than that of said speaking-tube, all as shown and described, whereby said plate may be raised or displaced by inserting the mouth-piece, and will automatically resume the vertical position when said mouth-piece is withdrawn, as and for the purpose specified.

253,093. DRAIN AND IRRIGATING TILE. MORGAN PAYNE, WILLIAM P. FOUST, and ROBERT M. THOMAS, Cardington, Ohio, said Payne assignor to Morgan Foust, same place. Filed Apr. 22, 1881. (Model.)

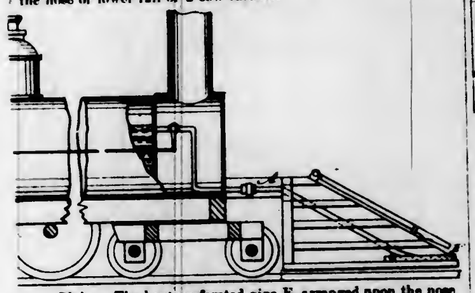


Claim.—1. As a new article of manufacture, a draining and irrigating tile provided with a reservoir or liquid-holding compartment, as set forth.

2. A tile for draining and irrigating purposes, the same consisting of a plain cylindrical or other shaped tile or conduit, with contracted ends to form a reservoir therein, as set forth.

3. The process herein described of draining and irrigating land, the same consisting in forming the drain tiles or conduits with water-holding compartments or reservoirs, which are filled with water during the rainy or wet season, which evaporates or percolates into the soil to irrigate the same in the dry season.

253,094. PLOW. PETER PETERSEN, Laporte City, Iowa. Filed Nov. 9, 1881. (No model.)



253,094.

Claim.—In a plow, the axle-block C, mounted on the wheels E and F, the broad tongue G, and the plow-beam A, having perforations a, in combination with the brackets K and L, the links N, and the pin b, substantially as specified.

253,095. STOCK-ALARM FOR LOCOMOTIVES. WILLARD A. PLACE, Lincoln, Nebr. Filed Nov. 18, 1881. (No model.)

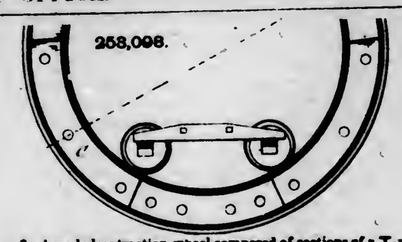
Brief.—A pipe leading from a boiler is connected to a bent perforated pipe, which ejects steam or water, and is arranged upon the nose or lower rail of a cow-catcher.

Claim.—The bent perforated pipe E, arranged upon the nose or lower rail of the cow-catcher, in combination with a steam-pipe leading from the boiler, as and for the purpose specified.

253,096. BUTTON-FASTENING. GEO. W. PERVIER, Providence, R. I. Filed Nov. 17, 1881. (No model.)

Claim.—As an improved article of manufacture, the herein-described fastening device for attaching buttons to wearing-apparel, consisting of the base or plate A, provided with the upwardly-extending prong B, formed from the central part of said plate and bent at right angles thereto, and with the spurs a upon each side of the plate and integral therewith, substantially as and for the purpose specified.

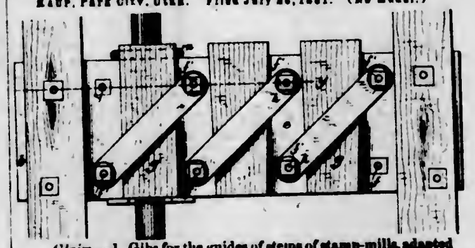
253,097. MINING APPARATUS. OLIVER S. PHAENEY, Port Henry, N. Y. Filed Apr. 13, 1881. (No model.)



Claim.—In a portable mining apparatus, the combination of a boiler, engines, drum, and compressors, said engine arranged to operate the driving and drum shafts and compressors, the whole in relative position on the bed-plate A, as set forth.

253,098. TRACTION-WHEEL. THEAT T. PHOENIX, Chicago, Ill. Filed Nov. 19, 1880. Renewed Jan. 5, 1882. (No model.)

Claim.—1. A spokeless traction-wheel composed of a T-rail and bound with a tire, substantially as described.



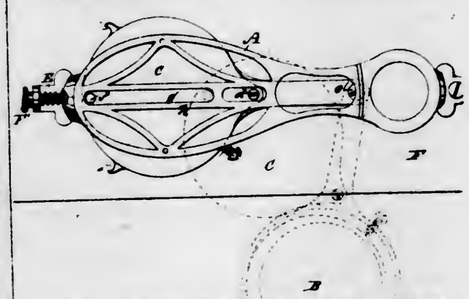
2. A spokeless traction-wheel composed of a T-rail in sections and bound with a tire, substantially as described.

253,098.

3. A spokeless traction-wheel composed of sections of a T-rail connected by fish-plates and combined with alternate sections of wood, substantially as described.

253,099. GUIDE FOR STEMS OF STAMP-MILLS. WILLIAM RAUP, Park City, Utah. Filed July 26, 1881. (No model.)

Claim.—1. Gibs for the guides of stems of stamp-mills, adapted to be laterally reversed in their sockets to compensate for wear, combined with the guide-rail and blocks secured thereto, forming sockets in shape corresponding with and to receive the gibs, and with means to hold the gibs in such sockets, substantially as described.



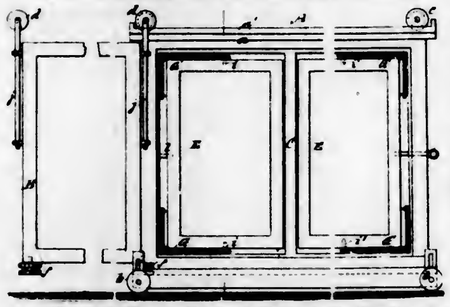
2. The gibs for the guides of the stems of stamp-mills, combined with clamping plates or bars arranged diagonally, or nearly so, across them to hold them in place, substantially as described.

3. The gibs for the guides of the stems of stamp-mills, held firmly against or upon the guide-rail, and secured against displacement in any direction by means of plates or bars attached at an incline across their faces, the parts being combined substantially as described.

4. The gibs for the guides of the stems of stamp-mills, adapted to be reversed or adjusted to present new wearing-surfaces for the stems, combined with a socketed guide-rail and diagonal clamps to hold the gibs in place, substantially as described.

5. A sectional gib for the guides of the stems of stamp-mills adapted to receive the stem, combined with a separate clamp for each gib to hold the gib-sections together and them and the stem in place, the said clamp being held at each end and adapted to be released at one end and swung aside to permit the withdrawal of the front section of the gib and its contained stem, whereby the stem-tappet may be renewed readily without interfering with any other stem or gib or interrupting the operation of the stamp-mill or battery, substantially as described.

253,100. COMBINED BLACKING-BOX HOLDER AND FOOT-REST. JACOB REAS, Cleveland, Ohio, assignor of one-fourth to Samuel Wagner, same place. Filed Oct. 18, 1881. (Model.)



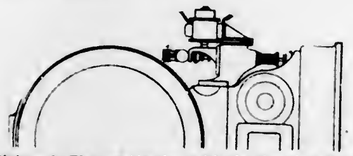
Claim.—1. The foot-rest A, formed with the slot g, in combination with the swinging box-holder B, and the cover C, provided with the pin f, substantially as and for the purposes set forth.

2. The combination of the foot-rest A, having slot *g*, the cover C, pivoted to box at *d* and provided with the opposite stud *f*, and the box B, having arm *a* pivoted at *e*, whereby the box is automatically uncovered when swung out on its pivot *e*, as described.

3. The combination of the foot-rest A, having the bracket E the spring-stop F, passing through the said foot-rest, and the box-holder having a notch to receive the end of said stud, as described.

253,101. BACKGROUND-FRAME FOR PHOTOGRAPHERS. GEORGE H. RICHARDS, Philadelphia, Pa., assignor to Thomas H. McCollin, same place. Filed Dec. 6, 1881. (Model.)

Claim.—1. The combination, with the vertically-adjustable main frame A, of the sliding scenery-frames B D, arranged upon the outside of said main frame, as and for the purpose specified.



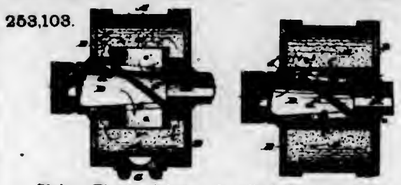
2. The main frame A, in combination with the scenery-frames B, C, and D, substantially as described.

3. The frame A, carrying the movable frames B, C, and D, in combination with the adjustable casters *b*, substantially as and for the purposes set forth.

4. The combination, with the frame C, of the two reversible panels E E, pivoted in frame C on the studs *i i'*, said studs forming a part of bent rods G G', secured to the vertical bars of frame C, as and for the purpose specified.

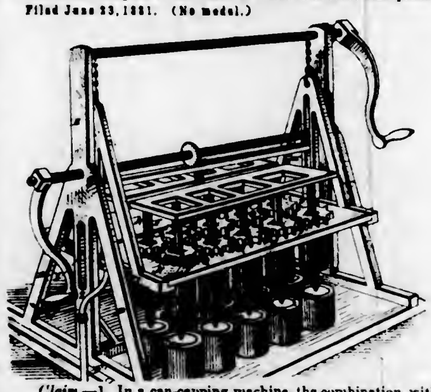
5. The frame B, provided with the wheels *f* at the bottom and the wheels *d* at the top, in combination with the gutter *g*, and the way *a* of the main frame, the wheels *d* being journaled upon the rod *j*, which is loosely connected to the frame, substantially as and for the purposes set forth.

253,102. SPEED-GOVERNOR. JOHN RICHARDSON, Lincoln, County of Lincoln, England. Filed Dec. 7, 1881. (No model.) Patented in England Jan. 23, 1881.



Claim.—1. The combination, with the throttle-valve of an engine which drives the dynamo-electric machine to produce the current for electric lighting purposes, of a speed-governor acting on said valve and an electrical device, constructed essentially as described, which governs or controls the speed of the said governor and is included in the circuit the current through which produces the electric light, all substantially in the manner and for the purposes set forth.

2. The combination, with the throttle-valve of an engine which drives the dynamo-electric machine to produce the current for electric lighting purposes, of a speed-governor acting on said valve, and an electromotor which drives said governor and is included in the circuit the current through which produces the electric light, substantially as and for the purposes described.



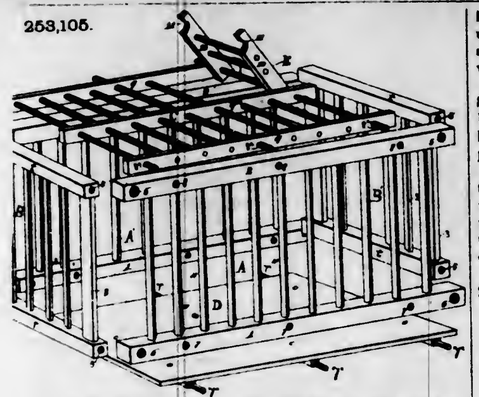
3. The combination, with the throttle-valve of an engine and a dynamo-electric machine driven by said engine and serving to produce a current for electric lighting purposes, of an electro-magnet included in the circuit the current through which produces the electric light, and operated thereby to close said throttle-valve when the current through said circuit ceases, substantially in the manner and for the purposes set forth.

253,103. FILTER. CHAS. L. RIDGWAY, Boston, Mass. Filed Apr. 9, 1881. (Model.)

Claim.—The hereinbefore-described filter, consisting of the cylindrical shell A B, the axial pipe C, provided upon opposite sides with radial central openings, *c* and *c'*, which are covered by means of wire strainers *c²*, and having the recess *c³* midway between said openings, the hollow plug D, provided with radially-opposite ports *d*, *d'*, and *d²*, and having its interior divided by means of the diagonal partition *d³*, and the thimble E, fitted into the smallest end of said plug, in combination with each other and with filtering material placed within said shell, substantially as and for the purpose specified.

253,104. CAN-CAPPING MACHINE. JOSEPH ROBERTS, Baltimore, Md., assignor of one-third to Wm. F. Roberts, same place. Filed June 23, 1881. (No model.)

Claim.—1. In a can-capping machine, the combination, with a standard, an adjustable frame suspended therefrom, and a removable plate supported in said frame, of a series of soldering-irons having cog-wheels attached thereto and arranged to retain the soldering-irons in place, and suitable gearing for imparting rotary movement to the series of soldering-irons simultaneously, substantially as set forth.

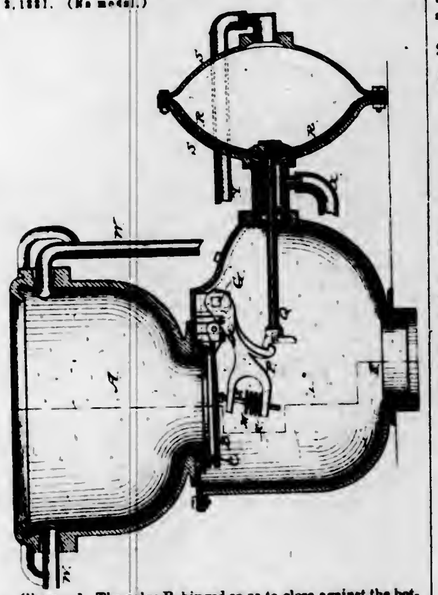


2. In a can-capping machine, the combination, with a standard having a shaft journaled therein, a frame, and flexible connection between said shaft and frame, and a plate supported in the lower end of said suspended frame, of a series of soldering-irons connected with said plate, cog-wheels attached to each soldering-iron, and gearing for imparting simultaneous rotary motion to the entire series of soldering-irons.

3. In a can-capping machine, the combination, with a standard, of a frame, perforated plates removably secured thereto, soldering-irons attached to said plates, cogs secured to the several irons and arranged to mesh with each other, centering-irons adapted to reciprocate in the vertical axes of the cogs and soldering-irons, and gearing to revolve them, substantially as set forth.

4. In a can-capping machine, the combination, with a standard, of an adjustable frame, two perforated plates mounted in said frame and adapted to be inserted therein or withdrawn therefrom from opposite sides of the standard, soldering-irons mounted in each of said plates, gearing to rotate them, and centering-irons rigidly secured to frames located above the plates and adapted to reciprocate in the vertical axes of the cogs and soldering-irons, substantially as set forth.

5. In a soldering-iron, the combination, with a block provided with two or more collars of different sizes, of a metallic ring secured according to its size to one of said collars, the ends of the ring being cut away to form a slot where they come together, substantially as set forth.



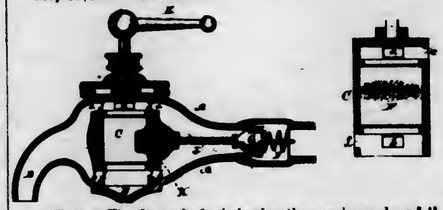
253,105. CRATE FOR TRANSPORTING VEGETABLES, LIVE POULTRY, &c. JNO. W. ROGERS, Denver, Colo. Filed Oct. 18, 1880. (Model.)

Claim.—1. A knockdown crate consisting of the bottom D and sides A A', secured together by tongues 7* and eyes 7, the ends B B', secured to the sides by binding-screws 5*, and eyes or slots 5, and the top secured to the sides by tongues 8* and eyes 8, as set forth.

2. A knockdown crate having the top C, consisting of longitudinal pieces 9 9 and center piece, 9*, said pieces connected by cross slats or bars, in combination with the hinged door E, provided with recesses 11, substantially as described.

253,106. WATER-CLOSET. WILLIAM H. SACK, Oakland, Cal., assignor of one-half to Ezra A. May, same place. Filed Sept. 2, 1881. (No model.)

Claim.—1. The valve B, hinged so as to close against the bottom of the bowl A, in combination with the lever H, mounted upon a shaft, G, and connected with the valve, the acting diaphragm R, and the rod Q, substantially as and for the purpose herein described.

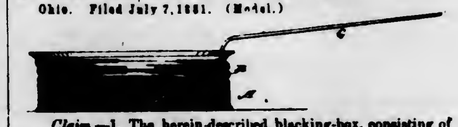


2. The forked lever H, secured to the rotating shaft G, and having the pin J sliding through its two fork ends, in combination with the spring K, so that after the pin has closed the valve B the compression of the spring will allow the shaft to continue its rotation, substantially as and for the purpose herein described.

3. The diaphragm R, having its edges secured between the convex cases S, and the rod Q, extending from its center to operate the lever H, as shown, in combination with the water-pipes opening into the cases upon each side of the diaphragm, so that water under pressure may be admitted to force the diaphragm to one side or the other of the case and move or release the lever and valve, substantially as herein described.

4. The diaphragm R, moving within the double-convex case S and operating the rod Q, in combination with the four-way cock U, the supply and discharge pipes V W, and the pipes X Y, leading to opposite sides of the case S, substantially as and for the purpose herein described.

5. The diaphragm R, moving in the case S, with its rod Q the four-way cock U, and the connecting-pipes, the operating-lever Z *a*, and connecting-rods, in combination with the shaft *c*, lever-arm *d*, and the lug *f*, which are operated therefrom and made to engage a lever, *g*, upon the shaft G, so as to prevent the rotation of the latter until released, substantially as herein described.

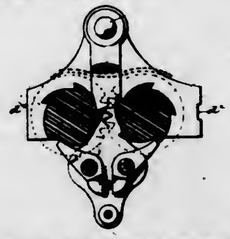


253,107. FILTERING-FAUCET. WILLIAM H. SACK, Oakland, Cal., assignor of one-half to Ezra A. May, same place. Filed July 21, 1881. (No model.)

Claim.—The faucet-body A, having the openings *a b*, and the plug C, having the filter F, and the openings *d*, *e*, and *f*, as shown, and having the channel or groove K upon its exterior surface, in combination with the valve G, having the stem or spindle J, extending in and resting against the plug in line with the groove K, substantially as and for the purpose herein described.

253,108. WITHDRAWN.

253,109. BLACKING-BOX. ALONZO H. SAVAGE, Ashtabula, Ohio. Filed July 7, 1881. (Model.)



Claim.—1. The herein-described blacking-box, consisting of a box having screw-threaded sides, and lid having a screw-threaded flange and a central aperture, as and for the purpose set forth.

2. In a blacking-box, the combination, with the box A, having screw-threaded sides B, of the lid D, having a screw-threaded flange, F, and provided with a central aperture, K, and scraper H, substantially as and for the purpose set forth.

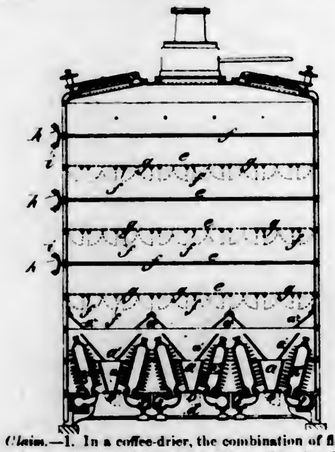
3. In a blacking-box, the combination, with the box A, having screw-threaded sides B, of the lid D, having a screw-threaded flange, F, central aperture, K, handle G, and scraper H, substantially as and for the purpose set forth.

253,110. CORN-PLANTER. LEVI SCOFIELD, Grand Haven, Mich. Filed Apr. 26, 1881. (Model.)

Claim.—1. The combination, with the two meshed gear-wheels having the reversed ratchets on their hubs, of the pivoted arm or pawl-carrier moving between the hubs of the gear-wheels and carrying the pawls which alternately engage with the ratchets as the arm is vibrated, substantially as described.

2. The combination, with the two meshed gear-wheels having the reversed ratchets on their hubs, of the pivoted vibratory arm,

or pawl-carrier moving between the hubs of the gear-wheels, the ratchets mounted on said pivoted arm, and an elastic friction-brake or stop, also mounted on the said pivoted arm and operating alternately on the peripheries of the gear-wheels, substantially as described.

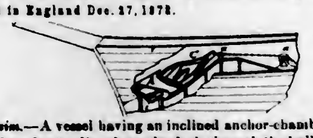


3. The combination of the meshed gear-wheels, the pivoted arm or pawl-carrier, the pawls, and the friction-brake or stop consisting of an elastic plate mounted centrally upon the pawl-carrier, and projecting laterally so as to bear alternately against the peripheries of the gear-wheels as the pawl-carrier is vibrated or swung on its pivot, substantially as described.

4. The combination of the meshed gear-wheels, the pivoted arm or pawl-carrier, the pawls, and the elastic stop or friction-brake, curved so as to conform to the outline of the gear-wheels and to bear upon two or more of the teeth of the same at once, substantially as described.

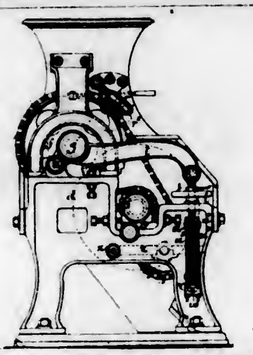
5. The combination, with the vibrating pawl-carrier, of the reversed pawls and the single spring interposed between the two pawls to operate both, substantially as described.

6. The arched casting D, having the shouldered side flanges, d^3 d^3, and the shouldered rib d^2, in combination with the plate D', carrying the gear-wheels and the pawl-carrier, and having the arched end d^4 and plain end d^5, the parts being connected together substantially as described.



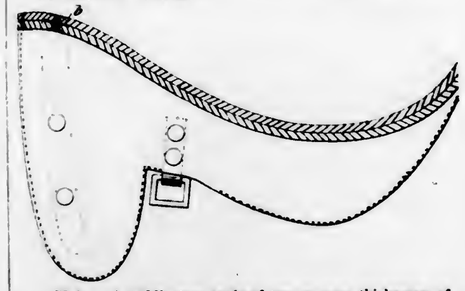
253,111. APPARATUS FOR DRYING COFFEE, GRAIN, &c. HENRY SCHOLFIELD, New York, N. Y. Filed Aug. 3, 1881. (No model.)

Claim.—1. In a coffee-drier, the combination of flaps *g*, rods *f*, crank-arms *h*, pivoted bars *i*, hand-levers *k*, and yokes *m*, substantially as and for the purposes described.



2. The combination, with the discharge valves or flaps *e* and the radiators E, of the plates $a\ a'\ a^2$, about and above said radiator, substantially as described, whereby the air is guided in contact with the radiators and the dried coffee in conducted to the discharge-valves, as set forth.

253,112. ANCHOR-WELL FOR VESSELS. JAMES SCOTT and JOHN H. RISDEL, Glasgow, County of Lanark, Scotland, assignors to said Scott. Filed Feb. 28, 1881. (Model.) Patented in England Dec. 27, 1878.



Claim.—A vessel having an inclined anchor-chamber open at both ends and extending from the deck through the hull to a point above the water-line, and provided with a sliding cover, the said chamber conforming in shape to the shape of the anchor, substantially as herein shown and described, and for the purpose set forth.

253,113. ROLLER-MILL FOR GRINDING CORN, &c. CHRISTIAN SECK, Dresden, Saxony, Germany, assignor of one-half to Carl Seck, same place. Filed July 9, 1881. (No model.) Patented in Germany Nov. 28, 1880, in England Apr. 13, 1881, in Austria-Hungary June 4, 1881, in Belgium June 21, 1881, and in Italy June 30, 1881.

Claim.—In a roller-mill, the combination of two rollers, a chain for transmitting motion from one to the other, pivoted levers comprising bearings for one of said rollers, a chain-wheel or idler around which said chain is passed, and a lever comprising bearings therefor, and a shaft and connections whereby said levers may be simultaneously raised to remove one roller from the other and for slackening said chain, substantially as specified.

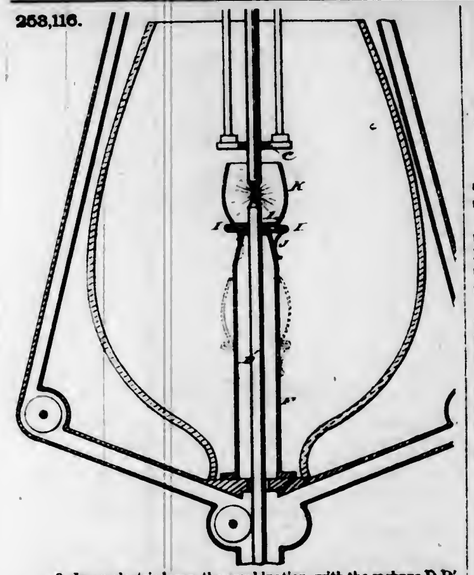
253,114. SADDLE-TREE. MARTIN SEDLACEK, Troy, Mo. Filed Nov. 11, 1881. (Model.)

Claim.—A saddle-tree made of two or more thicknesses of leather molded into the form of a saddle and secured together, and provided with the front stay, *b*, inserted and secured between the layers of the leather, substantially as described.

253,115. BORING AND CUTTING IMPLEMENT. ISAAC SHARP, Waveland, Ind., assignor of one-half to George Seybold, same place. Filed Mar. 16, 1881. (Model.)

Brief.—A semi-cylindrical cutter has routing-lugs upon its convex surface and an adjustable bit upon the concave side.

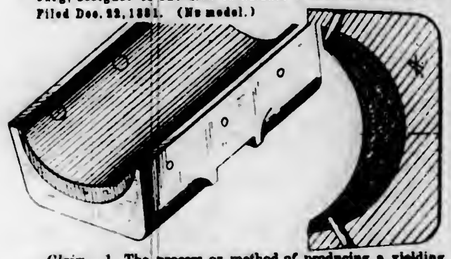
Claim.—1. A plug cutter or borer consisting of a semi-cylindrical bit having a sharp arcuate edge and a slotted abrading-tool adjustable on the concave surface of said bit, substantially as shown and described.



2. A plug cutter or borer consisting of a semi-cylindrical bit having a sharp arcuate edge and piercing and cutting lugs on its convex face, and a slotted abrading-tool adjustable on the concave face of the said bit, substantially as shown and described.

253,116. ELECTRIC LAMP. HENRY B. SHERIDAN, Cleveland, Ohio. Filed Oct. 26, 1881. (No model.)

Claim.—1. An electric-arc lamp having a small adjustable globe with a closed bottom and open top arranged within a larger globe and surrounding the adjacent points of the carbon, substantially as shown and described, whereby a circulation of air in the region of the arc is prevented and the flicker of the light avoided, as set forth.



2. In an electric lamp, the combination, with the tube F, having tapered upper end and surrounding the lower carbon, of the annular support I, provided with springs J, and the globe K, provided with the plate L, substantially as and for the purpose set forth.

253,116.

3. In an electric lamp, the combination, with the carbons D D' and the tube F, having its upper end tapered and provided with the fillet G, of the annular support I, provided with the springs J, the globe K, and the apertured plate L, substantially as and for the purpose set forth.

253,117. JOURNAL-BEARING. GEORGE J. SHIMER, Freemansburg, assignor of one-half to Samuel J. Shimer, Milton, Pa. Filed Dec. 22, 1881. (No model.)

Claim.—1. The process or method of producing a yielding journal-bearing, which consists in forming alternate layers of hard and soft metals by bending or folding and casting, substantially as described.

2. The process or method of producing a yielding journal-bearing, which consists in forming alternate layers of hard and soft metals by bending or folding, casting, and riveting the parts together, substantially as described.

3. A yielding journal-bearing for a journal-box, composed of a series of alternate layers of hard and soft metals arranged crescent-shaped in cross-section, substantially as described.

4. A yielding journal-bearing for a journal-box, composed of layers of punctured or indented sheet metal or its equivalent and layers of soft metal arranged crescent-shaped in cross-section, substantially as described.

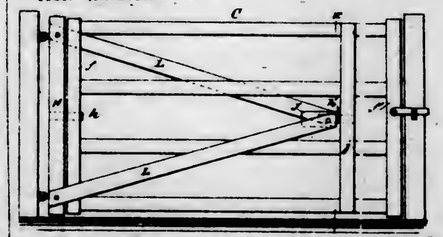
5. The combination of a yielding journal-bearing composed of a series of alternate layers of thin and hard and soft metals, an outer shell, and fastening means, substantially as described.

253,118. CHEESE-VAT. GOTTLIEB H. SIMON, Kiel, Wis. Filed Oct. 14, 1881. (Model.)

Claim.—1. The pivoted levers arranged at the corner legs of the vat and having angular slots through which their pivots pass, substantially as and for the purpose described.

2. The combination, with the outer vat, A, having depression D, of the fine *d*, the wooden cover E, held by bolts passing through slotted lugs *e*, the channels F, perforations *f*, metal plates *f'*, wooden strips G, and the perforated wooden cut-off H, held by

253,118.



spring-fingers and operated by levers, said members being constructed and adapted for use substantially as described.

3. The combination of the outer vat having a central longitudinal depression, a heating-flue extending through the same, the heater *a* at the end of said flue, the boiler Q, the outlet-flue a^3 through the boiler, and the regulating valve or damper a^5, substantially as described.

4. The combination of the outer vat having a central longitudinal depression, the flue extending through the same, the false bottom, the perforations *f*, cross-channels F, the cut-off H, its yielding guides A, and the inner vat, substantially as described.

5. The combination of the outer vat, the flue passing centrally through its depressed bottom, the cover E, channeled and perforated at F *f*, the cut-off H, and deflector-plates *f'*, substantially as described.

253,119. FARM-GATE. DANIEL SPENCER, Albion, assignor of one-half to Albert W. Austin, Marengo, Mich. Filed Dec. 9, 1881. (No model.)

Claim.—1. The gate C, pivoted upon the pivots or studs A and A', the pivot A being secured to and the pivot A' being supported from the post H, substantially as described.

2. The diagonal bars L L, secured at one end to the post H and carrying the block J at their outer ends, in combination with the gate C and the pivots A and A', substantially as described.

253,120. APPARATUS FOR MANUFACTURING GAS. THEODORE G. SPRINGER, New York, N. Y. Filed Dec. 6, 1881. (No model.)

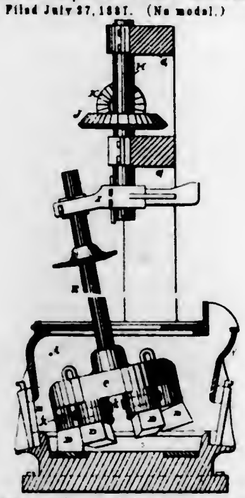
Brief.—Steam is decomposed in the lower chamber of a cupola in contact with incandescent fuel, and the resulting gases are enriched with hydrocarbon liquid or vapor on their passage through a flue leading to the upper chamber of the cupola, where the mixture is highly heated in contact with fire-brick, and thus converted into a fixed gas. The upper chamber is filled with fire-brick for storing up and retaining the heat given off from the fuel during the period when it is being brought to an incandescent condition by air-blasts preparatory to the decomposition of steam.

Claim.—1. A cupola or gas-generating apparatus having a decomposing-chamber wherein steam and solid hydrocarbon may be mutually decomposed, a fixing-chamber wherein mixed gas and hydrocarbon vapor may be fixed, and a connecting-flue wherein the liquid hydrocarbon and the hydrogen and carbonic oxide gases may be mixed before entering the fixing-chamber and the heat of the cupola thoroughly utilized, the respective chambers being located respectively one above the other, substantially as specified.

2. An apparatus for generating gas, consisting of a cupola divided into communicating compartments by means of a perforated diaphragm or diaphragms, the lower of said compartments being adapted to contain fuel and the upper refractory material, the fuel-compartment being provided with suitable air-inlet and steam-inlet pipes, whereby air may be admitted to create the proper heat, or steam may be admitted for decomposition, and the intermediate flue provided with suitable means for the introduction of liquid or vaporized hydrocarbon, substantially as specified.

3. The combination, in a cupola divided into communicating compartments by a perforated diaphragm, of the damper adapted to open and close communication between compartments, substantially as and for the purposes specified.

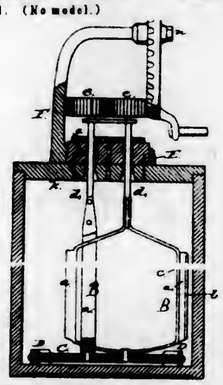
4. In combination with the communicating compartments of a vertical cupola, the flue extending from the lower to the upper compartment, and the hydrocarbon-induction tube leading into said flue, whereby the hydrogen and carbonic oxide and hydrocarbon may be mingled and the hydrocarbon vaporized before entering the upper compartment, substantially as specified.



5. In combination with the communicating chambers of the cupola, the perforated diaphragm, the connecting-flue, and the damper arranged to cut off direct communication between the two chambers and direct the gases from the lower chamber through the flue into the upper chamber, substantially as specified.

6. The combination, with the communicating chambers, the perforated diaphragm, the damper, and connecting-flue, of an oil-supply pipe leading into said connecting-flue, substantially as specified.

7. In combination with the communicating chambers, the perforated diaphragm and damper and the connecting-flue, the air-blast pipes leading into the ash-pit and combustion-chamber, and the smoke-stack and damper, whereby the fuel may be prepared for the subsequent decomposition of the steam and the carbonic oxide utilized for heating the fixing-chamber, substantially as specified.

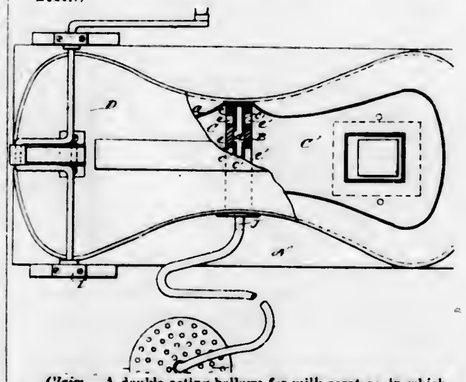


8. In combination with the communicating chambers, the perforated diaphragm and dampers, the connecting-flue and oil-inlet, and the air and steam blast pipes, whereby a current of air or steam, as may be required, may be passed through the ignited fuel for heating the fixing-chamber or generating a fixed gas, substantially as specified.

253,121. QUARTZ-CRUSHER. CHAS. P. STANFORD, San Francisco, Cal. Filed July 27, 1881. (No model.)

Claim.—An ore-crusher consisting of the mortar A, pestle C, with its separated peripheral dies D, keyed to the bosses, as shown, and stem E, and the crank I, revolving shaft H, gears J and K, shaft L, and driving pulley M, substantially as herein described.

253,122. CHURN. FRANK P. STEBBINS, Collins, Mich. Filed Oct. 25, 1881. (No model.)



Claim.—1. In a double-dash rotary churn, the foot-bearing C, carrying the pivots of the dashers, and the transverse guards D, substantially as specified.

2. In a double-dash rotary churn, the dashers B B, their foot-bar C, and guard D, the pintles *e e*, raised sectional bearings *g h*, and fastening-band E, carrying the drive-wheel bearing, substantially as specified.

3. In a rotary churn, the combination, with the cover-sections and the raised bearings *g h*, of the fastening-band E, its arm F, and terminal journal-bearing *n* for the drive-wheel, substantially as specified.

253,123. DOUBLE-ACTING BELLOWS FOR MILK-AERATORS. NORMAN G. STEBBINS, Rome, N. Y. Filed July 12, 1881. (No model.)

Claim.—A double-acting bellows for milk-aerators, in which are combined valved air-chambers C C', a chambered partition, B, with inside valves over openings *e e'*, and a board, D, hinged to the top of said partition B, as shown and described.

253,124. EVAPORATING-PAN. HENRY B. STEVENS, Buffalo, N. Y., assignor to George L. Squier, same place. Filed June 8, 1881. (No model.)

Claim.—1. An evaporating-pan having its bottom provided with a depression, B, in combination with a bent discharge-pipe, c, adapted to be turned down into the depression B, substantially as set forth.

2. An evaporating-pan constructed with a cast end piece, *a'*, having a depression, B, cast therein, to accommodate the bent discharge-pipe c when turned down, and provided with a water-tight joint, *c'*, through which the pipe *c* passes, substantially as set forth.

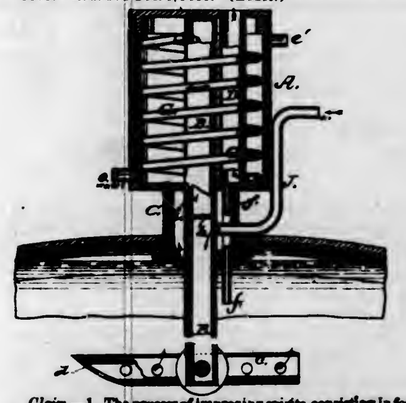
3. The combination, with an evaporating-pan, of one or more scum-gatherers, E, constructed with open ends for the admission of the scum, substantially as set forth.

4. The combination, with an evaporating-pan, of a scum-gatherer, E, constructed with open ends for the admission of the scum, and having its inner wall projecting to or above the level of the liquid to prevent the escape of the scum, substantially as set forth.

5. The combination, with an evaporating-pan, of a scum-gatherer made vertically adjustable, substantially as set forth.

6. The combination, with an evaporating-pan, of hinged scum-troughs D and removable scum-gatherer E, substantially as set forth.

7. The combination, with the manifold head G, of the straight diaphragm A, cast in one piece with the head G, steam-supply pipe *j*, and exhaust-pipe *k*, communicating respectively with chambers on opposite sides of the diaphragm, substantially as set forth.

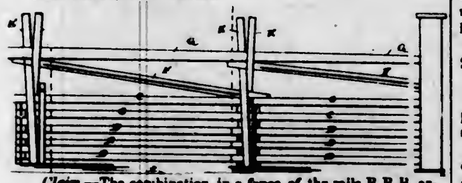


8. The combination, with the steam-pipes F, of exhaust-pipes *i*, arranged on the bottoms of the pipes F, substantially as set forth.

9. The combination, with the manifold head G, of the steam-pipes F, exhaust-pipes *i*, arranged in the pipes F, and caps *g*, applied to the open end of the pipes F, substantially as set forth.

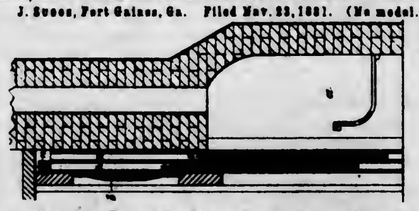
10. The combination, with an evaporating-pan, of steam-heating pipes F, movable scum-troughs D, and a bent discharge-pipe, *c*, substantially as set forth.

11. The combination, with an evaporating-pan, of steam-heating pipes F, connected with the pan by trunnions, movable scum-troughs D E, and bent discharge-pipe *c*, substantially as set forth.



253,125. PROCESS OF AND APPARATUS FOR IMPROVING SPIRITS. FREDERICK SUTTER, Louisville, Ky. Filed Oct. 11, 1879. Renewed Dec. 8, 1881. (Model.)

Claim.—1. The process of improving spirits, consisting in forcing air through a retort containing burning charcoal and conducting the resulting gas directly into the spirits, and condensing the alcoholic vapors taken up by the gas, substantially as specified.



2. The spirit-improving apparatus consisting of the close vessel A, having tube B, provided with the swiveled gravitating rose-pipe c, an induct and educt, a perforation or perforations, *i*, and a diaphragm, *b*, the escape-pipe D, containing coarse gravel, and having drip-pipe *f*, the worm G, opening at its upper end into the pipe B and its lower end into pipe D, and a hot-gas-supply pipe, J, opening into the said pipe B below its diaphragm, the whole arranged and operating as set forth.

253,126. FENCE. ANDREW R. STORMONT, Princeton, Ind. Filed Oct. 19, 1881. (Model.)

Claim.—The combination, in a fence, of the rails B B B, arranged in line one above the other, the rails C C, located above the rails B B B and out of line with the same to serve as a barrier to prevent animals from jumping the fence, the inclined rails F and crossed stakes E, the longitudinal rail G, and the cross-pieces D, interposed between the rails B B B and C C, substantially as specified.

253,127. COMBINED FIRE-SCREEN AND FENDER. THOMAS J. SUGGS, Fort Gaines, Ga. Filed Nov. 23, 1881. (No model.)

Claim.—1. The combination, with a fire-place and a mantel-piece surmounting said fire-place, of a fender and a screen arranged in front of the fender, the fender and screen being each balanced by a separate weight and adapted to be raised and lowered independently of each other in a space between the mantel-piece and the fire-place, substantially as described, and for the purpose set forth.

2. The combination, with the fire-place *a* and the mantel-piece *b*, provided with channels c and vertical grooves *b b*, of the fender *l*, screen *k*, arranged in front of the fender, cords *m m'*, pulleys *n n'*, and weights *o o'*, substantially as described, and for the purpose set forth.

253,128. FIRE-EXTINGUISHER. CHAS. W. TALCOTT, Woonsocket, R. I. Filed Apr. 6, 1879.

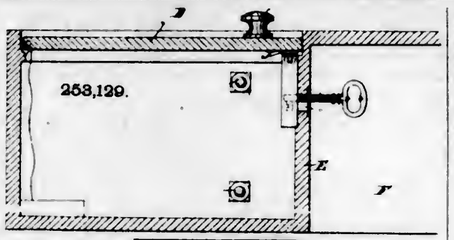
Claim.—1. The combination, with a distributer designed to spread water or other fluid over a large area, of a hinged metal cap arranged to cover and protect the distributer, substantially as described.

2. The combination, with a distributer designed to spread water or other fluid over a large area, of a hinged metal cap arranged to cover and protect the distributer, said cap being secured to its base with a low fusible material, substantially as described.

3. The combination, with a distributer designed to spread water or other fluid over a large area, of a hinged metal cap arranged to cover and protect the distributer, and fastened to the base with a pin made of a low fusible material, substantially as described.

4. The combination, with a distributer designed to spread water or other fluid over a large area, of a hinged metal cap arranged to cover and protect the distributer, and fastened to the base with a pin made of low fusible material, and a packing-annulus, substantially as described.

5. The combination, with the base provided with projections or ears, and a distributer designed to spread water or other fluid over a large area, of a hinged metal cap arranged to cover and protect the distributer, and fastened to said base with a pin made of low fusible material, substantially as described.

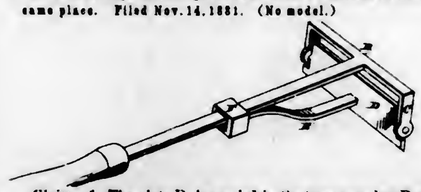


6. The combination, with a perforated distributer, of a cap closely fitting over the perforated portion of the distributer and secured by solder fusible at a low temperature, substantially as described.

7. The combination, with a distributer, of a cap extending over the distributer to protect the same, and held to a flange or shoulder by fusible solder, and a seal placed between the distributer and the fusible solder, so as to prevent the water from reaching the solder joint, substantially as described.

253,129. SAFE. ROBERT W. TOWNS, Parker's Landing, Pa. Filed Oct. 5, 1881. (Model.)

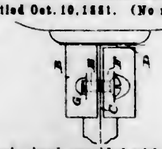
Claim.—1. An improved safe, having an open-bottom compartment at its key-hole end adapted to cover the key-hole, substantially as and for the purpose set forth.



2. In a safe, the combination, with the box A, of the cover or door D and the partition E, forming a compartment, F, having its opening in that side of the box opposite the one in which the door or cover D is placed, substantially as and for the purpose set forth.

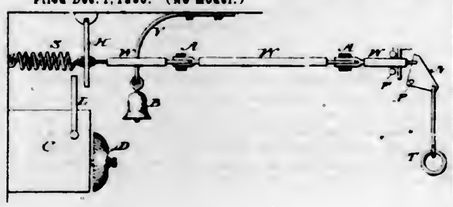
253,130. BASIC PROCESS OF TREATING IRON IN THE MANUFACTURE OF BESSEMER STEEL. SIDNEY G. THOMAS, 3 Queens Road Villas, County of Surrey, England. Filed Nov. 9, 1879. Patented in England Sept. 3, 1879, in Belgium Oct. 15, 1879, and in France Dec. 5, 1879.

Claim.—The herein-described improvement in the process of treating iron, which consists in adding to the refined metal which has been dephosphorized in a basic-lined converter, with basic additions at the end of the after-blow, from three to seven per cent. of ordinary non-phosphoric pig-iron, preferably containing less than three per cent. of silicon, immediately followed by the addition of spiegeleisen or ferro-manganese, so as to recarburize the metal and prevent red-shortness without rephosphorizing it, without wasting manganese, and without leaving so much as one-tenth per cent. of silicon in the metal, substantially in the manner and proportions herein described.



253,131. COMBINED MOP-HOLDER AND SCRAPER. JOHN E. TIFFIN, Redding, Cal., assignor of one-half to William A. Smith, same place. Filed Nov. 14, 1881. (No model.)

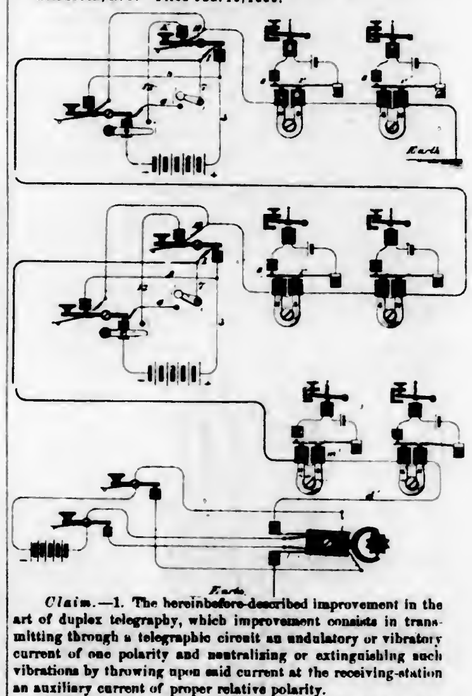
Claim.—1. The plate D, journaled in the transverse bar B, so that it may be turned to receive the material of the mop, and having the projecting arm or brace E engaging with the slide F, whereby it may be locked to hold the material in place, substantially as herein described.



2. The combined mop and scraper, consisting of the plate D, having its edge formed into a scraper, as shown, and ends journaled to the bar of the frame, and provided with the arm E, adapted to be held by the slide F, so as to retain the material of the mop, substantially as herein described.

253,132. KNOB ATTACHMENT. HENRY R. TOWNE, Stamford, Conn., assignor to the Yale Lock Manufacturing Company, same place. Filed Oct. 10, 1881. (No model.)

Claim.—A knob-shank provided with a longitudinal slot, C, transverse slot D, and lugs E and F, in which works the screw G, substantially as herein set forth.

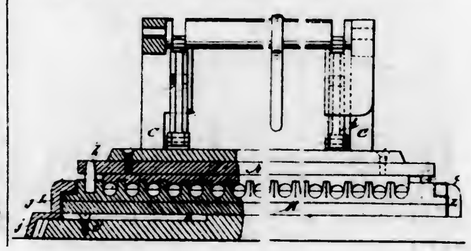


253,133. AUTOMATIC FIRE-ALARM. PETER H. VANDER WEYDE, Brooklyn, assignor to Charles Colne, New York, N. Y. Filed Dec. 1, 1880. (No model.)

Claim.—1. The combination, with the bell-wire and bell operated by a pull of the wire in the usual manner, of a piece of easily-fusible alloy and a separate signal-alarm, which is operated by the release or breakage of the bell-wire by heat, in the manner set forth.

2. The combination of wooden strips connected by an easily-fusible alloy with the bell-pull spring and alarm, in the manner described.

253,134. DUPLEX TELEGRAPH. HENRY VAN HOEVENBERGH, Elizabeth, N. J. Filed Jan. 16, 1880.



Claim.—1. The hereinbefore-described improvement in the art of duplex telegraphy, which improvement consists in transmitting through a telegraphic circuit an undulatory or vibratory current of one polarity and neutralizing or extinguishing such vibrations by throwing upon said current at the receiving-station an auxiliary current of proper relative polarity.

2. The hereinbefore-described improvement in the art of duplex telegraphy, which improvement consists in transmitting undulatory or vibratory currents of opposite polarities through a telegraphic circuit, cutting off from the line, at the pleasure of the transmitting-operator, either set of vibrations, and in neutralizing either current so transmitted by throwing upon the line at the receiving-station an auxiliary current of the proper relative polarity.

3. The hereinbefore-described improvement in the art of duplex telegraphy, which improvement consists in transmitting through a telegraphic circuit undulatory or vibratory currents of opposite polarities and neutralizing or extinguishing at pleasure either one of said currents (while strengthening the other) by throwing upon said current at the receiving-station an auxiliary current of a polarity opposite to that of one of the transmitted currents.

253,135. CIGAR-MOLD PRESS. GEORGE VOLLKOMMER, Brooklyn, N. Y. Filed Dec. 8, 1881. (No model.)

Claim.—1. The combination, with the base A, having grooves i i, of the sliding plates J, having flanges j, as and for the purpose specified.

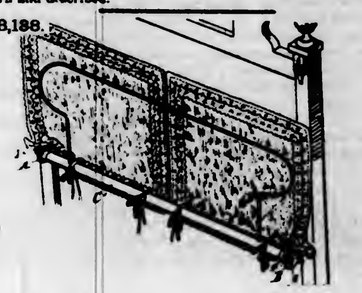
2. The combination, with the grooved base A and mold M, having the shoulders, of the extensible plates J, having beat flanges, with the horizontal portions c, as and for the purpose specified.

253,136. FAUCET. JAS. O. WADDELL, Elizabeth, N. J. Filed May 11, 1881. (Model.)

Claim.—1. The combination, in a faucet, with the eccentric a, of a collar, b, and a stem and valve-head formed integral with one another, said head having a regular outline, the shape being that of a round-based cone, said parts being arranged and operating substantially as and for the purposes set forth and shown.

2. In a faucet having a metallic valve-head operated by an eccentric, the combination, with the body of said faucet having a flange, and a thimble having a co-operating flange, h, of a tubular rubber (or composition of rubber) valve-seat the depth of which approximates the diameter thereof, substantially as and for the purposes set forth and shown.

3. The combination, with the faucet-body A, having an upper bearing formed integral therewith, of a shaft having a shoulder formed thereon engaging with said bearing, and a bottom screw, forming a lower bearing for said shaft, secured in an opening of sufficient size and adapted to allow the upward passage of said shaft, all substantially as and for the purpose herein set forth and shown.

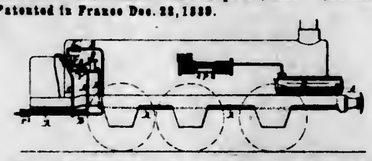


253,137. WINDOW-SCREEN. ROBERT B. WALTER and JOHN P. VOELKER, New York, N. Y. Filed Sept. 24, 1881. (No model.)

Brief.—The screen, mounted on a spring-roller, and with a bar at its upper edge attached by eyes to knobs on the lower sash, its side edges being covered by guard-bars having guide-rollers at their lower ends, has a spring-plate bearing against the roller.

Claim.—The hollow screen-roll C, carrying internally a spiral spring on a rod, E, secured to the brackets F, in combination with the bar H, having eyes I, the sash-knobs J, the guard-bars K, carrying pivoted rolls L, and the spring-plate M, all arranged as shown and described.

253,138.



253,138. PILLOW-SHAM HOLDER. JOHN A. WARLEBE, Toledo, Ohio. Filed Oct. 26, 1881. (No model.)

Claim.—1. A pillow-sham holder consisting of a frame, D, a rod, C, and means, substantially as described, for locking the rod and frame in position when partially rotated, as and for the purpose specified.

2. The combination, in a pillow-sham holder, of the fastenings A B, the rod C, and the frame D, said rod being provided with the bearings and said fastenings being constructed and the parts arranged and operating as and for the purposes set forth.

253,139. FLUID-PRESSURE RAILWAY-BRAKE. ADOLPHE WEBER, Paris, France. Filed Sept. 28, 1881. (No model.) Patented in France Dec. 28, 1880.

Claim.—1. A railway-car provided with a cylinder, a differential piston therein, a pipe communicating with said cylinder on the side of said piston of least area, another pipe communicating with said cylinder on the side of said piston of greatest area, the said pipes extending from end to end of the car, and connections between said piston and the brake-shoes, combined substantially as set forth, whereby, when the pressure against the side of the piston of greatest area exceeds by more than the difference of area the pressure on the opposite side, it moves the piston and applies the brakes.

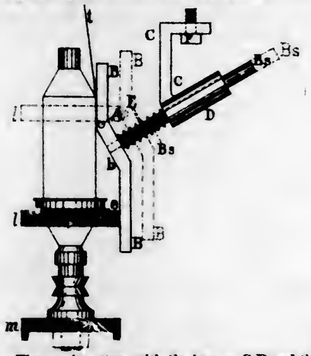
2. The combination, with a railway-car and its brakes, of a brake-applying mechanism consisting of a cylinder, a differential piston therein, a pipe extending from end to end of the car, a connection between said pipe and the cylinder on the side of the piston of greatest area, a branch from said pipe connecting with said cylinder on the side of the piston of least area, and a check-valve in said pipe, substantially as set forth.

3. A locomotive provided with an air-compressing pump, a reservoir arranged to receive the compressed air therefrom, a pipe leading from said reservoir extending to the rear of the locomotive and provided with a coupling at its end, and a reducing-valve in said pipe, consisting of a differential piston controlling a cut-off valve, combined and arranged substantially as set forth, whereby a high pressure in the reservoir generates a proportionately less pressure in the pipe beyond the valve.

4. The combination of a source of compressed air on the locomotive, an air-pipe leading thence through the train and communicating with cylinders on the cars, the said cylinders, differential pistons therein, and a second pipe, connected also to said cylinders on the opposite side of said pistons, extending to the locomotive, and there connected with a source of compressed air through the medium of a valve under the control of the engineer, whereby the latter may control the pressure in the said second pipe, substantially as set forth.

5. The combination of cylinder F, differential piston K, pipes A and B, and escape-valve G', substantially as set forth.

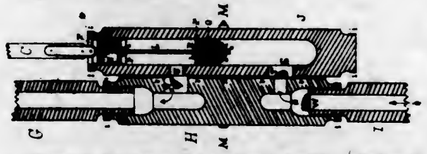
6. The escape-valve G', consisting of the casing, the plunger f therein, holes r r in said plunger, and valve g, operated thereby, in combination with pipe B and cylinder F, substantially as set forth.



7. The combination of the differential piston K, provided with an axial rod or plunger, with a cylinder, F, having a stuffing-box through which the said rod or plunger passes out, and a washer of packing substance arranged inside the cylinder, around said rod or plunger, where it enters said stuffing-box, whereby, when the brakes are off and said piston is forced toward the washer and a shoulder on the piston compresses said washer, the latter supplements the stuffing-box and more effectually prevents the escape of air, substantially as set forth.

8. The combination of the car-wheels, brake-applying mechanism, hanger b^2, brake-shoe S, having cheeks a' a', embracing said hanger, pin a', jointing said shoe to said hanger, and springs a^2, inserted in sockets in the hanger and bearing against the cheeks of the shoe, substantially as set forth.

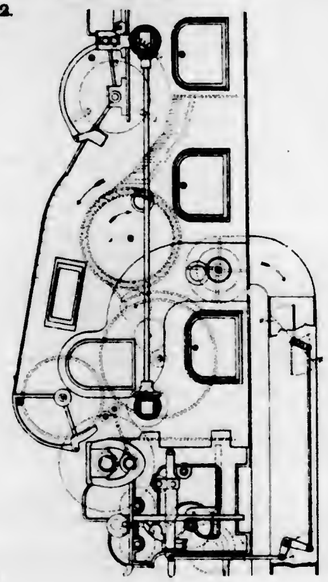
253,140. THREAD-SEPARATOR FOR RING-SPINNING MACHINES. FRANKLIN H. WYMAN, Lowell, Mass. Filed Sept. 19, 1881. (No model.)



Brief.—The separator-wire is suspended between supporting-rods having inclined surfaces, said rods being in turn suspended

from hangers by inclined stems. The ring-rail in its upward traverse engages with the inclined surfaces on the supporting-rods, thereby moving the separator-wires from the bobbin.

Claim.—The combination, with the hanger C D and the ring-rail *l*, of the support B, having the inclined portion *b*, the sliding stem B *s*, and the separator-wire A, as set forth.

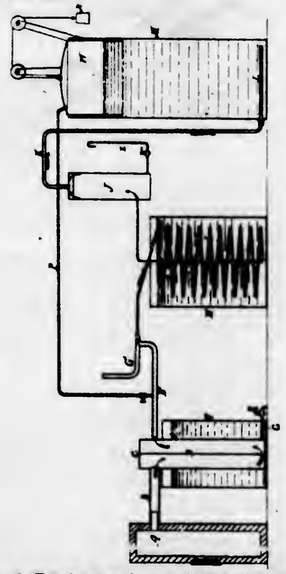


253,141. FORCE-PUMP. MILO L. G. WHEELER, Oregon City, Oreg. Filed Jan. 11, 1881. (No model.)

Claim.—1. In a pump, the combination of the cylinders H and J, the pin *x*, let into the surfaces of said cylinders, the clamp M, and the rubber packing-rings *r*, substantially as shown and described.

2. In a pump, the combination of the cylinder J, having ports U and S and valves V and T, the plunger N and bucket O, secured to the same lift-rod, and the cylinder H, communicating with cylinder J through the ports of the latter, whereby the weight of the column of water being lifted is supported in cylinder H instead of cylinder J, substantially as specified.

253,142.



253,142. MACHINERY FOR OPENING OR PREPARING COTTON OR OTHER FIBROUS MATERIAL. WILLIAM E. WHITEHEAD, Tewksbury, assignor to the Whitehead & Atherton Machine Company, Lowell, Mass. Filed Nov. 18, 1881. (No model.)

Brief.—A damper is placed in the dust-flue, and by rods and levers is connected to and operated by the drop-lever in such manner that when, through the operation of said lever the feed is stopped, the damper will be closed, thereby preventing a spread of fire which may have been generated in the machine.

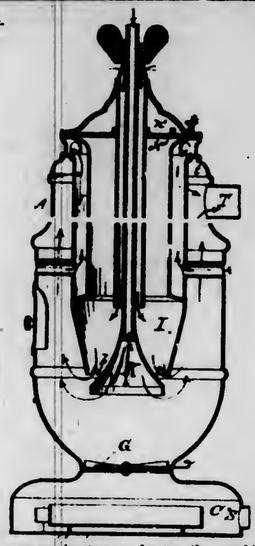
Claim.—The combination, with the drop-lever, the exhaust-fan, and the dust flue or trunk, of an automatic damper placed in said trunk at or near the discharge or delivery end of the exhaust-fan, and connected with and operated by the drop-lever, substantially as and for the purposes hereinbefore set forth.

253,143. APPARATUS FOR MANUFACTURING SODIUM HYPOSULPHITE. WILLIAM H. WHITMORE and GEORGE H. PRATT, Boston, Mass., assignors to said Whitmore. Filed Oct. 21, 1881. (No model.)

Claim.—1. For the manufacture of hyposulphite of soda by forcing sulphurous-acid gas through a solution of sulphide of soda, an apparatus or combination, substantially as described, consisting of an oven or retort, A, one or more coolers, C F or H I, the steam-jet G', the gas and water separator J, the conduit K, and tank M, all being connected and to operate essentially as set forth.

2. The combination of the gasometer-bell W and the conduit P with the oven or retort A, the pipe B', steam-jet G', one or more coolers, C F H I, the separator J, pipe K, and tank M, all being adapted essentially in manner and to operate as set forth.

253,144. STOVE. TENGEOAN WILLI, Dayton, Ohio, assignor of two-thirds to Frank S. Richeimer and Clement L. Baumann, both of same place. Filed Feb. 17, 1881. (Model.)



Claim.—1. In a stove or heater, a bottomless fire-pot connected to a magazine having an air-tight cover, said fire-pot having a centrally-supported base provided with a central downward-draft flue, in combination with the shell of the stove, provided with a chimney-flue and an air-tight base, substantially as shown and described.

2. The combination of a bottomless fire-pot, a cone-shaped base provided with an adjustable supporting-rod, and a main downward-draft flue, substantially as shown and described.

3. The combination of the air-tight shell, the suspended bottomless fire-pot, the adjustably-suspended base, the register G, and the ash-chamber C, substantially as shown and described.

4. In a reservoir-stove, the combination of the reservoir, a suspended fire-pot attached thereto, a central main downward-draft flue, and an adjustably-suspended base, substantially as shown and described.

253,144.

5. In a reservoir stove or heater, the combination of a centrally-suspended downward-draft flue, a concentrically-arranged reservoir having an air-tight cover, a fire-pot suspended from the covered magazine, and an encircling jacket provided with induction and eduction air-passages, substantially as shown and described.

6. The combination, with the air-tight shell, of the base separated therefrom by a partition provided with a register, a cylinder resting upon the upper flange of the shell and laterally braced by induction-pipes, a superimposed flanged reservoir resting upon said upper flange, and an air-tight top resting upon said reservoir-flange and supporting a main downward-draft flue, which terminates within the fire-pot, substantially as shown and described.

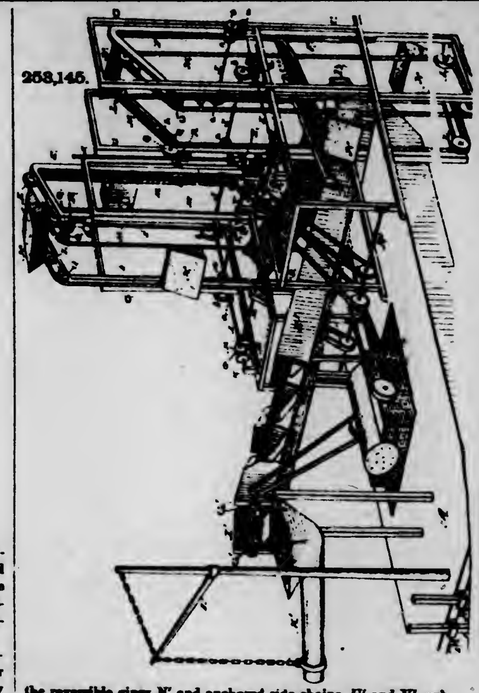
7. The combination of the flaring fire-pot I, notched at its lower edge, and the base K, conical in shape, ribbed, as shown, and adjustably suspended therein, as shown and described.

253,145. DREDGING-MACHINE. ESPHARIAN WILLIAMS, Oakland, Cal. Filed Aug. 5, 1881. (No model.)

Brief.—Corner towers on the boat guide vertically-adjustable frames, over which travel the chains of buckets. The buckets deliver by chutes into a central tank, whence the silt is again elevated to a hopper and spout. Suitable gearing adjusts the frames and actuates the chains. The boat is advanced by swinging it alternately upon either of two spuds astern, and the cut of each chain of buckets is in the arc of a circle, the two arcs meeting at the center of oscillation.

Claim.—1. In a dredger, the vertical corner towers, C C, the ladders E E, with their racks F, said ladders being rendered adjustable within the towers by means of the gears G G, double gearing H H, shafts K and I, worm-screws *a*, worm-wheels *b*, and pinions *c*, substantially as herein described.

2. In a dredger, the vertical corner towers, C C, the adjustable ladders E E, having pulleys L L, boxes *d d*, and carrying-chains M, with buckets N, said chains being revolved by means of the sprocket-wheels O O, bevel-gears Q, T, and U, pinions R R, feathered shafts S S, and driving-shaft V, substantially as herein described.



3. In a dredger having vertical corner towers, C C, adjustable ladders E E, and carrying-buckets N, the inclined spouts C' C', with the central receiving-tank, D', when arranged substantially as and for the purpose herein described.

4. In a dredger, the combination of vertical corner towers, C C, adjustable ladders E E, carrying-buckets N, the inclined spouts C' C', central receiving-tank, D', and extended inclined way E', substantially as and for the purpose herein described.

5. In a dredger, the combination of the vertical towers C C, the adjustable ladders E E, with their system of traveling buckets N, and the inclined way E', with its system of buckets I', substantially as and for the purpose herein described.

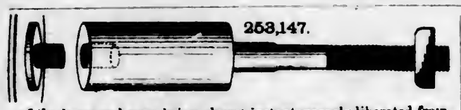
6. In a dredger, the rear spuds, M' M', in combination with

253,145.

the reversible gipsy N' and anchored side chains, U' and V', substantially as and for the purpose herein described.

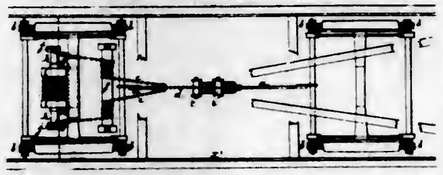
7. The method of advancing a dredger, consisting of securing it at its rear end alternately by means of spuds set on each side of the central line, and causing its front to swing to one side or the other over an arc, each spud acting alternately as a pivot-point, and being advanced at each swing of the scow, substantially as herein described.

8. The method of dredging by means of a dredger having towers and adjustable ladders on its forward corners, said ladders carrying the traveling dredging-buckets, which consists in advancing said dredger by securing it at its rear end alternately by spuds set on each side of the central line, and causing its front to swing alternately to one side or the other over an arc, and causing one system of dredging-buckets to stop at a point on the arc where the other began, each spud acting alternately as a pivot-point, and advancing at each swing of the scow, substantially as herein described.



253,146. OIL-CAN. CHARLES B. WILSON, Orange, Tex. Filed July 25, 1881. (Model.)

Claim.—The combination, with the oil-can A, of the handle B, the air-tube C, and the cap D, substantially as herein shown and described, and for the purpose set forth.



253,147. TRACE-FASTENING BOLT. CORNELIUS WOOLNOUGH, No. 2 Elizabeth Street, Eaton Square, County of Middlesex, England. Filed Sept. 26, 1881. (No model.) Patented in England Mar. 3, 1880, in France Aug. 21, 1880, and in Belgium Sept. 15, 1880.

Claim.—A carriage roller-bolt or dragon-tongue bolt having a movable head capable of being easily detached from the shank, so as to allow of the trace being readily slipped off the same and

of the horse or horses being almost instantaneously liberated from a carriage, wagon, or other vehicle in case of accident.

253,148. ELECTRIC APPARATUS FOR WORKING RAILWAY-BRAKES. FERDINAND A. ACHARD, Paris, France. Filed Mar. 17, 1881. (No model.) Patented in England June 17, 1880.

Claim.—1. The combination, with the electric apparatus for operating the brakes of a railway-train, comprising drums suspended by swinging supports beneath the car-body, and electro-magnets connected with said drums, and adapted by their attraction to bring and hold said drums in contact with the car-axles, of two piles or sources of electricity located at opposite ends of the train, and means, as indicated, for simultaneously bringing said piles into action, so that the brakes throughout the train receive substantially the same quantity of electricity, as set forth.

2. The combination, with an electric circuit and electric-brake apparatus located on branches of said circuit, so as to be supplied by derivation therefrom, of two piles or other sources of electricity at opposite ends of the train, adapted to be simultaneously brought into action, substantially as described.

3. The combination, with the brake apparatus and circuit for conveying electricity thereto and two piles or sources of electricity, of a commutator and relay with connections for connecting said piles in the brake-circuit, substantially as described.

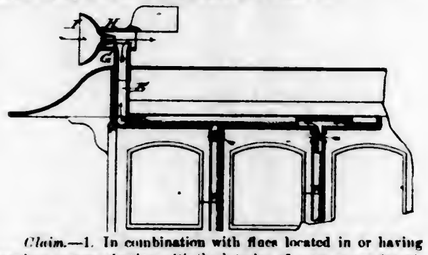
4. The combination of brake-circuit, electric-brake apparatus supplied by said circuit, a relay-circuit, a relay located in the relay-circuit and adapted to connect in with the brake-circuit a pile or other source of electricity, two piles normally connected in opposition in said relay-circuit, and a commutator with conductors and contacts, as indicated, whereby said piles can be connected in tension to operate the relay, substantially as described.

5. The combination, with electric circuits extending through a railway-train and electric-brake apparatus in the cars of said train, of electric piles, and means, as indicated, for connecting in said piles, arranged symmetrically at opposite ends of the train, substantially as described.

6. In an electric-brake apparatus, the electro-magnets, the swinging supports for suspending the same from the car-frame, and the springs for supplying electricity thereto, combined and operating substantially as described.

7. The combination, in an electric-brake system, with electric apparatus for applying the brakes, of a normally-closed circuit containing piles or other sources of electricity connected in opposition and placed at opposite ends of the train, said circuit comprising suitable conductors on the several cars, and of couplings for completing the circuit through the train, constructed and operating substantially as described, so that in case a coupling breaks the circuit is automatically closed for the two parts of the train and the brakes applied, as set forth.

8. The combination of the brake-circuit, its piles, the additional circuit, its piles and relays, and the commutator for altering simultaneously the connections of the two circuits, substantially as described.

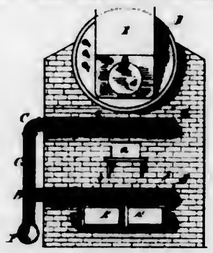


9. The combination of the brake apparatus, the brake-circuit and its piles, the relay, the relay-circuit and its piles, the couplings between the cars for the two circuits, and the commutators, substantially as described.

10. The combination, with electric-brake apparatus, conductors for supplying electricity thereto, one or more piles, and a commutator, of operating cords or rods connected with said commutator, substantially as described.

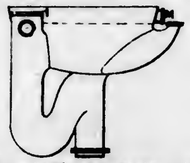
11. The combination, with the commutator or the controlling device of a brake system, of a cord connected at one end with the commutator or device and fastened at the other to a car of the train other than that on which the commutator is placed, so that the tension on the cord caused by separating of the train acts upon said commutator or device and applies the brakes, substantially as described.

253,149. APPARATUS FOR VENTILATING CARS, &c. JAMES ARNELL, Canajoharie, N. Y. Filed July 12, 1881. (No model.)



Brief.—The apartment to be ventilated is provided with vertical air-tubes, which are furnished with registers at varying heights. These vertical tubes terminate in a horizontal tube running the length of the apartment near its top, the end of which tube projects upward through the roof and is provided on the outside with a funnel-shaped device to receive the currents of air.

Claim.—1. In combination with flues located in or having openings communicating with the interior of a car or apartment, a series of registers located some near the bottom and some near the top of the car or apartment, and an exhausting device, substantially as shown and described, connected with a pipe outside of the apartment and communicating with said flues, all substantially as set forth.



2. In combination with the exhaust end of a ventilator-tube, E, an ejector-like contrivance composed of a tube, G, having the upper end of its bore flared, as described, a tube, H, arranged with its bore transversely to that of tube G, and the lowermost part of it about coincident with the plane of the mouth of G, and a funnel-shaped receiver, I, the whole constructed and operating substantially as described.

253,150. HEATING-FURNACE. BENJAMIN BAYLISS, Sr., Pittsburg, Pa. Filed Oct. 5, 1881. (No model.)

Claim.—In a heating-furnace, the combination and arrangement herein set forth of the horizontal air-supply blast-pipes B C, the said pipes provided with a different number of air-jet nozzles *b* and *c*, the pipe B having the lesser number and larger jets and the pipe C the greater number and smaller jets, the upright service-pipe G, connecting the pipes B and C, the main air-flue F, and the combustion-chamber A, with solid stationary bottom without a grate, substantially as described.

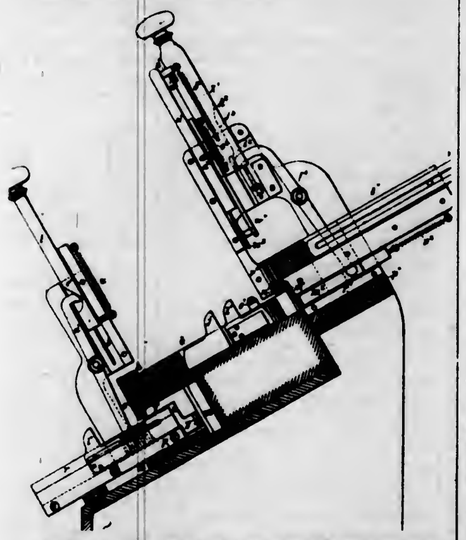
253,151. WATER-CLOSET. DANIEL T. BOSTEL, Brighton, County of Sussex, England, assignor to Henry C. Meyer and Samuel F. Sniffen, New York, and Frederick R. Smart, Bayside, N. Y. Filed May 23, 1881. (No model.) Patented in England Oct. 11, 1880.

Claim.—1. In a water-closet apparatus, a trunk or exit-pipe located at one side of the bowl or basin and at its front, for the purposes set forth.

2. In a side-delivery water-closet, the combination, with the bowl and the outlet-trunk, of an intermediate channel or water way, D, substantially as and for the purpose set forth.

253,152. WATER-CLOSET. DANIEL T. BOSTEL, Brighton, County of Sussex, England, assignor to Henry C. Meyer and Samuel F. Sniffen, New York, and Frederick R. Smart, Bayside, N. Y. Filed Aug. 4, 1881. (No model.) Patented in England Apr. 21, 1877.

Brief.—Water is admitted to the flushing-rim through two independent inlets, E E. The flushing-rim is provided with larger apertures at the point opposite the delivery side and with apertures of diminishing capacities from said point toward the delivery side.



Claim.—1. In combination with the bowl of a side-delivery closet provided with a flushing-rim, the two water-inlets E E, arranged to supply the flushing-rim with two streams of water directed into the rim from points near that opposite the front part of the bowl, as and for the purpose set forth.

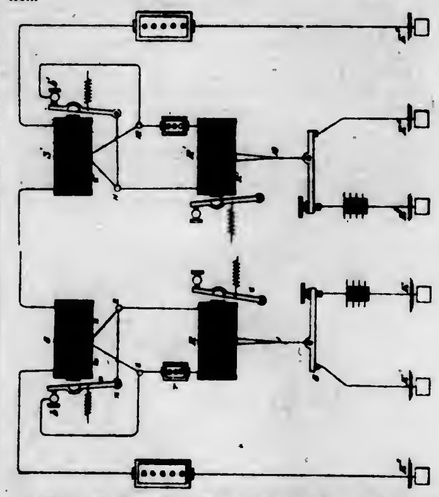
2. In combination with a side-delivery bowl having a flushing-rim formed with apertures largest at the point opposite the delivery side of the bowl, and of diminishing capacities from said point toward the delivery side of the bowl, the two water-inlets E E, arranged to supply the flushing-rim with two streams of water directed into the rim, as hereinbefore described.

3. The combination, with the side-delivery bowl having a flushing-rim and an open communication with the trap, of a trunk, D, extended upward from the trap nearly or quite to the level of the top of the bowl, and provided with a removable top, D^3, all in substantially the manner and for the purpose set forth.

253,153. TYPE SETTING AND DISTRIBUTING APPARATUS. ERNST W. BRACKELSBERG, Hagen, Westphalia, Prussia, Germany. Filed July 13, 1881. (No model.) Patented in England Apr. 13, 1881, in France Apr. 16, 1881, in Germany Apr. 17, 1881, in Belgium Apr. 19, 1881, in Austria-Hungary June 24, 1881, and in Italy June 30, 1881.

Claim.—1. The combination, with the setting mechanism or composer B, containing the ejector-bar *i*, with ejector *l*, spring *u*, and composing-race *r*, of the type-driver *x* and the adjuster *y*, co-operating with the vertical grooves *m*, or their specified equivalent, together with mechanism, substantially as described, for imparting the required reciprocating motion to the driver *x* and the adjuster *y* by the downward motion of the bar *i*, as and for the purpose specified.

2. A type-distributing apparatus consisting, first, of a number of type-channels *b*, and of a register, *q'*, corresponding with these channels; and, secondly, of the distributing mechanism or distributor C, guided in a suitable manner, and movable transversely to and in the rear of the channels *b*, this distributor comprising the bar *a'*, to be depressed by hand or by the foot and drawn upward by the spring a^2, the ejector-bar *a'*, having the ejector a^3 attached to it, and connected by a spring, b^3, with the bar *a'*, the holding-down bar *w'*, connected with the bar *a'* by a spring, c^3, the distributing-race *l'*, projecting with its front end above the channels *b*, and the pointer *c'*, whose distance from the distributing-race is equal to the distance between any type-channel and the corresponding point of the register *q'*, substantially as described.



3. The combination, with the distributing mechanism C, containing the bars *a'*, *u'*, and *w'*, ejector a^3, springs a^2, b^3, and c^3, and the distributing-race *l'*, of the bar m^2, serving as type-driver and as adjuster, and operated by the inclined surfaces b^2 and c^2 on the bar *a'*, together with the lever f^2 and spring e^2, as and for the purpose specified.

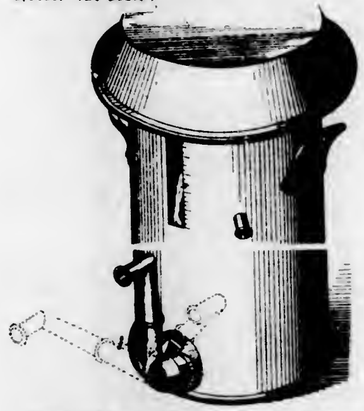
4. The type-containing race or channel having the front portion of its bottom formed of a spring, a^5, in combination with the type-ejecting mechanism, substantially as hereinbefore set forth.

5. The combination, with the bars *a'*, *u'*, and *w'*, and the springs b^3 and c^3, of the projections or stops *s'* and c^2 on the bars *w'* and *a'*, respectively, and the projection or pin d^3, fixed to the bar *a'* or *u'*, and acting against a shoulder or other suitable part of the bar *w'*, as and for the purpose specified.

253,154. DUPLEX TELEGRAPH. CHARLES L. BUCKINGHAM, Elizabeth, N. J., assignor to the Western Union Telegraph Company, New York, N. Y. Filed Dec. 27, 1881. (No model.)

Brief.—A contrivance for avoiding troubles due to static charge and discharge. A normally-closed bridge unites the artificial and main lines at points beyond the differential receiving-instrument, and the static charge and discharge are caused to act equally upon both coils of the receiver by reason of the bridge. This bridge, however, is broken by a signal from the distant station.

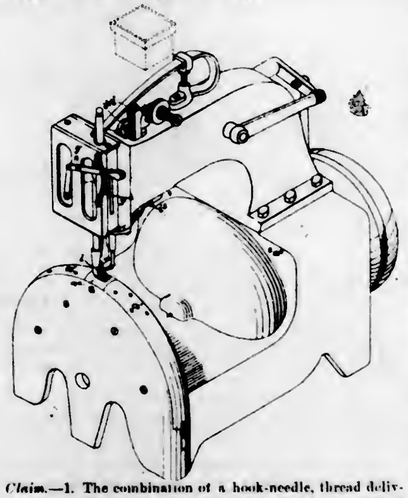
Claim.—1. In a telegraph system for simultaneous transmission in opposite directions, the combination, substantially as specified, at each station of the main line, an artificial line, a differential receiving-instrument, an electro-magnet, and a bridge-conductor joining the main and artificial lines, which is opened and closed by the agency of said electro-magnet.



2. In combination with a duplex-telegraph line, an artificial circuit, a differential receiving-relay, a normally-closed bridge or branch conductor, and an electro-magnetic circuit-breaker whose armature is adjusted to be insensible to the static discharge from the line, but which is actuated by a sufficiently prolonged current from a distant station to make a signal, whereby the static discharge will pass to earth through both coils of the differential relay, while a prolonged signal-current sent from a distant station will cause the bridge-conductor to be broken.

3. The combination, substantially as specified, of a main and artificial line, differential relay R, polarized circuit-breaker S, and

a normally-closed bridge which is broken and closed by means of said circuit-breaker S.



4. In combination with a duplex-telegraph line, an artificial circuit, a differential receiving-relay, a bridge or branch conductor connecting the main and artificial lines, and means for opening and closing said bridge, whereby said bridge may be closed to cause an equal division of current between the two oppositely-wound coils of the receiving-relay, both at the time of inductive charge and discharge of the main line, substantially as specified.

253,155. PROCESS OF SEPARATING CREAM FROM MILK. FRANCIS G. BURLEN, West Hartford, Conn., assignor to the Vermont Farm Machine Company, Bellows Falls, Vt. Filed Nov. 3, 1881. (No model.)

Claim.—The within-described method of separating cream from the milk from or upon which it shall have been raised, which consists in first ascertaining, as set forth, the quantity or depth of cream raised in the vessel, and then adjusting a discharge-faucet to the desired point and withdrawing the milk from beneath the cream, leaving such predetermined quantity of cream within the vessel.

253,156. WAX-THREAD SEWING-MACHINE. DUNCAN H. CAMPBELL, Pawtucket, R. I., assignor of three-fourths to Henry B. Metcalf, Frank E. Comey, and Daniel McNiven, all of same place. Filed Aug. 5, 1881. (Model.)

Claim.—1. The combination of a hook-needle, thread delivering and controlling mechanism, a curved shuttle, and an arched shuttle-race, serving as a heating-flue, substantially as described.

2. The combination of a hook-needle, thread delivering and controlling mechanism, a curved shuttle, an arched shuttle-race, and an arched work-plate, said needle, shuttle, and race being beneath the work-plate, substantially as described.

3. The combination of the hook-needle, the work-plate convex laterally and longitudinally, and the shuttle beneath the work-plate operating in a race which serves as a heating-flue, substantially as described.

4. The combination of a hook-needle, a curved centrally-pointed shuttle, an arched shuttle-race which supports the shuttle in its course therein and serves as a heating-flue, and a shuttle-driver mounted on a rock-shaft below the center of the race, substantially as described.

5. The combination, with a shuttle having a longitudinally-recessed web or groove on its upper side, of a race-plate grooved on its under side for co-operating with the shuttle for causing the slack shuttle-thread to occupy the recess in the top of the shuttle during its backward movement, substantially as described.

6. In an arched or curved shuttle-race serving as a heating-flue, upper bearings for the shuttle, composed of cork or similar yielding material not injuriously affected by heat, substantially as described.

7. A curved shuttle provided with a longitudinal thread-recess extending from nose to heel on its upper side, substantially as described.

8. A curved shuttle provided with a longitudinal thread-recess on its upper side and a thread-delivery aperture near the nose of the shuttle, substantially as described.

9. A curved shuttle having a thread groove or recess on its upper side extending from nose to heel, and a spring for bearing upon the thread within the recess, substantially as described.

10. In a sewing-machine, a segmental plate integrally affording an arched shuttle-rail, and bearings for a needle-bar, substantially as described.

11. The combination, with the awl-bar, its operating rock-shaft, and the arm or lever thereon, of the bearing-disk on the awl-bar, slotted to receive said arm, substantially as described.

12. The combination, substantially as hereinbefore described, with the feed-slide carrying an awl or a needle for feeding its vibrating mechanism and coupling mechanism, of a feed-graduating lever for varying the position of said coupling mechanism, whether the feed-slide is in motion or at rest, and for supporting said mechanism in position, as set forth.

13. The combination, substantially as hereinbefore described, of the slide-vibrating mechanism, the feed-slide having an inclined slot, and the coupling-blocks capable of a sliding movement for varying the vibrations of the feed-slide while in active operation, as set forth.

14. The combination, substantially as hereinbefore described, of the slide-vibrating mechanism, the feed-slide having the inclined slot, the coupling-blocks, and means for fixedly adjusting said block, and thereby varying the vibrations of the feed-slide, as set forth.

15. The combination, substantially as hereinbefore described, of the vibrating slotted arm, the slotted feed-slide, the coupling-blocks, the lever for moving said blocks in their slots, and the graduated scale.

16. The combination, substantially as hereinbefore described, of the feed-slide carrying an awl or a needle, the feed-graduating lever, the coupling mechanism controlled by said lever, the graduated scale, and a locking device for maintaining said lever and supporting the coupling mechanism in any desired position.

17. The combination, with a hook-needle below a work-plate and take-up mechanism, including a pulley over which thread passes just prior to approaching the needle, of an inclined thread-tube which occupies a direct line from the periphery of said pulley to the path of the needle, substantially as described.

18. The combination, with a hook-needle and a presser-foot, of a thread-eye for carrying thread across the path of the needle and above the presser-foot, and a thread-arm vibrating in the arc of a circle wholly at one side of the presser-foot and the path of the needle, substantially as described, whereby the space above the presser-foot, less that required by the thread-eye, is rendered available for the complete elevation of the presser-foot.

19. The combination, substantially as hereinbefore described, of a hook-needle, a thread-arm, a thread-eye, and operating mechanism for the arm and eye, which causes said eye to first carry and deliver the thread to the arm and thence deliver thread to the needle, and also causes the arm to merely retain and release the thread delivered to it by the eye, whereby said arm is prevented from abrading the thread, as set forth.

20. The combination, substantially as hereinbefore described, of a hook-needle, take-up mechanism, a thread-tube in line with the path of the needle, and a thread-eye which, when it has delivered thread to the needle, rests in line with the thread-tube during the operation of the take-up, for obviating deflection and the consequent abrasion of the thread by the eye, as set forth.

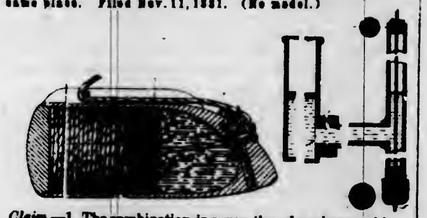
21. The combination of the hook-needle, the thread-eye, its lever and reciprocating slide, and the stationary slotted plate, substantially as described, whereby the path traversed by the eye toward and from the needle is laid in a straight line, and in a curved line in delivering thread thereto, as set forth.

22. The combination, substantially as hereinbefore described, of a hook-needle, a presser-foot, a vibrating thread-eye, and a thread-measuring arm which is variably adjusted for measuring off thread by the vertical movement of the presser-foot.

23. The combination of the presser-foot and the thread-arm pivoted upon an axis, which is varied in its location by raising or lowering the presser-foot, substantially as described.

24. The combination, with the presser-foot provided with a rounded projection on its bar, of a thread-arm rotatively mounted on a lever, a vertically-inclined lug or web on said lever, and a spring for maintaining the surface of the inclined lug in contact with the projection on the presser-foot bar, substantially as described, whereby the position of said thread-arm is varied by the vertical adjustment of the presser-foot, as set forth.

25. The combination of the thread-arm, mounted on a movable axis, the presser-foot controlling the position of said axis, the reciprocating rod, and the bell-crank lever and link connecting said rod with the thread-arm, substantially as described.



26. The combination, with the presser-foot, its bar, and lifting-finger, of the vibrating lever which lifts the foot during the feeding operation, and an adjustable seat for the lifting-finger on said lever, substantially as described.

27. The combination of an arched shuttle-race, a wax-thread shuttle, and one or more heating-burners located near the lower ends of the race, substantially as described, for heating the shuttle and its contents, as set forth.

28. The combination, substantially as hereinbefore described, with the parts to be heated in a wax-thread machine, of a burner or burners remotely located from said parts, and intermediate metallic connections for metallically conducting heat from said burners to said parts, as set forth.

29. The combination, with a thread-tube for heating thread in its passage through said tube, and a heating-burner remote from said tube, of a heating rod or plate connected with said tube at one end and exposed to the flame of the burner at its opposite end, substantially as described.

253,157. WAX-THREAD SEWING-MACHINE. DUNCAN H. CAMPBELL, Pawtucket, R. I., assignor of three-fourths to Henry B. Metcalf, Frank E. Comey, and Daniel McNiven, all of same place. Filed Nov. 11, 1881. (No model.)

Claim.—1. The combination, in a wax-thread sewing-machine, of a main wax-cup, and an auxiliary wax-cup on a level with the main cup, adapted to be supplied with wax by flowage from the main cup, and arranged to be traversed by the thread on its way to the work-plate, substantially as described.

2. The combination, in a wax-thread sewing-machine, of a main wax-cup, and an auxiliary wax-cup connected with the main cup and located between the take-up mechanism and the work-plate, and in the straight path of the thread, substantially as described, whereby the thread enters and leaves the auxiliary cup in a direct line, as set forth.

3. In a wax-thread sewing-machine, a tubular wax-cup traversed longitudinally by the thread on its way to the work-plate, and provided at top and bottom with perforated plugs, substantially as described, whereby the wax is inclosed and guarded against injurious exposure, as set forth.

4. A wax-thread shuttle having a thread-chamber, a wax-chamber, and an aperture provided with packing for stripping the surplus wax from the thread as it leaves the shuttle, substantially as described.

253,158. FLUX FOR ALLOYING PLATINUM. MILTON H. CAMPBELL, New York, N. Y., assignor of one-half to Marvin Green, same place. Filed Oct. 20, 1881. (Specimens.)

Claim.—1. A flux for metallurgic purposes, consisting of sodic hyposulphite for effecting ebullition, an oxygen-yielding substance for generating intense heat, and a slag-producing substance for affording a covering which shall be impervious to air and a non-conductor of heat, substantially as specified.

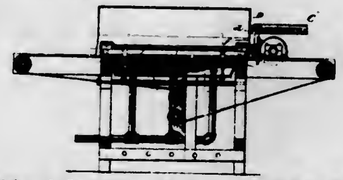
2. A flux consisting of sodic hyposulphite, potassium nitrate, and sodic biborate, or their equivalents.

3. A flux consisting of twenty parts sodic hyposulphite, thirty parts potassium nitrate, and fifty parts sodic biborate, substantially as specified.

253,159. ELECTROPLATING WITH PLATINUM AND SILVER. MILTON H. CAMPBELL, New York, N. Y., assignor of one-half to Marvin Green, same place. Filed Oct. 20, 1881. (No specimens.)

Claim.—1. In an electroplating-bath, an electrolyte containing a dissolved double salt of platinum and silver, in combination with an anode of the homogeneous alloy of platinum and silver.

2. In an electroplating-bath, an electrolyte containing a dissolved double salt of platinum and silver, in combination with means, as specified, for repleting the solution with the double salt.



3. In an electroplating-bath, the combination of an anode of a homogeneous alloy of platinum and silver, and a liquid for said bath having in solution a compound chloride of platinum and silver.

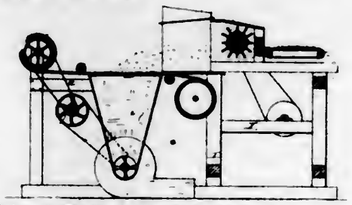
253,160. METHOD OF STICKING FUR TO FIBROUS GOODS. WILLIAM E. DOUBLEDAY, Bay Ridge, N. Y., assignor to Ellen M. Doubleday, same place. Filed Nov. 9, 1881. (No model.)

Claim.—The herein-described improvement in the art of making hats which have a flowing nap of fur, the same consisting in applying a bat of fur to a hat-body which has previously been felted and shrunk to the size and density which it is desired that it shall have when the hat is completed, next subjecting the fur bat and body to the combined rubbing and pressing action of a vibrating plate, whereby the fur is stuck to the surface of the previously-felted hat-body, and subsequently scalding the same, substantially as set forth.

253,161. MACHINE FOR BEATING UP THE NAP OF FUR FACED ARTICLES. WILLIAM E. DOUBLEDAY, New York, N. Y., assignor to Ellen M. Doubleday, same place. Filed Dec. 9, 1881. (No model.)

Claim.—1. In a machine for whipping or beating fur-faced articles, the combination of a stationary bed, a traveling apron above the bed, whippers, and means for imparting moisture to the fur-faced fabric, substantially as set forth.

2. In a machine for whipping or beating fur-faced fabrics, the combination of perforated stationary bed, a traveling apron above the bed, whippers, and means for passing a heated current through the perforated bed, substantially as set forth.



3. In a machine for whipping or beating fur-faced fabrics, the combination of a stationary bed, a traveling apron above the bed, whippers, means for imparting moisture to the fur-faced fabric, and means for passing heated currents upward through the perforated bed, substantially as set forth.

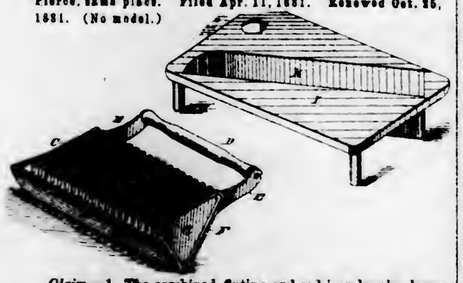
4. In a machine for whipping or beating fur-faced fabric, a support for the fabric to be beaten, whippers, an inclosing-chamber above the support for the fur-faced fabric, and means for imparting moisture to the material, substantially as set forth.

5. In a machine for whipping and beating fur-faced fabric, a support for the fabric to be beaten, whippers, an inclosing-chamber above the support for the fur-faced fabric, and means for imparting moisture and heat to the material, substantially as set forth.

6. In a machine for whipping or beating fur-faced fabrics, the combination, with the traveling apron and the whippers, of the water-pipe C D, substantially as set forth.

253,162. MAKING FUR BATS. WILLIAM E. DOUBLEDAY, New York, N.Y., assignor to Ellen M. Doubleday, same place. Filed Dec. 13, 1881. (No model.)

Claim.—1. The herein-described fur bat, consisting of a layer of loose fur, in combination with a supporting fabric of substantially non-feltable fibrous material.

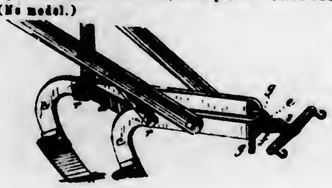


2. The herein-described method of making a fur bat in a continuous flat sheet—that is to say, by depositing a layer of loose fur upon a traveling fabric of substantially non-feltable fibrous material and attaching the fur to the fabric by means of an air-current which passes through the fur and the fibrous material, substantially as set forth.

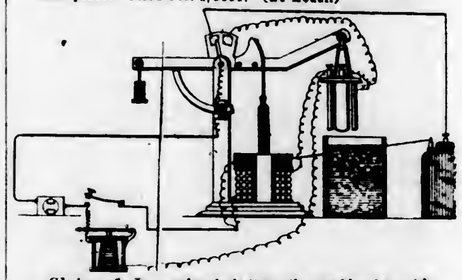
3. In a machine for making fur bats, the combination of the following elements, namely: a perforated surface, means for moving a fabric over said surface, means for depositing fur upon the fabric, and means for causing the fur to adhere to the fabric, substantially as set forth.

4. In a machine for making fur-faced articles, the combination of the following elements, namely: means adapted to move a continuous non-feltable fabric over a perforated suface, means adapted to deposit fur on said fabric, means for causing the fur to adhere to said fabric, means for supplying a feltable fabric to the fur bat thus produced, and mechanism adapted to stick the fur bat to the feltable fabric.

5. The herein-described process of making a continuous fur bat—that is to say, by depositing a layer or surface of fur by means of the practically continuously-feeding mechanism upon a continuous fibrous base, substantially as set forth.



253,163. COMBINED FLUTING AND SAD IRON. HIRAM R. ELLIS, Grand Rapids, Mich., assignor of one-half to Byron R. Pierce, same place. Filed Apr. 11, 1881. Renewed Oct. 25, 1881. (No model.)



Claim.—1. The combined fluting and sad iron herein shown and described, composed of a hollow triangular body, A, having a polished bottom, B, a corrugated side, C, and a smooth side, F, the sides C F converging to form the top ridge or apex of the triangular body, and the side F having a pair of rigid curved arms or brackets, E, for supporting the handle D vertically above or in a line with the top ridge or apex of the iron, as shown and set forth.

2. The combination, with a combined fluting and sad iron, constructed substantially as herein described, and having a non-detachable handle, of a stand, I, having groove or recess K, substantially as and for the purpose shown and specified.

253,164. CULTIVATOR. MILTON T. HANCOCK, Thomasville, Ga., assignor to James P. Turner, same place. Filed Jan. 3, 1882. (No model.)

253,165. APPARATUS FOR IMMERSING GALVANIC-BATTERY PLATES. ARTHUR J. HOLT, Grand Rapids, Mich., assignor of two-thirds to William H. Jones and John J. Sours, same place. Filed Oct. 4, 1881. (No model.)

Claim.—1. In a galvanic battery, the combination, with a weighted tilting beam supporting the electrodes, of a cell or cells, an electro-magnet, and a core, all arranged substantially as described, so that the electrodes are immersed in or withdrawn from the exciting-fluid by the current of the battery itself, as set forth.

2. In a galvanic battery, the combination, with the electrodes adapted to be immersed in or withdrawn from the exciting-fluid by means of the current formed by the battery itself, of a core and a magnetic coil placed in the circuit of the battery, said circuit being provided with a suitable circuit-breaker, substantially as set forth.

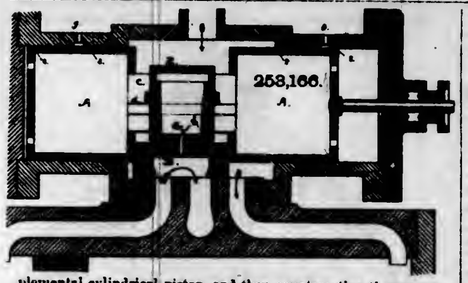
3. In a galvanic battery, the combination, with the suspended electrodes, of a magnetic coil placed in the circuit of the battery and adapted to act upon a core, thus immersing the electrodes, and a key or equivalent device by which the circuit is broken, the magnetic coil rendered inoperative, and the electrodes withdrawn from the exciting-fluid, substantially as set forth.

4. In a galvanic battery, the combination, with the suspended electrodes adapted to be immersed in the exciting-fluid by means of the current formed by the battery itself, of a core, a magnetic coil placed in the circuit of the battery, and means for compensating for the decrease in weight of the electrodes when immersed, substantially as set forth.

5. In a galvanic battery, the combination, with a standard supporting a pivoted weighted beam and a stop device, of a core and electrodes suspended from the beam, and a magnetic coil arranged in the circuit of the battery, adapted to act upon said core, and thus immerse the electrodes in the exciting-fluid, and a circuit-breaker by means of which the electrodes are raised, substantially as set forth.

6. In a galvanic battery, the combination, with the electrode and cell, of the standard, the weighted beam, and the adjustable stop, substantially as set forth.

7. In a galvanic battery, the combination, with the electrodes and cells, of the standard and its adjustable stop and the beam provided with a segment, to which the core is flexibly connected, substantially as set forth.

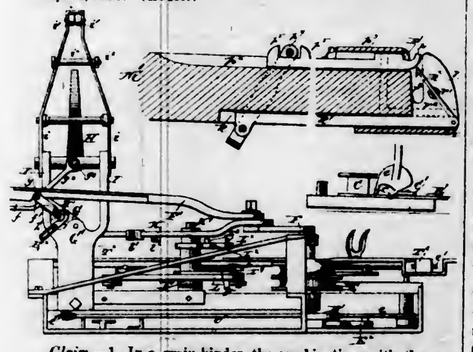


8. In a galvanic battery, the combination, with the electrodes and cells, of the standard, the adjustable stop, and the weighted beam provided with the upwardly-inclined end supporting the electrodes, substantially as set forth.

9. In a galvanic battery, the combination, with the main battery and its suspended electrodes, of the standard and weighted beam and a local constant cell, and a switch, substantially as set forth.

10. In a galvanic battery, the combination, with the cells and electrodes, of the standard and beam, and a variable resistance located on a derived circuit, substantially as and for the purpose set forth.

253,166. BALANCED VALVE. WILLIAM D. HOOKER, Oakland, Cal. Filed June 8, 1881. (No model.)



Claim.—1. The improvement in balancing slide-valves, consisting in transferring the steam-pressure from the valve to a supplemental cylindrical piston, and then counteracting the pressure upon the piston by exposing a corresponding area of the piston to the steam-pressure in a counter direction, substantially as described.

2. The inverted-cup-shaped cylinder E, attached to the horizontally-moving supplemental piston A A, in combination with the slide-valve B, with its piston G fitting in the cylinder E, and having the space above it connected with the exhaust or open air by a passage, *i*, substantially as described.

3. The hollow supplemental piston A A, arranged to move in a case or shell having a space, *g*, connected with the open air, in combination with the inverted-cup-shaped cylinder E and main valve B, with its piston G and the passage *i*, all combined and arranged to operate substantially as above described.

253,167. GRAIN-BINDER. CHRISTOPHER LIDDEN, La Fayette, Ind., assignor to himself and R. Jackson, same place. Filed Apr. 4, 1881. (Model.)

Claim.—1. In a grain-binder, the combination, with the reciprocating rake-carriage arranged below the platform, the rake hinged to the rake-carriage, a pair of latches, the one adapted to hold the rake in an upright position and the other adapted to hold the rake prostrate below the platform, a stop-pin, *c'*, and stops or dogs for raising and depressing the rake and for engaging and disengaging the latches, so that the rake will be held upright while carrying the grain in gavels to the binder-arm, and then knocked down and held prostrate while moving away from the binder-arm, substantially as described.

2. The combination, with the vibratory binder-arm, of the slotted reciprocatory bar F', the crank-arm having a wrist-pin passing through the slot of said bar, the swiveled connecting-rod connecting the crank-arm with the binder-arm, and the lever H', arranged to raise the slotted bar F' at certain periods to free the wrist-pin of the crank from a notch at one end of the slot in said bar, substantially as described.

3. The combination, with the vibratory binder-arm, of the slotted reciprocatory bar F', having a notch formed at one end of its slot, the crank G, provided with a wrist-pin passing through the slot of the reciprocatory bar, the connecting-rod swiveled at each end to a collar, one of which collars is arranged loosely upon an arm, A, of the binder-arm and the other similarly arranged upon a wrist-pin of the crank, and the lever H', having a slotted bar, H', pivoted thereto, said lever being adapted to raise the bar F' at the proper moment, so as to free the wrist-pin of the crank from the notch at the end of the slot in the said bar, whereby the latter will travel to a certain extent without actuating the crank, substantially as described.

4. The combination, with the binder-arm, of the spring-bars *i*, the tension-pulleys arranged between the ends of said spring-bars, and a bolt passing through the spring-bars and provided with a nut for drawing them together, one of said tension-pulleys being mounted upon a hub of the other, substantially as described.

5. The combination, with the oscillatory shaft carrying the tying devices, of a vibratory lever having its ends connected with the oscillatory shaft by means of a chain wrapped several times around the shaft, a sleeve or hub upon the vibratory lever provided with radial arms and studs upon said arms, and a slotted bar guided by the axle that passes through the hub of the lever, said slotted bar being provided with dogs that act at certain moments upon the studs of the hub-arms, and being also connected with the crank of the driving-shaft, substantially as described.

6. The combination, with the binder-arm, of the armed rotary cord-holder N, and the arm N', pivoted to the lever L, and arranged to act upon the rotary cord-holder at certain moments, so as to cause the holder to engage the cord, substantially as described.

7. The combination, with the oscillatory shaft M', of the cutter and holder P, arranged to slide along said shaft, the links connecting the cutter and holder with a collar loose upon the oscillatory shaft, and the vibratory lever arranged to move the collar, substantially as described.

8. The combination, with the oscillatory shaft, of the cutter and holder P, arranged to slide in a longitudinal channel in the shaft, a sheath into which the cutter and holder is retracted in order to sever the cord between the rotary armed holder and the said cutter and holder, and also to gripe the ends of the cord between the cutter and holder and the gavel, substantially as described.

9. The combination, with the oscillatory shaft, of the cutter and holder P, arranged to slide along said shaft, a link, *p'*, connecting with the cutter and holder bar and pivoted to the oscillatory shaft, the link *p'*, connecting said link with a grooved collar, Q, arranged to slide upon the oscillatory shaft, the vibratory yoke-bar *q'*, arranged to move the loose collar, the lever-arm L', provided with a wrist-pin, and the slotted bar connecting with the vibratory yoke-bar, and having its slot arranged to receive the wrist-pin upon the lever-arm, substantially as described.

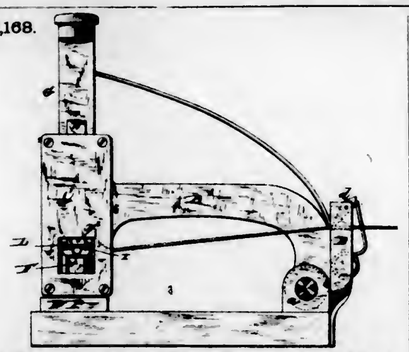
10. The combination, with the oscillatory bar carrying the cutter and holder, of a bar arranged to slide along said shaft, and having pivoted to its outer end a notched grabber or finger, and guides arranged to raise said grabber when the bar is retracted and to depress the same when the bar is extended out from the oscillatory shaft, substantially as described.

11. The combination, with the oscillatory shaft carrying the movable cutter and holder, of the movable bar carrying the pivoted finger or grabber, the cutter and holder and the grabber-bar being connected by a link pivoted to the oscillatory shaft, so that the vibration of the link will cause the said two devices to slide along the shaft in opposite directions, substantially as described.

12. The combination, with the oscillatory shaft having the longitudinal channel R, of the pivoted grabber R', arranged to work in said channel, the cutter and holder P, and devices for moving the bars of the cutter and holder and the grabber, said shaft also having the slots *r'*, in which the cord is received as it is being wound around the shaft, substantially as described.

13. The combination, with the oscillatory shaft, of the movable cutter and holder, the grabber pivoted upon a sliding bar, and mechanism timed to rotate the shaft in one direction, so as to cause the cutter and holder to engage the cord and then to cause the grabber to engage the same, said mechanism being also timed to cause the shaft to then rotate in a reverse direction and to actuate the cutter and holder, so as to release the cord after the knot has been tied, substantially as described.

14. The combination, with the oscillatory shaft, of the cutter and holder P, mechanism for actuating the same, the grabber-hook R', the slots *r'*, the channel *r'*, the guide *r'*, and the arm S, connected with the cutter and holder bar and arranged to push the loop off from the end of the oscillatory shaft, substantially as specified.



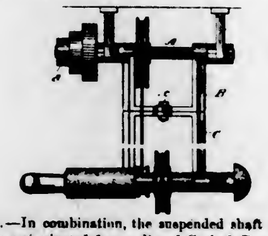
253,168. STAPLING-MACHINE. BLOOMER E. MILLER, La Fayette, Ind., assignor to himself and Charles A. Reynolds. Filed Oct. 10, 1881. (Model.)

Claim.—1. The combination, with the anvil F, of the plunger G and the sliding check I, substantially as described.

2. In a wire cutting and bending machine, the combination of the check I, having the bent ends *i i*, with the slotted clearer-bar L and plunger G, having pin *i'*, all constructed and arranged to operate substantially as described.

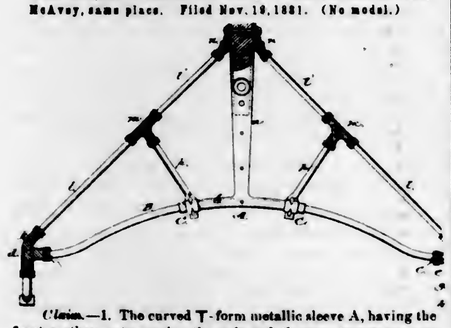
3. In a wire cutting and bending machine, the combination, with a plunger and a swinging clearer-bar, of the check I, having bent ends *i i*, screw-threaded pin *k*, and spring *k'*, all constructed and arranged to operate substantially as and for the purpose specified.

253,168.



4. The combination of the swinging clearer-bar L, formed with slot *l* and inclines *l' l'*, with the sliding check I, plunger G, and anvil F, all constructed and arranged to operate substantially as and for the purpose set forth.

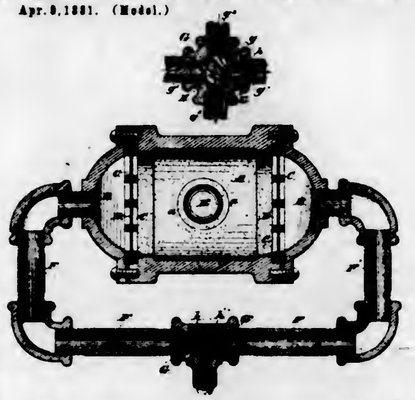
5. In a wire cutting and bending machine, the combination of the clearer-bar L, plunger G, spring M, pin *m*, sliding check I, and anvil F, all constructed and arranged to operate substantially as and for the purpose set forth.



6. In a wire cutting, bending, and clinching machine having a base plate and a vibrating arm hinged or pivoted thereto, the combination of the head C, provided with a suitable anvil therein, with a bifurcated plunger, a bifurcated and swinging clearer-bar, the sliding check I, auxiliary plunger N, and plate P, having clinching grooves, all constructed and arranged to operate substantially as and for the purpose set forth.

253,169. SOLE BUFFING, CLEANING, AND EDGE SETTING MACHINE. EDES PATTEN and THOMAS DAVEY, Lynn, Mass.: said Davey assignor to said Patten. Filed June 6, 1881. (No model.)

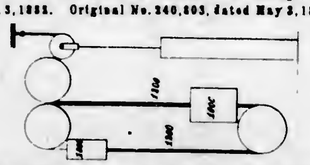
Claim.—In combination, the suspended shaft A, provided with pulleys *a a'*, pivoted frames B and C, shaft D, carrying pulleys *e* and *f*, frame E, arm E', arm F, axially pivoted thereto, and head G, carrying shaft, pulley, and tools, all as set forth.



253,170. VEHICLE-POLE. HEZEKIAH B. RICHARDS, Racine, Wis., assignor of one-half to Henry W. Hurlbut and Anthony McAvoy, same place. Filed Nov. 19, 1881. (No model.)

Claim.—1. The curved T-form metallic sleeve A, having the front portion, *a*, to receive the pole and the rear transverse portion, *b*, to engage the circle-bar, substantially as specified.

2. The carriage-pole having the curved T-form metallic sleeve A, the circle-bar B, clip-braces *p*, and clips C, the braces *l* and *l'*, and stem-eyes *k* and the screw-couplings *d*, *m*, and *n*, substantially as specified.



253,171. FILTER. CHAS. L. RIDGWAY, Boston, Mass. Filed Apr. 9, 1881. (Model.)

Claim.—In combination with the cylindrical shell A B B, filled with filtering material, and having its ends connected by means of the pipes F and F', the casing G, placed at the intersection of said pipes, and provided with an axial opening, *g*, and with four radial water-ways, *g'* and *g²*, and the plug H, fitted within said axial opening, and having within opposite sides of its periphery ports *h* and *h'*, each of which may be caused to simultaneously coincide with and connect two of said radial water-ways, substantially as and for the purpose specified.

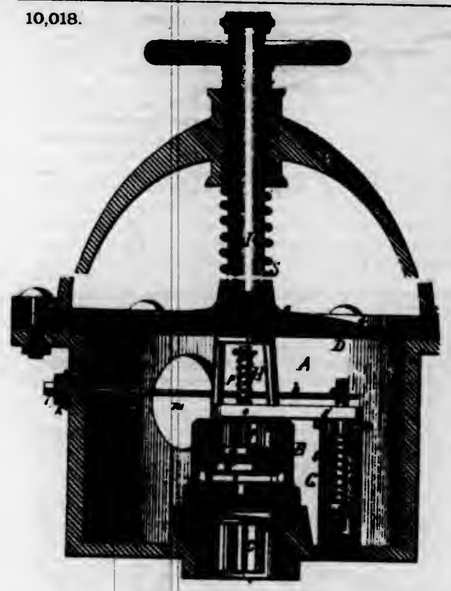
REISSUES.

10,017. ELEVATOR. CYRUS W. BALDWIN, Chicago, Ill. Filed Jan. 3, 1882. Original No. 240,603, dated May 3, 1881.

Claim.—The combination, with a car, counter-balance, and flexible suspensories, of a supplementary cable suspended from the lower ends of and connecting the car and counter-balance, the supplemental, suspensory, and counter-balance cables, being relatively proportioned, substantially as set forth.

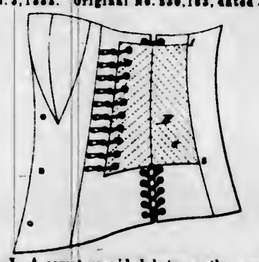
10,018. STEAM AND WATER PRESSURE REGULATOR. NATHANIEL C. LOCKE, Salem, Mass., assignor, by mesne assignments, to the Locke Regulator Company, of Connecticut. Filed May 17, 1881. Original No. 113,069, dated Mar. 28, 1871. Reissue No. 7,108, dated May 10, 1876.

Claim.—1. The combination, in a pressure-regulator constructed to be connected with a street-main or other supply-pipe and having a receiving-chamber, A, of a supply-valve, F, and safety-valve G, when both valves are so arranged as to be operated by one and the same diaphragm, substantially as shown and described.



2. The yielding connection between the supply-valve F and the diaphragm or piston D, whereby, after the supply-valve is closed, the diaphragm or piston can have a further upward movement, and thus operate upon a safety or relief valve, substantially as described.

3. The combination, in a pressure-regulator constructed with a receiving-chamber, A, a flexible diaphragm, D, and a check-valve, C, of a relief-valve, G, substantially as and for the purpose described.

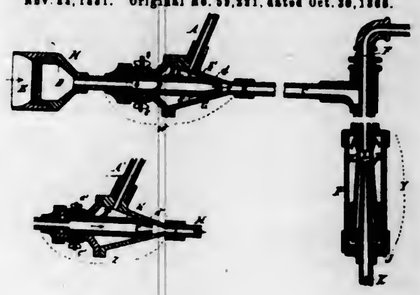


4. In a pressure-regulator having receiver A, supply-valve F, loaded diaphragm D, and safety-valve G, the combination of extension *g'*, of yoke J, carried by the stem of valve F and so arranged as to engage with stem *s*, of safety-valve G, for operation substantially as described.

5. The combination, in a valve having body B, with metallic seat and valve-opening, and having valve F, with projection L closely fitting and entirely filling said opening, of the soft renewable packing, all combined for operation substantially as shown and described, and for the purpose specified.

10,018.

10,019. CORSET. CHAUNCEY F. ALLEN, Waterbury, Conn. Filed Jan. 3, 1882. Original No. 230,163, dated July 20, 1880.



Claim.—1. A corset provided between the arm and the hip with a stiffened section overlying the body portion and secured thereto at the edges, substantially as set forth.

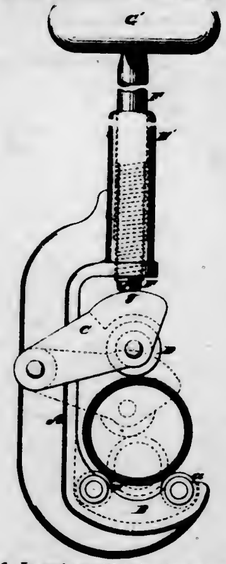
2. A corset provided with one or more stiffened wings, each attached externally to the body at one edge, overlapping the body and extending between the arm and the hip, and provided at the opposite edge with lacing or other fastening, substantially as set forth.

3. The combination, in a corset, of the overlying stiffened side sections and the sides stiffened beneath said sections, substantially as set forth.

10,020. STEAM AND AIR EJECTOR. SHUBAEL E. HEWES, Hoopeston, Ill., assignor to James Jenks, Detroit, Mich. Filed Nov. 22, 1881. Original No. 50,221, dated Oct. 30, 1865.

Claim.—1. In an injector, the combination of the injector W, projector Y, and ejector Z, operating together substantially as described.

2. In an injector, the adjustable nozzles *h i*, operating substantially as described.



3. In an ejector, the expansible and contractible slit nozzle *i'*, constructed and operating substantially as and for the purpose described.

4. In an injector, the slotted nozzle *h'*, in combination with an outer casing and an inner nozzle, substantially as described.

5. In an ejector, the combination, with the chamber I and the socket J, of the pipes K and L, and the flanges *l* within said chamber I, substantially as and for the purpose specified.

6. In an injecting device, the combination, with an ejector having a supply-pipe, of an internal tube affording communication between said ejector and an injector, substantially as and for the purpose specified.

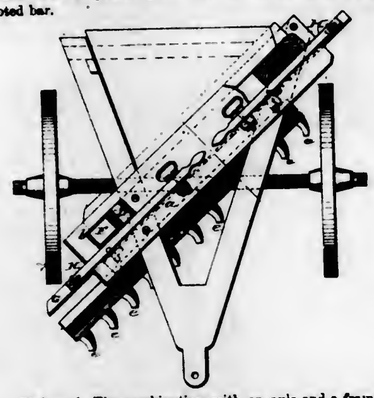
10,021. PIPE-CUTTER. ANDREW SAUNDERS, Yonkers, N. Y., assignor to D. Saunders' Sons, same place. Filed Jan. 10, 1881. Original No. 226,888, dated Nov. 23, 1880.

Claim.—1. In a pipe-cutting implement, the combination of the stock A, having the extended internally screw-threaded shank E', and the bearing B, formed on the stock at a point opposite the axis of the said screw-threaded opening, with the movable rotary cutter, the cutter-carrying arm C, pivoted to the stock A, and the screw F, working through the shank E', and constructed to serve both as a handle by which to turn the implement and as a screw for forcing the movable cutter-carrying arm toward the bearing B, all arranged substantially as and for the purpose set forth.

2. In a pipe-cutting implement, the combination of the anti-friction rollers *a* and an adjustable rotary cutter, D, with a stock, A, and a screw for forcing the cutter toward the material to be cut, substantially as and for the purpose herein set forth.

3. The combination, in a pipe-cutting implement, of the following elements, to wit: the stock A, the anti-friction rollers *a*, placed in the jaw B of the stock, the rotary cutter D, the arm C, pivoted to the said stock, and the feeding-screw F, all combined and arranged for joint use and operation substantially as and for the purpose herein set forth.

10,022. METHOD OF CONNECTING SPUTS TO BOILERS. JOHN TRAUBEL, New York, N. Y. Filed Dec. 24, 1881. Original No. 210,476, dated Dec. 3, 1878.



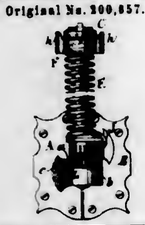
Claim.—1. The method of connecting sputs to boilers, consisting in calking the metal of the boiler against the surface of the sput and brazing the joint, substantially as shown and described.

2. The method of connecting sputs to boilers, consisting in forming a recess around the body of the sput, into which recess the metal of the boiler is worked and the joint brazed, substantially as shown and described.

10,023. ROAD-SCRAPER. SAMUEL PENNOCK, Kennet Square, Pa. Filed Sept. 19, 1881. Original No. 194,367, dated Aug. 21, 1877.

Brief.—The scraper is suspended diagonally beneath the axle and is independently vertically-adjustable at its ends. A pivoted toothed bar is suspended parallel to the scraper to an adjustable pivoted bar.

Claim.—1. The combination, with an axle and a frame connected therewith, of a scraper suspended at its ends beneath the axle and arranged diagonally thereto, practically one half of the length of the scraper being located in front and the other half in rear of the axle, and devices for adjusting the ends of the scraper independently of each other, substantially as set forth.



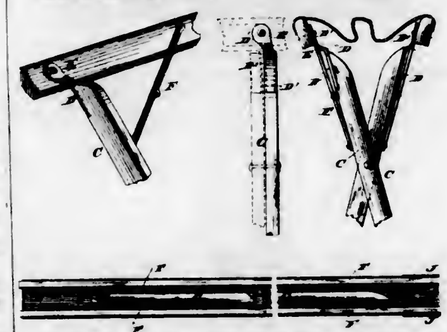
2. The combination, with a frame connected with an axle supported by carrying-wheels, of the scraper-bar G, rods c, slotted pivoted standards I, standards D, and levers H, substantially as set forth.

3. The combination, with a scraper, of a pivoted toothed bar located parallel to the scraper, and means for imparting vertical adjustment to said toothed bar, substantially as set forth.

4. The combination, with a scraper, of a pivoted toothed bar located parallel to the scraper, and means for raising said bar and locking it out of operative position, substantially as set forth.

5. The toothed bar K, pivoted to the scraper G and connected with the pivoted rod *f*, substantially as set forth.

10,024. SPRING-HINGE. WESLEY HULL, Fort Wayne, Ind., assignor to Scovill Manufacturing Company, Waterbury, Conn. Filed July 5, 1881. Original No. 200,857, dated Feb. 26, 1878.



Claim.—1. The combination, with the leaves of a hinge, a rod serving to connect the leaves, and a spring adapted to impart a swinging motion to said leaves, of a lower bearing consisting of a circular shell extending from and turning with a socket affixed to one of the said leaves, wholly surrounding the rod, and receiving around it the end portion of the spring which acts upon the leaf of the hinge that is provided with said socket, thereby holding the spring away from said rod, and an inclined end bearing for the spring at the base of said shell, substantially as described.

2. The combination, with the leaves of a hinge and a rod whereby they are connected, of a spring adapted to impart a swinging motion to said leaves, and an upper bearing for the end portion of the spring, impinging against the outer side of the same, and holding it out of contact with the rod, the spring being exposed below said upper bearing, substantially as specified.

3. The combination, with the leaves of a hinge and a rod whereby they are connected, of a spring adapted to impart a swinging motion to said leaves, a lower bearing consisting of a shell extending from and turning with a socket affixed to one leaf, fitting upon the rod and receiving around it one end portion of the spring, and an upper bearing, for the other end portion of the spring, impinging against the outer side of the same and holding it out of contact with the rod, the spring being exposed between said lower bearing and upper outside bearing, substantially as specified.

4. The regulating-drum F, cap C, and rod R, in combination with spring E, secured to the exterior end of socket D, substantially as and for the purpose set forth and described.

10,025. FOLDING COT. THOMAS W. B. MURRAY and CALEB J. BAKER, Chicago, Ill. Filed Jan. 6, 1882. Original No. 240,533, dated Apr. 26, 1881.

Claim.—1. In a folding cot, the angle-irons or hinge-plates D D, the upper ends of each pair of which are deflected toward each other, so as to bring the pivoting-points of the legs C, which they connect, to the side rails of such cot in the same axis, substantially as shown and specified.

2. In a folding cot, the hinge-plates D, bent at E, so as to afford room between the legs and side rails for the jointed braces F, substantially as set forth.

3. In a folding cot, the angle-irons or hinge-plates D, having deflected upper ends, D′, and bent at E, for securing the legs to the side rails, substantially as and for the purpose set forth.

4. The combination of the side rails, A, flexible cover B, legs C, angle-irons D, bent at E, and the jointed braces F, substantially as and for the purpose set forth.

5. In a folding cot having a flexible cover, as shown, the head-rest consisting of rods G G, pivoted standards H H, bars I I, and the flexible strip J, secured to the bars I I, and having its front corners secured permanently and its rear corners detachably to the side rails of the cot, substantially as and for the purpose set forth.

THE ELIOTYPE PRINTING CO. BOSTON

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

DECISIONS OF THE U. S. COURTS.

Supreme Court of the United States.

JAMES v. CAMPBELL, *et al.* CLEXTON v. CAMPBELL *et al.* CAMPBELL v. JAMES *et al.*

Decided January 9, 1882.

1. REISSUE NO. 4,143—POST-OFFICE STAMP.
Norton's reissue patent, dated October 4, 1870, for an improved post-office stamp for printing the postmark and canceling the postage-stamp at one blow, *Held* to be void by reason of not being for the same invention specified in the original.

2. REISSUE—EXPANDING CLAIMS.
If a patent fully and clearly describes and claims a specific invention, complete in itself, so as not to be inoperative or invalid by reason of a defective or insufficient specification, a reissue cannot be had for the purpose of expanding and generalizing the claim so as to embrace an invention not specified in the original. *Burr* v. *Duryee* (1 Wall., 531) reaffirmed.

3. SAME—EXPLORATION OF HISTORY OF ART BY COURT—HOW PATENTEE IS BOUND.
In such case the court ought not to be required to explore the history of the art to ascertain what the patentee might have claimed. He is bound by his statement of what his invention was.

4. CLAIMS FOR THINGS CLAIMED OR DESCRIBED IN PRIOR PATENTS.
A patentee cannot claim in a patent the same thing claimed by him in a prior patent, nor what he omitted to claim in a prior patent in which the invention was described, he not having reserved the right to claim it in a separate patent and not having seasonably applied therefor.

5. REISSUE OF MACHINE PATENTS TO COVER PROCESSES.
A patent for a machine cannot be reissued for the purpose of claiming the process of operating that class of machines, because, if the claim for the process is anything more than for the use of the particular machine patented, it is for a different invention. *Powder Company* v. *Powder Works* (98 U. S., 126) reaffirmed.

6. RIGHT OF GOVERNMENT TO USE PATENTED INVENTIONS.
The Government of the United States has no right to use a patented invention without compensation to the owner of the patent.

7. SUITS AGAINST GOVERNMENT OFFICERS—COURT OF CLAIMS.
Query, whether an officer of the Government can be sued for using an invention only for and in behalf of the Government, and whether the Court of Claims is not the only tribunal in which the claim for compensation can be prosecuted.

APPEAL from the Circuit Court of the United States for the Southern District of New York.

Mr. George H. Williams and *Mr. B. F. Butler* for Campbell.

Mr. Attorney-General Devens and *Mr. S. B. Clark* for James.

Mr. Justice BRADLEY delivered the opinion of the Court.

This case is founded on a bill in equity filed by Christopher C. Campbell, the complainant below, against Thomas L. James, United States postmaster in and for the city of New York, to enjoin him from using a certain implement for stamping letters, which the complainant claims to have been patented to one Marcus P. Norton by letters patent dated April 14, 1863, and surrendered and reissued on the 23d of August, 1864, and again surrendered and reissued on the 3d of August, 1869, and again, finally, on the 4th of October, 1870. The complainant claims to be assignee of Norton, the patentee. Other persons, claiming an interest in the patent, were made parties to the suit. The circuit court rendered a decree in favor of the complainant and adjusted the rights of the several parties to the amount of the decree. The defendant, James, appealed. The other parties, not being satisfied with the decree, as it affected their mutal interests, also appealed. The case is now before us in all its aspects. Supposing the court below to have had jurisdiction of the case, the first question to be considered will be the liability of the principal defendant, James, to respond for the use of the machine or implement in question.

That the Government of the United States, when it grants letters patent for a new invention or discovery in the arts, confers upon the patentee an exclusive property in the patented invention, which cannot be appropriated or used by the Government itself without just compensation any more than it can appropriate or use without compensation land which has been patented to a private purchaser, we have no doubt. The Constitution gives to Congress power "to promote the progress of science and useful arts by securing for limited times to authors and inventors the exclusive right to their respective writings and discoveries," which could not be effected if the Government had a reserved right to publish such writings or to use such inventions without the consent of the owner. Many inventions relate to subjects which can only be properly used by the Government, such as explosive shells, rams, and submarine batteries, to be attached to armed vessels. If it could use such inventions without compensation, the inventors could get no return at all for their discoveries and experiments. It has been the general practice, when inventions have been made which are desirable for Government use, either for the Government to purchase them from the inventors and use them as secrets of the proper department, or, if a patent is granted, to pay the patentee a fair compensation for their use. The United States has no such prerogative as that which is claimed by the sovereigns of England, by which it can reserve to itself, either expressly or by implication, a superior dominion and use in that which it grants by letters patent to those who entitle themselves to such grants. The Government of the United States, as well as the citizen, is subject to the Constitution; and

when it grants a patent the grantee is entitled to it as a matter of right, and does not receive it, as was originally supposed to be the case in England, as a matter of grace and favor. But the mode of obtaining compensation from the United States for the use of an invention where such use has not been by the consent of the patentee has never been specifically provided for by any statute. The most proper forum for such a claim is the Court of Claims, if that court has the requisite jurisdiction. As its jurisdiction does not extend to torts, there might be some difficulty as the law now stands in prosecuting in that court a claim for the unauthorized use of a patented invention, although, where the tort is waived and the claim is placed upon the footing of an implied contract, we understand that the court has in several recent instances entertained the jurisdiction. It is true it overruled such a claim on the original patent in this case, presented in 1867, but, according to more recent holdings, it would probably now take cognizance of the case. The question of its jurisdiction has never been presented for the consideration of this Court, and it would be premature for us to determine it now. If the jurisdiction of the Court of Claims should not be finally sustained, the only remedy against the United States, until Congress enlarges the jurisdiction of that court, would be to apply to Congress itself. The course adopted in the present case of instituting an action against a public officer, who acts only for and in behalf of the Government, is open to serious objections. We doubt very much whether such an action can be sustained. It is substantially a suit against the United States itself, which cannot be maintained under the guise of a suit against its officers and agents except in the manner provided by law. We have heretofore expressed our views on this subject in the case of *Carr* v. *The United States*, (98 U. S., 433,) where a judgment in ejectment against a Government agent was held to be no estoppel against the Government itself. But, as the conclusion which we have reached in this case does not render it necessary to decide this question, we reserve our judgment upon it for a more fitting occasion.

The subject-matter of the patent on which the bill in this case was founded is an implement or stamp for postmarking letters and canceling revenue and postage stamps. The original patent, dated April 14, 1863, exhibited two stamps connected together by a cross-bar, which was attached to a handle, one stamp being intended for printing the postmark and the other for canceling the postage-stamp, both operations being performed by a single blow. The stamps consisted of small hollow blocks or cylinders, in which were inserted and fastened the types which produced the impressions desired. In one were placed the lettered types, which produced the postmark, and in the other a single type, which blotted or canceled the postage-stamp.

The patentee, in his specification, described the invention as follows:

> The nature of my improvements herein described consists in the employment and combination of a device for canceling postage or other stamps by means of wood, cork, or similar material inserted in a tube or recess therein for the purpose of effacing or blotting such stamps with indelible ink.
>
> It also consists in the combination of a canceling device having wood, cork, rubber, or any similar material for the type or blotter therein with any postmarking device, so as to blot, cancel, or efface postage-stamps with indelible ink at the same time and operation of postmarking of letters, packets, &c.
>
> To enable others skilled in the art to which my invention relates to make and use the same, I will here proceed to describe the construction and operation thereof, which is as follows, to wit:
>
> I construct the postmarking-stamp D of any suitable material. E, Fig. 3, is the mortise or recess, of suitable dimensions to receive the type for the month, the day of the month, and the year, around which is the name of the place where used, and is the same as the postmarking device described in my letters patent bearing date the 16th day of December, 1862, and which is secured to the cross-piece B in the same manner and by the same means as described and set forth in the said patent, which is also the case with the canceling device C.
>
> I construct the canceling stamp or device C of any suitable material, of any size required in diameter, and in length to correspond to the postmarking device D. F, Fig. 3, is the tube or recess in the device C, for the purpose of receiving the blotting or canceling device G, Figs. 2 and 5, which device is made of wood, cork, rubber, or similar material, so as to closely fit the said tube or recess F, Fig. 3. The face of this device may contain a plan or form for canceling with indelible ink, like that shown at Fig. 2, or it may have any plan or form for that purpose thought best to devise or use. This device G may project somewhat below the lower end of the said tube F, as seen at Fig. 5, and may also project below the face of the postmarking or rating device D, Figs. 2 and 3, and it may be driven out of the said tube or recess by means of a pin or bolt operating through the hole A, Figs. 3 and 5, for the purpose of repairs, or to replace it by a new one. The said tube or recess G may be of any size in diameter required or any depth desired. The said canceling stamp or device C being thus constructed with cork, rubber, or other elastic substance for type or blotter, will receive and hold on the face thereof ink in quantities sufficient to blot or cancel the postage-stamp in such manner as to prevent the possibility of the said postage-stamp being cleansed of the canceling-ink by any chemical or other process, for the said ink would be so effectually put thereon that any attempts to remove it therefrom would entirely destroy the said postage-stamp, and thereby render the same incapable of a second or re use. The said cork, rubber, or other elastic substance, as aforesaid, will render the said stamp capable of an easy and rapid use, for there being a yielding of the same when the blow is given, the operator will not tire as soon by a constant or continued use of the same as though it were of solid metal, and the same will greatly aid in raising the entire stamp from the paper and postage-stamp when the impression shall have been given by the operator. The said blotter or type can be more easily repaired or replaced by a new one at less expense than if made of solid metal. The said cork, rubber, or other elastic material may extend upward to the said cross-bar B, and there be connected to the same by a screw or pin bolt, if desired, which will be the same in effect and in operation.
>
> Having thus described my invention and improvements in marking and canceling stamps, what I claim, and desire to secure by Letters Patent of the United States of America therein, is—
>
> 1. The canceling device C, with wood, cork, or rubber type or blotter G therein, or any device substantially the same, so as to cancel the postage-stamp with indelible ink, substantially as herein described and set forth.
>
> 2. The canceling device C, with wood, cork, or similar material forming the type or blotter G therein, in combination with the cross-piece B, and with the postmarking device D, substantially as herein described and set forth.

We have given the description and claim in full for the purpose of better comparing it with the reissued patent on which the suit was brought, and which is dated October 4, 1870. It will be seen that the invention claimed is very specific and definite in its character. In the first place, the canceling device is claimed separately, consisting of a hollow tube, in which is inserted the canceling type or blotter, made of wood, cork, rubber, or other elastic substance. The nature of the substance of which the blotter was to be made is emphasized thus:

> The said cork, rubber, or other elastic substance, as aforesaid, will render the said stamp capable of an easy and rapid use, for there being a yielding of the same when the blow is given, the operator will not tire as soon by a constant or continued use of the same as though it were of solid metal, and the same will greatly aid in raising the entire stamp from the paper and postage-stamp when the impression shall have been given by the operator. The said blotter or type can be more easily repaired or replaced by a new one, at less expense, than if made of solid metal.

It is plain, therefore, that elasticity in the material of which the blotter was to be composed was a distinctive feature of the blotting device thus separately claimed. Besides the advantages referred to in the foregoing extracts, its superior adaptability to hold indelible ink was evidently regarded by the inventor as important. From the facts appearing in the case it is quite clear that a separate claim of this blotting device could not have been sustained had it not presented these special characteristics, had it not, in fact, contained all the elements it did contain. The patentee himself, as

will be more fully seen hereafter, had shortly before his application for this patent obtained a patent for a double stamp exactly like the one patented in this, except that the blotter-type was made of "steel or other material which would answer the purpose." Of course he could not claim a blotter of like material in the patent now under consideration. And the record is full of evidence to show that hand-types for stamping letters and other characters with or without the use of ink had long been constructed of almost every kind of material. The general form of the instrument was old. Stamps fastened to what is called a "brad-awl handle," adjusted thereto centrally, so as to balance the pressure, were used for seals and other instruments, for making impressions of every sort, from time immemorial, and hand-stamps of the same general description, having a cylindrical type-holder in place of a seal, made hollow for inserting and holding the type, had long been used in the Post-Office Department. It was not without good cause, therefore, that the separate claim for the canceling device as a distinct invention was confined to an elastic type or blotter inclosed in a hollow tube. In like manner, the combination of devices in the entire instrument, forming the subject of the second claim, was necessarily specific in its character, being restricted by the special construction of the canceling device. The specific form of a cross-bar to sustain the type-holder and balance the effect of the blow or pressure when making the impression was substantially contained in the common hand-type long before used for printing names on linen with indelible ink. This instrument consisted of a metallic trough or receiver to hold the type, the bottom of which, at its middle part, was attached to a wooden brad-awl handle. Inserting the types for a postmark in one end of this device and the type for blotting the postage-stamp in the other, it would be a complete double stamp like that claimed by Norton, the patentee. The fact that it might require a stronger piece of metal for post-office uses than was required for stamping letters on cloth, or that the type-holder would be better adapted to the purpose by being divided into two compartments, does not detract from the substantial similarity of the instruments. Given the idea of stamping the postmark and blotting the postage-stamp with one instrument at a single blow, it required but little invention, in view of what was then in common use, to adjust the printing apparatus to the handle by means of a block, shoulder, or cross-bar, or other similar device. The needs and requirements of the instrument would soon be developed and manifest themselves to any skilled workman in that branch of mechanics.

The evidence does not show to our satisfaction that Norton was by any means the first inventor of a double post-office stamp, so constructed as to make the postmark and cancel the postage-stamp at one blow. If that fact was important, the burden of proof was on the complainant to show that Norton's invention antedated those of others proven in the cause, of which there were several independent of each other; but there is no satisfactory proof that Norton ever produced prior to 1862, or, at most, prior to 1861, any other double stamp than the one which he patented in 1859. In connection with one C. A. Haskins, he obtained a patent in October, 1857, for a hand-stamp attached to a standard with a projecting arm, and provided with a spring to lift it from the paper automatically after the blow which made the impression was given. This stamp was an elaborate and complicated contrivance of wheels and cylinders for arranging and manipulating the types for making letters and figures, showing the month and day of the month in the postmark. It had no hint of any secondary apparatus for effacing a postage-stamp at the same time. But in August, 1859, Norton obtained a patent for the use of his assignees, Reynolds and Low, which did contain a device for effacing the postage-stamp. Low seems to have been associated with him in the patent of 1857 in the way of furnishing money, but what was the nature or extent of the assignees' real interest in the patent of 1859 is not made to appear. The application for this patent was dated May 3, 1859, but when filed in the Patent Office is not shown. The principal feature of the stamp described in this patent was also an elaborately-contrived device for arranging the types for the letters and figures in the postmarking-stamp, something in the same line with that described in the patent of 1857, no claim of which, however, was allowed. But to the postmarking-stamp, which was fixed to the handle in the ordinary way, was attached on one side, entirely outside of the bearing of the handle, a flat piece of metal, to be used as a blotter, for which, in combination with the postmarking-stamp, a claim was allowed. It is clear to us that this was the stamp to which Norton alluded, and which he asked to have the privilege of testing in the post-office at Troy, in his letter to the Assistant Postmaster-General of the 11th of April, 1859, on which much stress has been laid by the complainants. The letter does not give a description of the stamp he wished to test, but it concludes with these words:

> I herewith inclose you an envelope containing a postmark from the stamp on the left and an erasure upon the stamp made at the same operation of postmark. As now constructed is believed to work well.

This is a clear intimation that what he desired to have tested had been recently brought to its existing form. In a former part of the letter he had said:

> While the order given by your department was in force I was unable, in consequence of sickness, to thoroughly test my stamp. It was used upon about three thousand letters only during that time. I have since made some changes in it, which seem to make it a much better thing for the purpose designed. Now I ask the opportunity to test it without any expense to the Government.

An order was made by Mr. King, the Assistant Postmaster-General, on the 4th of May, 1859, authorizing the postmaster at Troy to use for postmarking letters at his office for the term of three months "Norton's improved marking-stamp." The application for the patent had been prepared and sworn to the day previous to this order—namely, May 3, 1859. In this application the description of the invention commences thus:

> The nature of my invention consists in constructing, combining, and arranging a hand-stamp hereinafter described, so as to contain a cylinder with the initials of each and every month in a year, and two other cylinders with figures for the respective days of each and every month; also, a cylinder with figures to represent ten years, more or less, as the case may be, which cylinders shall revolve upon the same shaft with each and within a stationary form of type, and thereby print the month, the day of the month, and the year in connection with each, and each in connection with and at the same time of the printing of the subject-matter upon the aforesaid stationary form of type. It also consists in attaching a blotter, hereinafter described, to the hand-stamp aforesaid, upon one or two sides thereof, for the purpose of cutting, blotting, canceling, or effacing the frank or postage-stamp, so as to prevent a second use of the same, while at the same time the name of the post-office, the year, the month, and the day of the month is printed upon the envelope and one side of the said frank or postage-stamp, thereby giving a good impression of the same and prevent undue wear of the said postmarking-stamp in consequence of being used upon the uneven surface made by the said frank or postage-stamp.

Now, if Norton had, as he pretends, invented as early as 1854 the stamps for which he took out his subsequent

patents in 1862 and 1863, it is hardly conceivable that he should have taken out the patents of 1857 and 1859 in the form in which they stand. The fact that he did take them out reduces it almost to a demonstration that he had not invented any such stamps at this time. It is true he produces a caveat, filed by him in 1853, which has or had an amendment, bearing date "Tinmouth, Vt., August 7, 1854," which amendment contained a full description of the double stamp as finally exhibited in his patent of 1863 and the reissue thereof; but this amendment was shown to have been surreptitiously introduced by him among the papers of the Office certainly as late as 1864, ten years after its pretended date. In his examination as a witness in this cause he admitted that he made the paper referred to in the summer of 1864, when his assignees, Shavor and Corse, were applying for a reissue of the original patent now in question, and that it was used in that application; but he pretends that it was a copy of a paper which he made and sent to the Patent Office in 1854. No such original paper, however, has ever been found in the Patent Office, and on a regular charge for the offense of making the surreptitious paper and introducing it among the files he was found guilty in September, 1871, and debarred, by order of the Commissioner of Patents, from further access to the papers of the Office. This amended caveat, therefore, as well as the testimony of Norton on the subject, may be laid out of view.

A witness by the name of Sherwood, a machinist and model-maker, was examined, who produced a sheet or two of items of account copied from his books, showing charges against Norton for work on stamps in 1857, 1859, 1860, and 1862. There were four items in 1857, under date of May, for certain hours of work charged, thus: "May 8, to 3 hours, finish stamp." There was a large number of items of similar character in the other years named, particularly in January and March, 1859, and August, September, November, and December, 1862, corresponding, as will be observed, with the times when Norton must have been getting up his models for his different patents. The witness was unable to distinguish the kind of stamps he worked on at these different dates, except that he professed to feel quite sure that the first one would postmark a letter and cancel a stamp thereon at the same time. Describing on his cross-examination the stamp which he thus referred to, he says:

> It was a dating-wheel stamp, the wheels giving the dates, with a die for the office and year in the top of the frame that held it, blotting or canceling at one end the impression given by a blow on the lever by the hand.

Now, this description applies aptly to both the stamp patented in 1857 and to that patented in 1859, except that it was the latter only which had the blotting attachment. We think it perfectly apparent that the witness had, by a very natural mental process, confounded the instruments together and imagined that the blotter was attached to the first instead of the second invention. His examination took place twenty years after the date of the accounts, and he relied solely on his memory as to the character of the articles which he worked upon.

This is really the strongest evidence that can be found in the record affording any ground for the conclusion that Norton ever produced any double stamp at all prior to the one he patented in 1859. The testimony of Mr. King, the former Assistant Postmaster-General, when compared with his own contemporary letters and other circumstances, clearly indicates that he had, quite naturally, confounded the device of one date with that of a later date. Other evidence was relied on, but all of such a loose and indefinite character that no reliance can be placed on it in support of the complainant's theory, and it is quite significant that no stamp of the kind claimed, made at the period in question, was produced in the examination. Had such stamps ever been in existence, it is strange that they should have altogether disappeared.

Now, there is abundant evidence in the record to show that double stamps were conceived of and used before 1859, and that about that time they sprung up spontaneously in various parts of the country. It was but recently that there had been any demand for their construction, since postage-stamps had not been in general use in the country for any long period. They were first authorized to be issued and used by the act of March 3, 1847, (9 Stats., 201;) but it was optional to use them or not. By the act of 1851 postage on single letters was reduced from five cents to three on being prepaid. (9 Stats., 587.) It was not till the passage of the act of March 3, 1855, that all postage was required to be prepaid. This law first brought postage-stamps into universal use, and, as they must be canceled, two impressions had to be made on a letter, one for the ordinary postmark, giving the place and date of mailing the letter, the other for canceling or effacing the postage-stamp. This required two blows and produced double work; but, without any great exercise of ingenuity, postmasters and clerks in various places improvised double stamps, generally by screwing, welding, or binding to the side of the common stamp an appendage to serve as a blotter at the same time. This was done by Ezra Miller, at Janesville, Wisconsin, as early as January, 1859, or in 1858, and by General Dix, in New York, and one Powers, in Buffalo, in the summer of 1860. There is also evidence that a similar appendage for the purpose of stamping a large figure 5, to show the postage due, was invented and used by one Rees in the Philadelphia post-office as early as 1845, when the rates of postage were five and ten cents, and that one Ireland devised and used at the same office a like appendage for canceling postage-stamps as early as 1853. Other similar devices were referred to in the evidence. The adoption of a more artistic and convenient form of the instrument thus spontaneously originated as its use was continued and became more imperative was a matter of course. Norton's particular form and construction of the double stamp, as described in his patent of 1863, was undoubtedly an improvement; but we should expect to find, as we do find, that he was restricted in his claim to the particular form and construction set forth in his specification.

A reference to Norton's application for the original patent in question in this case, a copy of which is in evidence, and which being preserved of record in the Patent Office may properly be referred to, shows that the functionaries of that Office regarded it important that the instrument sought to be patented should be specialized with particularity. This application was presented to the Office on the 5th of January, 1863, and was rejected on the 21st of February. On the 21st of March, 1863, the application was renewed in a letter addressed by Norton to the Commissioner of Patents,

and after certain amendments were made to the specification the patent was allowed to pass. The most important amendment was the insertion of that portion of the specification commencing with the words "The said canceling stamp or device C being thus constructed with cork, rubber, or other elastic substance for type or blotter," and so on to the end of the paragraph. This amendment derives further importance and illustration from the letter of Norton above referred to, in which a renewal of the application was made, and which was dated at the National Hotel, in Washington, March 21, 1863. In that letter the writer says:

> I do not understand that the device referred to in your letter of the 21st of February last is "a common ink canceling-stamp, such as has been used for years in our post-offices for blotting and thus canceling post-office stamps." The devices to which you undoubtedly refer have always been made of metal entirely or of wood entirely. Wood was found to answer no purpose, because not at all durable, so metal ones were used. Now, this device consists of a barrel or tube, into which wood, cork, rubber, or some such material is inserted, for the purpose of holding an indelible ink in quantities sufficient to blot the postage-stamp so thoroughly as to prevent the same being washed or cleansed by a chemical mixture and again being used in payment of postage. This tube or barrel holds firmly the elastic substance therein, and prevents the same from undue wear and exposure. The elastic substance therein being worn out can again be replaced at the office where used, thus saving the trouble and expense of returning the same to the Government contractors for such repairs. This therefore constitutes a new device, composed of two distinct parts in combination, producing new results, besides blotting the postage-stamp.
>
> This device being new, its combination with the postmarking device for the purposes set forth in the specification is of course new. Upon these two claims I therefore most respectfully ask a patent.

On the same day that this letter was received, according to the memorandum on the file-wrapper, the specification was returned to the applicant to enable him to amend it, and was re-examined on the 26th of March, and favorably passed upon on the 1st of April. No one can read the patent in the light of these contemporary documents and of the previous history of the stamp without arriving at the conclusion that, so far as the blotting device was separately concerned, the invention consisted of and was confined to a tube containing a type-blotter made of an elastic substance as contradistinguished from iron or other hard substance. The iron or steel blotter had been patented in 1862, as already mentioned, and as will be shown more fully hereafter. There was not, there could not have been, any inadvertence or mistake in confining the invention to the combination described and claimed in the patent.

The second claim is merely that of a combination of this specific device with the other parts of the apparatus. As the patentee says in his letter to the Commissioner, "this device being new, its combination with the postmarking device for the purposes set forth in the application is of course new." In other words, the substantive invention for which the applicant desired a patent was the blotting device constructed specifically in the manner and for the purpose described. The addition of the combination claim was for the purpose of possibly securing the combination if the principal claim should be found to be untenable.

Perhaps we have gone more minutely into the evidence relating to the progressive improvements in this instrument than was necessary to show that the claim of the patent was not more restricted than it should have been. The court ought not to be called upon to explore the entire history of an art in order to ascertain what a patentee might have included in his patent had he been so disposed. If he was the author of any other invention than that which he specifically describes and claims, though he might have asked to have it patented at the same time and in the same patent, yet if he has not done so, and afterward desires to secure it, he is bound to make a new and distinct application for that purpose, and make it the subject of a new and different patent. When a patent fully and clearly, without ambiguity or obscurity, describes and claims a specific invention, complete in itself, so that it cannot be said to be inoperative or invalid by reason of a defective or insufficient specification, a reissue cannot be had for the purpose of expanding and generalizing the claim so as to make it embrace an invention not described and specified in the original. It is difficult to express the law on this subject more aptly and forcibly than in the words of Mr. Justice Grier in the case of *Burr* v. *Duryee*, (1 Wall., 577,) where, in delivering the unanimous opinion of the Court, he says:

> The surrender of valid patents and the granting of reissued patents thereon, with expanded or equivocal claims, when the original was clearly neither "inoperative nor invalid," and whose specification is neither "defective nor insufficient," is a great abuse of the privilege granted by the statute, and productive of great injury to the public. This privilege was not given to the patentee or his assignee in order that the patent may be rendered more elastic or expansive, and therefore more "available" for the suppression of all other inventions.

Of course, if by actual inadvertence, accident, or mistake, innocently committed, the claim does not fully assert or define the patentee's right in the invention specified in the patent, a speedy application for its correction, before adverse rights have accrued, may be granted, as we have explained in the recent case of *Miller et al.* v. *The Bridgeport Brass Company;* but where it is apparent on the face of the patent or by cotemporary records that no such inadvertence, accident, or mistake as claimed in a reissue of it could have occurred, an expansion of the claim cannot be allowed or sustained.

Turning now to the reissued patent on which the present suit was brought, which is the third reissue, dated October 4, 1870, we find the invention described as follows:

> The nature of my said invention and improvements herein contained and described consists in the employment and combination of a device or die used for the more complete and perfect cancellation of postage-stamps or letter-franks by means of soft wood used endwise, or of cork, rubber, or other suitable material, whereby such stamp or frank is effaced and canceled in and by indelible or other ink in the manner substantially as herein described and set forth.
>
> It also consists in the combination of a postage-stamp canceling device or die constructed of wood, cork, rubber, or any suitable material, with any suitably arranged and constructed postmarking stamp or device, so as to cancel, efface, or destroy the postage-stamp or letter-frank with indelible or any suitable ink at the same time, blow, or operation of the stamp or instrument by which the postmark is given or made upon the letter, envelope, or packet, substantially as herein described and set forth.
>
> It also consists of the postmarking of letters, envelopes, or packets, and in the cancellation of the postage stamp or stamps thereon with, in, or by any suitable ink, or similar material, by means of some soft wood used endwise against the postage-stamp, or by the means of cork, rubber, iron, or steel, or by means of any other suitable material so combined with the postmarking stamp or instrument as to cancel, efface, or destroy the postage stamp or stamps at one and the same blow or operation of the entire instrument thus constructed for that purpose, whereby to prevent a second or re use of such postage stamp or stamps.

After some details as to the mode of construction, the specification proceeds:

> The said canceling type or die can be easily repaired or replaced by a new one whenever desired and at very little expense; and such canceling die or type G may extend upward to the said cross-bar B, and there be connected to the same by means of a screw, pin, or small bolt. In such case there would not be any tube or pipe surrounding said canceling die or type G. The operation and effect produced would in such case of construction be the same. The said postage-stamp-canceling device, die, or type G may be of any desired distance from the aforesaid postmarking or dating device or stamp D, or it may be securely fastened to the immediate side of the said postmarking and dating part or stamp or device D by any convenient and suitable mechanical means. The said canceling die, type, or device G I prefer to use made of cork, as it will hold a much greater quantity of canceling-ink upon and in the lower face thereof, and when it comes in contact with

the printed surface of the postage-stamp such surface will become somewhat and sufficiently broken by means thereof, and thus and thereby inject into or impregnate such broken surface with the said canceling-ink, whereby such postage-stamp, so operated upon and filled with such ink, cannot be sufficiently cleansed by any means as to enable it to be reused or used a second time, in fraud upon the postal revenue, without immediate detection of the same. Soft wood used e wise will answer nearly the same purpose. Still, long and continued use after the granting of my said patent (April 14, 1863) has fully proven the superiority of the cork for the canceling die or type used upon postage-stamps, as aforesaid. * * *

I also construct my said postage-stamp-canceling device, die, or type of cast iron, steel, or other suitable metal, substantially as shown at G', Figs. 5 and 6, and which may be secured to the said cross bar or piece B in like manner as the said tube or cylinder C, Figs. 2 and 4, and which is done either by screw and nut where the same unites with the said cross-bar, or it may there be firmly fastened by means of suitably constructed and arranged pins or rivets, or the same may be soldered to the under side of said cross bar or piece B, or otherwise attached thereto. * * *

The aforesaid metal canceling device, die, or type G', Figs. 5 and 6, may also be fastened or secured to the immediate side of the said postmarking device by any good and sufficient means, substantially as hereinbefore described and set forth, in reference to the said device C, or tube or cylinder, constructed to receive and contain the said type or die G, Figs. 2, 3, and 4.

Such metallic device, die, or type may also have upon its lower face or lower surface any suitable configuration deemed best to use for the purpose of canceling the postage-stamp in, with, or by any suitable ink at the same time, blow, and operation of the instrument or apparatus, as hereinbefore stated and set forth.

In any and every case the postmarking of the letter, envelope, or packet, and the effacing or cancellation of the postage-stamp or letter-frank thereon representing value are done at the same time and by the same blow or operation of the said several devices and parts, constructed and combined in the manner and by the means substantially as herein described and set forth.

Both the postmarking and cancellation of the said postage-stamp are done with indelible or other and suitable ink used for such cancellation or effacing of the postage-stamp.

Omitting much more of this verbose specification, containing, among other things, a dissertation on the supposed advantages and importance of the invention, we add the summary of the patentee's claims, which is as follows:

What I claim, and desire to secure by letters patent of the United States of America, is—

1. The postage-stamp-canceling device, cylinder, or tube C, containing a die or type, G, made of cork, wood, or other suitable material, or any equivalent for said cylinder or tube C, or for the said canceling die or type G, whereby to efface, cancel, or destroy the postage-stamp with indelible or other ink, in the manner and for the purposes substantially as herein described and set forth.

2. The canceling device, cylinder, or tube C, with cork or wood, or any substantial equivalent thereof, forming the die or type G therein, in combination with the cross bar or piece B, and with the postmarking device D, substantially as and for the purposes herein described and set forth.

3. The postmarking of letters, envelopes, and packets and the cancellation of the postage-stamps thereon with ink at one and the same blow or operation of the instrument in the manner and by the means substantially as herein described and set forth.

4. The employment and combination of a postmarking device with a postage-stamp-canceling device, both being operated by one and the same handle, for the postmarking of letters, envelopes, or packets, and for the cancellation of the postage-stamps thereon with indelible or other ink, in the manner substantially as herein described and set forth.

By these extracts from the specification and the summary of claims it appears perfectly obvious that the patentee has embraced in the reissued patent several matters of supposed invention different from and additional to the invention which formed the subject of the original patent; and it is principally, if not wholly, these new and additional claims which the appellant, James, as postmaster of New York, is charged with infringing. In the first place, a new form of the canceling device is set forth and claimed, different from that described in the original patent, to wit: a canceling type or die attached directly to the cross-bar, without any tube or pipe surrounding and holding the same. This is not contemplated or hinted at in the original patent. The latter does suggest, it is true, that "the cork, rubber, or other elastic material may extend upward to the cross-bar, and there be connected to the same by a screw or pin-bolt, if desired;" but this suggestion had reference to a type inclosed at the same time by a surrounding cylinder, which formed the distinctive feature of the invention. The context shows that nothing more was intended by the suggestion than the extension of the type upward through the cylinder and fastening it in a particular way. The thought seems to have occurred to the patentee that it might be an advantage, under some circumstances, in addition to fastening the type in the cylinder by compression, to extend it through the cylinder and fasten it to the bar to secure it from any danger of falling out of the cylinder by becoming loose. Not a hint was given that the cylinder could be dispensed with. This was an after-thought. The cylinder was clearly and distinctly set forth as a necessary constituent of the device and an essential element in the combination of which the blotting device consisted. The bearing which this new feature in the reissued patent has on the case is evinced by the fact that one of the devices used for several years in the post-office which is complained of as an infringement of the patent was a naked blotter made of cork, directly attached to the cross-bar, without any inclosing cylinder to support it. Also, by the fact that the other device used in the post-office during the defendant's term of office, consisted of an iron blotter directly attached to the side of the postmarking-stamp without any inclosing cylinder. In our judgment, this addition to the patent was no part of the original invention, and could not lawfully be embraced in the reissue, and that the claim for it is therefore void. It is true that this particular feature is not made the subject of a distinct claim, but it is described as part of the invention, and would probably be included in the general and sweeping terms employed in the claims that are made. Regarded as not being a part of the original invention, those claims cannot stand if they are construed to include it. If they are construed so as not to include it, then the use of this form of device by the defendant cannot be adjudged an infringement of the patent.

Another new matter, forming no part of the original invention, but expressly disclaimed in the original patent, is the making of the blotter of cast iron, steel, or other suitable material. The original specification, in various forms of expression, excludes such materials. The words "wood, cork, rubber, or any similar material" have this intention, as shown by the context. A claimed advantage is that—

The said cork, rubber, or other elastic substance, as aforesaid, will render the said stamp capable of an easy and rapid use, for there being a yielding of the same when the blow is given, the operator will not tire as soon by a constant or continued use of the same as though it were of solid metal. * * * The said blotter or type can be more easily repaired or replaced by a new one, at less expense, than if made of solid metal.

This language amounts to an express disclaimer of solid metal. The merit claimed for the invention was that the elastic materials proposed to be used for the blotter, and the use of which the patent throughout supposes possible by the support received from the surrounding cylinder, were far superior to solid metal and other solid and inelastic substances. How after this it could be supposed that the use of solid metal as a material for the type-blotter was included in the invention, and that a claim for it was omitted through inadvertence and mistake, it is difficult to understand. Besides, as already seen, and will be again adverted to, the use of steel or other material that would answer the purpose had already been described and claimed in Norton's patent of 1862. We think that any claim in the

reissued patent which can be fairly construed to embrace a blotter made of metal is void, and that the use of such a blotter by the defendant did not afford the patentee or the complainant any just ground of complaint.

In connection with this branch of the subject it is observable that the patentee has added two new diagrams to his drawings for the purpose of exhibiting and illustrating this new ground of claim. This fact, though not decisive, is strongly corroborative of the conclusion which we have reached on the subject.

A third addition in the reissued patent to the invention described in the original is that of the process of stamping letters with a postmark and canceling the postage-stamp at one and the same blow or operation of the instrument in the manner and by the means described and set forth. Leaving out of view the history of the art prior to the invention claimed by the patentee, what possible pretense can there be for contending that the general process was part of the invention which formed the subject of the original patent? Suppose it be true that Norton was the first inventor of this process, was that process the invention which he sought to secure in the original patent? A patent for a process and a patent for an implement or a machine are very different things. (*Powder Company* v. *Powder Works*, 98 U. S., 126.) Where a new process produces a new substance the invention of the process is the same as the invention of the substance, and a patent for the one may be reissued so as to include both, as was done in the case of Goodyear's vulcanized rubber patent. But a process and a machine for applying the process are not necessarily one and the same invention. They are generally distinct and different. The process or act of making a postmark and canceling a postage-stamp by a single blow or operation as a subject of invention is a totally different thing in the patent law from a stamp constructed for performing that process. The claim of the process in the present case, however, is not so broad as this. It is for the process or act of stamping letters with a postmark and canceling the postage-stamp at one and the same blow or operation of the instrument in the manner and by the means described and set forth. Perhaps this claim amounts to no more than a claim to the exclusive use of the patented instrument or device. If it is anything more, it is for a different invention from that described in the original patent. If it is not for anything more, the question is brought back to the instrument or device itself which forms the subject of the patent, and which has been already considered.

The last claim—to wit, "the employment and combination of a postmarking device with a postage-stamp-canceling device, both being operated by one and the same handle, for the postmarking of letters, envelopes, or packets, and for the cancellation of the postage-stamps thereon with indelible or other ink in the manner substantially as herein described and set forth"—may admit of two constructions. It may either amount to a claim for a combination of any kind of devices for stamping and blotting or for a combination of the particular devices described in the patent. Inasmuch as these specified devices, as we have already shown, embrace new devices not described in the original patent, the claim is too broad in either of its aspects to be advanced in a reissue of that patent, unless the patentee was really the inventor of the general combination of such devices in a double stamp and was entitled to add a claim therefor to such reissue. We have seen that his original patent was for a specific blotting device and for the combination of such specific device with a poststamping device in the same instrument. Could he in a reissue of the patent lawfully make the broad claim of the combination of any and all devices for blotting and poststamping at one and the same time in one and the same instrument? This would be, it is true, only adding a new claim to his patent, but greatly enlarging its scope and making it to embrace every kind of double stamp that can be conceived. Did he forget to insert this claim in his original patent? Was it omitted through accident and mistake? When we examine his original application, the changes it underwent, the careful exclusions, as well as inclusions, which it contained, and the particularity of the specific combination which he did claim, could he, after the lapse of more than a year, (if we take the date of his first application for a reissue as the time for consideration,) be allowed to return to the Patent Office and pretend that he had inadvertently omitted the principal claim of the whole thing? If he were, or pretended to be, really the inventor of the entire double stamp, did not the patent on its face show that the invention was not secured to him, that it contained no such claim? And was not this omission obvious upon inspection? The truth is that when he made his original application and got his original patent all the documents show demonstrably that he did not intend it to embrace any such broad invention. That was not the invention he sought to secure. Having obtained a patent for his specific device and combination, if he afterward wished to claim the general combination, and had not already abandoned it by taking a narrower patent, he was bound to make a new application for that purpose. Patentees avoid doing this when they can and seek to embrace additional matters in a reissue in order to supersede and get possession of the rights which the public, by lapse of time or other cause, have acquired in the meantime. It is for this very reason that the law does not allow them to take a reissue for anything but the same invention described and claimed in the original patent. But these broad claims in the reissued patent, if construed according to the latitude in which they are expressed, are void by reason of embracing inventions which had been patented both in England and in this country prior to the patentee's application for the original patent.

A stamp with a postmarking device and a blotting device combined in one instrument was described in an English patent, dated April 24, 1860, granted to one David G Berri. As shown in the drawing, the postmarker and blotter were attached to one metallic plate, analogous and equivalent to the cross-bar described in Norton's patent, to the center of which plate the handle was attached, so that the instrument was equally balanced. The particular object of the patent was to secure a method of hinging the plate containing the types onto the fixed plate to facilitate the insertion and change of the types. But the double stamp is fully exhibited, and the patentee, in the specification, says:

In conclusion to the foregoing description, it may be here necessary to note that my improved date-stamp may be employed either in connection with the double or obliterating mark, as represented, or separately, in conformity with the usual requirements.

The same combination of postmarker and blotter in one instrument was also exhibited in Norton's own patent of August 9, 1859. As he did not then reserve the process of stamping letters with such an instrument,

nor the combination of a postmarker and a blotter, and did not make any simultaneous application therefor, he could not afterward obtain a patent for such process and combination, but would be restricted to such particular combination or process as might be exhibited in a new device or apparatus. We have already referred to this patent of 1859, and will here only quote from the specification to show the construction of the tamp and the scope which the patentee claimed his invention to possess. He says:

The blotter J is fastened to the frame B upon one side thereof by the use of the shaft D, one end of which passes through the upper part of the said blotter, and which is firmly secured to the said frame by means of the nut E, or by using it for the nut in place of the said nut E, as aforesaid. This blotter is then and thereby retained in a fixed and strong position by means of the screw S in connection with the said shaft D, the blotter J, or nut E, and is for the purpose of cutting, inking, blotting, effacing, and effectually canceling the frank or postage-stamp, while at the same time and operation the name of the post-office, the year, the month, and the day thereof are given upon the envelope or letter at one side of the said frank or postage-stamp, and not upon it, as now practiced, in order to efface and to cancel it under the operation of stamping, which unduly wears out the marking-stamp, gives a bad and unintelligible impression, and is in direct violation of the rules or statute of the Post-Office Department. This stamp may have another blotter like J, which shall be upon the opposite side thereof, by the use of which the frank or postage-stamp would be cut, inked, blotted, effaced, and canceled upon any part of the letter or envelope where it may be placed. One blotter like J, however, is believed to answer the required purpose. This blotter J may be made of any size or shape, and of any material to answer the end or purpose sought to be obtained. The face, which receives the ink, and which comes directly upon the frank or postage-stamp, is grooved or cut, thereby leaving various projections, which have a sharp or knife edge sufficient for each to cut entirely through the frank or postage-stamp, but not through the envelope immediately under the same, while at the same time the places thus cut are inked by the same sharp-edged projections or cutters on the face of said blotter, as aforesaid. The said blotter J should be made of the best kind of cast-steel, and in such shape as not to break any part thereof. The projections upon the face of the said blotter may be kept sharp and in cutting order by filing and sharpening them when dull.

The claim of this patent is as follows:

Having thus set forth and described my invention, what I claim, and desire to secure by Letters Patent of the United States, is—

The blotter J, connected or attached to the main part of any post-office postmarking-stamp for the purpose of cutting and inking, blotting and effacing, so as to successfully cancel the frank or postage-stamp of any letter or any package at the same time and operation of marking or printing upon such letter or package the name of any post-office, the year, the month, and the day of the month, substantially as and for the purpose herein set forth.

Another patent was taken out by Norton on the 16th of December, 1862, for a double stamp containing a combination of the postmarker and blotter and the cross-bar connecting them, and to which they were attached. The drawings attached to this patent exhibit exactly the same form of instrument which is exhibited and described in the drawings and specification of the patent sued on in this case. The blotter, however, instead of being confined to wood, cork, or other elastic material, was proposed to be made of "steel or other material which will answer the purpose," and to have on its face circular cutters inclosed in circular rings to cut the postage-stamp at the same time that it defaced it with ink.

The invention is described in the specification as follows:

The nature of my improvement consists in so constructing canceling-stamps that the same shall cut the postage-stamp or any stamp similar thereto without injury to the contents of the envelope or packet inclosed therein, and at the same time cause a heavy circular mark upon the inside and one upon the outside of that part of the stamp or letter-frank canceled by the cutting device, so that said postage-stamp or letter-frank shall readily show cancellation in ink, and when removed from the letter or packet on which the same may have been canceled it shall be reduced to parts or pieces, whereby a second use of the said stamp or frank is thus prevented, although it may have been previously cleaned by a chemical or other process.

It also consists in the employment and combination of a canceling-stamp with a cutting and inking device thereon with a postmarking or rating stamp, so that the canceling of the letter-frank and the postmarking on the envelope or packet shall be effectually done by the means fully described hereinafter.

To enable others skilled in the art to which my invention relates to make and use the same, I will here proceed to describe the construction and operation thereof, which is as follows, to wit:

I construct the postmarking-stamp D of steel or any material which will answer the purpose.

G is the mortise or opening to receive the type for the month, the day of the month, and the year, around which is the name of the place where used. E is a screw for the purpose of holding the type in the said openings G.

This stamp is secured or firmly fastened to the block or cross-piece B, Figs. 1, 2, and 3, by means of the screw K, which is held in its place by means of the small screw *a*, Figs. 1 and 2, which is placed near one side of the said screw K, so as to prevent the same from becoming loose by reason of turning backward.

After further directions as to the construction of the canceling-stamp, he adds:

The cross-piece B is made of iron or steel, and in width the same as the diameter of the said rating and canceling stamp, and of any thickness required. The said canceling-stamp *c* is securely fastened to the said cross-piece B, and at any desired distance from the said rating-stamp D, as seen at Figs. 1, 2, and 3, and in the same manner as that of the said stamp D. H is a screw-bolt or stem, the lower end of which is screwed into the center of the said cross-piece B. The handle A is then screwed upon the said bolt or stem H, and firmly upon the said cross-piece B, thereby making a strong and reliable joining of the handle to the whole stamp.

The claim in this patent is, first, for the canceling-stamp separately, and, secondly, as follows:

I also claim the combination of the canceling-stamp *c* and the postmarking or rating stamp D with the cross-piece B, substantially as and for the purposes herein described and set forth.

It is hardly necessary to remark that the patentee could not include in a subsequent patent any invention embraced or described in a prior one granted to himself any more than he could an invention embraced or described in a prior patent granted to a third person. Indeed, not so well; because he might get a patent for an invention before patented to a third person in this country if he could show that he was the first and original inventor, and if he should have an interference declared.

Now, a mere inspection of the patents referred to above will show that after December, 1862, Norton could not lawfully claim to have a patent for the general process of stamping letters with a postmark and canceling-stamp at the same time, nor for the general combination of a post-stamper and blotter in one instrument, nor for the combination of a poststamper and blotter connected by a cross-bar, for all these things, in one or other specific form, were exhibited in these prior patents. Any such claim, therefore, in the reissued patent of 1870 must be inoperative and void, as well because the thing claimed was anticipated in former patents as because it would be for a different invention from that contained and described in the original patent. We may, therefore, dismiss from consideration the third and fourth claims of the reissued patent. If they are to be construed as being broader and claiming more than the original patent, they are void; if to be construed as claiming nothing more, they are simply redundant, because the first and second claims embrace all that was in the original and more.

The case, then, upon the patent is narrowed down to the claim of the specific device of the blotter as described and claimed in the original patent and the combination thereof with the postmarking device in one instrument by means of the cross-bar. This being the case, it will be pertinent next to inquire whether the defendant used that device or combination. If he did not, it is unnecessary to pursue the subject further.

As we have already seen, the canceling stamp or device described in the patent consisted of a cylinder corresponding in length to the postmarking device and containing a type of wood, cork, rubber, or other elastic material slightly projecting therefrom. It does not appear that this device was ever used by the defendant. The stamp used by him until January, 1876, had a blotter of cork, it is true, but it was not the specific device described in the patent and to which the patent was restricted. The cork was not inclosed in a cylinder, as demanded by the patent. It was a naked piece of cork directly attached to the cross bar by a common wood screw passing through a hole in the cross-bar and driven into the cork, firmly holding it to the bar. This device, of course, was different from that which was patented. The only other stamp used by the defendant had a steel blotter connected with the postmarker by a solid metallic plate or mass of metal and having no cylinder. Neither of these devices infringed the complainant's patent, construed as we consider it must be in order to have any validity at all.

The decree of the circuit court is reversed and the cause remanded, with directions to dismiss the bill of complaint. This decision in effect disposes of all three appeals.

DESIGNS.

12,733.—TOY FOR EXPLODING CAPS AND FULMINATES.—*Charles Coester, Jr.*, Bridgeport, Conn. Application filed July 7, 1881. Term of patent 14 years.

12,734.—CARPET.—*John Fisher*, New York, N. Y., assignor to *The Lowell Manufacturing Company*, Lowell, Mass. Application filed January 7, 1882. Term of patent 3½ years.

12,735.—JEWELRY.—*Herbert G. Mackinney*, Providence, R. I. Application filed November 30, 1881. Term of patent 3½ years.

12,736 and 12,737.—OIL-CLOTH.—*Charles T. Meyer* and *Victor E. Meyer*, Bergen, N. J., assignors to *Edward C. Sampson*, New York, N. Y. Applications filed January 6, 1882. Term of patents 3½ years.

12,738.—OIL-CLOTH.—*Charles T. Meyer* and *Victor E. Meyer*, Bergen, N. J., assignors to *Edward C. Sampson*, New York, N. Y. Application filed January 6, 1882. Term of patent 7 years.

12,739 to 12,742, inclusive.—OIL-CLOTH.—*Charles T. Meyer* and *Victor E. Meyer*, Bergen, N. J., assignors to *Edward C. Sampson*, New York, N. Y. Applications filed January 6, 1882. Term of patents 3½ years.

12,743.—OIL-CLOTH.—*Charles T. Meyer* and *Victor E. Meyer*, Bergen, N. J., assignors to *Edward C. Sampson*, New York, N. Y. Application filed January 6, 1882. Term of patent 7 years.

12,744.—BEDSTEAD.—*Alexander F. Miles*, Pittsburg, Pa. Application filed December 24, 1881. Term of patent 7 years.

12,745.—EASEL.—*Ethaman L. Moodie*, New York, N. Y., assignor to *Gillespie & Moodie*, same place. Application filed November 18, 1881. Term of patent 3½ years.

12,746.—LAMP, &c.—*Jacob J. Nichols*, Brooklyn, and *William S. McLeesse*, New York, N. Y.; said *McLeesse* assignor to said *Nichols*. Application filed November 2, 1881. Term of patent 7 years.

12,747.—RUG, CARPET, &c.—*Adolph Petzold*, Philadelphia, Pa., assignor to *John Bromley & Sons*, same place. Application filed January 7, 1882. Term of patent 3½ years.

12,748.—FRINGE.—*Joseph Reshower* and *August Heck*, New York, N. Y. Application filed December 16, 1881. Term of patent

9,086.—TONIC BITTERS.—*Carl Spengler*, Kansas City, Mo. Appli-

12,748.—FRINGE.—*Joseph Reshower* and *August Heck*, New York, N. Y. Application filed December 16, 1881. Term of patent 3½ years.

12,749.—TOY FOR EXPLODING CAPS AND FULMINATES.—*Charles F. Ritchel*, Bridgeport, Conn., assignor to *Edward R. Ives*, same place, and *Cornelius Blakeslee* and *Edward G. Williams*, Brooklyn, N. Y. Application filed November 29, 1881. Term of patent 7 years.

12,750.—TOY FOR EXPLODING CAPS AND FULMINATES.—*Charles F. Ritchel*, Bridgeport, Conn., assignor to *Ives, Blakeslee & Co.*, same place. Application filed October 20, 1881. Term of patent 7 years.

12,751.—PANEL FOR MANTELS.—*John Williamson*, Louisville, Ky. Application filed November 11, 1881. Term of patent 14 years.

12,752.—JEWELER'S STAND.—*John B. Wood*, Montreal, Quebec, Canada. Application filed December 23, 1881. Term of patent 3½ years. Patented in Canada December 21, 1881.

12,753.—CARPET.—*Walter J. Gadsby*, Boston, Mass., assignor to *The Roxbury Carpet Company*, same place. Application filed January 12, 1882. Term of patent 3½ years.

12,754.—CARPET.—*David McNair*, Boston, Mass., assignor to *The Roxbury Carpet Company*, same place. Application filed January 12, 1882. Term of patent 3½ years.

12,755 and 12,756.—CARPET.—*Thomas J. Stearns*, Boston, Mass., assignor to *The Roxbury Carpet Company*, same place. Applications filed January 12, 1882. Term of patents 3½ years.

12,757.—HANDLE FOR ARTICLES OF TABLE-WARE.—*George Wilkinson*, Providence, R. I., assignor to *Gorham Manufacturing Company*, same place. Application filed November 2, 1881. Term of patent 7 years.

12,758.—TOY MONEY-BOX.—*Louis Kyser* and *Alfred C. Rex*, Philadelphia, Pa. Application filed January 9, 1882. Term of patent 3½ years.

12,759.—CLOCK-CASE.—*Thomas Lincoln* and *Daniel S. Wesson*, New Haven, Conn. Application filed January 9, 1882. Term of patent 3½ years.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 8,191 and upward are registered under the act of March 3, 1881.]

9,079.—HOG-PRODUCTS, INCLUDING HAMS, BACON, PORK, LARD, AND SUCH OTHER FOOD SUBSTANCES AS ARE USUALLY PUT UP BY PORK BUTCHERS AND PACKERS.—*Henry Denny & Sons*, Chicago, Ill. Application filed November 16, 1881.

"The letter 'D' surrounded by seven stars arranged in a circular form."

9,080.—STARCH.—*Thomson Kingsford*, Oswego, N. Y. Application filed January 9, 1882.

"The representation of two United States flags, one floating to the right and the other to the left, each supported by a staff, the staffs crossing each other near the lower parts thereof over a Centennial medal."

9,081.—STARCH.—*Thomson Kingsford*, Oswego, N. Y. Application filed January 9, 1882.

"The word-symbol 'SNOW FLAKE.'"

9,082.—STARCH.—*Thomson Kingsford*, Oswego, N. Y. Application filed January 9, 1882.

"The representation of an eagle with spread wings, as in the act of flying."

9,083.—STARCH.—*Thomson Kingsford*, Oswego, N. Y. Application filed January 9, 1882.

"The representation of a shield or escutcheon supported on the left by the figure of a female Indian and on the right by the figure of a farmer holding a sickle, and embellished at the bottom and on either side by the representation of the leaves and ears of Indian corn."

9,084.—CORN-STARCH.—*T. Kingsford & Son*, Oswego, N. Y. Application filed September 30, 1881.

The words 'SILVER GLOSS.'"

9,085.—STEEL AND METALLIC PENS.—*William Mitchell*, Birmingham and London, England. Application filed January 9, 1882.

"The representation of the city of London arms."

"The arbitrary word-symbol 'MALARIAL SHIELD,' in connection with a representaton of an amazon with shield and spear guarding a gladiator."

9,087.—GRATES FOR STOVES AND RANGES.—*Spicers & Peckham*, Providence, R. I. Application filed December 31, 1881.

"The word 'REFLEX.'"

9,088.—ASTHMATIC PASTILLES.—*Elizabeth D. Stowell*, Charlestown, Mass. Application filed April 2, 1881.

"The words 'SAMUEL KIDDER & Co.'s' and the words 'ASTHMATIC PASTILLES.'"

9,089.—PLUG AND OTHER KINDS OF CHEWING-TOBACCO, SMOKING-TOBACCO, CIGARS, AND CIGARETTES.—*L. & E. Wertheimer*, New York, N. Y., and San Francisco, Cal. Application filed January 10, 1882.

"The arbitrarily-selected words 'MAN'S COMPANION.'"

9,090.—BUTTONS.—*Williston Knight & Co.*, New York, N. Y. Application filed July 28, 1881.

"The representation of a crown in the center of a sun-burst, above which, in a cloud-like center, is contained a representation of the world bearing the inscription 'NORTH AMERICA,' surmounted by an eagle holding a pennant in his beak bearing the inscription 'FINIS CORONAT OPUS.'"

9,091.—SEWING COTTON AND THREAD.—*Jonas Brook & Brothers*, Meltham Mills, near Huddersfield, county of York, England. Application filed October 5, 1881.

"The words 'J. BROOK & BROS., MELTHAM MILLS.'"

9,092.—LOZENGES FOR THE CURE OF DYSPEPSIA, INDIGESTION, AND KINDRED DISEASES.—*J. Niven Hegeman*, New York, N. Y. Application filed January 14, 1882.

"The word 'GASTRICINE.'"

9,093.—PLUG AND TWIST CHEWING-TOBACCO.—*Dabney A. Martin*, Greenville, Ky. Application filed December 3, 1881.

"The symbol of a star."

9,094.—BAKING-POWDER.—*John J. O'Brien*, Kansas City, Mo. Application filed December 30, 1881.

"The word 'WELCOME,' in connection with the image of a bird with outspread wings having a can suspended from its beak."

9,095.—BOOTS, SHOES, AND SLIPPERS.—*Ordway & Clark*, Haverhill, Mass. Application filed January 13, 1882.

"The arbitrarily-selected word 'DONGOLA.'"

9,096.—LEATHER.—*Ordway & Clark*, Haverhill, Mass. Application filed January 13, 1882.

"The arbitrarily-selected word 'DONGOLA.'"

9,097.—REFINED PETROLEUM.—*Henry W. Peabody & Co.*, Boston, Mass. Application filed January 14, 1882.

"The word-symbol 'INVINCIBLE.'"

9,098.—LINIMENT.—*Bernard M. Ross*, Peoria, Ill. Application filed December 24, 1881.

"The words 'GRAND FATHER'S' in connection with the picture of an old man sitting in an arm-chair holding in one hand a bottle and approached by a cripple with extended hand."

9,099.—CLEANING AND POLISHING PREPARATIONS.—*Bertram G. Seeback*, Peru, Ill. Application filed January 14, 1882.

"The arbitrary word-aymbol 'ZINCINE.'"

9,100.—MEDICAL SALT.—*Stadtgemeinde Karlsbad*, Karlsbad, Austria. Application filed October 6, 1881.

"A rampant lion having a crown on his head and two tails. Beneath the lion there are three undulated stripes which cover the hind legs of the same."

9,101.—QUICKSILVER-FLASKS.—*The Quicksilver Mining Company*, New Almaden, Cal. Application filed September 14, 1881.

"The letter 'A.'"

LABELS.

2,610.—Title: "BOWERS' ELECTRIC SUSPENDERS."—*James Bowers*, Newark, N. J. Application filed January 5, 1882.

2,611.—Title: "CRANE'S LADIES NOTE PAPER AND ENVELOPES, DISTAFF."—*Z. Crane, Jr., & Brother*, Dalton, Mass. Application filed January 5, 1882.

2,612.—Title: "SWEDISH BITTERS."—*Swedish Bitters Co.*, Woodbury, N. J. Application filed November 14, 1881.

2,613.—Title: "TOLMAN'S BELT HOOKS."—*Henry Tolman*, Wallingford, Pa. Application filed January 13, 1882.

PATENTS

GRANTED FEB. 7, 1882.

253,172. AUTOMATIC ELEVATOR-GUARD. JEREMIAH F. ARNETT, Revere, assignor of one-half to Marie Brofée Robbins, Boston, Mass. Filed Dec. 27, 1881. (No model.)

Claim.—1. In an elevator-guard, the head *k*, with its two supports, K K, the tumbler *d*, located in bearings in the post *c*, and having two fulcra, D and D', located on two opposite sides of the center of gravity of the head and guard *k k'*, as and for the purpose set forth.

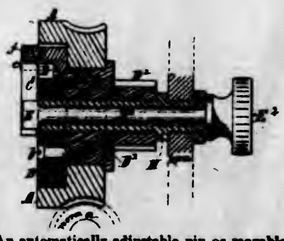
2. In an elevator-guard, the head *k*, with its supports K K', the tumbler *d*, having fulcra D D' and trunnions *d' d'*, arranged in bearings on the post *c*, and the connecting mechanism *e f f' f'' g' g' g''* *h*, or its equivalent, combined with a projection or wedge *b'*, on the elevator *b*, as and for the purpose set forth.

253,173. DOOR-SPRING. WILLIAM F. H. AMWAKE, Lancaster, Pa. Filed Oct. 13, 1881. (No model.)

Claim.—A flange, F, of a bracket, B, having an opening, O, parallel with an opening in the same, through which the stem S passes, and having a countersink at its lower side, in combination with a fast-pin, P, having a head at its upper end and a flange about the lower corresponding with the countersink aforesaid, and lugs L, projecting from the collar C, all as and for the purpose specified.

253,174. ROOFING-TILE. THOMAS B. ATTERBURY, Pittsburg, Pa. Filed Dec 10, 1881. (No model.)

Brief.—A wedge-shaped portion or lug on the under surface forms the support of and a continuous bearing-surface for the tile.

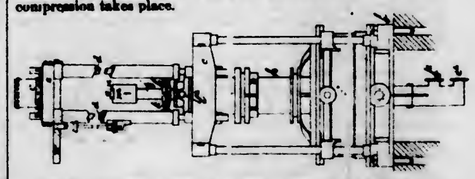


Claim.—1. A tile or shingle made of glass or other vitreous material, adapted to be placed on the roof with break and lap joints, as in the ordinary shingle roof, and provided with lugs or inclined portions *s*, to form a continuous bearing-surface for the tile or shingle, as set forth.

2. A tile or shingle constructed substantially as described—that is to say, with the horizontal under surface having wedge-shaped or inclined portions on its upper outer edges running parallel with each other and forming supports for the upper end of the shingle or tile, and adapted to be laid or secured in position shingle fashion, as set forth.

253,175. FRICTION-CLUTCH. JOHN R. BACK, Worcester, Mass., assignor of one-half to Frederick E. Reed, same place. Filed Sept. 3, 1881. (No model.)

253,175.



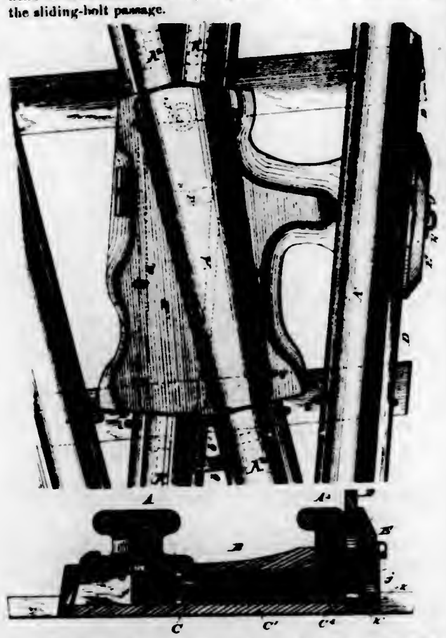
Claim.—1. An automatically-adjustable pin or movable fulcrum-bearing sustaining the operating-levers in a friction-clutch device, substantially as set forth.

2. The combination, substantially as described, of the wheel-rim with internal friction-surface, the divided friction-band arranged within said rim, the levers pivoted on the ends of said band, the automatically-adjustable fulcrum-piece arranged between the short arms of said levers, and means for forcing apart the long arms of said levers, substantially as hereinbefore set forth.

3. The combination, with the worm-wheel A, feed-pinion D^2, and hand-knob E^2, of the friction-band B, fixed on the feed-pinion disk D, the expanding-levers C C, pivoted on the ends of said friction-band, and the eccentric button or cam E, fixed on the end of the hand-knob spindle E', substantially as and for the purposes set forth.

253,176. PROCESS OF AND MACHINE FOR CASTING STEEL INGOTS. GEORGE W. BILLINGS, Cleveland, Ohio. Filed Oct. 29, 1881. (No model.)

Brief.—The bottom block attached to the piston of the hydraulic cylinder is raised into the ingot-mold, and is gradually lowered as the metal is poured. After the required length of ingot is obtained the compression-plate is run under the mold and the ingot compressed by the action of the steam-piston. To insure the withdrawal of the ingot during pouring it is secured to the bottom block by a key, which is knocked out just before the compression takes place.



Claim.—1. The continuous process of making and compressing steel ingots by pouring the molten steel into the mold and at the same time gradually lowering the ingot until it has reached the required length, and then compressing the ingot lengthwise, substantially as set forth.

2. The steam-cylinder *f* and its piston *g*, the water-cylinder *h* and its piston-rod *j*, in combination with an ingot-mold bottom, a separate bottomless ingot-mold, and an adjustable compression-plate, substantially as and for the purpose set forth.

253,177. RAILROAD-FROG. THOMAS BERSH, Knowlton, Pa. Filed Oct. 15, 1881. (No model.)

Brief.—The frog-rail is pivoted by a pin having rounded re-enforcing shoulder fitted in a countersunk aperture in the bed of the casting. The rail is operated by a spring-beld rod having a beveled end, which in turn is operated by a lever having a beveled

point and supported upon elastic bearings, and which is depressed by a passing train. A plate is provided adapted to embrace the head of the bolt and to be sprung over and cover the entrance of the sliding-bolt passage.

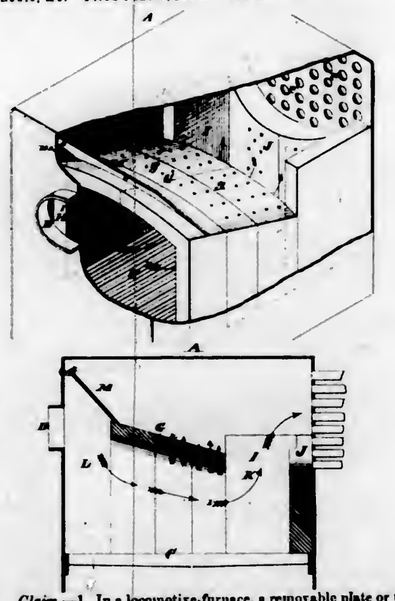
Claim.—1. In an automatic railway-frog, the combination, with the frog-rail A, of the pivotal pin having a rounded re-enforcing shoulder fitted in a countersunk aperture in the bed or casting, substantially as and for the purpose set forth.

2. In an automatic railway-frog, the combination, with the shifting rail A, of the spring-actuated rod C and its beveled bar C^3, and means for imparting a sliding motion thereto by the action of the car or train wheels, substantially as and for the purpose set forth.

3. In an automatic frog, the combination, with the shifting rail A, having connected thereto a spring-actuated rod, C, provided with a beveled bar, C^3, of the lever D, having a beveled point and supported upon elastic bearings, substantially as and for the purpose set forth.

4. In an automatic frog, the combination, with the headed pivotal bolt of the lever D, of the plate *j*, adapted to embrace the head of the bolt, and to be sprung over and cover the entrance of the sliding-bolt passage, as set forth, substantially as and for the purpose specified.

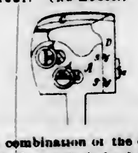
5. In an automatic railway-frog, the combination, with the frog-operating rod and bar C C^3, having the beveled face, of the lever D, having the beveled point, and the vertical slot through which its pivot passes, and supported in an elevated position out of forcible contact with the aforesaid bar upon springs encircling rods having vertical movement, substantially as and for the purpose specified.



253,178. MILK-COOLER. AUGUSTUS H. BAILL, Oxford, N. Y. Filed Aug. 26, 1881. (No model.)

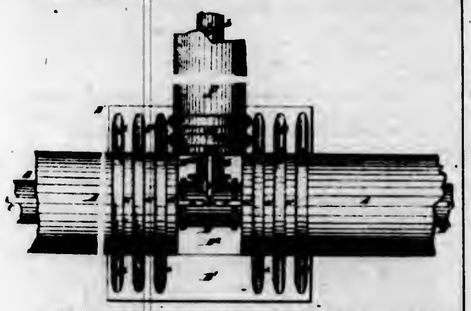
Claim.—1. In a milk-cooler, a vat to contain milk, provided with horizontal ribs open upon one end and bottom and closed on the top and other end, combined with a water-tank in which said milk-vat sits, said water-tank being longer than the milk-vat to form an ice-box on the end, and pipes, independent of the ribs, extending up into the same to feed cold water at the closed ends and near the top of the ribs, and through which it passes to the open ends and into the ice-box, said open ends of the ribs opening directly into the ice-box, substantially as and for the purpose specified.

2. In a milk-cooler, a water-tank, A, in combination with a milk-vat, B, secured to a frame and supported in said water-tank, said milk-vat being shorter than the water-tank to form an ice-box, and provided with hollow ribs D, closed at one end and open on the bottom and other end, passage-way *b*, feed-pipes H, independent of the ribs, extending up into said ribs and close to the closed ends, an ice-box located in said water-tank and at one end of said milk-vat, the open ends of the ribs opening into the ice-box, and an overflow, J, the overflowing water being drawn through the ice-box and passed back to the feed-pipes H through the medium of a pump, substantially as and for the purpose specified.



253,179. LOCOMOTIVE-FURNACE. THOMAS A. BUCKLAND, St. Louis, Mo. Filed June 6, 1881. (No model.)

Claim.—1. In a locomotive-furnace, a removable plate or tile, M, extending from the front *a* of the furnace to and having its forward edge resting upon the arch, serving, when lowered, to close the space L, between the arch and furnace-front *a*, substantially as described, and for the purposes set forth.

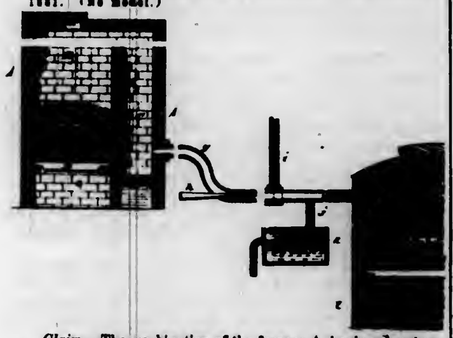


2. The combination of the furnace A, arch G, and plate M, said plate extending and closing, as described, the space L, between the furnace-front and arch, and the latter not extending to the farther end of the furnace, the throat K being arranged beyond said arch, substantially as described.

253,180. SOLE-EDGE PLANE. WILLIAM F. BULLOCK, Boston, assignor to himself and HORACE A. LOTHROP, Sharon, Mass. Filed Nov. 21, 1881. (No model.)

Claim.—The combination of the channeled cutter C and its set-screws *a a* with the stock A, having slots *b b*, wider than the shanks of such screws, and also with the channeled guard D, adapted to the stock so as to be adjustable laterally with respect to it and the cutter, substantially and for the purpose set forth.

253,181. MEANS FOR PROTECTING UNDERGROUND PIPES AND WIRES. AUGUSTUS CAMPBELL, Hoboken, N. J. Filed Mar. 28, 1881. (Model.)



Claim.—1. A protector for steam or other pipes and telegraphic wires or similar wires, having corrugations *a'*, in combination with blocks D D', formed each in two parts halved together, and provided with corrugations *d*, substantially as shown and described.

2. The combination, with the sectional blocks D D', provided with a man-hole, D^2, and corrugations *a' a²*, of main sections A A and branch sections F F, formed with corrugations for the reception of cement, substantially as shown and described.

3. As an improvement in what is known as the "Holly" system of steam-heating, the protector A, of burnt clay or analogous earthy cheap non-conducting material, having the large central passage, A', and surrounding smaller passages *a*, in combination with the steam-pipe B and wires or cables *c*, arranged to serve substantially as and for the purposes herein specified.

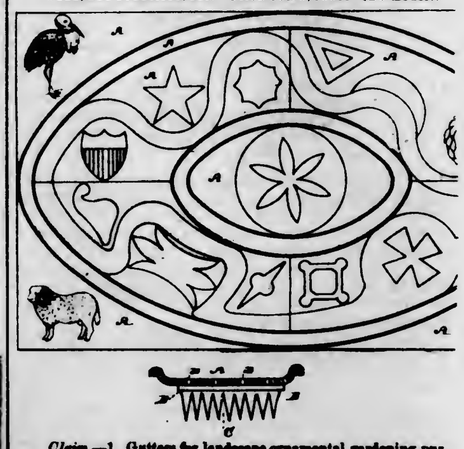
253,182. APPARATUS FOR EXTINGUISHING FIRES IN COKE-OVENS. JOSEPH H. CAMPBELL, Pittsburg, Pa. Filed Mar. 5, 1881. (No model.)

Claim.—The combination of the furnace A, having chambers B and C, pipe *g*, steam-jet pipe *h*, water-pipes *i j*, trap *k*, and coke-oven, all constructed and operating substantially as herein described, and for the purpose set forth.

253,183. FRICTION-ROLL. THOMAS M. CHAPMAN, Old Town, Me. Filed July 26, 1881. (No model.)

Claim.—In a friction-roller having alternate rubber and metallic disks *g g d d*, the former projecting beyond the latter and having side surfaces of greater extent than their edge surfaces, the combination of the shaft *a*, roll *b*, having longitudinal grooves *e e* therein, perforations *e* in said disks corresponding to said grooves, and screws *i i*, passing through said grooves and through the holes *e*, and serving both as splines and to hold the parts together, as set forth.

253,184. ORNAMENTAL WIRE. JAMES A. CHARELEY, Providence, R. I. Filed Jan. 19, 1880.



Claim.—As a new article of manufacture, a flexible wire having engraved or depressed upon its exterior surface any suitable design or ornamentation, substantially as and for the purposes specified.

253,185. IMPLEMENT FOR BLEEDING TREES. MATHIAS CHRISTMILLER, Washington, D. C. Filed Dec. 19, 1881. (Model.)

Claim.—In an implement for bleeding trees, the combination, with the two-part handle having the slotted metallic guard at its point, of the threaded shaft having the key-post, and the sleeve I, having the removable blade and the stationary sleeve within which the shaft works, substantially as specified.

253,186. ORNAMENTATION OF GROUNDS. HENRY D. COGSWELL, San Francisco, Cal. Filed Oct. 8, 1881. (No model.)

Claim.—1. Gutters for landscape ornamental gardening purposes, provided with openings of fanciful form cut in their surfaces and covered with raised skeleton-frames, through which may be trained the protruding vegetation, as specified.

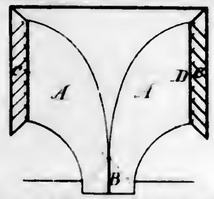
2. The sections A, having their meeting ends perforated, as shown, in combination with the supports B, having the pins or lugs D, and the extension C, substantially as and for the purpose herein described.

253,187. TURNED SHOE. WILLARD COBBY, Westborough, assignor to the Improved Sole Sewing Machine Company, Boston, Mass. Filed Nov. 9, 1881. (No model.)

Claim.—The improved mode of manufacturing turned shoes, consisting in channeling the sole upon the grain side from or near its edge inward, then folding back the channel-flap toward the middle of the sole, then lasting the shoe with the inner surface of the channel-flap of the sole resting against the sole of the last, then drawing the last, and sewing, turning, and finishing the shoe, as set forth.

253,188. CAR-VENTILATOR. EDWARD O. COSSONS, Lorain, Ohio. Filed July 14, 1881. (No model.)

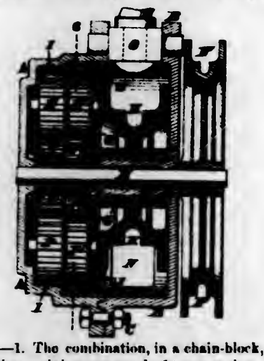
Claim.—The herein-described ventilator, consisting of the curved trumpet-shaped tubes A A, having open flaring mouths



253,188.

5. In a whip-socket, the combination of an external ring, in-

Claim.—1. In a furnace, the combination, with the flour or

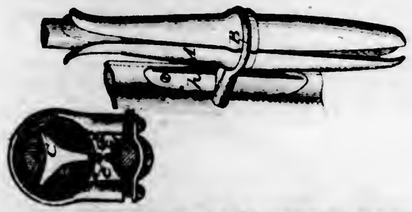


253,195. MACHINE FOR CLEANING HEMP. THOMAS J. FER-

253,188.

provided with horizontal diagonal slats C C and wire screen D, said tubes united in a common throat having a swinging valve, B, as shown and described.

253,189. DIFFERENTIAL CHAIN-BLOCK. JOSEPH D. DAVIES, Bond Hill, Ohio. Filed Nov. 14, 1881. (No model.)



Claim.—1. The combination, in a chain-block, of a driving-shaft operating a pinion composed of two members, one of which engages with a fixed circular rack, while the other member gears with the hoisting-sheave, the pitch-lines of said rack and sheave-rim being of different diameters, for the purpose specified.

2. The combination, in a chain-block, of driving-shaft E, arm G, pinion H H', fixed circular rack I, and toothed sheave-rim J, the pitch-lines of said rack and sheave-rim being of different diameters, for the purpose specified.

3. The combination, in a chain-block, of driving-shaft E, arms G G', pinions H H' P P', fixed circular rack I, and toothed sheave-rim J, the pitch-lines of said rack and sheave-rim being of different diameters, as and for the purpose specified.

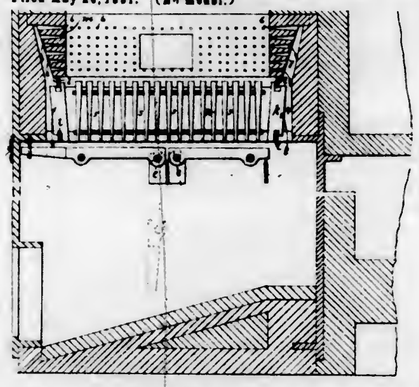
4. The combination, in a chain-block, of housings A B, box D, driving-shaft E, master-wheel F, arm G, pinion H H', fixed circular rack I, toothed sheave-rim J, and sheave K, the pitch-lines of said rack and sheave-rim being of different diameters, as and for the purpose specified.

253,190. WHIP-SOCKET. GEORGE W. EDDY, Waterford, N. Y. Filed Oct. 19, 1881. (Model.)

Claim.—1. In a whip-socket, the combination, substantially as described and shown, of a horizontal sustaining-ring, a series of vertical staves pivoted thereon, and the spring or springs to retain the staves in position with reference to the ring.

2. The improved whip-socket consisting of the body staves or sections, the sustaining-ring encircling the same, and internal means, substantially as described, for holding the staves outward against the ring.

3. The combination of the external ring, the internal rocking staves supported thereon, and the two internal springs.



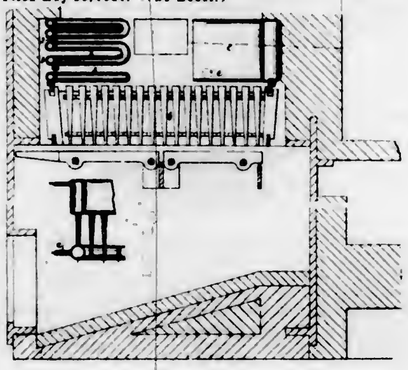
4. The combination of the supporting-ring, the staves, the key inserted between the staves, and the internal springs applied to hold both the staves and the key.

5. In a whip-socket, the combination of an external ring, internal rocking staves or body-sections mounted thereon, and a key inserted between two staves for the purpose of holding them in an expanded condition within the ring.

6. In combination with a whip-socket composed of longitudinal pivoted body-sections, a single circular spring arranged to bear upon all the sections and hold the socket normally in an open position.

7. The staves or body-sections and the supporting-ring provided with the extended curved foot-plate *h*, in combination with the second plate, *i*, attached thereto, substantially as shown.

253,191. FURNACE. ALEXANDER C. FULTON, Warwick, Mass. Filed May 26, 1881. (No model.)



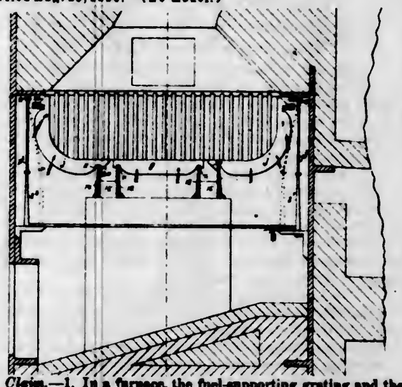
Claim.—1. In a furnace, the combination of the bottom or floor grating with upright gratings the bars of which are tapered from end to end in their thickness, measured parallel with the wall of the furnace that they constitute, to afford a variable amount of space for the passage of air between them, as and for the purpose set forth.

2. The series of grate-bars connected together to form a continuous grating, and strung or mounted at one end upon a rod pivoted and supported on a suitable bearing-bar, combined with a removable support for the other end of the said grate-bars, whereby the entire connected grating may be permitted to turn on the pivoted rod to remove the fire or fuel from the furnace, substantially as described.

3. In a furnace, the following elements in combination: the bottom or floor grate, the upright gratings on all sides thereof, the perforated refractory lining above the said upright gratings, and a continuous air-passage behind the said upright grating and refractory lining, substantially as described.

4. The main bearing-bar provided with notched wings and a series of grate-bars with perforated lugs and rods passed therethrough, one rod being supported in the said wings and sustaining one end of the said bars, combined with a removable hook or support for the other end thereof, substantially as described.

253,192. FURNACE. ALEXANDER C. FULTON, Warwick, Mass. Filed May 26, 1881. (No model.)



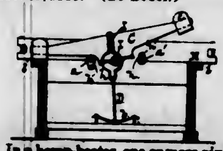
Claim.—1. In a furnace, the combination, with the floor or bottom grating and vertical gratings extended upward therefrom, of a water-back surrounding the fire-chamber above the said vertical gratings, substantially as and for the purpose described.

2. The combination, with the bottom or floor grating, of the water-back consisting of a series of horizontal tubes surrounding the furnace, and a continuous chamber connected with the upper ends thereof, spaces being left behind and between the said pipes for the admission of air to the fuel, substantially as and for the purpose described.

3. In a furnace, the combination, with the bottom or floor grating, of a water-back consisting of a series of tubes surrounding or lining the wall of the furnace at the sides of the said grating, and provided with air-spaces between them gradually diminishing in size toward the upper part of the furnace, substantially as described.

253,193. FURNACE. ALEXANDER C. FULTON, Warwick, Mass. Filed Aug. 25, 1880. (No model.)

Claim.—1. In a furnace, the fuel-supporting grating and the fire-chamber, having its side walls inclined upward and inward from the edges of the said grating toward the middle of the furnace, to reduce the pressure of the fuel against the side walls, and thereby prevent the adhesion of clinker material thereto, substantially as and for the purpose set forth.



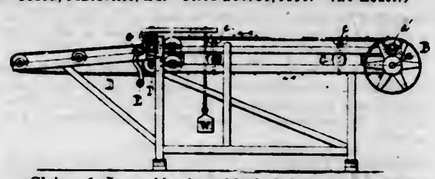
2. In a furnace, the upwardly-extending gratings at the sides thereof, and side dampers to control the draft or flow of air through the said gratings, as and for the purpose described.

3. In a furnace provided with upwardly-extended side gratings, side dampers to control the draft through the said gratings, and damper-operating mechanism to move all the said dampers simultaneously, substantially as described.

4. In a furnace-grate, the bearing-bar A, having two ribs, each to support the ends of adjoining sections of grate-bars, and provided with notches to insure the proper spacing of the said bars, combined with grate-bars having notches to engage and be held in place by the said notched ribs, substantially as described.

5. In a furnace, the removable side bars, beveled at their ends, as described, to enable them to be readily removed from their supports, substantially as and for the purpose set forth.

253,194. HEMP-BEATER. THOMAS J. FERGUSON, Pikesville, Md. Filed Nov. 23, 1881. (No model.)



Claim.—1. In a hemp-beater, one or more pivoted arms carrying mallets or beaters, in combination with cranks or cams adapted, as described, to raise the arms and fallow them through a part only of their downward strokes, as and for the purpose set forth.

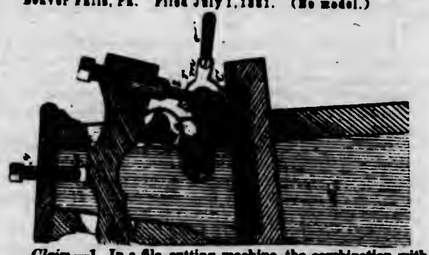
2. In combination with the arms C, having beaters *c*, the springs *h*, attached to the arms above their pivots, and the cranks A, as set forth.

3. In combination with the beds H, the beaters *c*, and arms C, the cranks A, springs *h*, and rod and loop D J, as set forth.

4. In combination with the frame A, having shafts *a a'* I, the beds H, arms C, having beaters *c*, cranks A, rollers E E', and the actuating-springs attached to the arms, as set forth.

253,195. MACHINE FOR CLEANING HEMP. THOMAS J. FERGUSON, Pikesville, Md. Filed Nov. 23, 1881. (No model.)

Claim.—1. In combination with the belts having transverse bars provided with interlocking teeth, the feed-rollers F F', roller *e*, and crank E, as set forth.

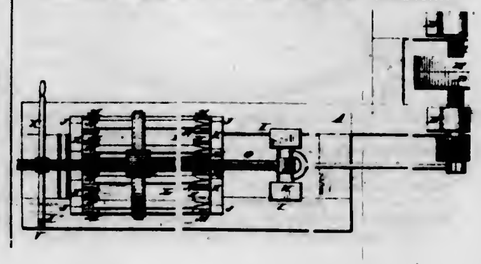


2. In combination with the belts having interlocking teeth, as described, the rollers F F', endless apron D, roller *e*, and crank E, substantially as and for the purpose set forth.

253,196. ABRASIVE BELT. GORDON H. P. FLAGG and WILLIAM GORDON, Boston, Mass.; said Gordon assignor to said Flagg. Filed Dec. 29, 1880. (No model.) Patented in Canada July 26, 1881.

Claim.—The sand-paper belt above described, consisting of a strip of sand-paper the ends of which are joined together, the end *a* being denuded of sand and the end *a'* skived and lapped over and connected to the end *a*, as set forth, thereby bringing the outer surfaces of the abrasive coating on a line at the joint.

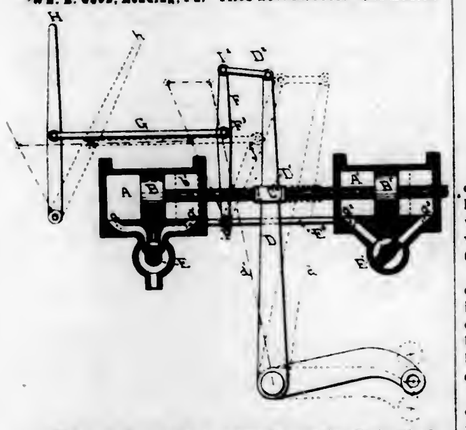
253,197. FILE-CUTTING MACHINE. FREDERICK FOSKAY, Beaver Falls, Pa. Filed July 1, 1881. (No model.)



Claim.—1. In a file-cutting machine, the combination with the hammer, cutter-box, and the cutters, of the pivoted and yielding holder adapted to engage with the front and long bevel of the cutter to hold it in position in the cutter-box by mere frictional contact, as herein described, and for the purpose set forth.

2. In a file-cutting machine, the combination, with the cutter, holder, and presser, having the pivoted part *j*, of the cutter-box provided with detachable cutter-supports having less area of surface than the rear face of the cutter, substantially in the manner herein shown and described.

3. In a file-cutting machine, the combination of the cutter-box *i*, cutter *l*, pivoted holder *m*, springs *n q*, and pivoted lever *o*, substantially in the manner herein shown and described.



253,198. MACHINE FOR STRIPPING FILES. FREDERICK FOSKAY, Beaver Falls, Pa. Filed June 30, 1881. (No model.)

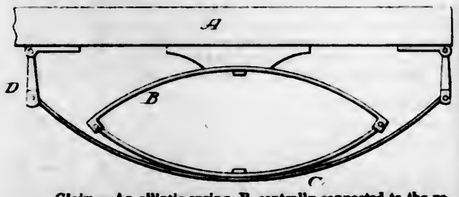
Claim.—1. In a file-stripping machine, the combination of a pivoted table or tables, L, having independently-pivoted file-blank supports N, pivoted stripping-file support or supports S, and operating mechanism, substantially in the manner as and for the purpose herein shown and described.

2. In a file-stripping machine, the combination, with the pivoted lever O, of the pressure-lever X, provided with the friction-roller Y, and the spring Q, having the friction-roller *b*, substantially in the manner as and for the purpose herein shown and described

258,199. REVERSING APPARATUS FOR STEAM-ENGINES. WM. E. GOOD, Reading, Pa. Filed Nov. 21, 1881. (No model.)

Claim.—1. In a steam or automatic reversing device, the lever F, in combination with the valve E of the cylinder A, valve-rod E^1, link D^2, and arm D, as shown, and for the purpose specified.

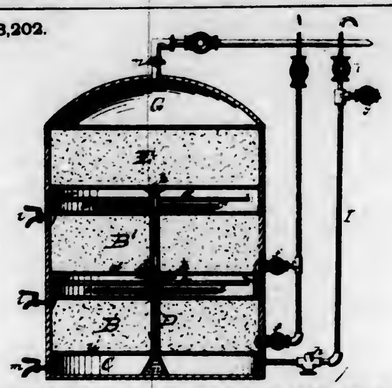
2. The lever F, connected as shown, whereby the joints F', F^2, and F^3 automatically become the fulcrum-points of movement, in combination with the valves E E', cylinders A A', pistons B B', piston-rods C C', arm D, link D^2, lever H, or its equivalent, rod or link G, and valve-rod E^2, substantially as shown, and for the purpose specified.



3. In a steam or automatic reversing device, the automatic opening and closing of the valves E E' over their respective ports by the movement of piston B and arm D, in combination with lever F, link D^2, and rod E^2, substantially as shown, and for the purpose set forth.

258,200. COMPOSITION FOR BUTTONS, &c. TIMOTHY GUILFORD, New York, N. Y. Filed Nov. 12, 1881. (Specimens.)

Claim.—1. The herein-described compound, comprising as its elements pulverized horn or hoof and steatite, substantially as and for the purposes set forth.



2. The combination, with a compound composed of pulverized horn or hoof and steatite, of a coloring-pigment, substantially as and for the purposes set forth.

258,201. VEHICLE-SPRING. ALBERT GUMMER, Omro, Wis. Filed Dec. 21, 1880. (Model.)

Claim.—An elliptic spring, B, centrally connected to the vehicle-body A, or a projection thereof, on one side and within the curve to the half-spring C on the opposite side, in combination with jointed coupling-studs D, substantially as shown and described, and for the purpose set forth.

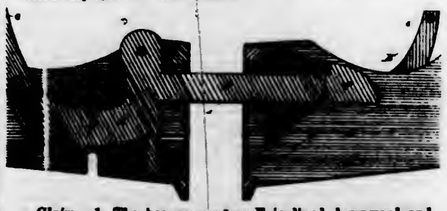
258,202. CARBURETOR. JACOB HARRINGTON, Ocean Beach, N. J. Filed Apr. 5, 1881. (No model.)

Claim.—1. In a carbureting apparatus, the combination of an evaporating-chamber and an air-conduit, the latter provided with lateral perforated exit-pipes surmounted by a shield or deflector, whereby air is conducted to and in contact with the hydrocarbon vapor, and both are checked in their flow and are spread and intermixed, substantially as shown and described.

2. In a carbureting apparatus, an air-conduit divided into two or more independent sections, each of which is provided with an inlet and with lateral perforated exit-pipes surmounted by a shield or deflector, in combination with an evaporating-chamber located between the inlet and exit pipes of each section, whereby air may be successively charged and intermixed with hydrocarbon vapor, substantially as shown and described.

3. In a carbureting apparatus, the combination of the air-receiving chamber provided with a drip-cock, and communicating with an air-conduit, terminating at its base in an inverted perforated funnel, and provided with lateral perforated exit-pipes surmounted by a shield, with an evaporating-chamber encircling said conduit and having an imperforate bottom and perforated top and located between said funnel and exit-pipes, substantially as shown and described.

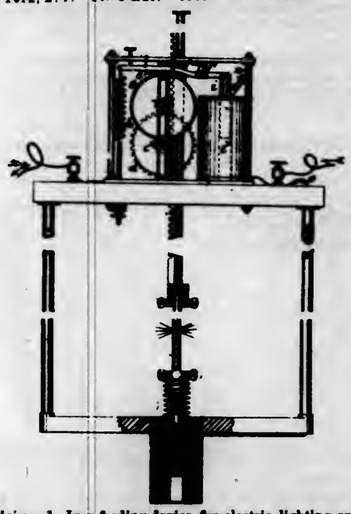
4. In a carbureting apparatus, the combination of an evaporating-chamber, a central conduit provided with lateral perforated exit-pipes surmounted by a shield, and a purifying-chamber having a perforated top and bottom, substantially as shown and described.



5. The combination of chamber C, provided with inlet *h* and outlet *m*, conduit D, provided with exit-pipes *e e'*, shields *e e'*, and ports *d*, with evaporating-chambers B B', each provided with inlets *f f* and outlets *l l*, and purifying-chamber E and chamber G, provided with outlet *a*, substantially as shown and described.

258,203. ORNAMENTAL CHAIN. ANDREW J. HARRIS, Providence, R. I. Filed Jan. 31, 1881. Renewed Jan. 4, 1882. (Model.)

Claim.—As a new and improved article of manufacture, the ornamental chain herein described, consisting of major links B, made of wood and finished in enamel, and having eyes *a a*, connected by one or more minor links, C, of gold or other suitable metal.



258,204. CAR-COUPLING. MICHAEL HERRING, St. Louis, Mo. Filed July 8, 1881. (No model.)

Claim.—1. The bearing-surface F, inclined downward and forward, combined with the coupling-bar E, having head or hook *d* and operating-lever *c*, to allow the uncoupling of the cars when under draft, as specified.

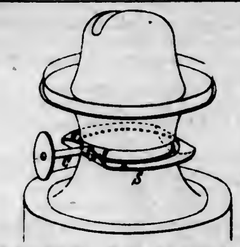
2. The standard K *h*, spring L, and pivoted hook J, or their equivalents, combined with the coupling-bar E *d'* and inclined bearing F, as and for the purposes set forth.

258,205. ELECTRIC LAMP. ALFRED S. HOLCOMBE, Danielsonville, Conn., assignor to the Standard Electric Light Company, New York, N. Y. Filed Mar. 1 1881. (No model.)

Claim.—1. In a feeding device for electric lighting apparatus, in combination, a brake-wheel actuated by the gravity of the carbon-holding rods by means of suitable connecting-gearing, a lever provided with a narrow-edge contact-shoe, caused to bear on the periphery of the brake-wheel by means of an adjustable spring, a stop device to govern the extent of movement of the lever, and an electro-magnet adapted to move the lever away from the brake-wheel and against the stop device, substantially as and for the purpose set forth.

2. In an electric lighting apparatus, an axial magnet included in the branch circuit of the lamp which is always closed, the movable core connected to the brake-lever, a brake-wheel actuated by a rack on the upper-carbon-holding rod, an adjustable spring for causing the lever to bear on the brake-wheel, and the upper carbon adapted to feed down by gravity when the axial magnet raises the lever off the brake-wheel, in combination with the lower carbon, its holder and supporting-spring, the core of an axial magnet, and the axial magnet, the whole of which, with the upper carbon, constitutes the main circuit of the lamp through which a part of the electric current flows to form the arc between the ends of the carbon rods when the lower carbon is depressed by the action of the axial magnet on its core, substantially as and for the purpose hereinbefore set forth.

258,206. COOKING-STOVE. JAMES A. HORTON, New Castle, Pa. Filed Nov. 22, 1881. (No model.)

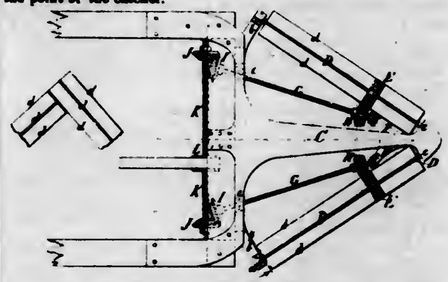


Claim.—The combination, with the central flue, C, and side flues, A B, communicating therewith, of the scrapers *e*, arranged in said side flues, and the pivoted valves *l*, substantially as and for the purpose herein shown and described.

258,207. LAMP FOR RAILWAY-CARS, &c. CHAS. P. HOWARD, Hartford, Conn. Filed Dec. 9, 1880. (Model.)

Claim.—1. The combination, with the ratchet or wick-raising shaft, of the spring S, properly fastened by one end or portion, and bearing with its free portion against the ratchet or wick-raising shaft, and thereby preventing it from being turned casually by the joltings of the car, substantially as described.

2. The spring S, provided with an upturned portion, C, having reverse inclines *g g*, and a notch, N, between the inclines, in combination with the fount, burner, and wick-raising shaft, substantially as described.



258,207.

3. The combination of a fount, the spring S, properly fastened by one portion, a rotary wick-raising shaft provided with a pinion, and a longitudinal rotary shaft passing through the fount and provided with a gear to engage with the pinion on the wick-raising shaft, substantially as and for the purpose described.

258,208. COW-CATCHER FOR LOCOMOTIVES. OLOF P. JOHNSON, New York, N. Y. Filed Oct. 15, 1881. (No model.)

Brief.—An axle or shaft operated by suitable mechanism has cog-wheels intermeshing with intermediate shafts provided with cog-wheels, which in turn intermesh with converging shafts provided longitudinally with radial vanes. The vanes of one shaft may extend to the outer circumference of the other, thus forming the point of the catcher.

Claim.—1. The combination of the axle or shaft K, having cog-wheels J, and the converging shafts D, provided longitudinally with radial vanes *d*, and having cog-wheels E, not exceeding in diameter the side vanes, with the intermediate shaft, G, provided with cog-wheels I H, gearing into the said wheels J E, all constructed and operating as and for the purposes shown and described.

2. The combination of the two shafts D, provided longitudinally with radial vanes *d*, when arranged as in Fig. 4, the vanes of one shaft extending to the outer circumference of the vanes of the other and forming the point of the catcher.

258,209. SURGICAL NEEDLE-HOLDER. GEORGE E. JONES, Cincinnati, Ohio, assignor to William Antonrieth, same place. Filed Oct. 24, 1881. (No model.)

Claim.—1. A needle holder or forceps having its working-handle hinged or pivoted to its accompanying handle, and provided with a sliding wedge-bar, which is actuated by the opening and closing of the working-handle, and which bar operates to open and close the griping-jaws, substantially as described.

2. In a needle-holder, the combination of an actuating-lever and shifting-wedge for closing and opening the jaws, substantially as shown and described.

3. A needle-holder having an elongated handle, the front extremity of which serves as one of the jaws, the arm forming the other jaw being inclined and pivoted thereto, and operated by a shifting-rod beveled for the purpose, which in turn is thrown forward by the closing of one of the handles, substantially as described.

4. In a needle-holder, the combination of the fixed handle, the movable working-handle, the sliding wedge-bar, the clamping-jaws, and the catch or lock for locking the parts when the working-handle is closed, substantially as described.

5. The combination, with a needle-holder, of the rings D D, or their equivalent, to allow actuating-rod B to pass freely back and forth, at the same time holding it securely in position, substantially as described.

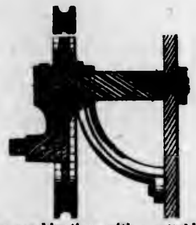
253,210. COMPOSITION FOR IMPROVING LACE-LEATHER. LOUIS JUNIOR, Belleville, Ill. Filed Aug. 8, 1881. (No specimens.)

Claim.—The herein-described composition of matter, consisting of water, alum, sal-soda, common salt, and bran, in the proportions and for the purpose stated.

253,211. CARRIER ATTACHMENT FOR BICYCLES. CHARLES H. LAMSON, Portland, Me. Filed Dec. 8, 1881. (No model.)

Claim.—1. The described metallic frame for a bicycle bundle-carrier, constructed with arms *a a'*, curved rests a^2 a^2, and a stop, a^4, substantially as shown and described.

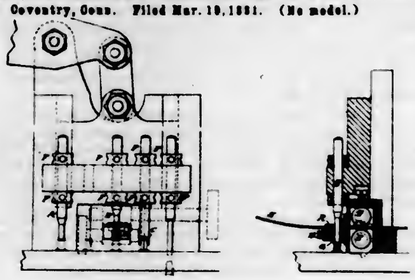
2. A bicycle bundle-carrier consisting of a metallic frame, A, having arms *a a'*, curved rests a^2 a^2, and stop a^4, and straps B B', connected therewith, constructed and combined essentially as set forth.



3. In a bicycle bundle-carrier having arms *a a'* to support a load and means of attachment to the head of a bicycle, the steadying-strap C, constructed and adapted substantially as set forth.

4. In combination with a bicycle bundle-carrier having a frame, A, and straps B B', a cross-strap, D, constructed and adapted substantially as and for the purposes set forth.

5. A bundle-carrier consisting of a frame, A, and straps B, B', and D, substantially as herein described and shown.

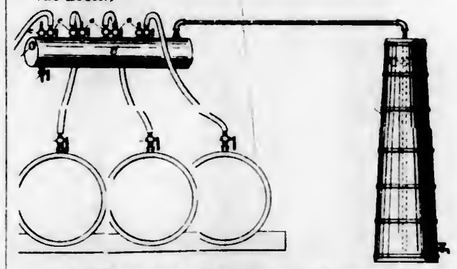


6. In combination with a bicycle-head and handle-bar, the arms *a a'* and straps B B', essentially as set forth.

253,212. TREADLE FOR SEWING-MACHINES. JOHN D. LAWLOR, Montreal, Quebec, Canada. Filed Dec. 20, 1881. (No model.)

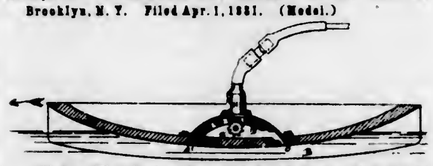
Claim.—The combination, with a suitable frame, of a shaft having at one end a conical point or shoulder fitting in a bearing in said frame, and at its other end a conical recess to receive a conical-pointed screw adjustable in said frame, a jam-nut adjustable upon said set-screw, and a band-wheel or treadle rigidly mounted upon said shaft, as set forth.

253,213. CARTRIDGE-MACHINE. HENRY W. MASON, South Coventry, Conn. Filed Mar. 10, 1881. (No model.)



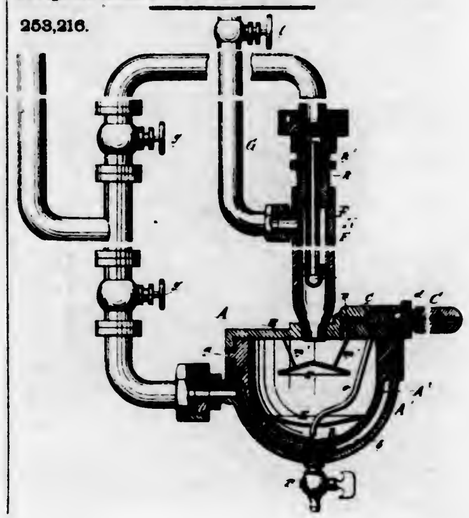
Claim.—1. In a cartridge-loading machine, the combination, with the shell-carrying mechanism, of the rammer A, the wad cutter and setter, having feed-rolls E E to supply the wad material thereto, and holding-down plate E, as described, and the swaging-punch C, operating together, as set forth.

2. The combination, with the shell-conveying mechanism, of the rammer A, the wad cutting and setting mechanism, substantially as described, and the swaging or closing punch C, substantially as set forth.



3. In combination with the shell-conveyer, the wad cutting and setting punch and mechanism for supplying the wad material thereto, substantially as described, and the swaging or closing punch, all substantially as set forth.

253,214. APPARATUS FOR FERMENTING MALT LIQUORS. MATTHIAS A. MAUS, Indianapolis, Ind. Filed Oct. 25, 1881. (No model.)



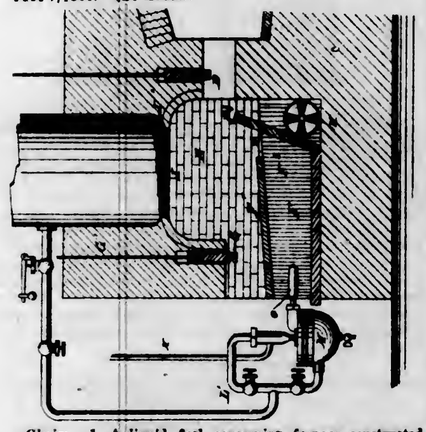
Claim.—In an apparatus for regulating the pressure in a series of fermenting-vessels, a hollow cylinder, common to all, for receiving and detaining foam, yeast, and particles of solid matter, and connected, by pipes entering at the top of the cylinder, with each cask or vat separately, in combination with a water-column which is connected also with such cylinder.

253,215. PNEUMATIC PROPELLER. ALFRED MAYNARD, Brooklyn, N. Y. Filed Apr. 1, 1881. (Model.)

Claim.—The air-chest C, provided with ports *o o'*, in combination with the slide-port D and pinion G, constructed to open and close either port and admit and cut off the pressure of the air through the bottom of the vessel.

253,216.

253,216. LIQUID-FUEL INJECTOR. FREDERICK A. MEYER, New York, N. Y., assignor of two-thirds to Marshall Lefferts and John A. Lefferts, same place. Filed June 16, 1881. (No model.)



Claim.—1. A liquid-fuel injector constructed substantially as herein shown and described, consisting of double hemispherical shell A' A^3, provided with cap B, and nozzle C, diaphragm K, conductor F, adjustable bushing *k*, and conically-tipped pipe H, arranged as set forth.

2. In a liquid-fuel injector, the combination, with the double shell A' A^3, having a steam-space, *b*, of the receptacle A, formed by the diaphragm E, substantially as herein shown and described, said receptacle being designed to receive the excess of fuel entering the injector, as set forth.

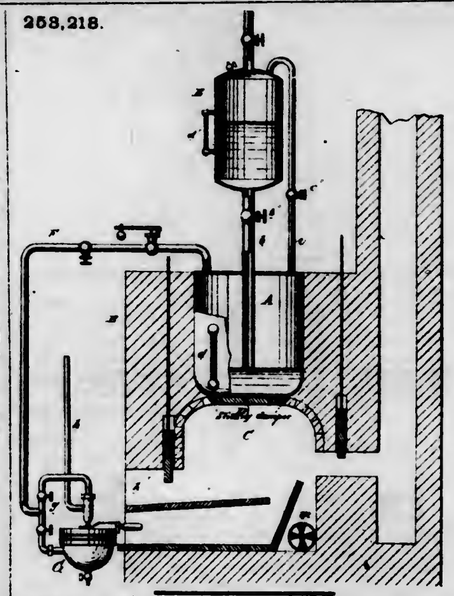
3. In a liquid-fuel injector, the combination, with the receptacle A, and diaphragm E, and double shell A' A^3, of the escape-pipe *e*, substantially as and for the purpose described.

4. In a liquid-fuel injector, the combination, with the cap B, provided with chamber *c*, communicating with the double shell A' A^3 and the interior of the injector, of the nozzle C, substantially as herein shown and described.

253,217. FURNACE FOR BURNING LIQUID FUEL. FREDERICK A. MEYER, New York, N. Y., assignor of two-thirds to Marshall Lefferts and John A. Lefferts, same place. Filed June 7, 1881. (No model.)

Claim.—1. A liquid-fuel-consuming furnace constructed substantially as herein shown and described, provided with a combustion-chamber, E, having in its bottom a mixing-chamber, F, provided with an adjustable sliding cover, F', damper D, for regulating the admission of the products of combustion to the furnace working-chamber, damper G, for regulating the admission of air over the chamber F into the combustion-chamber, and register H in rear of the mixing-chamber F, to regulate the admission of air especially for affecting the character of the flame, as set forth.

2. In a liquid-fuel-consuming furnace, the combination, with the combustion-chamber, of a gas-and-steam-mixing chamber provided with a sliding cover and located in the bottom of said combustion-chamber, substantially as herein shown and described.



3. In a liquid-fuel-consuming furnace, the gas-and-steam-mixing chamber F, provided with sliding cover or partition F' and inclined upward-projecting rear end, F^4, substantially as herein shown and described.

4. In a liquid-fuel-consuming furnace constructed, substantially as herein shown and described, with mixing-chamber located in the bottom of the combustion-chamber, the register H, fixed in the side of the combustion-chamber near its bottom and in rear of the mixing-chamber, as and for the purpose set forth.

253,218. HEATER AND FEEDER FOR STEAM-BOILERS. FREDERICK A. MEYER, New York, N. Y., assignor of two-thirds to Marshall Lefferts and John A. Lefferts, same place. Filed June 7, 1881. (No model.)

Claim.—The combination of furnace B, having sliding damper D, boiler A, reservoir E, water-pipe *b*, extending from the bottom of said reservoir into said boiler A and terminating at its water-line, and steam-pipe *a*, extending from the top of boiler A to the top of said reservoir, and provided with valve *c'*, substantially as and for the purpose specified.

253,218.

253,219. LATH-HOLDER. ISAAC MILNE, Manistee, Mich. Filed Aug. 26, 1881. (No model.)

Brief.—When the laths are inserted between the pins the springs hold them in place. A fastening put through the perforations in the bar holds the frame to the studding. A metallic plate on the cross-bars evens the laths at the ends.

Claim.—1. In a lath-holder, the combination, with the perforated bar *a*, of the cross-bars *b b*, each provided with pins *c* and springs *d*, substantially as described.

2. In a lath-holder, the combination, with the perforated bar *a* and cross-bars *b b*, of the pins *c*, springs *d*, and metallic plate *e*, substantially as described.

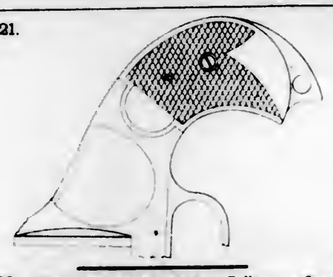
253,220. SKATE-BAR. HENRY MILLER, Providence, R. I. Filed Mar. 26, 1881. (No model.)

Claim.—The combination, with the supporting-bar *a*, of the short bars *c c c*, the central one of which is connected integrally for an intermediate portion of its length with said supporting-bar, the said short bars being connected laterally by the brackets *d*, substantially as described.

253,221. PISTOL-HANDLE. DANIEL MOORE, Brooklyn, N. Y. Filed Aug. 27, 1881. (No model.)

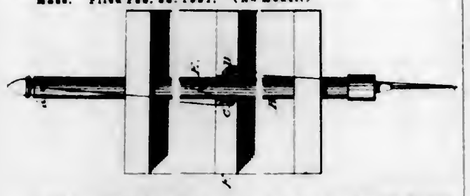
Claim.—1. A pistol-handle having a portion of the metallic strap extended below the side pieces in form of a crest, the concave curve of the crest being at the front or inner curve of the handle, substantially as shown and described.

2. A pistol-handle having a portion of the metallic strap extended below the side pieces in form of a crest, the concave curve of the crest being at the front or inner curve of the handle, said extended portion being perforated, substantially as shown and described.



253,221.

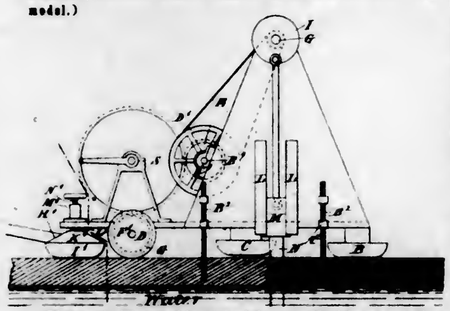
253,224.



Claim.—The combination of the coil of asbestos or other inflammable cord or strip with the receptacle adapted to hold the molten zinc, substantially as and for the purposes above set forth.

253,231.

253,221.



253,222. SEWING-MACHINE. GEORGE F. NEWELL, Greenfield, Mass. Filed Feb. 26, 1881. (No model.)

Claim.—The face-plate of a sewing-machine, provided with a broken or slotted cross-bar, F, having loops C D, placed thereon at opposite points, in combination with a needle-bar playing vertically in said slot, provided with a simple loop, E, substantially as and for the purpose set forth.

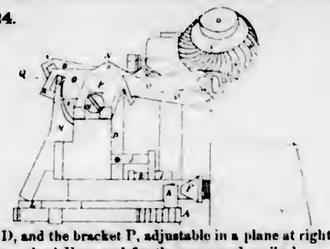
253,223. MACHINE FOR CUTTING ICE. FELIX L. DESCARRIS FRANCOIS, Montreal, Quebec, Canada. Filed Dec. 22, 1881. (No model.)

Claim.—1. The combination of the saws N with an operating mechanism, substantially as described, and traction-wheels D, simultaneously operated to move the machine forward, and runners B, substantially as described.

2. The combination of the saws N, wheels D, runners B, and operating mechanism by which the saws and wheels D are simultaneously operated, and guides B', the whole substantially as and for the purposes set forth.

3. The combination of the saws N, wheels D, runners C, and operating mechanism by which the saws and wheels D are simultaneously worked, substantially as described.

4. The combination of the platform A, provided with runners B C, wheels D, truck H', and guides B', also jacking device for raising the wheels D, with the saws N, and an operating mechanism for simultaneously working the said saws and wheels, the whole substantially as and for the purposes set forth.

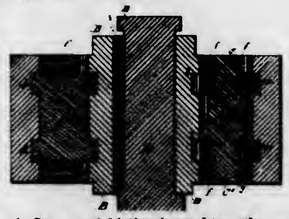


253,224. THREAD-GUIDE MECHANISM FOR KNITTING-MACHINES. WILLIAM H. PEARSON and JOHN BRADLEY, Lowell, Mass. Filed Aug. 10, 1878. Renewed Sept. 24, 1881. (Model.)

Brief.—The thread-guides and their actuating mechanism are used with a loop-wheel having two nibs on each leaf for carrying two yarns, to be shifted from one set of nibs to the other. By shifting the yarns each stripe may be ended in its own color. The guides are operated by a lever, cam, and spring.

Claim.—1. The combination, with the loop-wheel U, provided with two sets of nibs, of the yarn-guide O, provided with the slot R, the lever M, provided with the pin Q, and the cam L, as and for the purpose described.

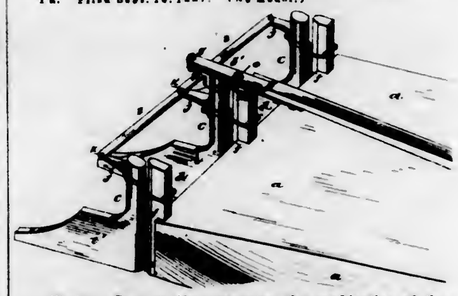
2. The combination of the loop-wheel U, the yarn-guide O,



253,224.

the stud D, and the bracket P, adjustable in a plane at right angles to the loop-wheel U, as and for the purpose described.

3. The combination of the yarn-guide O, the slotted stop-plate W, and the loop-wheel U, as and for the purpose described.



253,225. JOURNAL-BOX. SIMON E. PETTEE, Cleveland, Ohio. Filed June 30, 1881. (No model.)

Claim.—1. In an anti-friction journal-box, the combination, with the axle D and casing A, provided with annular grooves *a a*, of the sleeve B, provided with a smooth periphery and with annular grooves *b b*, and anti-friction rollers interposed between the sleeve and casing, a portion of said rollers being provided with collars which fit within the grooves *a a b b*, substantially as set forth.

2. In an anti-friction journal-box, the combination, with the axle D and casing A, the latter provided with annular grooves *a a*, of the sleeve B, having smooth periphery and provided with grooves *b b*, and the large and small anti-friction rollers interposed between the sleeve and casing, the large rollers being provided with collars that fit in grooves *a a b b* and the small rollers provided with enlarged portions that fit between the collars on the large rollers, substantially as set forth.

253,226. STEERING APPARATUS. JAMES RANS, Pittsburg, Pa. Filed Sept. 10, 1881. (No model.)

Claim.—In a steering apparatus, the combination of the series of rudders and stocks c c c, having fixed arms *j* projecting aft of said stocks, and links *l l* for connecting said arms, and the tiller fulcrumed forward of one of the stocks, having an arm, A, projecting aft of it, and said tiller having an extension connected to said arm A, substantially in the manner as and for the purpose herein shown and described.

253,227. MANUFACTURE OF ZINC-COATED WIRE. WILLIAM E. RICH, Worcester, Mass. Filed Aug. 15, 1881. (No model.)

Claim.—The combination of the coil of asbestos or other inflammable cord or strip with the receptacle adapted to hold the molten zinc, substantially as and for the purposes above set forth.

253,228. GLOVE-FASTENER. WILLIAM S. RICHARDSON, Newton, Mass. Filed Dec. 7, 1881. (Model.)

Claim.—1. In a fastening device for gloves and other articles, the combination of the spring catch or clasp, consisting of the yielding sections *a' a²*, connecting-bar *a'*, and spring-arms *a³ a³*, with the tongue *b* and its cross-bar *b'*, the said catch and tongue being adapted to be fastened to the material and used substantially as specified.

2. The spring catch or clasp consisting of the yielding sections *a' a²*, connecting-bar *a²*, and spring-arms *a³ a³*, all substantially as described.

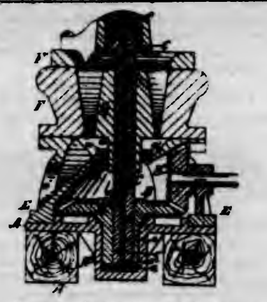
253,229. CONCENTRATOR FOR ORE-SEPARATING APPARATUS. JNO. P. HANSONS, Ogden, Utah. Filed June 28, 1881. (No model.)

Claim.—In a concentrator, A, having transverse ribs *d d*, which divide it into compartments, the sieves *i i*, placed above the receiving-bottom *l* of the concentrator and below the upper edges of the ribs, substantially as and for the purpose described.

253,230. APPLICATION OF COLORING-MATTER TO FABRICS. ANTONIE SAUSSE, Manchester, County of Lancaster, England, assignor of one-half to Henry D. Dupee, Boston, Mass. Filed Oct. 17, 1881. (No specimens.) English Patent No. 3,889 of 1881.

Claim.—1. That improvement in the art or method of applying coloring-matter to fabrics which consists in applying to the mordanted and wet fabric a dry insoluble granulous or powdered substance, such as described, coated or covered with an aniline or other suitable color substance, as set forth.

2. That improvement in the art or method of simultaneously producing spotted or stippled effects on mordanted fabrics which consists in first coating or covering separately insoluble granulous or powdered substances, substantially as described, with each of the several aniline or other color substances suitable to produce the different-colored spots to be shown on the fabric and drying the same thereon, and then mixing the said separately-prepared dried granulous or powdered substances and scattering and applying them on a wet mordanted fabric, so as to deliver to the said mordanted parts of the said fabric the coloring substance thereon, and then drying the fabric, substantially as set forth.



3. The herein-described process of producing stippled effects on woven fabrics, which consists in scattering upon the mordanted wet fabric sand or powdered insoluble granular substances, such as described, a portion of which has been previously coated with aniline or other suitable coloring substance, as described, and dried thereon, and a portion of which is in its natural dry state, all substantially as and for the purposes set forth.

253,231. ORE-CRUSHER. HIRAM H. SCOVILLE, Chicago, Ill., assignor to Fraser & Chalmers, same place. Filed Oct. 20, 1881. (No model.)

Claim.—1. The ore-crusher provided with the conic frustum-skirt for conducting away the crushed ore freely and protecting the actuating-gears, substantially as and for the purpose set forth.

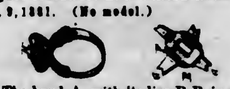
2. The ore-crusher provided with a hollow vertical gyrating shaft, C, having openings for the emission of the oil fed to the interior thereof, combined with the rotating step-gear B, having an eccentric socket for said shaft C, and a stationary socket-hub, A',

253,231.

wherein said wheel B has its bearing, and the foot-plate *a*, substantially as specified.

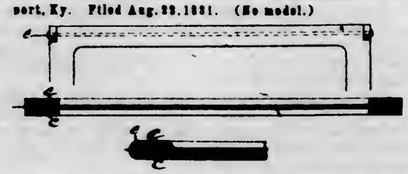
3. The ore-crusher the frame whereof is divided into sections E, F, and A, whereof section F contains the grinding-surfaces, section E contains the conic frustum-skirt, and the section A contains the hollow hub wherein is the bearing for the operative mechanism, substantially as described.

253,232. AUTOMATIC GATE. EPHRAIM E. SPITLER, Amity, Ohio. Filed Sept. 27, 1880. (No model.)



Claim.—1. In an automatic gate, the combination, with the lower pintle, G, and the operating-rods L, of the slotted plate H, levers J and K, meshing together with lost motion, and having the hooked fingers *l*, substantially as and for the purpose specified.

2. In an automatic gate, the adjustable upper hinge, consisting of the pivoted arm E, with an enlarged serrated end, *b*, in combination with the pintle D and bracket F, having corresponding serrations, and thumb-screw *d* substantially as set forth.



3. The combination, with the single trips M and operating-rods L, of the adjustable actuating-chains *e e'*, weighted lever P, and link *t*, substantially as and for the purpose specified.

253,233. FINGER-RING. JAMES H. SPRAGUE, Providence, R. I., assignor to Edward A. & William H. Luther, same place. Filed Nov. 9, 1881. (No model.)

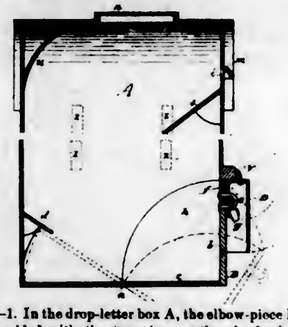
Claim.—The band A, with its lips B B, in combination with the slotted ornamental piece C and the slotting-setting E, the whole firmly united without the aid of solder by passing said lips through the slots in the ornamental piece and setting and turning down the protruding ends thereof, as described.

253,234. SLATE-FRAME. ALBERT W. STOCKBRIDGE, Newport, Ky. Filed Aug. 23, 1881. (No model.)

Claim.—1. A slate-frame consisting of continuous annular strips of pasteboard or other similar material, cut from the merchant sheets and overlapping the edges of the slate, and interposed narrower strips surrounding the slate, all held together by cementing adjacent surfaces, substantially as specified.

2. In combination with the slate-frames as constructed, the continuous pintles *e e*, held between the overlapping strips, the slate-edge, and the interposed strip, and the yokes *g g*, in which the ends of the pintles are riveted, substantially as and for the purpose set forth.

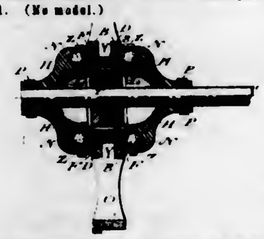
3. As a new article of manufacture, a school-slate having a frame made of two continuous annular strips of pasteboard, tar-



board, hard felting, or similar material, commonly produced in merchant sheets, cut from such sheets, and interposed narrower strips of the same or other material surrounding the slate at the edges, substantially as set forth.

253,236. OVEN AND FURNACE DOOR. WM. H. STRICKLER, Mount Pleasant, Pa. Filed June 23, 1881. (No model.)

Claim.—In a furnace-door, the combination, with a metallic front, of a fire-brick back bolted thereto, the said front and back being some distance apart, and the heads of the bolts embedded in the fire-brick, as described, for the purpose set forth.

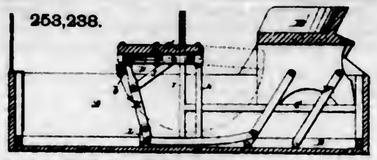


253,236. STREET LETTER-BOX. SAMUEL STRONG, Washington, D. C. Filed Apr. 1, 1881. (No model.)

Claim.—1. In the drop-letter box A, the elbow-piece B, herein described, provided with the trunnions *c*, the cheeks *h*, and the staple *e*, in combination with the ledge *d*, as and for the purposes specified.

2. The combination, in a street letter-box, of the letter-opening *i*, the rigid external hood, *m*, the internal chute, *s*, and the curved plate *u* in the upper part of the box, opposite the letter-opening *i*, extending downward to or below the level of said letter-opening.

253,237. WHEEL. ALBERT J. TAPLIN, Chicago, Ill. Filed Aug. 4, 1881. (No model.)



Claim.—1. The combination, in a wheel, of a spoke or radial arm, O, whereon is supported by step-bearing a cheek-plate, B, the cheek-plate R, the hub Y, and balls or rollers D, provided with holes K K and bolts E and F, with screw-nuts S S, substantially as and for the purpose set forth.

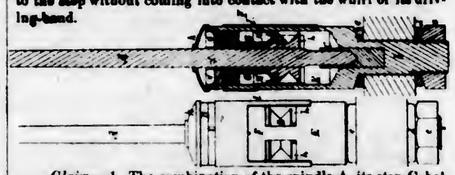
2. In combination with a shaft or axle, C, a ring, I, whereon encircling is arranged a system of balls or rollers, D, and whereon is placed a wheel with spokes or radial arms O, the hub Y, the cheek-plates B, and bolts E and F, with screw-nuts S S, substantially as and for the purpose set forth.

3. In combination with a shaft or axle, C, a wheel secured by adjustable frictionless wheel-blocks H, provided with set-screws P, the bolts and screw-nuts Z, and spherical-formed rollers N, designed to rotate on a circular step or projecting plane, L, substantially as and for the purpose set forth.

4. The combination of a wheel and wheel-block arranged on a shaft or axle, substantially as shown and described, and for the purpose herein specified.

253,238. SHIFTING SEAT FOR VEHICLES. JNO. C. THRASHER, Salem, Ohio. Filed Aug. 3, 1881. (Model.)

Claim.—1. The seat G, hinged at its rear, so as to swing and fold, in combination with hinged legs K and braces J, connecting the seat and legs together, the seat resting on the legs K when raised and swinging free of the same when lowered, substantially as set forth.

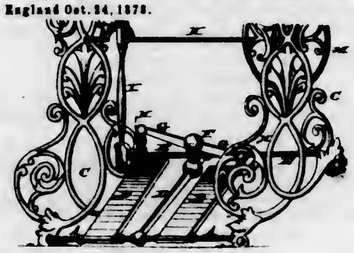


2. The seats E and G, connected together, so as to be shifted one by the other, the seat G being hinged at its rear, so as to swing and fold, and connected with legs K and bars J, so as to rest upon the legs when raised and swing free of the same when lowered, substantially as and for the purpose set forth.

3. The seat G, hinged at its rear, so as to swing and fold, and provided with shifting ears N, in combination with hinged legs K and braces J, the legs supporting the front of the seat and engaging with the ears when raised and disengaging from both when lowered, substantially as set forth.

4. The seat G, hinged at its rear, so as to swing and fold, and provided with shifting ears N, in combination with braces J and hinged legs K, provided with lugs *a*, whereby the legs and ears engage to support the seat when raised and the lugs and braces engage to support it when lowered, substantially as set forth.

253,239. MECHANISM FOR SUPPORTING AND LUBRICATING THE SPINDLES OF RING-SPINNING FRAMES. WALTER I. TISEHAM, Taunton, Mass. Filed Aug. 15, 1881. (No model.)

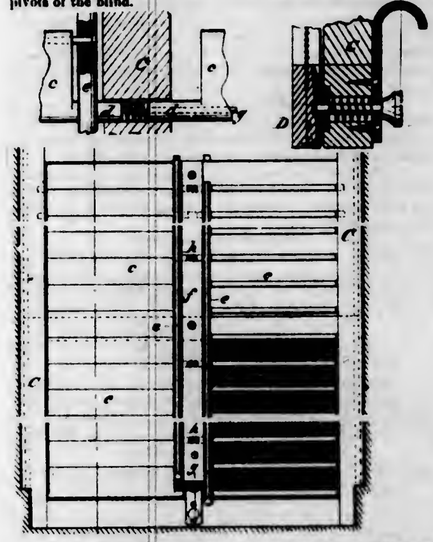


Brief.—The step and bolster are carried by a step-supporter and a perforated tubular standard, the latter of which is provided with a sleeve, which serves to partially cover the lateral openings in the same, leaving a sufficient opening for the passage of the driving-band to and from the whirl. The oil that flows from the bolster is caught by an oil-cup, which revolves with the spindle, and any oil that escapes from this cup enters another oil-cup, which is fixed within the standard, and from this cup it is discharged against the periphery of the bore of the standard and then flows to the step without coming into contact with the whirl or its driving-band.

Claim.—1. The combination of the spindle A, its step C, bolster D, and whirl B and step-supporter E with the laterally-perforated tubular standard F, extending from the step-supporter E upward around and above the whirl, and supporting the bolster, as described, and with the oil intercepting and discharging cups G and H, adapted to the spindle and the standard, substantially as specified, all being constructed and to operate essentially as explained.

2. The combination of the sleeve *l* with the step-supporter, laterally-perforated tubular standard, the step, bolster, spindle, whirl, and the two intercepting and discharging oil-cups, all being constructed, arranged, and adapted substantially in manner and to operate as set forth.

253,240. DRIVING MECHANISM FOR SEWING AND OTHER MACHINES. THOMAS S. TOSCER, Birmingham, County of Warwick, England. Filed Dec. 28, 1881. (No model.) Patented in England Oct. 24, 1878.



Claim.—1. The combination, with the treadle mechanism having the fulcrum-bar A at the front of the machine, from which extend rearwardly the treadles connected by a vibratory beam, G, at the rear of the machine in lieu of the front, and a rod connecting the treadles with the driving-shaft, of the fly-wheel secured rigidly on the latter, and having pins R, and the fly-wheel carrying a spring-ring, N, adapted to turn within an annular channel, and having the wedge P, adapted to be engaged by the pins on the fly-wheel, substantially as and for the purpose herein shown and specified.

2. The combination, with the fulcrum-bar A at the front of the machine, of the treadles B, pivoted or having bearings thereon at their front ends, and extending rearwardly therefrom and connected by the vibratory beam G at the rear of the machine in lieu of the front, and the rod connecting one of the treadles with the crank of the driving-shaft, substantially as and for the purpose specified.

3. The combination, with the fly-wheel rigid on the driving-shaft and having eccentrically-arranged pins R R, of the driving-wheel having a recess to receive a spring-ring, N, arranged to turn in a channel in said recess, and having a slot, O, to receive one end of a wedge, P, adapted to be engaged by the pins R R, as set forth.

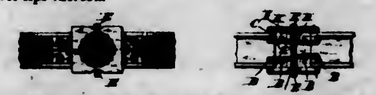
253,241. SCREEN AND BLIND FOR CAR-WINDOWS. ISAAC H. VAN WAGNER, Mynak, N. Y. Filed Sept. 14, 1881. (No model.)

Brief.—The sliding screen and blind are connected by a spring-bolt. A strengthening-wire extends through the slats and pivots of the blind.

Claim.—1. In a car-window, the combination of a blind and a screen fitted to slide in grooves in a window-frame, and connected together by a removable fastening for simultaneous movement, or disconnected from each other by removing the fastening from the screen, so that they can be moved separately, substantially as described.

2. The combination of sliding blind C, screen D, and spring-bolt *i*, substantially as and for the purposes set forth.

3. The wire *g*, inserted through the pivots of slats *c*, substantially as and for the purposes set forth.

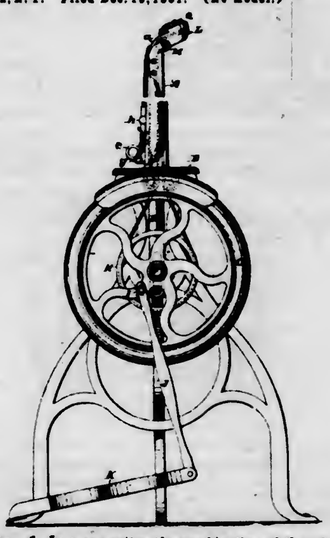


253,242. BRACELET. ADOLPH VRETEN, Providence, R. I. Filed Nov. 21, 1881. (No model.)

Claim.—A bracelet having a band, A, composed of a single piece of metal having its edges turned over and rolled into a cylindrical form, as described, and bent into an elliptical shape without hinge or joint, in combination with a continuous interior torsional spring, B, the whole constructed, arranged, and operating in the manner substantially as specified.

253,243. BRACELET. ADOLPH VRETEN, Providence, R. I. Filed Oct. 15, 1881. (No model.)

Brief.—The box contains a clasp having plates provided with teeth, which lock into the hollow ends of the bracelet by catching over lips thereon.



Claim.—1. A bracelet with its two ends clasped into a box, and adjustably held therein by means of a spring-clasp located in said box and interlocking with the ends of the bracelet at different fixed points, enabling the bracelet to be adjusted to different sizes, substantially as herein described.

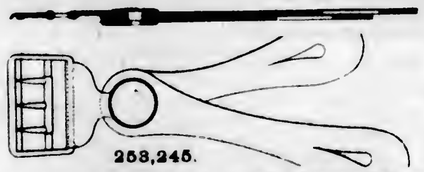
2. A bracelet with its two ends fitting into a box, and adjustably held there at certain points by a spring-clasp interlocking with the ends of the bracelet, as herein described, and with posts connected and arranged, as herein described, to govern the action of said spring-clasp, substantially as and for the purposes herein described.

3. A bracelet-clasp consisting of a box containing a spring, H, plates A, teeth B, posts E, and rod K, arranged to adjustably connect with and hold the ends of the bracelet, substantially as herein set forth.

253,244. PEG-CUTTING MACHINE. NATHAN B. WAKEFIELD, Camden, N. Y. Filed Dec. 19, 1881. (No model.)

Claim.—1. In a peg-cutter, the combination of the wheel G, carrying the grooved pulley H, with the spindle F, slotted arm D, and suitable tightening devices for the spindle F, all arranged and operating for the adjustment of the pulley to take up the slack of the cord.

2. The combination of the pulley X, standard A, tightening-pulley Y, spring, and cord W, whereby the cord is kept constantly tight, substantially as shown and described.



253,245. TAB-CONNECTOR FOR SUSPENDER-BRACES. THOMAS WALKER, Birmingham, County of Warwick, England. Filed Aug. 4, 1881. (No model.) Patented in England Mar. 17, 1881.

Claim.—1. A tab-connector formed of a bent metal strip with an eyelet drawn out of one arm of the strip and spanning the entire space between the arms, and having its end riveted or expanded on the outer face of the other arm, substantially as described.

2. The combination, with two separate tabs having holes in their upper ends, of a tab-connector comprising a bent strip of metal with an eyelet formed in one piece with said strip, said eye-

253,252. SHEARS FOR CUTTING FLOWERS, PLANTS, &c.

253,254. PROCESS OF AND APPARATUS FOR AMALGAMAT-

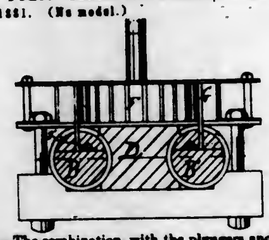
253,245.

let passing through the holes in said tabs and forming a pivot on which they may turn independently of each other, substantially as described.

3. A tab-connector comprising a bent metal strip with one arm straight and provided with an eyelet, and the other arm cranked and provided with a hole to receive the eyelet, the ends of the two arms being connected by the eyelet, so that an approximately-rectangular recess is made between the said arms, and said eyelet serves as a pivot to the tabs, substantially as described

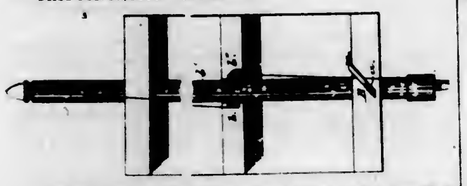
4. The combination, with a tab-connector having disk-shaped ends secured together by an eyelet, as described, of a cupped disk covering the eyeleted end, substantially as described.

253,246. CAR-COUPLING. JOHN F. WALLACH, Pittsburg, Pa. Filed Nov 17, 1881. (No model.)



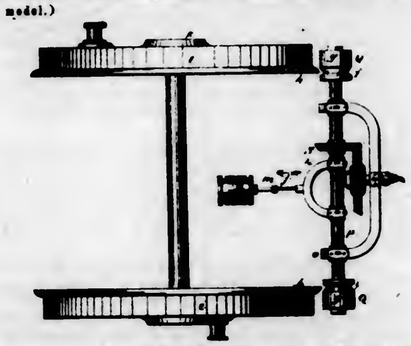
Claim.—1. A draw-head having a lateral link-opening and a re-enforce or brace upon the open or slotted side thereof, substantially as and for the purpose specified.

2. A draw-head having a lateral link-opening and projections or link-guides in front of and in line with the hole of the coupling-pin, substantially as and for the purpose specified.



3. The draw-head having the flaring lateral link-opening, the link-guides and re-enforces arranged in front of and in line with the hole of the coupling-pin, and the transverse brace or re-enforce upon the slotted side of the draw-head, substantially as and for the purpose specified.

253,247. PUMP. THOMAS V. WARREN, Waukegan, Ill. Filed May 31, 1881. (No model.)



Claim.—The combination, with the plungers and the up-flow tube, of the pinion and racks, whereby the semi-rotation of the tube is caused to reciprocate the plungers and the tube to serve a double purpose, substantially as specified.

253,248. SEWING-MACHINE. WASHINGTON WORDELL, Orange, assignor of one-half to George F. Newell, Greenfield, Mass. Filed Feb. 26, 1881. (No model.)

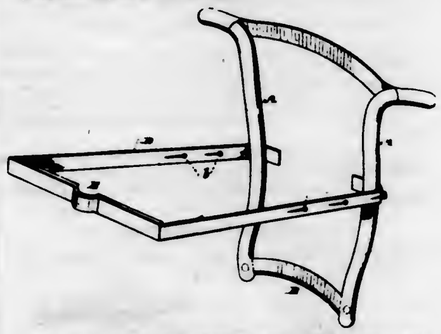
Claim.—In a sewing-machine having a face-plate provided with a broken or slotted middle bar, the take-up composed of three loops, *b b' b'*, the first two being on said bar and the latter on the needle-bar, in combination with the spring B, attached to said face-plate, provided with a curvature, *c*, substantially as and for the purpose set forth.

253,249. CAR-BRAKE. ROBERT J. WILSON, Pittsburg, and AUGUST SPYKER, Allegheny, Pa. Filed May 27, 1881. (No model.)

Claim.—1. The combination, with a shaft or shafts, coupled by flexible connections, and provided with a wheel, T, of a movable shaft having pulleys adapted to engage with the car-wheels, and a wheel to engage the wheel T, substantially in the manner as and for the purpose specified.

2. In a mechanism for operating the brake-levers of brakes for railway-cars, the combination, with a revolving shaft or shafts coupled through the medium of flexible connections, of movable mechanism adapted to be thrown into engagement with the rim of the car wheel or wheels, and thereby communicate motion to said shaft or shafts, substantially in the manner herein shown and described.

3. In a mechanism for operating the brake lever or levers of brakes for railway-cars, a revolving shaft or shafts coupled through the medium of a flexible section of wire rope and coupling L M, substantially in the manner herein shown and described.



4. The shaft P, having pulleys Q and wheel S, in combination with the wheel T, coupled to a shaft or shafts through the medium of a flexible section, substantially as herein described, and for the purpose set forth.

253,250. METHOD OF PREPARING HEADED TACKS FOR USE. ERASTUS WOODWARD, Somerville, Mass., assignor to the Copeland Tacking and Lasting Company, Paterson, N.J. Filed Dec. 5, 1881. (No model.)

Claim.—The method of preparing large-headed tacks having long sharp shanks for use, comprising the shearing, punching, or removal of the head of each tack to reduce the size thereof preparatory to or in the act of driving, all substantially as specified.

253,251. BODY-BRACE. JAMES W. ANDERSON, Bodie, Cal. Filed Nov. 18, 1881. (No model.)

Claim.—The body and shoulder brace and straightener consisting of the strips A A, base-strip B, and top strap, C, adapted to fit the abdomen, and the adjustable strap D, secured to the strips A A, and having the pad or brace E, said strap being adapted to pass around the waist as a belt and fit its pad E into the small of the back, substantially as and for the purpose herein described.

253,252. SHEARS FOR CUTTING FLOWERS, PLANTS, &c. JOSEPH S. BADIA, Philadelphia, Pa. Filed Sept. 27, 1881. (No model.)

Claim.—1. In shears for cutting plants, the combination, with the blades *a a*, of the spring B, formed with a bow, *b*, and jaws *b' b'*, composed of flaring sides *b² b²*, constructed and arranged substantially as and for the purpose described.

2. In shears for cutting plants, the spring B, having bow *b*, jaws *b' b'*, and recesses *b³ b³*, for the reception of holding pins or screws *c c'*, substantially as shown and described.

3. In shears for cutting plants, the spring B, having bow *b*, with corrugation *l*, jaws *b' b'*, composed of flaring sides *b² b²*, and recesses *b³ b³*, substantially as shown and described.

4. In combination with the spring B, the scissors or shears A, having blades *a a*, with projections *a²*, and pins *c c'*, substantially as shown and described.

5. In combination with scissors or shears A, the spring B, composed of a bow, *b*, and spring-jaws *b' b'*, substantially as shown and described.

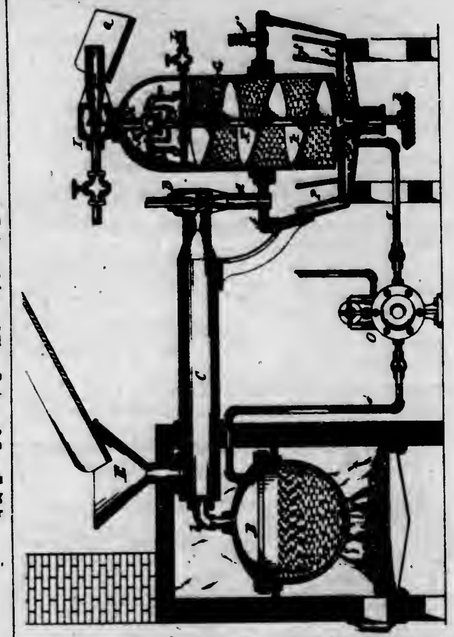
6. The combination, with scissors or shears A, of holding pins or screws *c c'* and spring B, formed with corrugated bow *b*, flaring spring-jaws *b' b'*, and recesses *b³ b³*, for the reception of said pins or screws, substantially as shown and described.

253,253. HEATER FOR RAILWAY-CARS. WILLIAM C. BAKER, New York, N. Y. Filed June 20, 1881. (No model.)

Claim.—1. The combination, with the heating-pipes in a circulating hot-water apparatus for heating cars, of a radiator placed outside the car and a cock in the pipe, which connects the boiler with the heating-coil to force the water to circulate through the outside radiator, substantially as set forth.

2. The combination, with the radiating-pipe *d* inside the car, of the pipe *f*, passing from one of the circulating-pipes near the boiler to the radiator-pipe near the end of the car, and one or more cocks to prevent the hot water circulating through the radiator *d* and direct the same through such pipe *f*, substantially as set forth.

3. In a hot-water warming apparatus for cars, the combination, with the radiators within the car, of tubes passing below the floor, and cocks to exclude the hot water to a greater or less extent from the radiators in the car without preventing the circulation of the water from and to the heater, substantially as set forth.



4. The combination, with the circulating-pipes *a e e*, radiators *d*, and cock *n* within the car, of the tubes *f* and *y* and radiator *l* outside the car, substantially as specified.

5. In a car-heating apparatus, the pipe *v*, in combination with the radiator-pipes *d*, to which it is connected, near the end of the car, and a cock to divert the circulating hot water from the radiator-pipes through such pipe *v*, and through a connection, *e*, to the boiler, substantially as set forth.

6. The combination, in a car-heating apparatus, of radiators inside the car, a heating-furnace, a radiator outside the car, connecting pipes, and cocks, substantially as set forth, whereby, in regulating the temperature of the car, the circulating hot water may be diverted to a greater or less extent from the radiators within the car to the radiator outside the car, substantially as set forth.

7. In a hot-water warming apparatus, the combination, with the boiler, pipes *a* and *e*, and radiator *d*, of the pipe *s* and its cock connecting the radiator, and the return-water pipe *e*, substantially as set forth.

253,254. PROCESS OF AND APPARATUS FOR AMALGAMATING ORES. CHARLES E. BALL, Philadelphia, Pa. Filed May 4, 1880. (No model.)

Claim.—1. The method or process herein described for collecting finely-divided mercury in amalgamating by drawing the same by suction or exhaust into a suspended body of liquid mercury and subjecting the same to artificial pressure or squeezing, substantially as specified.

2. The combination of a retort, B, a cylinder or mixing-chamber, C, an ejector or suction device, D, and a hopper or ore-feeder located between the ejector and retort, whereby suction or exhaust is created in said cylinder or chamber, and ore and mercury vapors drawn into and mingled in the same, substantially as shown and described.

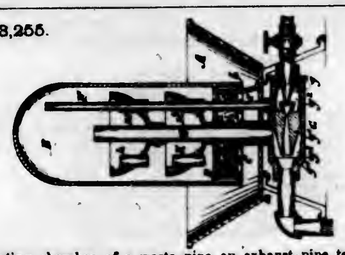
3. The combination, with a mercury-chamber, G, and an ejector or exhaust device, I, for holding mercury suspended therein, of a screw or spiral blade, *k*, for exerting pressure or a squeezing action on such suspended mercury, substantially as shown and described.

4. In combination with a central discharge-pipe, H, the branch pipes *m m*, supported upon said discharge-pipe by means of a swiveled collar, M, substantially as shown and described.

5. In combination with discharge-pipe H, having swivel-collar M, with branch pipes *m m*, the shaft K, with arms N N, substantially as shown and described.

6. The water-discharge pipe consisting of ring *l*, with radial arms *l' l'*, in combination with the inclosing amalgamating-chamber, substantially as shown and described.

7. An amalgamating apparatus comprising a lower chamber or section to receive the charge, an upper or vacuum chamber, a mercury-chamber connecting the two, and a screw arranged to rotate in the mercury-chamber, substantially as and for the purpose set forth.



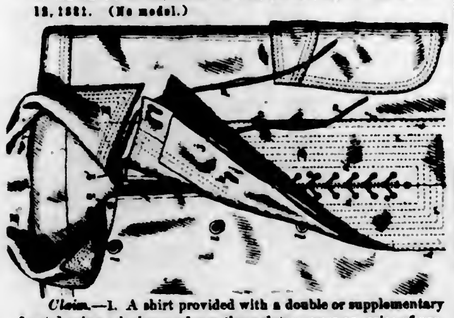
8. An amalgamating apparatus comprising a lower chamber to receive the charge, an upper or vacuum chamber, a mercury-chamber connecting the two last-named chambers, a central vertical shaft which passes through the three chambers, a screw on said shaft and in the mercury-chamber, and agitators fixed on said shaft in the upper and lower chambers and arranged to rotate with the said shaft and screw, substantially as set forth.

253,255. AMALGAMATOR. CHARLES E. BALL, Philadelphia, Pa. Filed Dec. 16, 1879.

Claim.—1. In combination with an amalgamating-vessel, B, a fibrous or filamentary packing located at the base or mouth of said vessel, substantially as and for the purposes set forth.

2. The combination, in an amalgamator or with an amalga-

258,255.

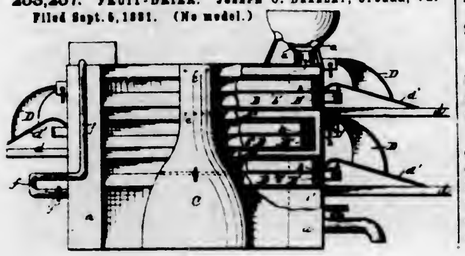


mating-chamber, of a waste-pipe, an exhaust-pipe terminating above said waste-pipe, and an ejector common to both said pipes, and to which both said pipes independently lead, substantially as and for the purpose set forth.

3. In combination with the waste-pipe E, exhaust-pipe F, and an amalgamating-vessel, B, the ejector G, having steam-jet *g*, and nozzle *g'*, forming two separate annular chambers, *g' g'*, substantially as shown and described.

4. In combination with an amalgamating-vessel, B, one or more cups or troughs, H, with hollow stems *h*, substantially as and for the purpose set forth.

258,256. SHIRT. JOSEPH G. BARKER, Watertown, assignor to Marsh Brothers, Pierce & Co., Boston, Mass. Filed Dec. 13, 1881. (No model.)

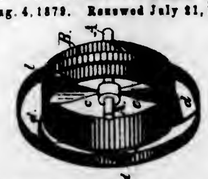


Claim.—1. A shirt provided with a double or supplementary front, having a lacing-cord run through two rows or series of eyelet-holes arranged upon each side of the central vertical line of said front, and detachably secured to the body of the shirt along one of its vertical edges by buttons and button-holes or other separable fastenings, substantially as described.

2. In combination with a shirt of ordinary plain construction, a supplementary front permanently secured along its bottom and one vertical edge to the body of the shirt and detachably secured along its other vertical edge by buttons and button-holes or other separable fastenings to said body, a pair of folds or plaits in the center of said front and extending from its top to a point near its bottom, a series of eyelet-holes in each of said plaits, and a lacing-cord run through said eyelet-holes, substantially as and for the purposes described.

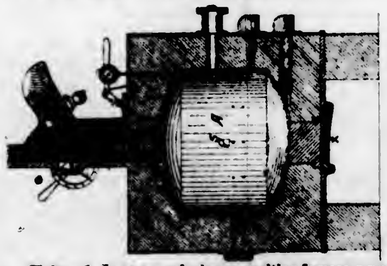
3. In combination with a shirt of ordinary plain construction, the supplementary front D, provided with the folds or plaits *s* and *s'*, and secured along one of its vertical edges to the body of the shirt by buttons and button-holes or other separable fastenings, the two series of eyelet-holes *o o*, formed in the folds *s* and *s'*, the two eyelet-holes *q* and *q'*, formed in the opposite ends of the collar or collar-band, and the lacing-cord *p*, all arranged and adapted to operate substantially as described.

258,257. FRUIT-DRIER. JOSEPH O. BRADLEY, Urbana, Va. Filed Sept. 5, 1881. (No model.)



Claim.—1. In a fruit-drier, the combination of the steam-chambers, arranged one above another and connected at alternate ends with a hot-air gatherer, perforated upper chambers, and a steam-generator, as set forth.

2. The hot-air gatherer C, having flaring mouth opening downward, combined with the perforated hot-air and steam chambers and a generator, as set forth.



3. The guides *d* and inclines *d'*, combined with scraper D, spring D', and trays having inclines *d'*, as and for the purposes set forth.

258,258. SCREW-PROPELLER. JOS. BELDUKE, San Francisco, Cal. Filed Aug. 4, 1879. Renewed July 21, 1881. (Model.)

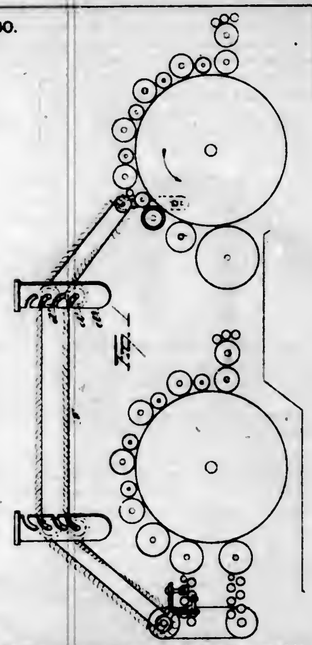
Claim.—In a propeller for vessels or ships, the combination, with the band or cylinder B, connected to the propeller-shaft A, with an intermediate space between them, of the buckets *d d*, with concaved edges and chambers and disposed obliquely across the periphery of said cylinder, with their apices fastened to a ring, *i*, substantially as and for the purposes set forth.

258,259. SMELTING-FURNACE. JONATHAN BELL, New York, N.Y. Filed Dec. 16, 1880. (No model.)

Claim.—1. In an ore reducing or smelting furnace, a smelting or heating chamber the interior of which is substantially that of an oblate spheroid provided around its interior with a double set of graduated inlets for the heat-producing gases, as hereinbefore set forth.

2. The combination, in a smelting-furnace, with the smelting-chamber, of the ore-roasting chamber above it communicating with the stack and provided at its bottom with a slide-valve, and having hopper with valve or gate, as and for the purposes hereinbefore set forth.

3. In a smelting-furnace, the combination, with the stack provided with damper and perforated wall, of the roasting-chamber, communicating through perforated wall with the stack and provided with check-valve at its bottom, as hereinbefore described.



4. The combination, with the chamber A, of the pipes or flues K L, for supplying the heating-gases encircling the chamber, and provided with lateral branches or inlets K' A, &c., leading into the interior of the chamber, said inlet branches or flues being graduated in size—that is, smallest toward the conduits from the gas-generator and largest toward the end of the flues—as and for the purposes hereinbefore set forth.

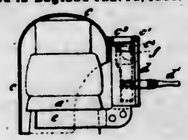
258,260. CARDING-MACHINE. GEORGE BERNHART, Amana, Iowa. Filed Apr. 14, 1881. (No model.)

Claim.—1. The combination, with a finisher-card and a breaker-card, of an endless conveyer or conveyers extending from the rub of the finisher-card over the same to the last stripper of the second breaker-card, substantially as set forth.

2. The combination, with a finisher-card and a breaker-card, of endless conveyers (one or more) extending from the finisher-card over the same and leading to the breaker-card, of a stripper located between the endless conveyer and breaker-card, and a worker located between the stripper and doffer of the breaker-card, said worker having a girdle of card-clothing removed from each end thereof, substantially as set forth.

258,260.

3. In a waste-roving conveyer for carding-machines, the combination, with the finisher and second breaker cards, of an endless conveyer or conveyers, removable shafts, and adjustable rollers above said finisher and breaker cards for supporting such conveyer or conveyers, the said conveyer or conveyers being adapted to convey the waste rovings from the rub of the finisher to the last stripper of the second breaker-card, substantially as set forth.



4. In a waste-roving conveyer for carding-machines, the combination, with the finisher-card, endless conveyer or conveyers, fixed guard and last stripper of second breaker-card, of a worker situated below said stripper, said worker having a girdle of card-clothing removed from each end, which allows the rovings to pass uninterrupted to the doffer, where it is mixed with the new wool, substantially as set forth.

5. In a waste-roving conveyer for carding-machines, the combination, with a finisher-card and second breaker-card, of an endless conveyer or conveyers provided with card-clothing on one face and supported above the said finisher and second breaker cards, adjustable hangers, rub-roll gearing of the finisher-card, and suitable mechanism by which the desired motion is imparted to said conveyer, substantially as set forth.

6. In a waste-roving conveyer for carding-machines, the combination, with a finisher and second breaker card, the endless conveyer, removable and shafts therefor, and intermediate removable shafts adapted to be vertically adjusted, as described, of hooks adapted to receive said removable end shafts and hold them up out of the way while grinding and cleaning the cards, and suitable supporting means for said hooks, substantially as set forth.

7. The combination, with the main cylinder of the second breaker-card, of the fifth worker provided with card-clothing of less width than that on the main cylinder, and arranged to form an annular naked space around each end of the fifth worker, substantially as set forth.

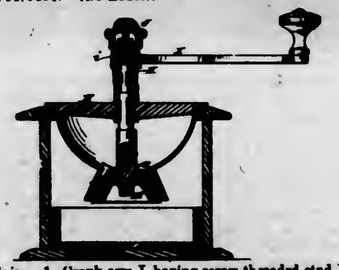
258,261. MEANS OR APPARATUS FOR SECURING OR LOCKING UP THE CONTENTS OF BOTTLES AND OTHER HOLLOW ARTICLES. JOHN BUTTENSHAW, 36 and 38 Pentonville Road, County of Middlesex, England. Filed July 23, 1881. (No model.) Patented in England Jan. 13, 1881.

Claim.—The combination of the cap or cover *c*, hasp *c'*, clip *c*, and lock *d*, receiving the hasp within it and forming the sole means of connection between the said cap and clip, substantially as herein shown and described, and for the purpose set forth.

258,262. REED FOR MUSICAL INSTRUMENTS. MELLEN BRAY, Newton, Mass. Filed Nov. 11, 1881. (No model.)

Claim.—1. A reed-tongue for musical instruments reduced to the desired variable thickness by compression, as distinguished from milling or filing, substantially as described.

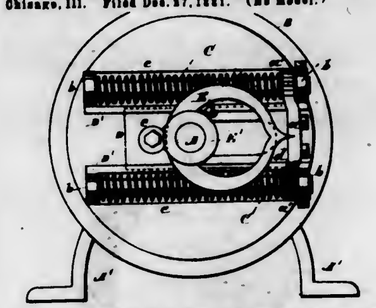
2. A reed and reed-plate formed from a single piece of metal and having the tongue of the reed made of the desired varying thickness by pressure, as distinguished from filing, substantially as described.



3. The process of forming a reed and its reed-plate from the same piece of metal, which consists in forming the necessary recesses and condensing and hardening that portion of the metal from which the reed is to be formed by pressure and cutting away the surplus metal to separate the sides and one end of the reed from the reed-plate, substantially as described.

258,263. COMBINED DRILL AND REAMER. FREDERICK H. BULTMANN, Cleveland, Ohio. Filed Sept. 28, 1881. (No model.)

Claim.—The herein-described tool, consisting of a drill and reamer combined, constructed and arranged substantially as and for the purposes set forth.



258,264. COFFEE-MILL. FRANK H. CHAPMAN, Meriden, Conn., assignor to the Charles Parker Company, same place. Filed Dec. 14, 1881. (No model.)

Claim.—1. Crank-arm I, having screw-threaded stud I', permanently connected thereto, in combination with adjusting-nut J, slotted sleeve K, a support for said sleeve, and the detachable spindle of the runner, which is connected to said crank-arm within said sleeve.

2. In a coffee-mill, a crank-arm having a spindle or stud and screw formed therewith, in combination with an adjusting-nut, a slotted sleeve, means for supporting said sleeve, and the spindle F, substantially as set forth.

258,265. SELF-ADJUSTING CRANK. WILLIAM H. CLARK, Chicago, Ill. Filed Dec. 27, 1881. (No model.)

Claim.—1. The hollow shaft B'', having the disks or plates B B' attached to its ends, in combination with the interior shaft, A, substantially as and for the purpose specified.

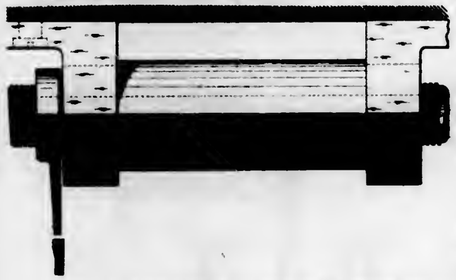
Claim.—1. The curved spring-bars G, in combination with

2. The combination of the disk or plate B with the springs c and slide D, substantially as described.

3. The combination of slide D, having the roller or pin e, with the cam or eccentric E, substantially as set forth.

4. The combination of the disk or plate B, springs c, and slide D, having the pin or roller e, with the cam or eccentric E and shaft A, substantially as specified.

5. The combination of the disk or plate B′ and its guide-plates with the crank-block H, having the projections *f* and shoulders *g*, substantially as described.



6. The combination of the crank slide or block H, having the shoulders *g*, with the nut I and the eccentric *h*, substantially as set forth.

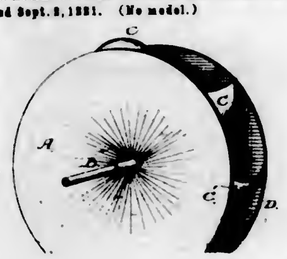
7. The combination of the disk or plate B′, having the guides G G′, and hollow shaft B″, with the sliding or crank block H, having guide-projections and shoulders, the nut I, eccentric *h*, and shaft A, substantially as and for the purpose set forth.

8. The combination of the disks or plates B B′ and hollow shaft B″, connected together as described, and the springs c, with the shaft A, cams or eccentrics E *h*, slide D, and crank-block I, substantially as specified.

9. The combination of the double cam or eccentric E, having the stop *d*, with the pin or roller e, for operating the slide when the eccentric is turned in either direction, substantially as described.

253,266. SCREW-NUT. SAMUEL DARLING, Providence, R. I. Filed Oct. 29, 1881. (No model.)

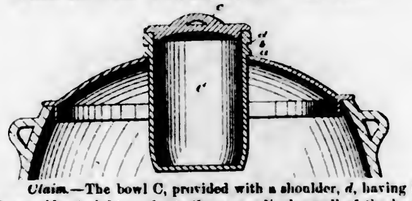
Claim.—1. A nut made in two parts for the leading-screws of dividing and screw-cutting engines, micrometers, and all screws that require great accuracy, one part being fixed and the other adjustable independently of the fixed part, the fixed part and a holder for the adjustable part being made in one piece or separate pieces rigidly held together, the same being constructed and operating substantially as herein described, for the purpose set forth.



2. A nut made in two parts, one part being fixed and the other adjustable, the fixed part and a holder for the adjustable part being made in one piece or separate pieces rigidly held together, the adjustable part having a screw on a part or the whole of its outer contour fitting a female screw in the holder by which it is held and adjusted, substantially as described.

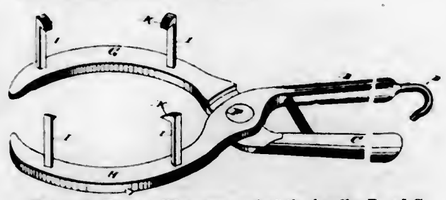
3. A nut made in two or more parts, one or more of the parts being adjustable when used for truing screws by attrition, the parts being constructed and operating substantially as herein described.

4. A nut made in two or more parts, one of the parts being adjustable and having a radial index-arm for adjusting the nut, to be used with or without a graduated scale, substantially as described.



5. A nut in two or more parts, one or more of the parts being adjustable, mounted on bearings or centers, substantially as described, and for the purpose set forth.

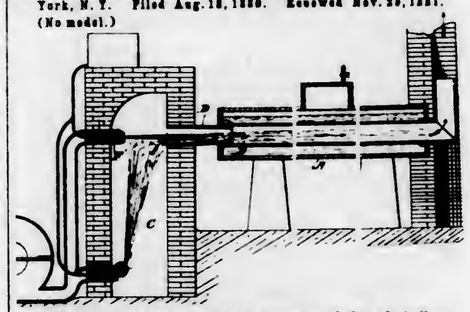
253,267. WATER-WHEEL. ROYAL M. DAVISSON, Weaverville, Cal. Filed Sept. 8, 1881. (No model.)



Claim.—A water-wheel consisting of the convex or conical side A, having a central axis, B, the tapering buckets or flanges C, secured upon the convex side and curved and tapering toward the center of the side A, and the rim or side D, with its open center, substantially as and for the purpose herein described.

253,268. POT FOR COOKING PURPOSES. JAMES DOWLING, Wilkes-Barré, Pa. Filed Aug. 25, 1881. (No model.)

Claim.—The bowl C, provided with a shoulder, *d*, having its lower side at right angles to the perpendicular wall of the bowl, and a shoulder, *e*, having its upper side beveled and its lower side at right angles to the perpendicular wall of the bowl, all arranged and operating to suspend the bowl and form bearing-surfaces for the lifter, substantially as shown and described.

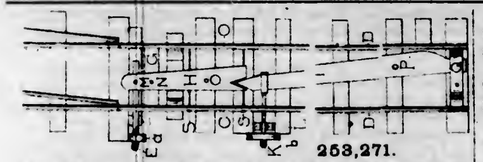


253,269. LIFTER FOR POTS. JAMES DOWLING, Wilkes-Barré, Pa. Filed July 11, 1881. (Model.)

Claim.—1. The pot-lifter composed of the handles B and C and jaws G and H, provided with hooks I, substantially as set forth.

2. In a pot or bowl lifter composed of jaws G and H, provided with hooks I and handles B and C, a hook, D, connected to one of the handles, substantially as specified.

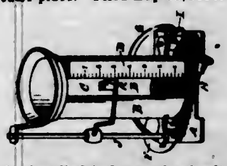
253,270. HYDROCARBON-FURNACE. GEORGE DUNYON, New York, N. Y. Filed Aug. 18, 1880. Renewed Nov. 29, 1881. (No model.)



Claim.—A steam-generating apparatus consisting of a boiler, A, having a flue, B, combined with an upright fuel-furnace, C, in front, and a compound blow-pipe delivering a blast of combined air and fluid fuel across the flame in the fuel-furnace in line with the boiler-flue, as described.

253,271. RAILROAD-SWITCH. NATHANIEL EATON, Mount Vernon, N. Y. Filed Apr. 9, 1881. (No model.)

Brief.—The switch is shifted through horizontal levers detachably connected at their meeting ends to allow of their disconnection when desirous of running a train onto or off of the siding. Otherwise the passing wheel-flanges would bear against one of the levers and set the switch for the main line.



Claim.—In an automatic railroad-switch, the combination of horizontal levers H and I, switch-rails C C, and cross-bar G, pivoted to lever H, said parts being adapted to be moved by the flanges of the wheels of passing locomotives or cars striking one of said

253,271.

levers, the levers H and I being adapted at their meeting ends to be disconnected to direct a train upon the siding, all substantially as shown and described.

253,272. COIN HOLDER AND COUNTER. JOHN W. ELLIOT, Toronto, Ontario, Canada, assignor of one-half to Thomas H. Sheppard, same place. Filed May 18, 1881. (No model.)

Claim.—1. A cylindrical case, A, of suitable diameter, set over a hole in the base B, and having a vertical slot, C, cut in it, as described, to permit the insertion of the divider-arm K, in combination with the pivoted trap E, held over the hole in the base A by the bow-spring G and operated by the handle I, substantially as and for the purpose specified.

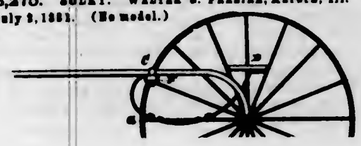
2. The slotted cylindrical case B, having a horizontal slot cut through it at or near its base, in combination with the pivoted push-plate F, curved to pass through said slot, and the bow-spring G, substantially as and for the purpose specified.

3. In connection with a cylindrical case containing coin, and having a pivoted push-plate to remove the coin one by one, and a pivoted trap through which the coin may be dropped when more than one is required, the combination of a bow-spring, G, one end of which is connected to the trap, so as to keep it closed, while its other end is attached to the push-plate, so as to keep it clear of the case.

4. In connection with a cylindrical case containing coin, and having a vertical slot cut through it to expose the coin, and an index, D, to indicate their number, the combination of a dividing-arm, K, sliding on the vertical spindle J, substantially as and for the purpose specified.

253,273. CUTTER-HEAD FOR WOOD-WORKING MACHINES. THOS. FITZSIMMONS, Burlington, Vt. Filed Nov. 10, 1881. (No model.)

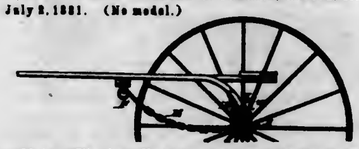
Claim.—1. The combination of the grooved cutter, with a plate, B, having a projection on its inner side to catch in the slot, a clamping-bolt, and a cutter-head, substantially as shown.



2. The combination of the grooved cutter-head, the plate B, provided with the projection *b*, and having one or more grooves made in its outer surface, the bolt E, nut F, and cutter having a bead or beads on its inner surface, substantially as described.

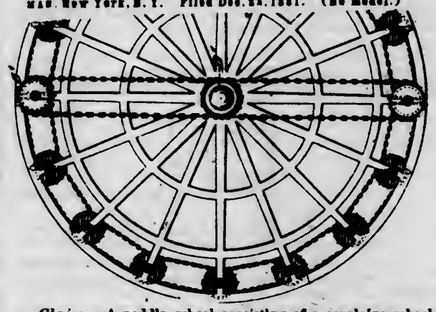
253,274. TAG. SIMON E. FLEISHER, Philadelphia, Pa. Filed Nov. 26, 1881. (No model.)

Claim.—A tag, made of fibrous or analogous material, having an opening, a, extending slit a′, and notch a², substantially as described.



253,275. SULKY. WALTER S. FRASIER, Aurora, Ill. Filed July 2, 1881. (No model.)

Claim.—1. The curved spring-bars G, in combination with the seat D, foot-rest E, and the cross-bar or shafts, substantially as specified.



2. In a sulky or two-wheeled vehicle, the spring arms or bars G, curved to support the foot-rest and seat in their proper relative positions, substantially as described.

253,276. SULKY. WALTER S. FRASIER, Aurora, Ill. Filed July 2, 1881. (No model.)

Claim.—The bars F, in combination with the springs a and axle A, substantially as specified.

253,277. FEATHERING PADDLE-WHEEL. GEORGE F. FREEMAN, New York, N. Y. Filed Dec. 23, 1881. (No model.)

Claim.—A paddle-wheel consisting of a revolving wheel-frame having a number of paddles pivoted to bearings at the circumference of the frame, of a circumferential transmitting-chain engaging sprocket-wheels on the pivots of the paddles, and of endless radial transmitting-chains engaging sprocket-wheels upon the pivots of one or more paddles, and being actuated by a stationary sprocket-wheel affixed to the bearing of the paddle-wheel shaft, substantially as and for the purpose set forth.

253,278. CLIP FOR BRAID, TAPE, &c., IN ROLLS. LYMAN B. GOFF, Pawtucket, R. I. Filed Jan. 17, 1878.

Claim.—1. A spring-clip for tapes, braids, and other coiled narrow fabrics, which is provided with a rigid sliding guide, serving as a lateral support for a portion of the coil in a line practically radial from the center, and a suitable spring or springs for confining said sliding guide to its working position, substantially as described.

2. The combination of a rigid sliding guide, serving as a lateral support for a portion of a coil of fabric, and a separate spring or springs, the whole constituting a spring-clip, substantially as described.

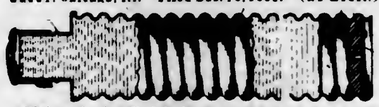
253,279. HAMMER. CHRISTOPHER J. GRELLNER, St. Louis, Mo. Filed June 23, 1881. (No model.)

Claim.—1. The hammer or mallet head A, having the cylindrical handle bore or eye B and grooves or recesses *b b*, extending from the top of the head down into the same and terminating in

rounded shoulders *a a*, substantially as and for the purpose herein shown and set forth.

2. The combination of the hammer-head A, having eye B and

small pipes P P′, L-shaped pipes *a a*, glass tubes E and N, and interior pipe, L, in combination with the steam-pipe of an engine, substantially as and for the purpose specified.

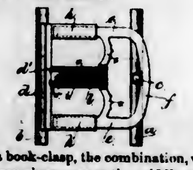


253,285. SEEDER AND CULTIVATOR. JOHN E. KERSIS, Dixon, Cal. Filed Aug. 12, 1881. (No model.)

253,287.

rounded shoulders *a a*, substantially as and for the purpose herein shown and set forth.

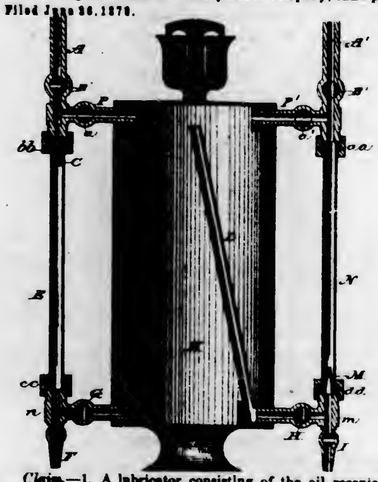
2. The combination of the hammer-head A, having eye B and grooves or channels *b b*, rounded at their terminal points *a a*, wedges D D, terminating each in a notched hook, *d*, and the handle C, substantially as shown and described, for the purpose set forth.



253,280. PAINT AND OTHER CANS AND TUBES. FRANK R. GROUT, CHICAGO, Ill. Filed Dec. 16, 1881. (No model.)

Claim.—1. A cylindrical can or tube, the cylinder being provided with a spiral screw-thread, and the bottom of the can being a follower fitting into such spiral screw-thread upon the cylinder, substantially as and for the purpose set forth.

2. A cylindrical can or tube, the cylinder being provided with an internal spiral screw-thread, and containing a follower mounted in the screw-thread for discharging the contents thereof, the follower being provided with means for the engagement of a driver therewith to force the same along the interior of the can, substantially as described.



253,281. ALBUM-CLASP. ALFRED C. HAFELY, New York, N. Y. Filed Dec. 27, 1881. (No model.)

Claim.—1. In a book-clasp, the combination, with the extensible clasp, of the finger-pieces *s* near the middle of the clasp, substantially as set forth.

2. In an extensible book-clasp, the tubes A, side pieces, *e*, bow *f*, and tube *l*, in combination with the spring *i*, tube *o*, hinge *d*, and clips *a b*, substantially as set forth.

253,282. LUBRICATOR. CHARLES H. HARRUN, Waterbury, Conn., assignor to the Waterbury Brass Company, same place. Filed June 26, 1876.

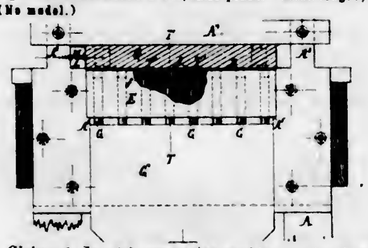
Claim.—1. A lubricator consisting of the oil receptacle or reservoir K, provided with the two pipes A A', glass cylinders E and N, and lower pipes, *n* and *m*, arranged respectively upon opposite sides and connecting with the interior of said reservoir and the inclined pipe L, arranged therein, and with the steam-pipe of an engine, substantially in the manner and for the purpose specified.

2. In a lubricator constructed as hereinbefore described, the oil-reservoir K, provided with the pipes A A', having bends or small pipes P P', L-shaped pipes *n m*, glass tubes E and N, and interior pipe, L, in combination with the steam-pipe of an engine, substantially as and for the purpose specified.

3. In a lubricator, the pipes A A', provided with the stop-cocks B B', pipes P P', provided with the stop-cocks *a a'*, pipes *n* and *m*, provided with the stop-cocks G and H and pet-cocks F and I, intermediate glass tubes, E and N, having nozzles C and M, projecting respectively therein, in combination with an oil-reservoir provided with the inclined pipe L, and with the steam-pipe of an engine, substantially as and for the purpose specified.

4. In a lubricator, the oil-reservoir K, provided with the pipes A A' and P P', L-shaped pipes *n* and *m*, and interior pipe, L, glass tubes E and N, and nozzles C and M, the several parts being adapted for operation in connection with the steam-pipe of an engine, substantially as and for the purpose specified.

5. In a lubricator, the pipes A' and P' and *m*, having the nozzle M and glass cylinder N, arranged within the stuffing-boxes *a a* and *d d*, in combination with the reservoir K, inclined pipe L, pipes A, P, and *n*, and glass cylinder E, arranged within the stuffing-boxes *b b* and *c c*, substantially as and for the purpose specified.

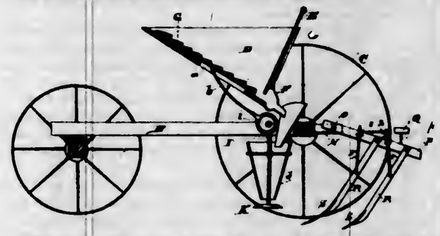


253,283. FOUNTAIN-PEN. GEORGE F. HAWKES, New York, N. Y. Filed Apr. 1, 1881. (No model.)

Claim.—1. The combination, in a fountain-pen, of a reservoir-handle, a detachable pen-section provided with a curved spout adapted to feed ink to a common pen, a coupling between the pen-section and reservoir-handle, and a detachable air-tube having a perforated end extended into the pen-section, substantially as described.

2. The combination, in a fountain-pen, of a reservoir-handle, a detachable pen-section provided near its upper end with a shoulder, and at its lower end with a curved spout adapted to feed ink to a common pen, a coupling having an enlarged bore, whereby an annular recess adapted to receive a common pen is formed between said coupling and the pen-section, and an air-tube having a perforated end extended into the pen-section, substantially as described.

253,284. MACHINE FOR ATTACHING TAGS AND LABELS TO PLUG-TOBACCO. EDWIN R. HEARN, Jersey City, N. J., assignor to P. Lorillard & Co., same place. Filed Aug. 9, 1881. (No model.)

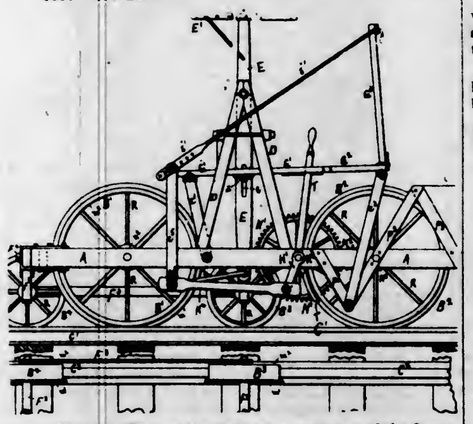


Claim.—1. In a tobacco-tagging machine, a series of equidistant posts, G, standing loosely within corresponding holes in a single continuous piece, serving as a platform, and serving by relative changes of position first to present a series of cavities by holding the ends of the posts lower than the surrounding piece, to receive the tags T' *t* upon the tops of the posts, and then to bring the working surfaces flush with each other to attach the tags to the tobacco, and to engage them firmly therewith, as herein specified.

2. In a tobacco tagging and labeling machine, the platform A' A', independently-movable strip E, inclosed loosely therein, stops A', and posts G, standing in perforations in the strip, combined and arranged as shown, with provisions for moving one relatively to the other, so that the posts, strip, and platform will all stand at different levels to receive the tags and paper, and afterward be all brought to the same level and into firm contact with the face of a tobacco-plug, and unite therewith the tags T' *t* and paper B, all substantially as specified.

3. In a tobacco-tagging machine, a series of equidistant posts rigid with and arranged vertically upon a bar, G', which is forced to reciprocate in guides by means of pitman and pedal-lever connections, combined with a platform having a series of holes, in which the posts operate loosely, in such a manner that the upstroke brings the upper ends of the posts flush with the upper face of said platform, and the receding stroke affords recesses, as and for the purposes set forth.

253,285. SEEDER AND CULTIVATOR. JOHN E. HERRIS, Dixon, Cal. Filed Aug. 12, 1881. (No model.)



Claim.—1. In a seeder and cultivator, the hopper D, with its regulating-plate E, spout F, and reciprocating feeding-plate G, arranged at an angle, as shown, to accelerate the gravity-feed, substantially as herein described.

2. In a seeder and cultivator, the combination of the hopper D, with its regulating-plate E, spout F, and reciprocating feeding-plate G, arranged at an angle, as shown, to accelerate the gravity-feed, the spouts or carriers L L, funnel-shaped receivers J, and rotating distributing-disks K, substantially as herein described.

3. In a seeder and cultivator having the hopper D, with a slot, *a*, the feeding-plate G, rod *b*, supports H, eccentric *c*, shaft N, pinion *e*, gear *d*, and wheel C, when arranged substantially as and for the purpose herein described.

4. In a seeder and cultivator, the distributing-disks K, funnel-shaped receivers J, vertical shafts or spindles I, bevel-pinions *n*, supports H, shaft M, bevel-gears *m*, pinion *e*, gear *d*, and wheel C, when arranged substantially as and for the purpose herein described.

253,286. MAN-POWER. THOMAS HILL, Troy, assignor of one half to Charles Culbath, Kinnickinnick, Wis. Filed July 25, 1881. (No model.)

Claim.—1. The combination and arrangement of the frame A D, lever E, plate G', and back-support G², substantially as set forth.

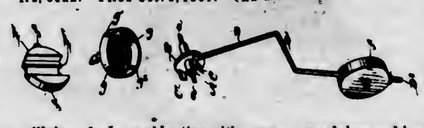
2. The combination and arrangement of the frame A D, lever E, plate G', back-support G², pivoted standards *c' c² c³ c⁴*, and treadles M' M², connecting-rods H⁴ H⁵, bent rod *h*, and crank-shaft H' H³ H⁴, whereby the power of the levers may be communicated to the mechanism it is desired to operate, substantially as set forth.

3. The combination and arrangement, with the frame A, wheels B' B², and rigidly-held trailing-wheel B¹, of the guiding-wheel B³, connected flexibly to the frame A and axle of the wheel B², substantially as and for the purpose set forth.

4. The combination and arrangement of the plate G', back-support G², and adjustable tie-rods *i' i²*, whereby the angle of the back-support may be adjusted, substantially as and for the purpose set forth.

253,287. SHIP'S LOG. WILLIAM S. HOSE, Washington, D. C. Filed Sept. 14, 1881. (No model.)

Claim.—1. In a ship's log, a vacuum apparatus constructed to permit a current of water to pass through the same as it is towed through the water, a gage upon a vessel, and a flexible tube connecting the gage and vacuum apparatus, and of a length to permit the latter to occupy a position in the water beyond the area affected by the vessel's motion, all as set forth.



2. The combination, with the appliances described and claimed, of a gage and throttling device, substantially as described.

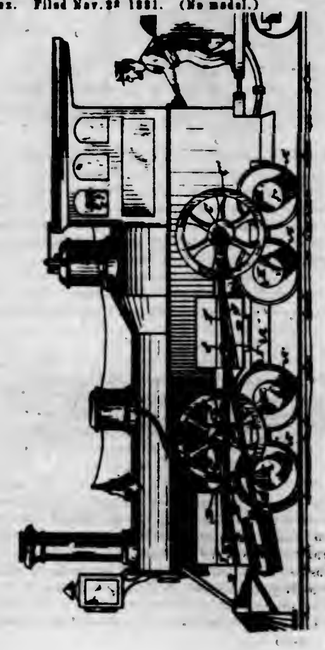
3. The combination of the vacuum device, gage, connecting flexible pipe, and a float, substantially as and for the purpose set forth.

253,287.

253,288. CLOCK-PENDULUM. ARTHUR E. HUTCHINS, Cheshire, Conn. Filed Oct. 6, 1881. (No model.)

Claim.—1. In combination with a verge, a pendulum-rod having its end bent at right angles to its length and inserted in a recess or perforation of the verge, substantially as and for the purpose set forth.

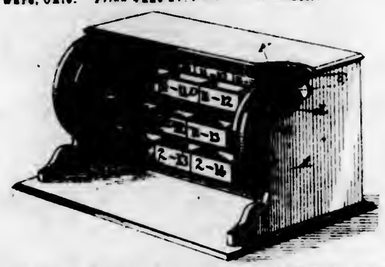
2. A pendulum-ball consisting of a perforated scalp or shell and a filling attached thereto by a part of its material extending into the perforation or perforations of said scalp or shell.



3. The collect on the verge-shaft carrying the pallets of the escapement and supporting the pendulums, as set forth.

4. Shell G, provided with an annular side wall, in combination with pendulum-rod D, which has a flattened or angular part, D', that passes through said side wall from top to bottom, to prevent the pendulum-ball from turning.

5. A pendulum-rod which is all in one piece, in combination with a shell or scalp, G, through the side walls of which it passes, said rod and the perforations in said scalp being of such shape as to prevent said shell from turning on said rod.

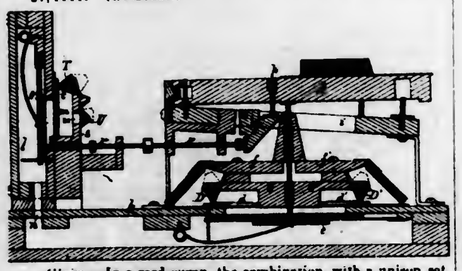


6. In combination with scalp G, the filling or body F, having pins *f f*, which extend into holes *g g* of said scalp, said parts composing a pendulum-ball, substantially as described.

253,289. LOCOMOTIVE. BENJAMIN F. HUNSUCK, Bear Creek, Tex. Filed Nov. 28, 1881. (No model.)

Claim.—The frame B, having inclined guides J J', and the reciprocating carriages I I', connected by the pitman E, the arms D F, connecting the carriages I I' to the driving-wheels, respectively, and the piston-rod G, all combined with the wheels C', cylinder H, and riding-wheels A', having circular bearings K for the driving-wheels, as set forth.

253,290. CASE FOR DISPLAYING WARES. JOHN E. HUSTUS, Washingtonsburg, (assignor of one-half to John H. Smith, Delaware, Ohio. Filed June 27, 1881. (No model.)



Claim.—1. In a case for containing and displaying wares, a revolving carrier provided with a series of teeth, *c*, having upright rear faces, and a pawl or dog adapted and arranged to engage automatically with said teeth and prevent the backward rotation of the carrier.

2. In combination with the rotating carrier provided with teeth *d*, a dog or hook adapted to engage with said teeth, and provided with a clamping device, whereby it may be held out of action.

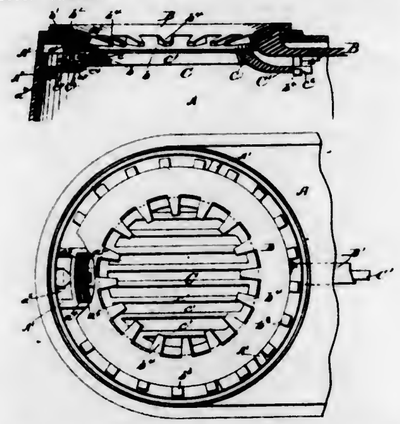
3. In combination with the carrier provided with teeth *c d*, the pawls or dogs E F, adapted and arranged to operate as and for the purpose set forth.

253,291. REED-ORGAN. JOHN JAMES, Cambridgeport, Mass., assignor of one-half to George Woods, same place. Filed Oct. 27, 1881. (No model.)

Claim.—In a reed-organ, the combination, with a unison set of reeds, *d' d'*, and its stop D', of an additional set of reeds, *m m*, and tube-board S, with its two stops T U and corresponding reed-openings, the reeds *m m* being so tuned as to be in tune when both of its stops T U are open and out of tune when either of said stops alone is open, as and for the purposes described.

253,292. BREECH-LOADING FIRE-ARM. IVAN JOHNSON and MARTIN BYE, Worcester, Mass. Filed Sept. 6, 1880. (No model.)

Claim.—1. The front stock, B, composed of the metal piece *b* and the wood stock *b'*, the metal piece *b* having a hollow projection formed on it, which extends through a mortise in and terminates flush with the exterior surface of the wood stock *b'*, and having the locking-lever *b²* and its spring *b³* mounted in this hollow projection, substantially as set forth.



2. A breech-piece for fire-arms, consisting of the breech-piece D and a lock-plate, *d*, having projections *d²* for supporting the hammer and tumbler, and a projecting piece on its rear end, the tang of the breech-piece D passing between the projections *d²*, to which and the projecting piece it is fastened, substantially as and for the purposes set forth.

3. The combination of a hammer having a tumbler provided with a recess the upper shoulder of which is shorter and nearer the center of motion than the lower shoulder thereof, with a double-leafed mainspring, both leaves of which lie in the recess in the tumbler, the upper leaf bearing against the upper shoulder and the lower leaf resting on a set-screw, by turning which it can be raised or lowered to the proper position to catch the lower shoulder while the hammer is falling, so as to throw the hammer back after it has struck, substantially as set forth.

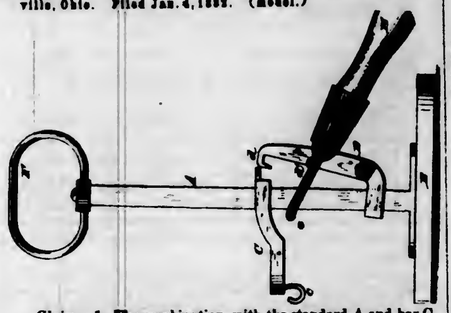
4. The combination of the cartridge-extractor *g* and its arm *g'* with the metal piece *g³*, mounted in a recess in the breech-piece D and held out by the spring *g⁴*, so that its shoulder *g²* is in the arc described by the end of the arm *g'* in opening the gun, and its shoulder *g²* is struck and depressed by the barrels of the gun, so as to cause the shoulder *g²* to move away from the arm *g'* and leave it free to be pushed in when the gun is open, substantially as set forth.

5. The hammer and tumbler rigidly connected by a connecting-piece, *f'*, lying at one side of the pin *f'*, which supports the hammer and tumbler, in combination with the projection *d²*, lying between the hammer and tumbler, substantially as described.

253,293. GRATE. GEORGE KAMP, Utica, N. Y. Filed June 10, 1881. (Model.)

Claim.—1. A two-part grate consisting of an upper section having a motion around its own center coincident with the center of the grate as a whole, and a lower section having its center of motion at the rear of the grate, substantially as and for the purpose set forth.

2. In a two-part grate, the upper part consisting of an annular section, B, concave upon its upper side, and provided with radial fingers *b² b'*, flanges *b b'*, and handle B', having depending stud *b³* and hook *b⁴*, substantially as described.

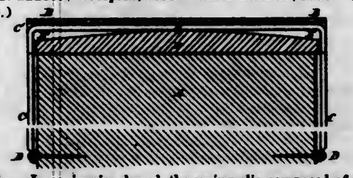


3. In a two-part grate, the combination of the grate C, having arm C' and bifurcated lug *c²*, with the tongue *c³*, pivoted at its forward end in said lug *c²*, and provided at its rear end with a downwardly-projecting stud, *c⁴*, whereby to pivot said tongue to the lug A^3 upon the base of the stove, substantially as described, for the purpose specified.

4. In a two-part grate, the combination of the lug A^3, tongue *c³*, and bifurcated lug *c²*, attached to the grate C by pivot *c⁴*, whereby the said grate is capable of being moved up or down or from side to side, substantially as described.

5. In a two-part grate, the combination of the upper rotary section, B, provided with radial fingers *b² b'*, flanges *b b'*, handle B', having depending stud *b³* and hook *b⁴*, with the lower laterally-moving grate, C, provided with bifurcated lug *c²* and curved arm C', substantially as described.

6. In a two-part grate, the supports A', having their outer ends provided with recesses *a* to receive and hold friction rollers or balls *a'*, and provided also with suitable openings a^4 a^5, for the escape of ashes, cinders, &c., in combination with the lower grooved surface, b^5, of the annular section B, substantially as described.



253,294. LIFTING-JACK. WILLIAM KIGHTLINGER, Marysville, Ohio. Filed Jan. 4, 1882. (Model.)

Claim.—1. The combination, with the standard A and bar C, with its opening, of the bracket D, adapted to be detachably connected to bar C, and the lever E, having metallic looped ends *e e'*, substantially in the manner as and for the purpose herein shown and described.

2. The herein-described lifting-jack, consisting of the base B, standard A, having front and rear roughened sides, the bar C, having openings through its rear end, the notched bracket D, having hook *d*, and the lever or handle E, having metallic looped ends *e e'*, substantially as and for the purpose specified.

253,295. IRONING-BOARD. THOS. E. KING, Saugatuck, and WM. H. SAXTON, Westport, Conn. Filed June 23, 1881. (No model.)

Claim.—In an ironing-board, the spring-clip composed of the bar B, having a groove, B', deeper at the ends than at the middle, and the wire C, hinged at the sides, whereby the wire acts as a spring where it passes through B, substantially as described.

253,296. SMOKE-FILTER FOR PIPES AND CIGARETTES. FRANCIS S. KINNEY, New Brighton, assignor to the Kinney Tobacco Company, New York, N.Y. Filed Nov. 25, 1881. (No model.)

Claim.—1. A smoke-filter for cigars, cigarettes, pipes, and the like smoking articles, composed of a vehicle of the character described, carrying in a powdered or finely-granulated condition a substance having purifying properties, substantially as described.

2. As a new article of manufacture, a smoke-filter for cigars, cigarettes, pipes, &c., composed of a suitable vehicle charged with or carrying charcoal, substantially as described.

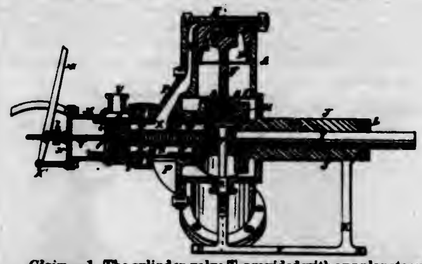
3. As a new article of manufacture, a smoke-filter for cigars, cigarettes, pipes, &c., composed of cotton charged with or carrying charcoal, substantially as described.

4. The combination of a cigarette, as B, a mouth-piece, as C, and a filter, as A, composed of a vehicle of the character described charged with or carrying in a powdered or finely-granulated condition a substance having purifying properties and interposed between the tobacco of the cigarette and the mouth-piece, all three being permanently secured together, substantially as described.

5. The combination of a cigarette, as B, a mouth-piece, as C, a filter, as A, interposed between said cigarette and mouth-piece, and an encircling band, as *a*, by which all three are secured permanently together, substantially as described.

253,297. FIRE-ALARM. ISIDOR KITZER, Cincinnati, Ohio. Filed Dec. 31, 1881. (No model.)

Claim.—1. In an automatic fire-alarm or fire-extinguisher actuated by rupture of fusible connections, a cord divided into sectional lengths, the several sections being joined by fusible coupling-links inclosed within a tube having under openings coincidentwith the fusible links, substantially as described.



253,298. FIRE-EXTINGUISHER. ISIDOR KITZER, Cincinnati, Ohio. Filed Nov. 30, 1881. (No model.)

Brief.—The inlet-valve is held to its seat by a friable brace, E. A weighted arm is suspended above it by fusible supports, which, in case of fire, melt and allow the weight to descend on brace E, breaking it and letting the water to the distributor through the valve.

Claim.—In an automatic fire-extinguisher, the conduit-pipe *a*, provided with a spring-pressed valve, in combination with the friable truss-brace E and swinging arm *f*, provided with weighted head *g* and the supporting fusible brace h, substantially as described.

253,299. THREE-CYLINDER ENGINE. LEOPOLD LAPYRE, Cincinnati, Ohio. Filed May 27, 1881. (No model.)

Claim.—1. The cylinder-valve T, provided with annular steam-opening *y*, annular steam-port space X', port X, counterbalancing piston or part 5, annular exhaust-port space Z', exhaust-port Z, annular diaphragm *p*, and central axial chamber 7, in combination with valve-spindle 3 and bell-crank 4 and pin 6, and a valve-case, substantially as and for the purposes specified.

2. The cylinder-valve T, provided with annular steam-opening *y*, annular steam-port space X', port X, counterbalancing piston or part 5, annular exhaust-space Z', and exhaust-port Z, annular diaphragm *p p*, and devices enabling the valve to be rotated by the crank-pin *e*, substantially as and for the purposes specified.

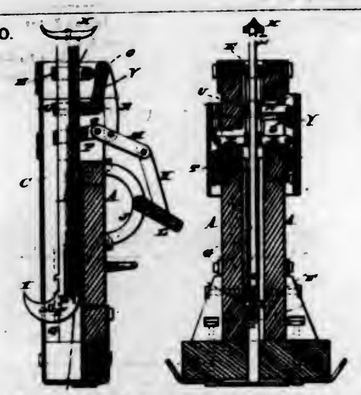
3. The cylinder-valve T, provided with annular steam-opening *y*, annular port-space X', port X, counterbalancing piston or part 5, annular exhaust-space Z', exhaust-port Z, annular diaphragm *p p*, and devices for enabling the valve to be rotated and operated longitudinally, substantially as and for the purposes specified.

4. The cylinder-valve T, provided with annular steam-opening *y*, annular port-space X', port X, counterbalancing piston or part 5, annular exhaust-port space Z', exhaust-port Z, annular diaphragm *p p*, and devices for rotating the said valve, and cap *i*, in combination with rod V, provided with head *j*, lever W, and a valve-case, substantially as and for the purposes specified.

5. The reverse steam-ports E E E, in combination with the valve-case M, provided with cap N, annular steam-space S, having steam-inlet U, and provided with steam-ports P P P, and flange O, substantially as and for the purposes specified.

6. The valve-case M, provided with cap N, annular steam-space S, having steam-inlet U, steam-ports P P P, reverse-ports E E E, and flange O, in combination with the cylinder-valve T, provided with annular steam-opening *y*, annular steam-port space X', steam-port X, counterbalancing piston or part 5, annular steam-exhaust space Z', steam-exhaust port Z, annular diaphragm *p p*, and devices for enabling the valve to be rotated and operated longitudinally, substantially as and for the purposes specified.

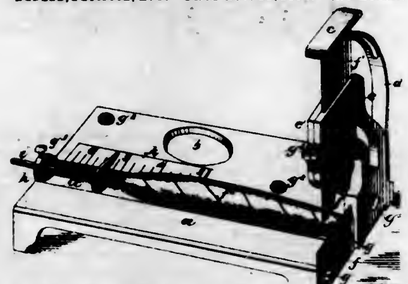
253,300. LIFTING-JACK. FREDERICK LEHMAN, Milwaukee, Oreg. Filed Dec. 2, 1881. (No model.)



Claim.—1. In a lifting-jack, the combination of the upright A and slide D, the sleeves P U, having arms or studs projecting through slots in upright A, the springs T Y, and lever mechanism, substantially as described, for operating the slide D through the medium of sleeve P, all arranged and operating as herein described.

2. In a lifting-jack, the combination, with the upright A and

253,306.



Claim.—The combination of the eyelets on opposite sides of the slit in the glove, the elastic or inelastic lace of a length as in-

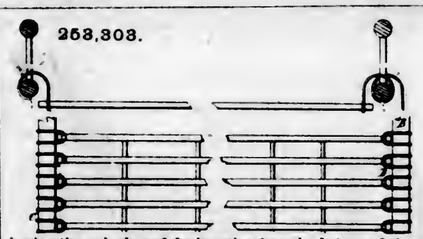
258,300.

slide D, of the hand-lever L, the transverse bolt O, having pivoted rods or hangers N V, carrying the lever M and pivoted sleeve U, the sleeve P, pivoted to lever M, and the rods K, connecting the levers L M, substantially as herein described, for the purpose shown and specified.

258,301. CIGAR-CUTTER. GEORGE H. MARSH and HARRY E. BUSELL, Paterson, N. J. Filed Nov. 28, 1881. (No model.)

Claim.—The combination of the V-shaped cutter f', frame e, constructed with a removable plate, e', screw g', spring a, spring d, flanges d', hood c, screw g^2, and bed-plate a, as shown, and for the purposes set forth.

258,302. LANTERN. FREDERICK MCLUWEE, New York, N. Y. Filed Nov. 7, 1881. (No model.)

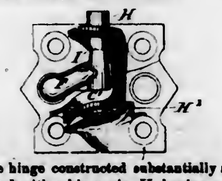


Claim.—1. In a lantern, the combination of the globe, through which the rays of light pass unobstructed, with a perforated metallic frame that encircles the exterior of said globe and carries in its apertures refracting-crystals, substantially as specified.

2. The combination of the base A of the lantern with the supports or straps D, encircling band E, crystals F, and globe B, substantially as herein shown and described.

3. In a lantern having base A and globe B, and posts or straps D, that project from said base, the combination thereof with the vertically-adjustable band E and clamping device *b*, substantially as herein shown and described.

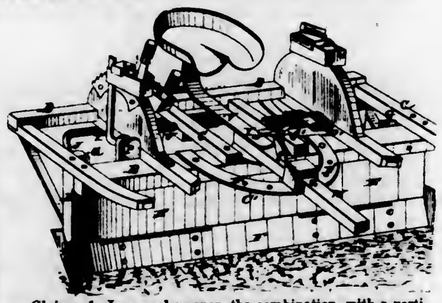
258,303. BED-BOTTOM. NATHAN T. MULVIS, Lodi, Ohio. Filed Nov. 28, 1881. (No model.)



Claim.—1. The coiled spring formed into a sustaining-loop having the ends thereof for insertion into the bottom of the rail and being curved around the rail, substantially as and for the purpose shown and described.

2. The combination of the coiled springs formed into sustaining-loops and the bed-supporting slats or rods with necks or grooves at each end, substantially as and for the purpose described.

3. A series of coiled springs formed into sustaining-loops and with ends for insertion into the rail, as described, arranged alternately on opposite sides of the rail, substantially as and for the purpose described.



258,304. LOCK-HINGE. FELIX MENARD, Montreal, Quebec, Canada. Filed Dec. 16, 1881. (Model.)

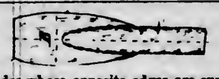
Claim.—The hinge constructed substantially as hereinabove described, provided with a hinge-pin, H, having a shoulder, I, in combination with a pawl, F, the whole constructed, arranged, and operating substantially as set forth.

258,305. COMBINED ROAD SCRAPER AND SCOOP. HENRY H. MESSERSMITH, Harvey's, Pa. Filed Sept. 17, 1881. (No model.)

Brief.—Consists of a vertical shield having a hinged scraper on its lower edge swung at an angle by lever mechanism connected to a transverse shaft on the scraper-frame. The wheel-legs are vertically adjustable on the frame by lever mechanism connected to a transverse shaft, formed in two sections, joined by an adjustable sleeve or coupling.

Claim.—1. In a road-scraper, the combination, with a vertical shield secured to a suitable frame, of a hinged scoop or scraper and suitable adjusting mechanism, as described, for the purpose set forth.

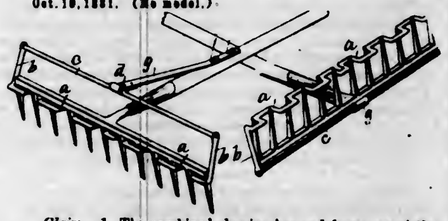
2. The combination, with the frame having the shield E and hinged scraper F, of the side standards carrying guards or plow-blades, as herein described, for the purpose shown and specified.



3. In a road-scraper having side guards or plows, the vertically-adjustable legs having swiveled wheels or casters, substantially as and for the purpose set forth.

4. The combination, with the vertically-sliding wheel-carrying legs, of the operating or adjusting levers mounted upon shafts which are capable of being connected by a suitable sleeve or coupling, as herein described, for the purpose shown and specified.

258,306. AUTOMATIC VENT. FERDINAND HESSMER, St. Louis, Mo. Filed Nov. 8, 1881. (No model.)

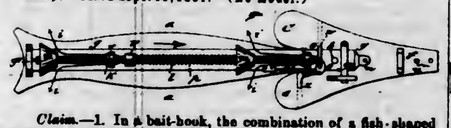


Claim.—The automatic vent herein described, consisting of

258,306.

two united flat sides whose opposite edges are curved, said sides being wider crosswise on a line midway of their length, the mouth as well as any cross-section of said sides being oval in shape, with its said curved edges made thinner than the longitudinal central portion of said sides, and the taper end of a tubular stem extending into the body and up to the center and widest portion of the vent proper, substantially as and for the purposes set forth.

258,307. TEETH-CLEANING ATTACHMENT FOR GARDEN-RAKES. CHARLES D. MILLER and GEORGE L. EAGER, Des Moines, Iowa, assignors of one-third to A. D. Crain, same place. Filed Oct. 19, 1881. (No model.)



Claim.—1. The combined clearing-bar and frame, consisting of the bent wire or rod *a a*, adapted to be intertwined between rake-teeth, and the frame *b b c*, adapted to extend above the rake-head, substantially as shown and described, for the purposes specified.

2. The attachment for cleaning rakes, composed of the combined clearing-bar and frame *a b c* and the spring *g*, adapted to be fastened to a rake-handle, substantially as set forth, to operate in the manner described, for the purposes specified.

3. A combined clearing-bar and frame adapted to surround, extend between, or intertwine the teeth of a rake, a spring extending from said frame and adapted to be fastened to a rake-handle, arranged and combined relative to each other and a rake substantially as shown and described, to operate in the manner set forth, for the purposes specified.

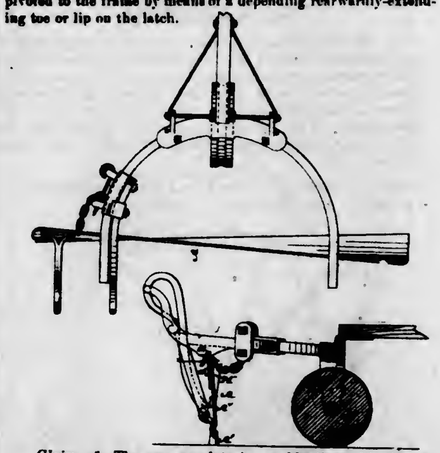
258,308. BAIT-HOOK. KARL MÜLLER, Hornberg, Baden, Germany. Filed Sept. 19, 1881. (No model.)

Claim.—1. In a bait-hook, the combination of a fish-shaped shell, having helically-bent fins back of the head and longitudinal slits in the body thereof, with outwardly-swinging hooks, a spring-actuated mechanism for throwing out the hooks, and a latch mechanism projecting through the head of the shell, whereby the hook-actuating mechanism is locked or released, substantially as set forth.

2. In a bait-hook, the combination of the longitudinally-guided rod *l*, having fixed cones *m* and spring *p*, with the outwardly-swinging hooks *i*, hinged to the bracket- *k*, substantially as set forth.

3. In a bait-hook, the combination of the outwardly-swinging hooks *i* and guided slide-rod *l* with a recessed locking-latch, *o*, spring *o'*, forked rod *w*, and fulcrumed lever *x*, substantially as specified.

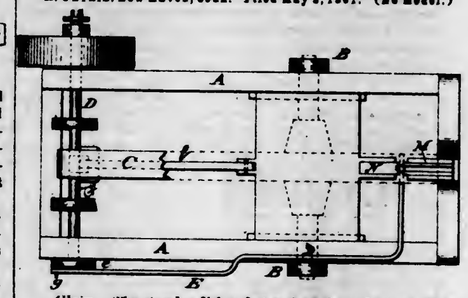
4. In a bait-hook, the combination of the guide-brackets *k*, having each a grooved cone, *t*, with hooks *i*, retaining-collars *v*, shell *a b*, having slits *c'* for the hooks *i*, and means for operating the hooks, substantially as set forth.



258,309. FASTENING FOR GLOVES, &c. FRANÇOIS A. C. J. OHLEN, Bonnevoie-les-Luxemburg, Luxemburg. Filed Dec. 19, 1881. (No model.)

Claim.—The combination of the eyelets on opposite sides of the slit in the glove, the elastic or inelastic lace of a length as indicated, the lace hook or button at the wrist of the glove, and the hook or similar device at the end of the lace, substantially as described.

258,310. ROAD-SCRAPER. WILLIAM PATTERSON, Salem, N. J. Filed May 4, 1881. (No model.)



Brief.—The vertically-swinging scraper-plate has an adjustable lip on its upper edge, which is guided into a notch on a latch pivoted to the frame by means of a depending rearwardly-extending toe or lip on the latch.

Claim.—1. The scraper-plate, in combination with the adjustable tongue and the latching-lever, substantially as and for the purpose set forth.

2. The scraper-plate A, having a tongue, H, in combination with a latching-lever having a depending rearwardly-extending toe and a notch in front of said toe, operating substantially as and for the purpose set forth.

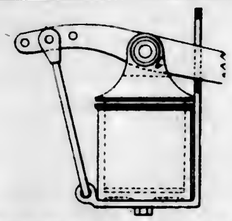
258,311. MACHINE FOR MAKING BLIND-HOOKS. WALTER R. PETRIE, New Haven, Conn. Filed May 2, 1881. (No model.)

Claim.—The circular disk *e*, fastened on the end of the shaft D and provided with the pin *g*, in combination with the lever E, turning on the stud *y* as a fulcrum in the upright part B, its front end being bent at right angles to the side of the frame A and coming in rear of the die M, as set forth.

258,312. TENDER AND OTHER BRAKES. DAVID S. RANDOLPH, St. Louis, Mo., assignor to the American Brake Company, same place. Filed July 18, 1881. (No model.)

Claim.—1. In a tender or like brake, the combination, with the horizontally-arranged brake-cylinder and its piston, of a brake-lever having its fulcrum supported by the brake-cylinder, said lever being pivotally connected directly to the piston of the brake-cylinder, substantially as and for the purpose specified.

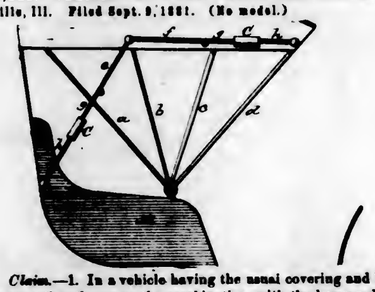
2. In a tender or like brake, the combination, with the horizontally-arranged brake-cylinder and its piston, of a swiveling fulcrum-frame pivoted on the axis of the cylinder, a brake-lever pivotally connected to the piston, and a fulcrum-link pivotally connected to the swiveling fulcrum-frame and to the brake-lever, substantially as and for the purpose specified.



258,312.

Claim.—1. In combination with the tool-spindle J, with its bevel-gear wheel L turning in the sleeve or box K, which is supported and adjusted upon a fixed standard, E, as shown, the swivel-

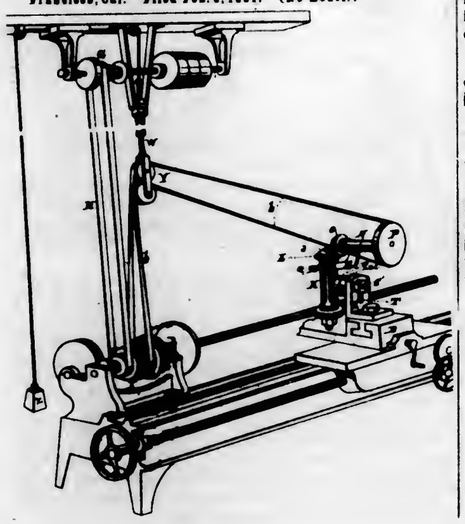
nected in pairs through a battery and a signaling device, which shows when the circuit is closed and a current is on the line. A suitable electro-magnetic switch at subscriber's station is operated from the central office to cut out the high resistance and give a



12. The combination, with a series of line-circuits and a central-office instrument normally connected with said lines and common to the series, of a switch-board provided with means for connecting said lines with each other and for disconnecting them from

253,312.

3. The combination, in a tender or like brake mechanism, of the horizontally-arranged brake-cylinder and its piston with the fulcrum-frame pivoted on the axis of the cylinder, the brake-lever pivotally connected to the piston and having a series of holes at its ends for the adjustment of the connections with the brakes and fulcrum-link, and the fulcrum-link pivotally connected with the fulcrum-frame and the brake-lever, substantially as and for the purpose specified.

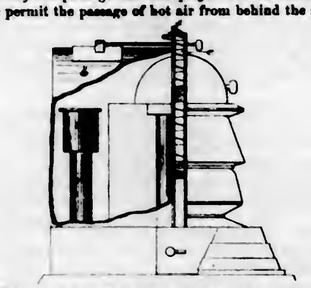


253,313. VEHICLE-TOP JOINT. HENRY REUTCHLER, Belleville, Ill. Filed Sept. 9, 1881. (No model.)

Claim.—1. In a vehicle having the usual covering and bows for supporting the same, the combination, with the brace-rods *e f*, of the right and left screw-rods *g h*, forming the outer brace-rods of the vehicle-top, and connected at their inner or screw-threaded ends with a coupling-sleeve, C, having a right and left screw-thread, and formed in a singe piece to made a rigid connection between the rods *g h*, substantially as and for the purpose set forth.

2. In a vehicle, the combination, with the brace-rods *e f* and rods *g h*, having right and left screw-threads, as shown, of the right and left screw-threaded coupling-sleeve C, having the plain extensions *l* at its ends, of such diameter as to receive the plain or unscrew-threaded portions of the rods *g h*, substantially as and for the purpose specified.

253,314. LATHE ATTACHMENT. HENRY RICHMANN, San Francisco, Cal. Filed Feb. 8, 1881. (No model.)

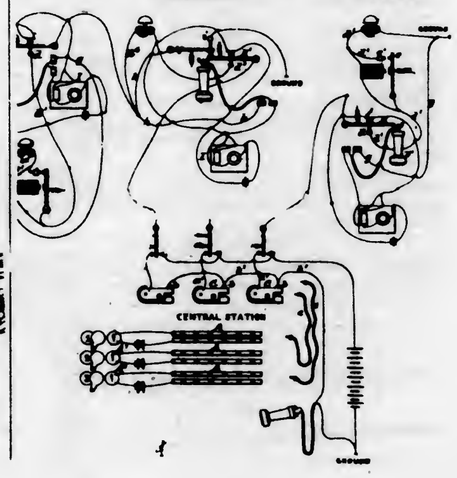


Claim.—1. In combination with the tool-spindle J, with its bevel-gear wheel L turning in the sleeve or box K, which is supported and adjusted upon a fixed standard, R, as shown, the swivel-arm M, turning loosely about the sleeve K and having the set-screw Q, said arm supporting the shaft carrying the bevel-gear O and pulley P at right angles with the tool-spindle, so that it may be fixed at any point radially around the tool-spindle, substantially as and for the purpose herein described.

2. The fixed standard R, slotted at T, and the sleeve K, within which the tool-spindle J revolves, as shown, in combination with the disk *u*, having a projection or lug to fit the slot T and a threaded portion to receive the nut S, and the disk *v*, having a bolt passing through the disk *u* and its projection, and threaded to receive the nut S', whereby a vertical adjustment or an angular adjustment about the bolt as a center may be made, substantially as herein described.

3. In combination with a lathe having the driving-pulley I, and the supplemental tool-carrying spindle J, turning in the sleeve K, which is supported and adjusted upon a standard, R, fixed to the movable rest D, the sliding tension-bar W, with the counter-balance Z, the pulleys Y, the pulley P, and the belt *b*, all combined and operating substantially as herein described.

253,315. FIRE-PLACE HEATER. GEORGE D. SANFORD, Peekskill, assignor of one-half to Watson Sanford, Brooklyn, N. Y. Filed Dec. 5, 1881. (No model.)



Brief.—Openings between projections on the frame of the heater permit the passage of hot air from behind the same.

Claim.—An extension-frame, *e*, constructed with a series of open spaces, *e*, in combination with the division-plate *f* and the casing of a fire-place heater, substantially as and for the purpose described.

253,316. TELEPHONE-EXCHANGE SYSTEM AND APPARATUS. GEORGE E. SCOTT, Brooklyn, N. Y., assignor to Eugene F. Phillips, Providence, R. I. Filed Feb. 17, 1880.

Brief.—Subscribers' lines having high resistance at their distant terminals are connected at central office to a common ground-line, including a telephone. Switch apparatus is provided for making connections between subscribers and breaking their ground-connections. The horizontal bars of the switch-board are connected in pairs through a battery and a signaling device, which shows when the circuit is closed and a current is on the line. A suitable electro-magnetic switch at subscriber's station is operated from the central office to cut out the high resistance and give a calling-signal.

Claim.—1. In a telephonic exchange system, a series of independent subscribers' wires or circuits, all branching out from and normally in connection with a receiving-instrument at a central office, but adapted to prevent the currents, or a too great portion thereof, from being diverted from the circuit through said central instrument into the branch circuits not in use, and provided with apparatus to receive and enable signals to be made from said central office.

2. In a telephonic exchange system, a series of closed circuits centering in and passing through a single central instrument, and resistance in the said circuits, to confine the electric currents, or the main portion thereof, in the circuit passing through said central instrument.

3. In a telephonic exchange system, a series of circuits, all uniting and passing through a single central instrument and adapted to confine the main portion of the current to the circuit passing through the central instrument, combined with electric switches adapted to be operated from the central office to close the distant end of said circuit through a suitable connection to ground, to enable the usual signals to be operated on any of the circuits from central office.

4. The combination, substantially as hereinbefore described, of a series of wires for telephonic communication with one or more subscribers on each, and radiating from a single ground-wire at a central station, with a listening-telephone connected with said ground-wire and a high resistance near the outer terminus of each subscriber's wire.

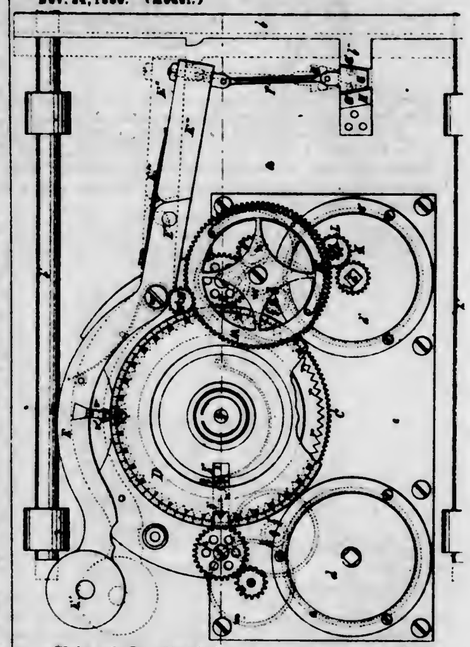
5. A telephonic exchange system embodying, substantially as hereinbefore described, a series of subscriber's wires, a telephone, a high resistance, and a signaling apparatus at the outer terminus of each wire, and a central station having a ground-wire and a listening-telephone common to all of the subscribers' wires, in combination with a suitable battery or its equivalent and means for applying the electric power thereof to any and all of the subscribers' wires for overcoming the high resistances thereon and operating the calling-signal.

6. The combination, substantially as hereinbefore described, of a series of telephonic subscribers' wires radiating from a central station, and provided in each case with a subscriber's calling apparatus located near the outer terminus of the wire and between a high resistance and ground, with means at the central station for attaining an electric power to overcome said high resistances and means for applying said power to any and all of the wires in the series for operating subscribers' signals.

7. In a telephonic exchange system involving a series of subscribers' wires or circuits branching from a ground-wire common to all the subscribers' wires, a high resistance located near the end of each subscriber's wire, as and for the purposes specified.

8. In a telephonic exchange system involving a series of subscribers' wires or circuits branching from a ground-wire common to all of them, a calling-signal near the outer end of each subscriber's wire, a high resistance, and a relay operating as a switch for cutting out said resistance, as and for the purposes specified.

9. On a telephonic line-wire provided at its outer terminus with a high resistance, the combination of a spring switch-lever maintained in a depressed position by the weight of a telephone thereon, and a switch to ground, which is automatically controlled by the switch spring-lever when loaded with or released from the weight of the telephone, substantially as described.



10. At a central station in a telephonic exchange system, the connecting-bars, constructed in pairs, coupled together and to a battery, substantially as described, whereby the power of said battery is placed on any two subscribers' wires when coupled by the connecting-bars, as set forth.

11. A battery and electric indicator combined, in substantially the manner described, with means, such as connecting-bars and conducting-cords, for connecting subscribers' lines with each other, so that in connecting said lines by the aforesaid means the electric indicator and battery are included in the circuit, as set forth.

12. The combination, with subscribers' lines having each a high resistance at the end and a telephone-switch of ordinary or suitable construction for cutting out the said resistance and connecting in the telephone, of a battery, an electric indicator, and means—such as connecting-bars and conducting-cords—for connecting subscribers' lines, said indicator and battery being connected with the said means, as indicated, so that when the subscribers' lines are connected with each other the battery and electric indicator are included in circuit, substantially as described.

12. The combination, with a series of line-circuits and a central-office instrument normally connected with said lines and common to the series, of a switch-board provided with means for connecting said lines with each other and for disconnecting them from said instrument, substantially as described.

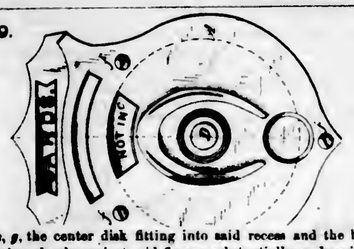
253,317. TIME-LOCK. SUMNER SHAW, Boston, Mass. Filed Nov. 24, 1880. (Model.)

Claim.—1. In a time-lock mechanism for safes, the disk-operating gear-wheel C, with its V-shaped teeth *r r r*, combined with its concentrically-arranged index-disk D, having notch *e*, sliding block *t*, and locking-projection *t'*, and the lever E, with its projection *v*, as set forth, by which the index-disk D may be disconnected from the disk-operating gear-wheel C by drawing the block *t* toward the center or automatically by the action of the lever E, as described.

2. The combination of the jointed lever E, its projection *v*, index-disk D, its notch *e*, the stationary block H on the door *a*, the movable wedge G, attached to and operated by the lever E, to effect a lock between the stationary block H and the bolt-work of the safe when the door is shut and the bolts thrown in, as described.

3. In a time-lock mechanism, the gear-wheel M, actuated by the driver *d'*, and having a segmental gear-ring, M', attached to its face, to engage with the small pinion N upon shaft N', in combination with wheel O, having projections O' upon the opposite end of said shaft, striker S, and connecting mechanism, whereby the bell-alarm T is actuated to the running down of driver *d'*, as set forth.

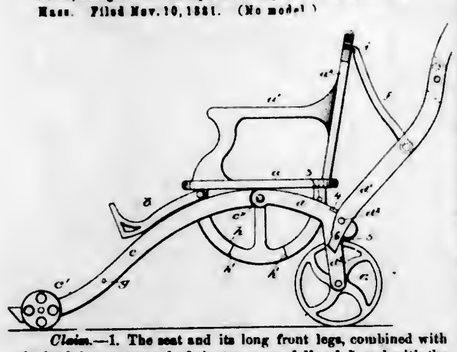
253,318. CAN. JOSEPH SIMPSON, Columbus, Ohio, assignor of one-half to William A. Gill, same place. Filed Dec. 19, 1881. (No model.)



Claim.—The combination, in a can or jar, of the arched top *a*, having upright flange *b*, the convex lid or cap B, having a slight flat horizontal flange, *c*, the packing *c*, and the coiled spring-fastening C, of the form shown, coiled at its center, bearing at one or more points upon the lid and hooked on one side of the top *a* to ear *d*, with the other end curved and held in latch or clasp *d'* on the opposite side of the top, substantially as described.

253,319. INDICATOR. WILMOT STEPHENS, Binghamton, N. Y. Filed Nov. 23, 1881. (Model.)

Claim.—1. In a business-indicator and card-holder, the combination of the front plate provided with an annular recess, *c*, and

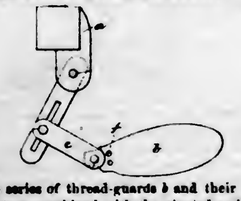


253,319.

a flange, *g*, the center disk fitting into said recess and the back plate fitting closely against said flange, substantially as described.

2. In a business-indicator and card-holder, the combination of the two plates A B, the front one provided on its back with a circular flange and the back one fitting flatly against said flange and extending above the front plate to form the card-holder, substantially as described.

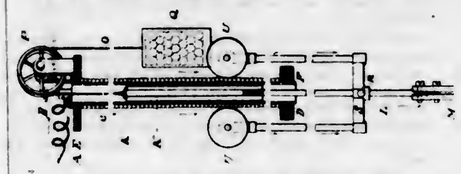
253,320. CHILD'S CHAIR. ASHER B. STEVENS, Stapleton, N. Y., assignor to Thompson, Perley & Waite, Baldwinsville, Mass. Filed Nov. 10, 1881. (No model.)



Claim.—1. The seat and its long front legs, combined with the back legs composed of the two parts *d d*³ and *d'*, and with the wheels *e*, the portions *d*³ of the parts *d* of the rear legs carrying the wheels *e*, while the portions *d'* of the said rear legs are pivoted with relation to the portions *d*, as described, to be turned up for a handle when the seat is lowered for a carriage, substantially as set forth.

2. The long front legs, *c*, and the wheel-carrying parts *d d*³ of the rear legs, and parts *d'*, pivoted thereto at *d*³, combined with the brace *f*, pivoted to the rear legs, whereby it is adapted at times to be engaged with the front legs to keep the front and back legs together for a high chair, and at other times to be engaged with the back or other fixed part of the seat or chair, substantially as described.

3. The part *d d*³ of the rear leg, provided with the stops 4 5, combined with the part *d'*, pivoted at *d*³, and having the short end 6 to engage the said stops, substantially as shown and described.



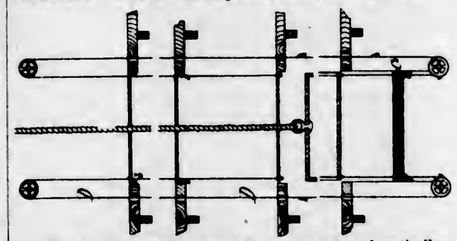
253,321. THREAD-GUARD FOR SPINNING-MACHINES. HORACE E. SWIFT, Hopedale, Mass., assignor to George Draper & Sons, same place. Filed Sept. 6, 1881. (No model.)

Brief.—The intermediate thread-guards of the series are carried by rods, which are supported by the end guards, which in turn are supported by jointed arms or levers, whereby the entire series of thread-guards may be adjusted horizontally or vertically, or in a direction the resultant of both, when desired.

Claim.—The series of thread-guards *b* and their connecting-rods *f* and brackets *a*, combined with the pivoted or jointed arms or levers, whereby the thread-guards may be adjusted vertically or horizontally, as described, or in a direction the resultant of both, to thus place the thread-guards in the described position with relation to the bobbins or their spindles, for the purpose set forth.

253,322. ELECTRIC LAMP. WILLIAM H. THOMAS, Cincinnati, Ohio, assignor of one-half to Samuel W. Skinner, same place. Filed Oct. 27, 1881. (No model.)

Claim.—1. In combination with an electro-magnetic helix, connected at one end with the positive wire from the generator, and constituting the terminus thereof, one or more conductors which travel on naked tracks on the external peripheries of the convolutions of the helix, and have electrical connection with the positive electrode and mechanical attachment to the suction-core, substantially as set forth.



2. In combination with an electro-magnetic helix that constitutes the terminus of the positive wire from the generator, one or more conductors which travel upon naked tracks on the peripheries of the convolutions and have electrical connection with the positive electrode, and direct mechanical attachment, by means of adjustable fastening R, to the suction-core, substantially as set forth.

3. In the described combination, the stationary negative electrode J, of refractory metal, the stationary electro-magnetic coil or helix C, constituting the terminus of the positive rheophore, the positive electrode N, and one or more conductors, U, that traverse naked tracks *e* on the peripheries of the coil-convolutions, and which have electrical connection with the positive electrode and direct mechanical attachment to the suction-core, substantially as set forth.

4. In combination with the electro-magnetic helix C *e*, shifting conductor U, positive electrode N, and suction-core K, the adjustable counterpoise O P Q, substantially as set forth.

253,323. AUTOMATIC ELEVATOR-HATCH. HARRIET R. TRACY, New York, N. Y., assignor to Benjamin T. Babbitt, same place. Filed June 3, 1881. (No model.)

Brief.—The series of hatches above and below the car are connected to and operated by endless bands passing over pulleys and attached to the car or to independent operating mechanism. Suitable stops for the hatches are placed on the endless bands. The lowest hatch above the car is adjustable on the hoisting-cable.

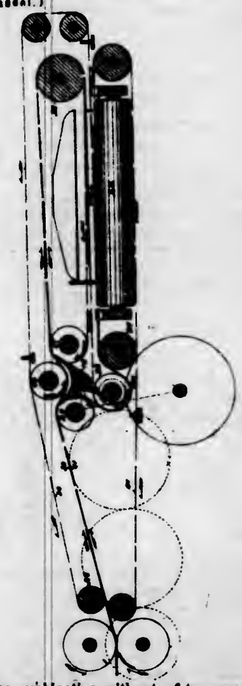
Claim.—1. In an elevator-shaft, the two series of vertically-moving hatches, one above and the other below the car, adapted to close the openings in each floor as the car passes either up or down, the two series being connected by a chain or cable passing over suitable pulleys in the region of the top and bottom of the shaft, substantially as and for the purposes set forth.

2. In an elevator-shaft, the two series of vertically-moving hatches, one above and the other below the car, adapted to close the openings in each floor as the car passes either up or down, the two series being connected by a suitable chain or cable passing over pulleys or wheels, said chain or cable being provided with blocks or stops which determine the location and movement of the hatches in the lower series, substantially as shown and described.

3. In an elevator-shaft, the two series of vertically-moving hatches connected by an endless band or cable having suitable stops or blocks, and running over suitable wheels or pulleys in the region of the top and bottom of the shaft, substantially as shown and described.

4. In an elevator-shaft, the two series of vertically-moving hatches connected by an endless band or cable having suitable stops or blocks, and running over upper and lower pulleys, as explained, the two series being unconnected with the car, and capable of being operated in the manner and for the purposes set forth.

5. In combination with the hatch above the car connected with those below the car by a suitable chain or cable, the adjustable stop located upon the elevator-cable, as and for the purposes set forth.

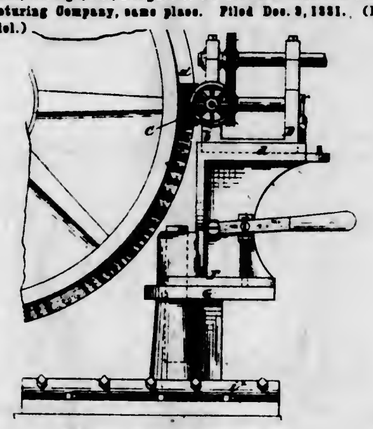


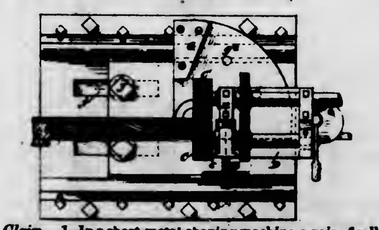
253,324. CARBON-HOLDER FOR ELECTRIC LAMPS. JOHN THOMSON, New York, N. Y., assignor to the United States Electric Lighting Company, same place. Filed Jan. 10, 1881. (No model.)

Claim.—1. The combination, with the lower carbon pencil of an electric lamp, of the flexible or expanding jaws *e*, resting in a tapering socket, *a*, and adapted to clamp the carbon and to be drawn down into the socket by means of a screw-rod and nut, substantially as described.

2. In combination with the socket and griping-jaws of a carbon-holder, a screw-rod for drawing the jaws down into the socket, and adapted to be pushed up between the jaws for displacing the ends of the carbons retained thereby.

253,325. SHEET-DELIVERY APPARATUS FOR PRINTING-MACHINES. STEPHEN D. TUCKER, New York, N. Y. Filed June 28, 1880. (No model.)



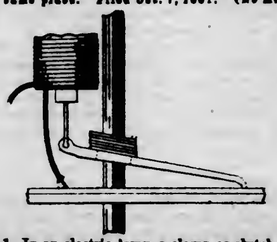


Claim.—1. The combination, with sets of tapes properly sustained so as to constitute two paths of travel for the sheets, and provided with an entrance-point between rollers, as 40 20, of a switching device for directing sheets alternately into said paths of travel, whereby successive sheets are superposed in said pathways, and a detaching device for removing said sheets, all substantially as described.

2. The combination of the cylinder 50 and the devices with which it is supplied, whereby the sheets are primarily acted upon, with sets of tapes properly sustained so as to constitute two paths of travel, and provided with an entrance-point between rollers, as 40 20, a switching device for directing sheets alternately into said paths of travel, and means for removing said sheets simultaneously therefrom, all substantially as described.

3. The combination, with sets of tapes properly sustained so as to constitute separate long and short paths of travel leading from the same, and sheet-conducting devices whereby successive sheets are superposed, of a folding mechanism for delivering said sheets simultaneously as a single product, substantially as described.

253,326. SHEET-METAL-SHAPING MACHINE. ISAAC VAN HAGEN, Chicago, Ill., assignor to the Adams & Westlake Manufacturing Company, same place. Filed Dec. 3, 1881. (No model.)



Claim.—1. In a sheet-metal-shaping machine, a pair of rollers, C C', and a rotary chuck, combined and operating substantially as set forth.

2. In a sheet-metal-shaping machine, a pair of rollers, C C', a rotary chuck, and rotary bed-piece F, combined and operating substantially as set forth.

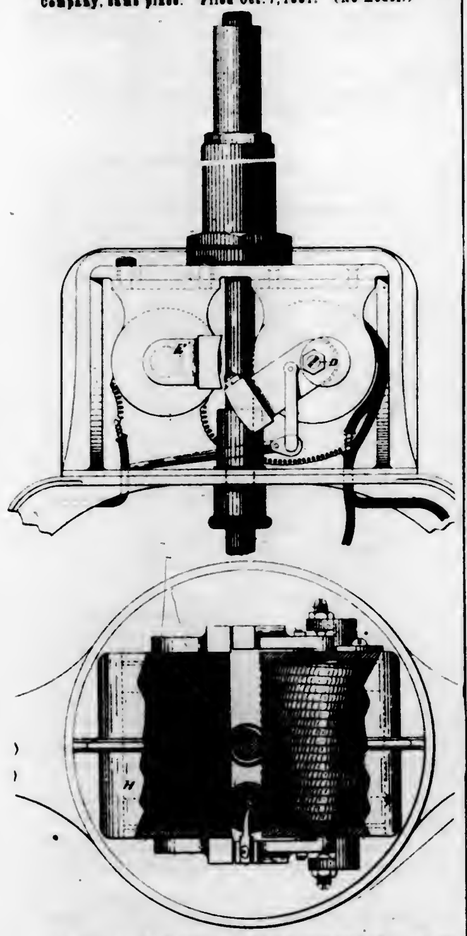
3. In a sheet-metal-shaping machine, a pair of rollers, C C', a rotary chuck, and sliding frame D, combined and operating substantially as set forth.

4. In a sheet-metal-shaping machine, a pair of rollers, C C', a rotary chuck, sliding frame D, and rotary bed-piece F, combined and operating substantially as set forth.

253,327. ELECTRIC LAMP. ADDISON G. WATERHOUSE, New York, N. Y., assignor to the United States Electric Lighting Company, same place. Filed Oct. 7, 1881. (No model.)

Claim.—1. In an electric lamp, a clamp or clutch composed of two or more superposed perforated plates surrounding the carbon-carrier, and adapted to gripe and move the same, substantially as described.

2. The combination, in an electric lamp, with a rod or tube constituting the carbon-carrier, of a clutch composed of two or more superposed perforated plates surrounding the said rod, and mechanism for moving the plates, as and for the purpose set forth.



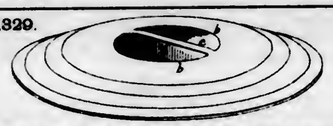
253,328. ELECTRIC LAMP. ADDISON G. WATERHOUSE, New York, N. Y., assignor to the United States Electric Lighting Company, same place. Filed Oct. 7, 1881. (No model.)

253,329.

Claim.—In a sled, the combination, with the cross-bars *a*, side rails, *b*, and seat-board *c*, of the metallic arches *f'*, the side bars, *f*, turned horizontally outward at the top, and the T-iron runners A, the said arch-bars and side bars being riveted together and to the

253,385.

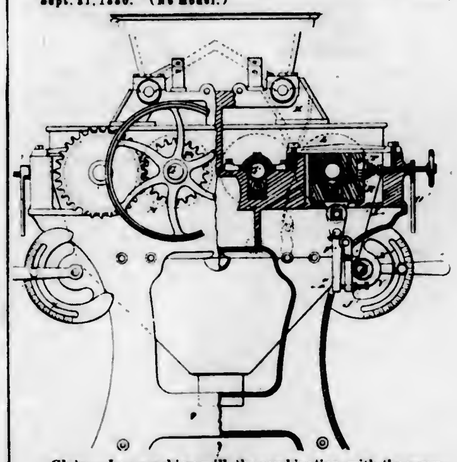
253,328. ELECTRIC LAMP. ADDISON G. WATERHOUSE, New York, N. Y., assignor to the United States Electric Lighting Company, same place. Filed Oct. 7, 1881. (No model.)



Claim.—1. In an electric lamp, the combination, with the feed-controlling mechanism, of a fixed and pivoted electro-magnet, each containing a single core, with pole-pieces extending at right angles therefrom, one of said magnets being included in the main or lamp circuit and the other in a shunt or derived circuit, substantially as and for the purpose set forth.

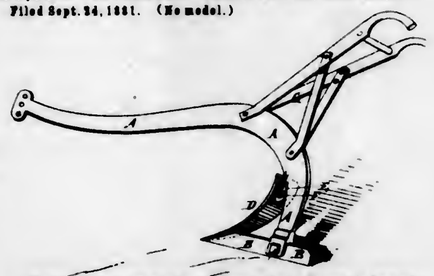
2. In an electric lamp, the combination of a fixed electro-magnet, composed of a helix and core, with right-angled polar extensions, with a similarly-constructed electro-magnet connected with the feed-controlling mechanism and pivoted in such a manner that its polar extensions may swing in face of those of the said fixed magnet, one of said magnets being included in the lamp-circuit, the other in a shunt or derived circuit about the lamp, as set forth.

3. The combination, in an electric lamp, with the feed-controlling mechanism, of a fixed electro-magnet composed of a single helix, and a core having right-angled polar extensions, and an electro-magnet composed of a stationary helix and a core capable of rotation therein, and provided with right-angled polar extensions, one of said magnets being included in the main or lamp circuit, the other in a shunt about the lamp, substantially as and for the purpose set forth.



253,329. EARTHENWARE COVER AND HANDLE. CHARLES S. WATKINS, Davenport, Iowa. Filed Nov. 14, 1881. (No model.)

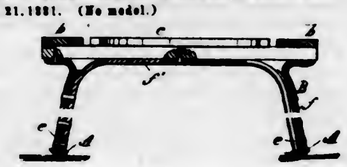
Claim.—1. An earthenware cover or lid provided with the cavities *b b* and the partition *c*, forming the handle molded on and with the cover, substantially as described.



2. The mold B, provided with the convexity *d*, having the groove *d'*, for forming the upper side of an earthenware cover and the handle thereon, substantially as described.

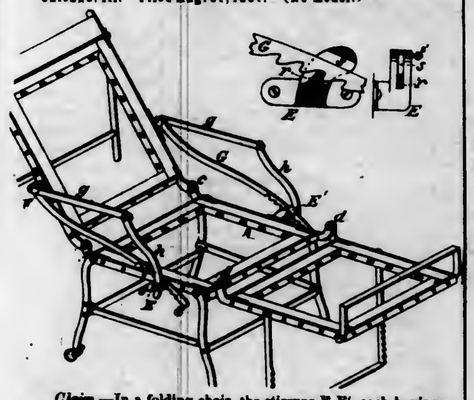
253,330. ROLLER-MILL. JEAN WEBER, Uster, Switzerland, assignor to John Feichter & Sons, Minneapolis, Minn. Filed Sept. 21, 1880. (No model.)

Claim.—In a crushing-mill, the combination, with the movable journals R, of the lever F', the arm H', pivoted thereto, the adjusting-screw J', and the eccentrics K', substantially as herein shown and described, and for the purpose set forth.



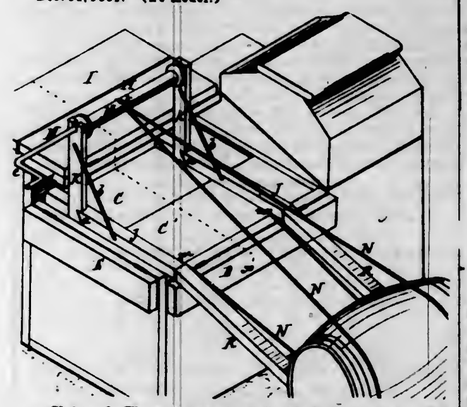
253,331. SHOVEL-PLOW. GEORGE S. ACRE, Mint Hill, No. Filed Sept. 24, 1881. (No model.)

Claim.—1. In a shovel-plow, the curved plow-beam A, formed, as described, with a slotted lower end and with the inclined lug E, substantially as and for the purpose set forth.



2. In a shovel-plow, the combination, with the beam A, having its lower end slotted and provided with the inclined lug E, of the shovel D, secured at its upper part to the said lug and welded along the center line to the beveled forward end of the bar B, secured in the slotted end of the beam, substantially as and for the purpose set forth.

253,332. SLED. CHARLES M. AMSDEN, Wooster, Ohio. Filed Oct 21, 1881. (No model.)

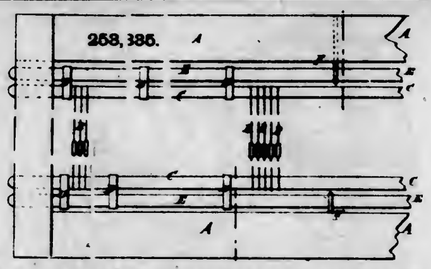


Claim.—In a sled, the combination, with the cross-bars *a*, side rails, *b*, and seat-board *c*, of the metallic arches *f'*, the side bars, *f*, turned horizontally outward at the top, and the T-iron runners A, the said arch-bars and side bars being riveted together and to the rib *e* of the runners, as shown and described.

253,333. FOLDING INVALID-CHAIR. WILLIAM ARMSTRONG, Chicago, Ill. Filed Aug. 31, 1881. (No model.)

Claim.—In a folding chair, the stirrups E E', each having a slot, *s*, and interior stud, *s'*, at the bottom of said slot, and provided with an exterior pin, *s'*, in combination with the seat and the back frames, the arm-rests *g h*, and the ratchet-arms G G, the said arm-rests being pivoted to the said stirrup-pins *s'* and at the back to the pivot-connections of said ratchet-arms, as shown and described.

253,334. OIL-TANK. JOHN D. ARNOLD, Holley, N. Y. Filed Dec. 12, 1881. (No model.)



Claim.—1. The casing constructed with the hinged covers H I and the hinged front and end pieces, D E, arranged, as described, so that when turned backward and downward they leave a flat and unobstructed space on top of the case to receive a barrel when rolled thereon, as herein shown and described.

2. In combination with the casing having an upper portion capable of being opened and closed, the knockdown elevator consisting of the cross-bars J J, standards K K, braces *b b*, windlass M, rope or cable N, and skids E E, the parts being of dimensions to be inclosed in the upper portion of the casing, substantially as described.

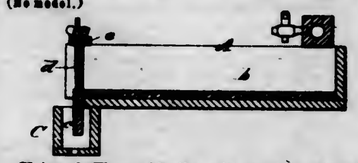
253,335. HEDDLE-FRAME. JOHN ASHWORTH, Wetherodville, Md. Filed July 2, 1881. (No model.)

Brief.—The bars on which the heddles are strung are connected by links to outer bars suspended by hooks or eyes from the top and bottom of the frame. The side bars of the frame are made double or slotted for the passage of the heddle-supporting bars.

Claim.—The combination, with the frame A, having slotted side bars, the heddles B, and the heddle-bars C, of the bars E, arranged between the said frame and heddle-bars, the links D, and

the hooks or eyes F, whereby the heddle-bars are prevented from bending and twisting and the heddles rendered easily changeable, substantially as shown and described.

253,336. HORSE-POKE. FRANKLIN P. ATHEY, Middleway, W. Va., assignor to himself and Benjamin C. Roberts, same place. Filed Aug. 30, 1881. (No model.)



Claim.—1. The reach B, formed with the slot *a*, in combination with the frame C and the bow A, substantially as and for the purpose specified.

2. The frame C, pivoted to the bow below the pivot *a'*, upon which the reach is pivoted, in combination with the slotted reach and the bow, the reach being formed with a rear extension, substantially as and for the purpose set forth.

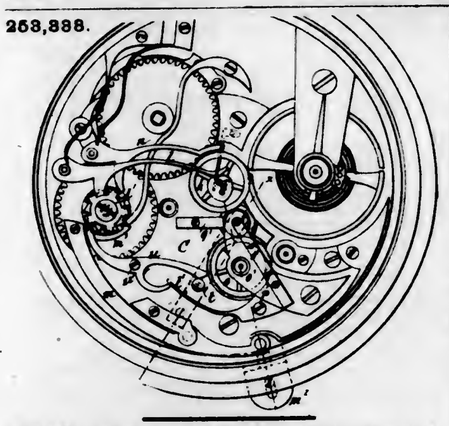
3. The reach B, formed with the slot *a*, and provided with the spring *f*, in combination with the frame C, pivoted in the bow below the pivot of the reach, substantially as and for the purpose set forth.

253,337. APPARATUS FOR THE MANUFACTURE OF STARCH. ANTHONY ATKINSON, New York, N. Y. Filed Sept. 15, 1881. (No model.)

Claim.—1. The combination, with starch-troughs, of adjustable gates or dams, substantially as shown and described.

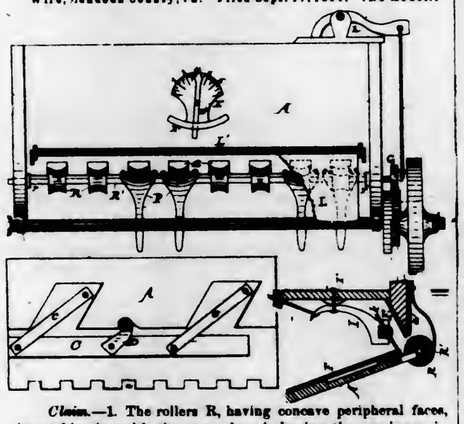
2. The adjustable gates *c*, combined with trough A, substantially in the manner and for the purposes set forth.

3. The combination of trough A, spout C, sliding gates *c*, and adjusting-screws *d*, substantially as shown and described, for the purpose specified.



253,338. STOP-WATCH. CHARLES H. AUDEMARS, Brassus, Switzerland. Filed June 23, 1881. (No model.)

Claim.—1. In a stop-watch, the combination, with the arbor *p*, which carries a fixed pinion, *r*, and a spring-supported loose pinion, *q*, of the two springs *r' s'*, of unequal power, and arranged to bear upon opposite ends of said arbor, whereby the pinions are forced out of connection by a strong spring and into connection by a weak spring, for the purpose specified.



2. The loose pin *t*, bevel-ended and protruding through plate C, the lever *u*, pressed by a spring, *s'*, and the ratchet-wheel *t'*, movable by a stem, m^2, in combination with the spring *r'*, arbor *p*, and spring *s*, the spring *s* being weaker than the spring *r'*, whereby the weak spring *s* is allowed to raise the arbor *p* and wheel *r*, as described.

3. In stop-watches, the combination, with the pinion *k* on arbor *s* and the second-hand pinion on arbor *s'*, of the loose pinion *q* and fast pinion *r* on the same vertically-movable arbor *p*, the former gearing with pinion *o* and the latter with pinion *k*, said pinions *r q* having respectively pin and teeth on their opposite faces, as and for the purpose specified.

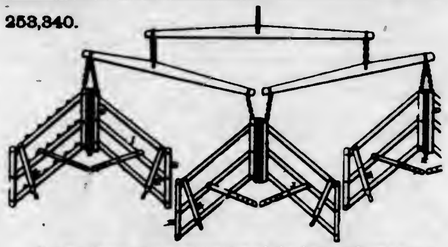
253,838.

253,839. FERTILIZER-DISTRIBUTER FOR GRAIN-DRILLS. GIDEON D. BAKER, Lovettsville, assignor of one-half to George Wire, Loudoun County, Va. Filed Sept. 17, 1881. (No model.)

Claim.—1. The rollers R, having concave peripheral faces, in combination with the guano-box A, having the openings *a* in the lower rear corner, said rollers being mounted on a shaft outside of said corner, and extending flush with or a little beyond the inner line of the box, substantially as set forth.

2. The combination of the slide C, links *e e*, and operating-lever D, shaft D′, hand-lever D², and spring *d*, forcing one end of the lever D² outward, with the ratchet E′ mounted outside of the lever D², the latter being adapted to be released from the ratchet by pressing down the spring end of it, as set forth.

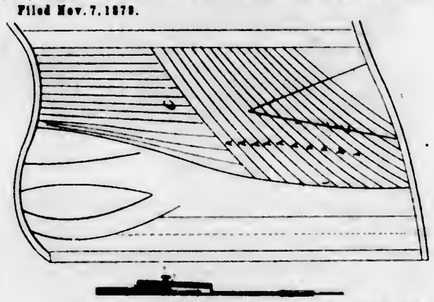
3. The dial E, formed into the journal-box *e*, and having the ratchet E′ formed on the under side of an elevated portion, in combination with the lever D², shaft D′, and with the spring *d*, forcing the lever D² into engagement with the ratchet, as set forth.



4. The guano-box described, cut away in the back to receive the slide and its operating-links, and having a sloping bottom formed on the wood, and a feather-edge, *a′*, at the point where the rollers revolve, and having the lining F, covering the entire interior of the box, lying over the slide and attachments, and also having the openings *a* in the rear corner provided with the metal boxes *a²*, forming with the lining F a complete metal cover for the port *a′*, substantially as set forth.

253,840. HARROW. JAMES M. BARLEY, Sedalia, Mo. Filed July 28, 1881. (Model.)

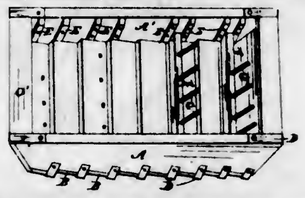
Claim.—1. The combination of an equalizing-draft attachment, substantially as set forth, with six sections of harrow-frames, the harrow being connected together in pairs, substantially as shown.



2. In a harrow, the combination of a set of rigid teeth which are adapted to run between the rows and a set of elastic spring-teeth which are intended to run directly upon the growing plants, substantially as set forth.

253,840.

3. In a harrow, the combination of the harrow-frame carrying rigid teeth with one or more bars placed at any suitable angle thereto, and provided with a series of elastic spring-teeth, substantially as specified.

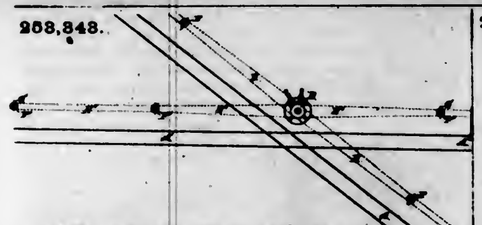


253,841. CORSET. ISAAC W. BIRDSEYE, Birmingham, Conn. Filed Nov. 7, 1879.

Claim.—1. In a corset, a pocket formed in the clasping-edge by turning a part over onto itself, and so that said pocket will receive the steel *b*, combined with a second pocket stitched upon the folded-over portion of the first pocket, then turned back and stitched to the first part, and so as to form a pocket overlapping the first pocket, and form a pocket for the second steel, *c*, overlapping the first, and secured by the stitching of the second pocket upon the first, substantially as described.

2. In a corset, the hip-section constructed with a series of stays, *h*, running diagonally from the rear edge of said section downward and forward over the hip-gore, and vertical stays arranged above said diagonal stays, substantially as described.

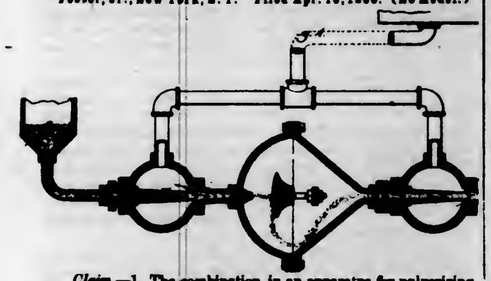
253,842. COMBINED HARROW AND PULVERIZER. JACOB BLESSING, Bloomdale, Ohio. Filed Dec. 16, 1881. (No model.)



Claim.—In a harrow and earth-packer, the combination of the notched side A, provided with guides for the reception of the tooth-bars, and cross-pieces B, seated in the notches of the sides A, and having a metallic strip or plate, D, as and for the purpose set forth.

253,843. SAFETY-SIGNAL FOR RAILWAYS. PETER C. SOUCK, Pittsfield, Mass. Filed June 16, 1881. (No model.)

Brief.—The targets of each series of signals pertaining to different lines of track, where the lines cross each other, are operated simultaneously from a given point, but are capable of independent movement when desiring to block both lines for any reason.



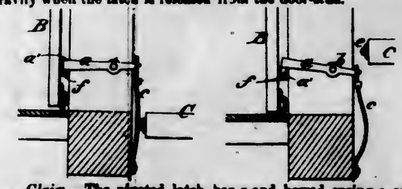
Claim.—1. In a safety-signal for the crossing-points of different railway-tracks, the combination, with a central operating-station, as herein described, of several series of connected signal-targets adapted to receive a simultaneous changing movement by a positive motion imparted to them from the said central station, as herein set forth, each of the several series of targets being exclusively appropriated to a line of tracks running parallel with that particular line of targets, but all the targets being connected to move conjunctively, as and for the purpose herein specified.

253,843.

2. In a safety-signal apparatus, the combination, with a sleeve, *b′*, provided with a lever, D, of the sleeve *b²*, surrounding the sleeve *b′*, and provided with a lever, D′, both of said sleeves being supplied with appliances for moving different lines of signals, as herein described, and adapted to move conjunctively as one piece, or separately, as and for the purpose specified.

253,844. APPARATUS FOR PULVERIZING GRAIN, ORES, &c. LEWIS S. CHICHESTER, Jersey City, N. J., assignor, by direct and mesne assignments, to Charles G. Francklyn and William Foster, Jr., New York, N. Y. Filed Apr. 13, 1880. (No model.)

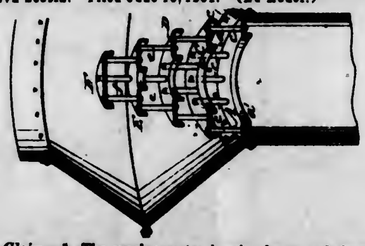
Claim.—1. The combination, in an apparatus for pulverizing grain, ores, and other materials, of a supply-pipe, a jet-pipe from which air under a high pressure is caused to issue, a target against which the material to be shattered is hurled, and a case surrounding the target and sufficiently close to the same to confine the air, and against which onto the materials are hurled by the current of air as they are deflected from the target, substantially as set forth.



2. In an apparatus for pulverizing grain and other material, the combination, with the supply-pipe, the jet-pipe, and the target, of a case around the target, against which the material is hurled as it is deflected from the target, and which case is contracted, and a second pipe, and jet-pipe, connected with the case and a second target, substantially as specified, whereby the material receives two or more shattering impacts in the apparatus, substantially as specified.

3. In an apparatus for pulverizing grain and other materials, the combination, with the supply-tube and jet-tube for air under a high pressure, of a convex target, against which the material is shattered and from which the said material passes freely as it rebounds, as set forth.

4. The combination, with the ejector and target in an apparatus for pulverizing grain and other materials, of a central support at the back of the target and a cross-bar for the same, substantially as set forth.

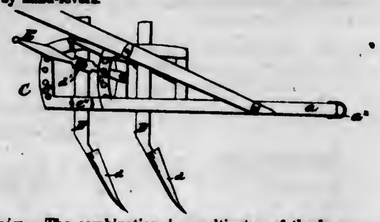


253,845. SELF CLOSING ELEVATOR-DOOR. THEODORE M. CLARK, Boston, Mass. Filed Nov. 1, 1881. (No model.)

Brief.—A lug on the elevator bears against a bowed spring on the door-frame, which tilts a latch, so as to engage a stud on the door and retain it in an open position. The sliding door closes by gravity when the latch is released from the door-stud.

Claim.—The pivoted latch-bar *a* and bowed spring *c*, combined with door B, having stud *f*, and platform C, having a lug or projection for contact with the spring, substantially as and for the purposes set forth.

253,846. SPARK-ARRESTER. GIDEON S. COOK, Windsor, Nova Scotia. Filed June 13, 1881. (No model.)

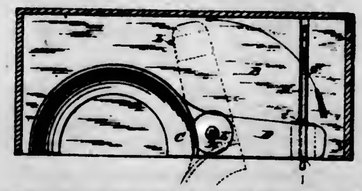


Claim.—1. The spark-arrester herein shown and described, composed of the series of annular flanged plates of gradually-diminishing diameter secured in the stack and supported upon posts one above the other, the whole being surmounted by the solid plate F, all constructed and arranged substantially as shown and described.

2. The annular plates C, D, and E, formed with downwardly-projecting flanges, in combination with the flanged plate A and the flanged solid plate F, said plates being arranged one above the other and supported upon posts, substantially in the manner and for the purposes herein described.

253,847. PLOW. FRANCIS E. COOPER and JOHN LEHNER, Colerain, Ohio. Filed Dec. 14, 1881. (Model.)

Brief.—The standards are adjustable vertically in guides, and are held by hand-levers.

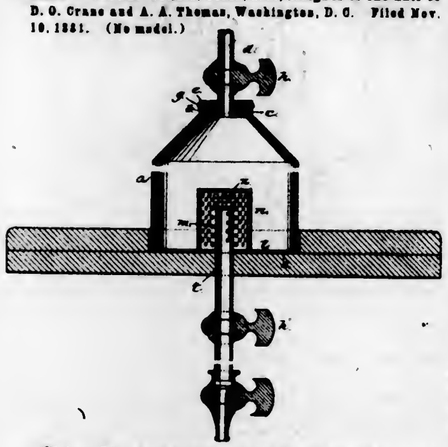


Claim.—The combination, in a cultivator, of the beams *a*, frames C, with perforated sides *c²*, and sockets *c′*, the lever E, having slots *e* and studs *d′*, the pin and spring *d′ d²*, and standard D, substantially as shown and described.

253,848. REVOLVING BOOT-HEEL. WILLIAM CRAIG, Jamestown, N. Y. Filed July 26, 1881. (No model.)

Claim.—The combination, in a revolving heel for boots or shoes, of the stationary part B, having the central recess, *f*, and chamber *a*, spindle D, having the top plate, E, provided with the central lug, F, and notched bottom cross-head, G, and revolving part C, attached permanently to the spindle D, substantially as and for the purpose herein shown and described.

253,849. STORE-COUNTER SEAT. ANDREW J. CULBERTSON, San Andreas, Cal. Filed May 31, 1881. (Model.)



Claim.—In a store-counter, the combination of a seat, B, pivoted on the shaft H, and provided with arm D, the case E, carrying a coiled spring, G, attached at one end to said shaft, the stop I, and the spring-lever J, having shoulders *i i*, substantially as shown and described.

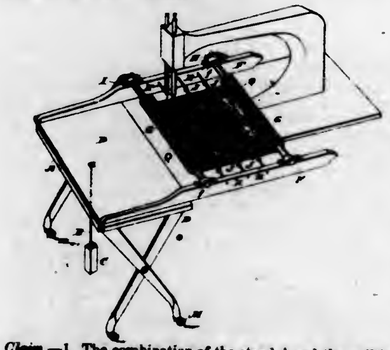
253,850. INEXTINGUISHABLE SELF-IGNITING SIGNAL.

253,853. FRUIT-SQUEEZER. WILLIAM B. DEAN, New York.

253,350. INEXTINGUISHABLE SELF-IGNITING SIGNAL-LAMP. THOMAS CURTIS, Ocala, Fla., assignor of one-half to D. O. Crane and A. A. Thomas, Washington, D. C. Filed Nov. 10, 1881. (No model.)

Claim.—The air-tight lamp-body *a*, having the screw-neck *b*, packing *g*, screw-burner *d*, and stop-cock *h* at its upper end, and at its lower end the downwardly-extending inlet-tube *k*, its perforated upper end, *m*, within the receiver, the perforated inclosing-wall *n* of the chamber *z* around said end, and the lower stop-cock, *h'*, substantially as specified.

253,351. ORNAMENTAL CHAIN-LINK. SALOMON DAVIDSON, New York, N. Y. Filed Dec. 7, 1881. (No model.)



Brief.—The link has recesses formed at its ends. Collars embrace the link and fit into recesses. An ornamental plate may be secured to the link by said collars.

Claim.—1. In a chain-link, the tube having recesses *a* at its ends, with one or more collars embracing the tube and fitting in said recesses, substantially as described.

2. The combination, in a chain-link, of the tube A, having at its ends the collars *b*, fitted into recesses in the tube, and an ornamental plate arranged upon the exterior of the tube and engaging at its ends with the said collars, substantially as described.

253,352. QUILTING-FRAME. HENRY T. DAVIS, Sherman, Tex. Filed Mar. 31, 1881. (Model.)

Claim.—1. The combination of the stand A and the quilting-frame movable thereon, having board D, arms F, and rollers G G', substantially as described.

2. The combination of a stand, A, the quilting-frame having board D, arms F, and rollers G G', the cord B, and the weight C, substantially as set forth.

3. The combination of the stand A, pivot-screw L, and the quilting-frame having board D, arms F, and rollers G G', substantially as and for the purposes set forth.

253,353. FRUIT-SQUEEZER. WILLIAM B. DEAN, New York, N. Y. Filed May 10, 1881. (Model.)

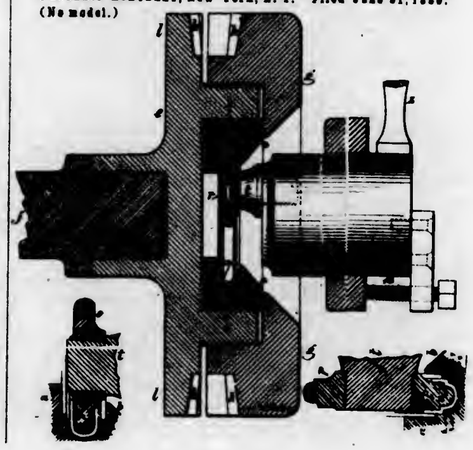
Brief.—The device is provided with handles parallel with each other, the lower handle being provided with legs at its extremities. The removable bottom die is provided with an upwardly-projecting flange, whereby the pulp is forced upon the top of said die.

Claim.—1. In a lemon-squeezer, the combination, with the upper handle, E, of the lower handle, G, running parallel therewith and having legs or standards H H, secured at its extreme end, whereby in squeezing a lemon the power of compression by the hand may be combined with pressure exerted upon the upper handle, substantially as shown and described.

2. A lemon or fruit squeezer constructed substantially as herein shown and described, consisting in the combination of the legs I H with the lower handle, G, provided with a frame, A, the juice-cup B, the removable die C, and the hinged handle E, provided with a stationary die D, as set forth.

3. In a lemon-squeezer, the combination, with the frame A, having ring or shoulder F, of a juice-cup, B, forming part of the squeezer and supporting a perforated die, substantially as herein shown and described, whereby the juice will be caught as it is expressed from the lemon and re-strained through the die by inverting the squeezer, as set forth.

4. In a lemon-squeezer, the removable bottom die, C, constructed with a projecting cutting-edge, P, around its top, substantially as herein shown and described, whereby the pulp is collected above the die, as set forth.



5. In a lemon-squeezer, the combination, with the frame A, having ring F, of the juice-cup B, having shoulders L M, and the separate die C, substantially as herein shown and described, whereby the said cup and die are connected with and supported by the said frame, as set forth.

253,354. PHOTOGRAPHIC PAPER. GEO. EASTMAN, Rochester, N. Y. Filed Dec. 19, 1881. (Specimens.)

Claim.—As a new article of manufacture, a package for photographers' use composed of sheets of sensitized photographic paper cut to suitable sizes, glued at their margins, provided with a suitable backing, and inclosed in a light-tight case or wrapper, substantially as and for the purposes described.

253,355. DEVICE FOR MAKING WATCH-CASE CENTRES. FREDERIC SCHUBERT, New York, N. Y. Filed June 21, 1880. (No model.)

Claim.—1. In a two-part die having offsets, annular flanges, and knurled surface for watch-case centers, a circular recess in one ring-die and a corresponding circular projection on the other ring-die, to prevent lateral movement of one die or the other, in combination with pins on one ring-die and holes in the other ring-die, as and for the purposes set forth.

2. In combination with the rings *a b*, forming a hollow die corresponding to the exterior of the watch-case center, the chuck *c*, having a recess for the rings *a b*, and the ring *g*, screwed upon the outside of the chuck and clamping the rings *a b* together, as set forth.

3. The chuck *c*, having teeth *h* and dies *a b* jointly with toothed ring *g*, screwed upon said chuck and pinion *m*, substantially as described.

4. The method herein specified of manufacturing watch-case centers, consisting in clamping a hollow sheet-metal ring between two ring-shaped dies, rolling the metal out into the knurled portion of the die to form the largest portion of the watch-case center first, then spreading the metal outwardly by a second roller to form the annular offsets or shoulders for the lids, substantially as set forth.

5. The method herein specified of manufacturing watch-case centers, consisting in clamping a hollow sheet-metal ring between two ring-formed dies, rolling the metal outwardly into the die by one roller to form the largest or knurled portion of the watch-case center, then spreading the metal outwardly by a second roller to form the offsets or shoulders for the lids of the case, and then spreading the metal outwardly by a third roller to form the annular offsets or shoulders for inner lid and ring of the glass, substantially as set forth.

6. In the manufacture of watch-case centers, the combination, with the hollow die that corresponds to the exterior surface of the center, of a roller corresponding to the interior surface of the watch-case center and having a groove at 10 to form the rib upon which the plate of the watch-works rests, substantially as specified.

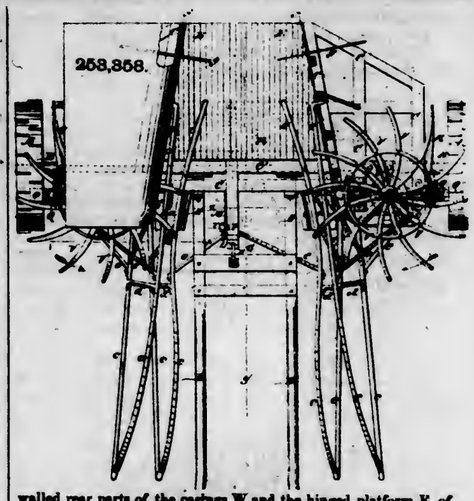
7. The combination, with the die *a b* and its clamping and revolving mechanism, of the cylindrical stock *w*, having an eccentric arbor at one end for the rollers *s p* or *r*, and the lever *z*, for giving to such stock a partial rotation for the purposes and as set forth.

253,356. SPECTACLE-LENS CASE. GEORGE D. EDMONDSON, Detroit, Mich. Filed Apr. 25, 1881. (No model.)

Claim.—A lens-package consisting of an envelope adapted to hold two lenses side by side, said envelope provided with two transverse lines or creases, along which it may be folded to bring the lenses face to face, and adapted to receive a printed or written description of the contents between the said lines, substantially as described.

253,357. METHOD OF TREATING WOOD IN ORDER TO OBTAIN FIBER SUITABLE FOR PAPER-MAKING, &c. JARL D. EKMAN, 87½ Old Broad Street, London, England. Filed Dec. 10, 1881. (No specimens.) Patented in England July 13, 1881, in France Nov. 16, 1881, and in Belgium Nov. 12, 1881.

Claim.—The boiling of wood under pressure with a solution containing sulphurous acid and magnesia, in the proportions and under the conditions substantially as described.



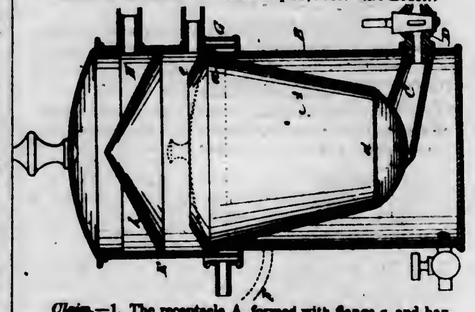
253,358. CORNSTALK-HARVESTER. WILLIAM I. ELY, Freehold, N. J. Filed Oct. 26, 1881. (No model.)

Claim.—1. The combination of the hinged platform E, the frame C, having arms F, the chains G, the angle-lever H, the lever I, pivoted to arm F, and the connecting-bar J, pivoted to hanger K, said hanger being rigidly attached to the middle of the lower side of platform, as and for the purpose specified.

2. The combination, with the cutters *a*, of the guide-arms *c*, made V-shaped, with the angle in front, with the lower arm nearly or quite horizontal, and with the upper arm rising gradually as it extends to the rear, said arms being connected at the middle by rods *d*, for the purpose specified.

3. In a cornstalk-harvester, the combination, with the frame C and the guides *c*, of the tie-rods *d* and the braces *e*, substantially as herein shown and described, whereby the said guides are strengthened in place, as set forth.

4. In a cornstalk-harvester, the combination, with the double-



walled rear parts of the casings W and the hinged platform E, of the flanges *f*, substantially as herein shown and described, whereby stalks are kept from getting between the said casings and platform, as set forth.

253,359. HOG-TENDON CUTTER. ORVILLE RWING, Decatur, Ill. Filed Dec. 24, 1881. (No model.)

Claim.—The instrument for cutting tendons, consisting of bar *a*, knife *c*, knives *i i*, sliding bar *d*, and means for forcing said sliding bar forward, all combined substantially as shown, and for the purpose set forth.

253,360. COMBINED PERCOLATOR AND STILL. BYRON FREEMAN, Westfield, N. Y. Filed May 25, 1881. (No model.)

Claim.—1. The receptacle A, formed with flange *a*, and having opening *c* in the bottom, and diaphragm *d* and the surrounding water-tank B, formed with water-seal G, in combination with the removable still attachment E, substantially as and for the purpose specified.

2. The still attachment E, provided with the flange *e*, and the conical partition I, forming the condenser H, in combination with the tank B and water-seal G, substantially in the manner and for the purposes set forth.

3. The water-tank B, formed with the water-seal G and the receptacle A, suspended in the tank, in combination with the removable still, the lower edge of which is adapted to fit in the chamber G, substantially as set forth.

253,361. APPARATUS FOR THE PRESERVATION OF MILK. [illegible] GR[illegible], [illegible], Switzerland. Filed Dec. 19, 1881. (No model.) Patented in Switzerland Aug. 31, 1881.

Claim.—1. The combination, with the milk-chamber A, of the cooling-chamber B, the ice-chamber C, the pipe *a*, and the pipe *b*, substantially as and for the purpose specified.

2. The combination, with the milk-chamber A, of the cooling-chamber B, the ice-chamber C, the pipe *a*, the pipe *b*, and the pipe *c*, substantially as and for the purpose specified.

3. The combination, with the milk-chamber A, of the cooling-chamber B, the ice-chamber C, the pipe *a*, the pipe *b*, the pipe *c*, and the pipe *d*, substantially as and for the purpose specified.

4. The combination, with the milk-chamber A, of the cooling-chamber B, the ice-chamber C, the pipe *a*, the pipe *b*, the pipe *c*, the pipe *d*, and the pipe *e*, substantially as and for the purpose specified.

253,362. CHAIR. JOHN W. FOSTER, Boston, Mass. Filed Dec. 19, 1881. (No model.)

Claim.—1. The combination, with the seat-frame, of the back-frame, the rock-shaft, the arms connecting the back-frame with the rock-shaft, the arms connecting the seat-frame with the rock-shaft, and the spring, substantially as and for the purpose specified.

2. The combination, with the seat-frame, of the back-frame, the rock-shaft, the arms connecting the back-frame with the rock-shaft, the arms connecting the seat-frame with the rock-shaft, the spring, and the adjusting-bar, substantially as and for the purpose specified.

3. The combination, with the seat-frame, of the back-frame, the rock-shaft, the arms connecting the back-frame with the rock-shaft, the arms connecting the seat-frame with the rock-shaft, the spring, the adjusting-bar, and the stop, substantially as and for the purpose specified.

253,363. CHAIR. JOHN W. FOSTER, Boston, Mass. Filed Dec. 19, 1881. (No model.)

Claim.—1. The combination, with the seat-frame, of the back-frame, the rock-shaft, the arms connecting the back-frame with the rock-shaft, the arms connecting the seat-frame with the rock-shaft, and the spring, substantially as and for the purpose specified.

2. The combination, with the seat-frame, of the back-frame, the rock-shaft, the arms connecting the back-frame with the rock-shaft, the arms connecting the seat-frame with the rock-shaft, the spring, and the adjusting-bar, substantially as and for the purpose specified.

3. The combination, with the seat-frame, of the back-frame, the rock-shaft, the arms connecting the back-frame with the rock-shaft, the arms connecting the seat-frame with the rock-shaft, the spring, the adjusting-bar, and the stop, substantially as and for the purpose specified.

253,364. CHAIR. JOHN W. FOSTER, Boston, Mass. Filed Dec. 19, 1881. (No model.)

Claim.—1. The combination, with the seat-frame, of the back-frame, the rock-shaft, the arms connecting the back-frame with the rock-shaft, the arms connecting the seat-frame with the rock-shaft, and the spring, substantially as and for the purpose specified.

2. The combination, with the seat-frame, of the back-frame, the rock-shaft, the arms connecting the back-frame with the rock-shaft, the arms connecting the seat-frame with the rock-shaft, the spring, and the adjusting-bar, substantially as and for the purpose specified.

3. The combination, with the seat-frame, of the back-frame, the rock-shaft, the arms connecting the back-frame with the rock-shaft, the arms connecting the seat-frame with the rock-shaft, the spring, the adjusting-bar, and the stop, substantially as and for the purpose specified.

253,365. CHAIR. JOHN W. FOSTER, Boston, Mass. Filed Dec. 19, 1881. (No model.)

Claim.—1. The combination, with the seat-frame, of the back-frame, the rock-shaft, the arms connecting the back-frame with the rock-shaft, the arms connecting the seat-frame with the rock-shaft, and the spring, substantially as and for the purpose specified.

2. The combination, with the seat-frame, of the back-frame, the rock-shaft, the arms connecting the back-frame with the rock-shaft, the arms connecting the seat-frame with the rock-shaft, the spring, and the adjusting-bar, substantially as and for the purpose specified.

3. The combination, with the seat-frame, of the back-frame, the rock-shaft, the arms connecting the back-frame with the rock-shaft, the arms connecting the seat-frame with the rock-shaft, the spring, the adjusting-bar, and the stop, substantially as and for the purpose specified.

253,366. CHAIR. JOHN W. FOSTER, Boston, Mass. Filed Dec. 19, 1881. (No model.)

Claim.—1. The combination, with the seat-frame, of the back-frame, the rock-shaft, the arms connecting the back-frame with the rock-shaft, the arms connecting the seat-frame with the rock-shaft, and the spring, substantially as and for the purpose specified.

2. The combination, with the seat-frame, of the back-frame, the rock-shaft, the arms connecting the back-frame with the rock-shaft, the arms connecting the seat-frame with the rock-shaft, the spring, and the adjusting-bar, substantially as and for the purpose specified.

3. The combination, with the seat-frame, of the back-frame, the rock-shaft, the arms connecting the back-frame with the rock-shaft, the arms connecting the seat-frame with the rock-shaft, the spring, the adjusting-bar, and the stop, substantially as and for the purpose specified.

253,367. CHAIR. JOHN W. FOSTER, Boston, Mass. Filed Dec. 19, 1881. (No model.)

Claim.—1. The combination, with the seat-frame, of the back-frame, the rock-shaft, the arms connecting the back-frame with the rock-shaft, the arms connecting the seat-frame with the rock-shaft, and the spring, substantially as and for the purpose specified.

2. The combination, with the seat-frame, of the back-frame, the rock-shaft, the arms connecting the back-frame with the rock-shaft, the arms connecting the seat-frame with the rock-shaft, the spring, and the adjusting-bar, substantially as and for the purpose specified.

3. The combination, with the seat-frame, of the back-frame, the rock-shaft, the arms connecting the back-frame with the rock-shaft, the arms connecting the seat-frame with the rock-shaft, the spring, the adjusting-bar, and the stop, substantially as and for the purpose specified.

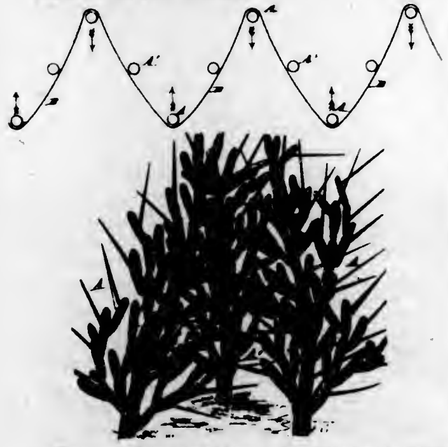
253,368. CHAIR. JOHN W. FOSTER, Boston, Mass. Filed Dec. 19, 1881. (No model.)

Claim.—1. The combination, with the seat-frame, of the back-frame, the rock-shaft, the arms connecting the back-frame with the rock-shaft, the arms connecting the seat-frame with the rock-shaft, and the spring, substantially as and for the purpose specified.

2. The combination, with the seat-frame, of the back-frame, the rock-shaft, the arms connecting the back-frame with the rock-shaft, the arms connecting the seat-frame with the rock-shaft, the spring, and the adjusting-bar, substantially as and for the purpose specified.

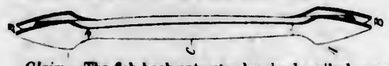
3. The combination, with the seat-frame, of the back-frame, the rock-shaft, the arms connecting the back-frame with the rock-shaft, the arms connecting the seat-frame with the rock-shaft, the spring, the adjusting-bar, and the stop, substantially as and for the purpose specified.

253,361. APPARATUS FOR THE TREATMENT OF TIMBER FOR PRESERVING IT. HENRY FLAD, St. Louis, Mo. Filed May 4, 1881. (No model.)



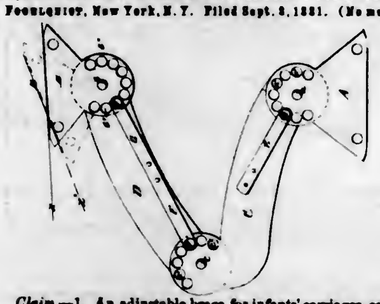
Brief.—The flexibility of the ring or hoop allows it to conform to the periphery of the log.

Claim.—1. The flexible metal hoop A, whose edge is fitted to enter the timber, provided with means for connection of a pipe or hose, for the purpose set forth.



2. The flexible metal hoop A, whose edge is fitted to enter the timber, provided with bosses D and nozzle E, substantially as and for the purpose set forth.

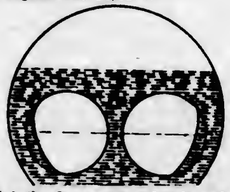
253,362. HEDGE. EDWARD H. FLEMING, Thery's Spring, Tex. Filed Oct. 31, 1881. (No model.)



Claim.—A living cactus hedge or fence composed of three rows of plants, A A' A, arranged as described, combined with a chain or rope, B, passing around the alternating plants of the outer rows, as described, whereby the said plants will be trained to converge toward each other, substantially as set forth.

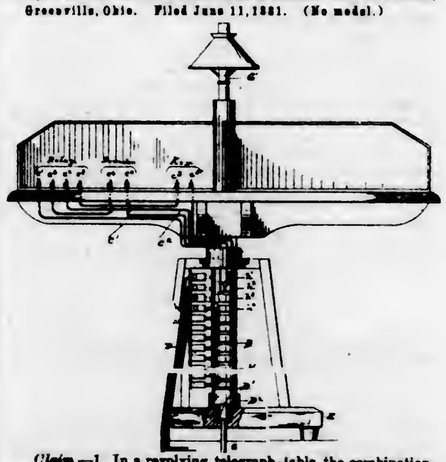
253,363. FISH-HOOK EXTRACTOR. JEREMIAH W. FOARD, San Francisco, Cal. Filed Oct. 1, 1881. (Model.)

Claim.—The fish-hook extractor herein described, consisting of the shaft C, having overlapping flanges A at the point and adjacent sides, forming recesses B, substantially as shown, and for the purposes specified.



253,364. FOLDING BRACKET FOR CARRIAGE-TOPS. CARL M. FOERLEICH, New York, N. Y. Filed Sept. 8, 1881. (No model.)

Claim.—1. An adjustable brace for infants' carriages, consisting of the body-bracket A, the arms C and D, and the top bracket, B, pivoted together successively and held in position by spring-catches, substantially as specified.

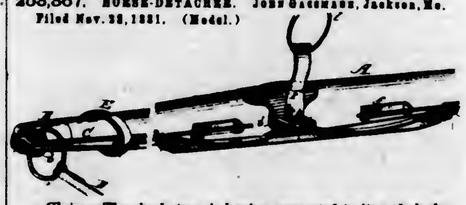


2. A carriage-brace consisting of the bracket-plates A B and arms C D, pivoted together at *a c b*, substantially as shown and described, the said bracket-plates and one of the said arms being provided with a series of notches or catches, *a' c' b'*, partly surrounding the said pivots *a c b*, respectively, and the said arms C D, having springs E F G, provided with catches or notches *e f g* to interlock with the respective notches or catches *a' c' b'*, for the purpose set forth.

253,365. STEAM-BOILER. CHAS. J. GALLOWAY, Manchester, County of Lancaster, England. Filed Mar. 8, 1880. (Model.) Patented in England Jan. 14, 1876.

Claim.—A boiler-flue constructed at its end substantially as described, whereby the distance between the shell of the boiler and the edge of the opening through the head is increased at one or more places, for the purpose specified.

253,366. REVOLVING TELEGRAPH-TABLE. JNO. L. GARNER, Greenville, Ohio. Filed June 11, 1881. (No model.)



Claim.—1. In a revolving telegraph-table, the combination, with a series of rings on the revolving central post and connected with both the main and local circuit wires, of a series of contact-tongues connected with both main and local circuit wires and attached to the inner side of the hollow leg surrounding the central post, substantially as and for the purpose set forth.

2. In a revolving telegraph-table, the combination, with the wires C and C, of the rings H on the post D, and of the plates L, the stem N, and the sockets J, attached to the hollow leg F, substantially as herein shown and described, and for the purpose set forth.

3. In a revolving telegraph-table, the contact-tongue, made substantially as herein shown and described, and consisting of the segmental plate L, attached to a countersunk item, N, in combination with a socket, J, and the spiral spring M, as set forth.

253,367. HORSE-DETACHER. JOHN GATEMANN, Jackson, Mo. Filed Nov. 28, 1881. (Model.)

Claim.—The single-tree A, having connected to its ends locking-arms C, and the seats *b*, in combination with the clamping-rings

E, having connected thereto rods *e*, the guide-plates *f*, and strap F, constructed and arranged to operate substantially as described, and for the purpose set forth.

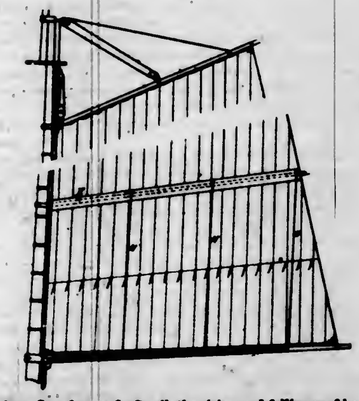
253,368. TRACING-DESK. EDWARD T. GIBSON, Fort Washakie, Wyo. Filed Dec. 5, 1881. (No model.)

Claim.—In a tracing-desk, the combination of the base C, open at one side for the entrance of the light and lined with a reflecting-surface, the frame B, secured thereto in an inclined position, the glass plate A, let into the frame, and the strips E and F, substantially as shown and described.

253,369. WATERPROOFING AND PRESERVATIVE COMPOUND. JAMES H. GILLESPIE, Warwick, N. Y. Filed Dec. 8, 1881. (No specimens.)

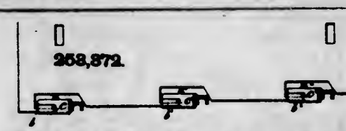
Claim.—1. A waterproofing and preservative compound composed of ceocerite or mineral wax and a siccative vegetable oil, substantially as herein described.

2. A waterproofing and preservative compound composed of ceocerite or mineral wax and linseed-oil, substantially as herein described.



253,370. BUTTON. CHARLES H. GOODWIN, Waterbury, Conn., assignor to the Waterbury Button Company, same place. Filed Dec. 15, 1881. (No model.)

Claim.—1. The herein-described button, consisting of the metal back *a*, the hollow flange-neck *c*, secured to said back, and the eyelet *e* through said neck, and having its flange inside said back, combined with the cap *b*, closed over said back and upon the flange of the said eyelet, substantially as described.

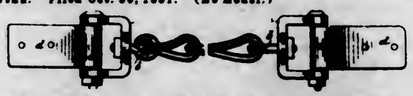


2. The combination of a button provided with an eyelet-like fastening with a collar on the reverse side constructed with a countersunk-like recess in its outer side to receive the turned-over end of the eyelet, substantially as described.

253,371. REEFING SAILS. WILLIAM H. GRISWOLD, New York, N. Y. Filed Dec. 5, 1881. (No model.)

Claim.—In a fore-and-aft sail, the rising and falling roof-boom located in a pocket in said sail between the gaff and main-boom, and combined with suitable lines for hauling it down upon the main-boom and setting it in position thereon for the purpose of reefing the sail, substantially as shown and described.

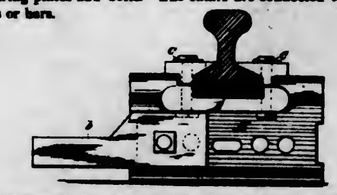
253,372. SEWING-MACHINE GUIDE. JAMES F. J. GUNNING, New Haven, Conn. Filed Oct. 21, 1881. (No model.)



Claim.—1. A sewing-machine guide consisting of the tongue *b*, arranged to lie between the presser-foot and work-plate and outside the needle, so that a previously-made line of stitches will run against the outside of the tongue as a guide, while the next line of stitches will be run close against the in or opposite side of the tongue, substantially as described.

2. A sewing-machine guide consisting of the tongue *b*, in transverse section corresponding to the transverse area of the pocket to be produced, combined with a presser-foot recessed upon its working-face to permit the said tongue to lie in said recess, one thickness of fabric above and the other below the said tongue, the body of the said presser-foot bringing the two thicknesses together inside the tongue and in line with the needle, substantially as described.

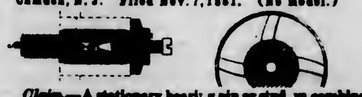
3. The combination of two or more tongues, *b b*, each arranged in a recess beneath its own presser-foot, each succeeding tongue and presser-foot arranged relatively to the next preceding, so that the line of stitches formed in the two thicknesses of fabric inside the next preceding tongue will run close to the outside of the next succeeding tongue and cause the succeeding line of stitches to be run upon the inside of that tongue and parallel with the preceding line, substantially as described.



253,373. HOPPLE. CHARLES J. GUSTAVSON, Salt Lake City, Utah. Filed Oct. 26, 1881. (No model.)

Claim.—A hopple consisting of the curved plates *d d*, adapted to inclose, or partly inclose, the legs of an animal, and having perforations whereby they shall be secured to hopple-straps, in combination with the detachable chain A, having twisted links *e* and swivels *b b* connecting said plates, substantially as shown and described.

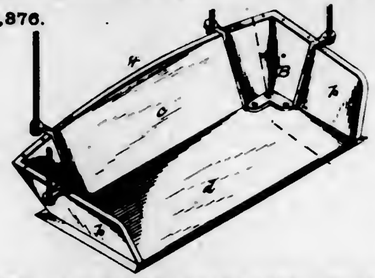
253,374. RAILROAD-CHAIR. LEVI HAAS, Chester, Pa. Filed July 18, 1881. (No model.)



Brief.—The chair is provided with recesses for the reception of wooden pieces, upon which rest the rails, which are secured by securing plates and bolts. The chairs are connected together by rods or bars.

Claim.—1. In a railway-chair, the securing-plates C and chair having recesses *a* and *a'*, in combination with rail-supports A, wooden pieces B, and rods or bars *b*, substantially as shown, and for the purpose described.

2. A railroad-chair adapted to be constructed of waste T-rail iron, provided with rods and bars *b*, the chair having securing-plates C, and being recessed for reception of wooden pieces B, placed therein, as shown, and for the purpose described.

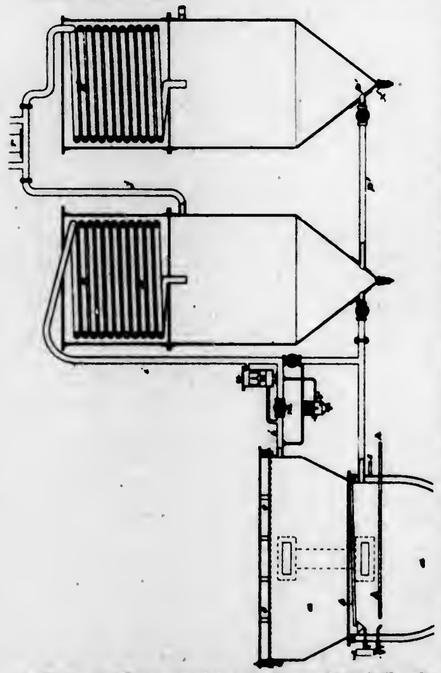


253,375. BEARING-PIN OR STUD FOR MACHINERY. HENRY M. HALL, Philadelphia, Pa., assignor of one-half to Wm. Huey, Camden, N. J. Filed Nov. 7, 1881. (No model.)

Claim.—A stationary bearing pin or stud, in combination with a piece adapted to run thereon, said studs having gibs adjustable at the periphery thereof, on which said piece runs, substantially in the manner and for the purpose set forth.

253,376. CORNER-IRON FOR WAGON-SEATS. DAVID H. HARRIS, Detroit, Mich., assignor of one-half to Edward S. Chapman, same place. Filed Dec. 9, 1881. (No model.)

253,376.

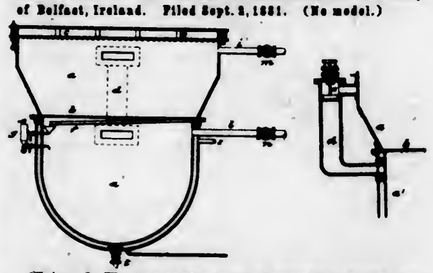


Claim.—As an improved article of manufacture, the corner-iron for a vehicle-seat, consisting of the corner-fitting walls, the bottom flange, *f*, top flanges, *h*, and the re-enforcing ribs *e*, with extensions forming socket-arms, substantially as shown, and for the purpose set forth.

253,377. MANUFACTURE OF ALUMINOUS CAKE. THOMAS S. HARRISON, Philadelphia, Pa., assignor to Harrison Brothers & Co., same place. Filed June 7, 1881. (No specimens.)

Claim.—As a new article of manufacture, a blue-colored aluminous cake containing ferro-cyanide of iron, as set forth.

253,378. RECOVERING VOLATILE SOLVENTS WHICH HAVE BEEN USED IN EXTRACTING SOLUBLE MATTER. EDWARD B. HART, Strandtown, County of Belfast, Ireland. Filed Sept. 2, 1881. (No model.)



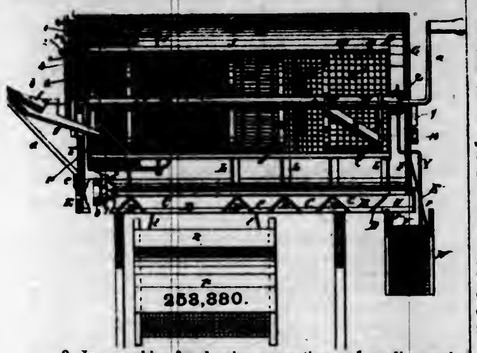
Claim.—1. The improved process of recovering volatile solvents which have been used in extracting soluble matter from substances containing it, the same consisting in heating the upper part or cover of the vessel inclosing said substance, introducing steam thereinto on one side of said substance, causing said steam to pass through said substance, and conducting it thence from said vessel into and through a condenser, substantially in the manner and for the purposes set forth.

2. The improved process of recovering volatile solvents held in absorption in a substance from which it has been used to extract soluble matter, which consists in heating the upper part or cover of the vessel containing said substance, admitting steam to said vessel on one side of said substance, producing by the action of an air pump or exhauster a partial vacuum in said vessel on the opposite side of said substance, whereby said steam is drawn through the substance, and conducting said steam thence through one or more condensers, substantially as set forth, whereby steam may be used at a less temperature than 212° without condensation.

3. The combination, to form an apparatus for recovering volatile solvents, of a vessel, *a*, a filter-bed, *b*, therein, a steam-jacketed cover or top, *c*, therefor, a steam-pipe, *h*, a pipe, *i*, a condenser, *k*, and a pump or exhauster, *r*, substantially as set forth.

253,379. EXTRACTING BY VOLATILE SOLVENTS SOLUBLE MATTER FROM SUBSTANCES CONTAINING IT, AND APPARATUS THEREFOR. EDWARD B. HART, Strandtown, County of Belfast, Ireland. Filed Sept. 2, 1881. (No model.)

Claim.—1. The improved process of extracting soluble matters by volatile solvents in a closed vessel divided horizontally by a filter-plate, which consists in placing the material containing the soluble matter on said filter-plate, placing the solvent in the lower compartment of the vessel, below said plate, applying sufficient heat to said lower compartment to vaporize the solvent, thereby causing its vapor to ascend and permeate the material, and in part to pass through the same and ascend into the upper compartment, cooling the surface of the upper compartment sufficiently to condense the vapor that comes in contact therewith, thereby causing the same to fall back on the material, maintaining for a while a pressure in the lower compartment sufficiently in excess of that in the upper compartment to prevent the condensed solvent falling from the material into the lower compartment, thereby retaining it in the material and boiling it therein, and finally equalizing the pressure in the two compartments or otherwise neutralizing or overcoming the superior pressure in the lower compartment, thereby causing the condensed solvent to flow downward through the material and fall into the lower compartment, all substantially as set forth.



2. An apparatus for extracting soluble matter by volatile solvents, consisting of the combination of a closed vessel, a filter-plate arranged horizontally therein and dividing it into two compartments, a steam-jacket around the lower compartment, or equivalent means of applying heat thereto, a condensing-jacket formed as the top of the upper compartment, the lower or condensing plate thereof being flat, level, and uniformly roughened or corrugated to cause the vapor condensed upon it to drop from the portion of the plate on which it is condensed, thereby insuring a uniform fall of condensed vapor from all parts of the plate, and means for equalizing at will the pressures in the two compartments, substantially as set forth.

3. An apparatus for extracting soluble matters by volatile solvents, consisting of the combination of a closed vessel, a horizontal filtering-plate, *b*, dividing said vessel into an upper compartment, *a*, and a lower compartment, *a'*, a steam-jacket surrounding the compartment *a'*, or equivalent means of applying heat thereto, a condenser, *c*, arranged at the top of the compartment *a*, a pipe or passage, *d*, connecting the two compartments, and a valve, *e*, in said pipe, substantially as set forth.

253,380. MACHINE FOR CLEANING, SEPARATING, AND GRADING GRAIN. JAMES H. HAWLEY, Odin, Ill. Filed Oct. 3, 1881. (No model.)

Claim.—1. In a machine for cleaning, separating, and grading grain and seeds, the combination, with the boards B, provided with the openings U and the plate X, the case F, spout R, and the reel, of the screen W, having plate V, the bails *o o*, and its operating mechanism, substantially as and for the purpose set forth.

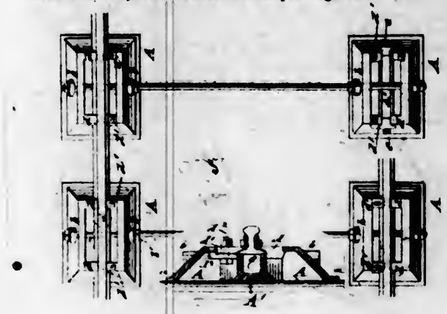
2. In a machine for cleaning, separating, and grading grain and seeds, the combination, with the reel, the reel-shaft H, and the rake-teeth Q, attached to the reel-ribs J, of the suspended spout R, substantially as herein shown and described, whereby coarse refuse raised from the lower part of the reel by the said rake-teeth is conducted out of the said reel, as set forth.

3. In a machine for cleaning, separating, and grading grain and seeds, the combination, with the boards B, provided with the opening U, the case F, and the reel-shaft H, provided with the projection Z, of the screen W, suspended from the end of the case, and the lever Y, provided with an offset and projecting within the case, substantially as and for the purpose set forth.

4. In a machine for cleaning, separating, and grading grain and seeds, the combination, with the hopper *b*, provided with the false bottom *f*, the apertured lower end of the case F, and the reel-flange P, having inwardly-projecting lugs *h*, of the shoe *g*, pivoted at its upper end by the pivot *g'* to the outer side of the said hopper and having its lower end projecting into the case F, substantially as and for the purpose set forth.

5. In a machine for cleaning, separating, and grading grain and seeds, the combination, with the hopper *b* and its feed-gate 1, of the inclined block 3, the inclined bar 4, and the keeper 5, substantially as and for the purpose set forth.

6. In a machine for cleaning, separating, and grading grain and seeds, the combination, with the hopper *b*, having the projecting edges of its vertical inner side beveled, and the lower part, F, of the case, of the beveled vertical cleats *c c*, the horizontal cleat *e*, and the inclined brace-bar, *d*, substantially as herein shown and described, whereby the said hopper is secured to the said case detachably, as set forth.



7. In a machine for cleaning, separating, and grading grain and seeds, the combination, with the reel H I J, of the exterior reel, *f*, detachably secured thereto by bolts or screws *f*, substantially as and for the purpose set forth.

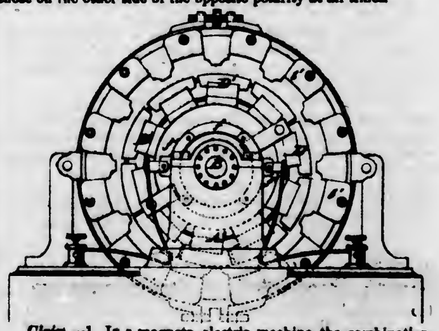
8. In a machine for cleaning, separating, and grading grain and seeds, the combination, with lower part, F, of the case and the reel-shaft H, of the lever 9, and the lever-cam 10, substantially as herein shown and described, whereby the inclination of the reel can be regulated, as set forth.

9. In a machine for cleaning, separating, and grading grain and seeds, the combination, with the fan-shaft *e* and the reel H I J, of the cone-pulley 6, the band 7, and the segmental cone-pulley 8, substantially as herein shown and described, whereby the fan-blower will be operated from the said reel, as set forth.

253,381. RAILROAD-TIE. CHARLES F. HERNEY, Brenham, Tex. Filed Oct. 1, 1881. (No model.)

Brief.—Oblong pot-sleepers are provided with a supporting central box, adapted for storing telegraph-wires, and recesses, in which the rails are securely held in position by fixed jaws on one side of the rails and detachable fastening devices on the other. Rods secured by bolts connect the sleepers together.

Claim.—1. As an improvement in railroad-ties, pot-sleepers provided with a supporting central box adapted for storing signal-telegraph wires, in combination with rails securely held in position upon the sleepers by fixed jaws on one side of the rails and suitable detachable fastening devices on the other side, substantially as described.



2. In a railroad-tie, the combination of a pot-sleeper, A, having recessed ends and a longitudinal center portion, A', with fixed jaws *d*, made integral with the sleeper, and with detachable jaws *e*, set into recesses and secured to interior shoulders, *d'*, of the sleeper, substantially as specified.

3. In a railroad-tie, a pot-sleeper of oblong shape provided with a longitudinal box-shaped center portion for laying telegraph-wires, substantially as described.

4. The combination of oblong pot-sleepers provided with top recesses for the rails and a supporting central box under the rails for depositing telegraph-wires, said box having a hole, *c*, for the exit of the wire, the rails, the fixed and detachable jaws for fastening the rails, the fish-plates, the projecting sockets, and connecting-rods, substantially as described.

253,382. MAGNETO-ELECTRIC MACHINE. LUDWIG HERMAN, Union, N. J., assignor to himself and Julius Jensen, New York, N. Y. Filed May 13, 1880. (No model.)

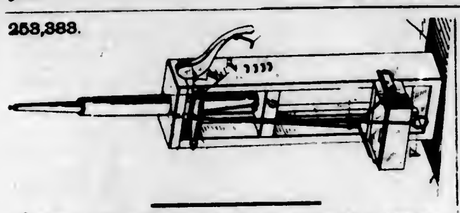
Brief.—An armature mounted on an eccentric driving-shaft is brought in contact with or in close proximity to the field-of-force magnets. The magnets are parallel with the shaft, and the entire body of the armature is wound with conducting-wire in the direction of rotation. Pole-pieces are provided at the ends and in the centers of armature and field-of-force magnets. The electrical connections are such that the field-magnets at one side of the point of nearest approach of the armature are of one polarity and those on the other side of the opposite polarity at all times.

Claim.—1. In a magneto-electric machine, the combination of fixed outer electro-magnets, an eccentric armature, springs *b* and *f*, revolving rings and cams, substantially as described.

2. In a magneto-electric machine, the combination of fixed outer electro-magnets, intervening insulated blocks, conducting-rods, radial springs, and an armature attached to an eccentric portion of main shaft revolving within the circle of the electro-magnets, substantially as described.

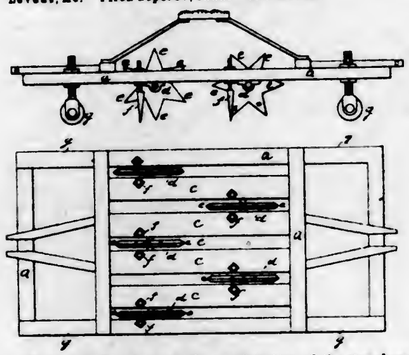
3. In a magneto-electric machine, the combination of a main shaft adapted to receive a laterally-adjustable eccentric armature, mechanism for transmitting currents, and a laterally-adjustable eccentrically-revolving armature, the field and armature magnets having end and intermediate poles, substantially as described.

4. In a magneto-electric machine, the combination of fixed outer electro-magnets having end and intermediate poles, an eccentric armature composed of segmental cores parallel with the axis, and a coil wound about said cores in the plane of rotation of said axis, substantially as described.



5. In a magneto-electric machine, a series of fixed exterior electro-magnets arranged in a circle with intermediate isolated blocks, radial springs attached thereto, and conducting-rods which pass through said blocks, in combination with a laterally-adjustable revolving armature, a main shaft which carries an eccentric and an eccentric armature which revolve within the circle of the magnets, contact-pieces, contact-rings, and cams attached to said shaft, which transmit the current to the radial springs, substantially as described.

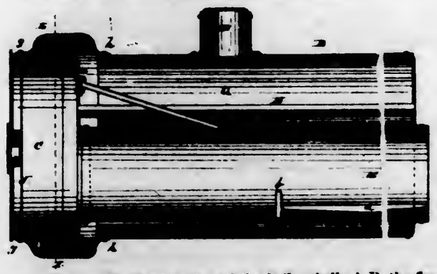
253,383. CLOTHES-DRIER. ANTHONY HIPPCHEN, Minneapolis, Minn. Filed Sept. 8, 1881. (Model.)



Claim.—In combination with the upright standards, the reel-supporting standard and block, the strap passing through the upright standards, and the cam for clamping the same, substantially as specified.

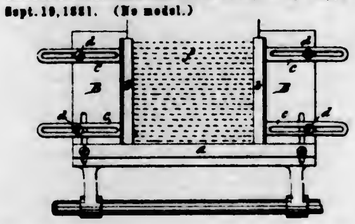
Claim.—1. The combination of the reciprocating disc D and

253,383.



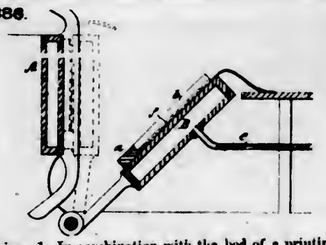
253,384. HARROW AND PULVERIZER. BENUS L. HODGDON, Levant, Me. Filed Sept. 17, 1881. (No model.)

Claim.—1. In a harrow, the combination of the star-shaped wheels *d d*, and vertically-adjustable stationary teeth *f*, placed on each side of said wheels and co-operating with them, substantially in the manner described.



2. The reversible harrow and pulverizer having the star-shaped wheels *d*, adjustable teeth *f*, and adjustable rollers *g g*, operating as a deep-soil harrow when drawn in one direction and as a surface-pulverizer when said direction is reversed, substantially as set forth.

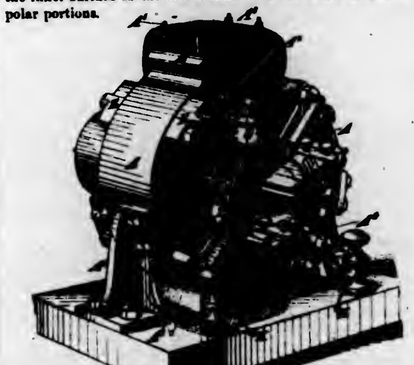
253,385. WATER-JACKET SMOKE-BOX. EDWARD HUSSE, Marion, Ohio. Filed Dec. 12, 1881. (No model.)



Claim.—The combination of the boiler-shells A B, the flue-sheet *c*, and the cylindrical wall K with the bulging jacket L, riveted to the outer shell, B, and to the said wall K, the latter being riveted to the flue-sheet, the whole forming a space, *i*, communicating directly with and being a part of the space G, substantially as and for the purposes specified.

253,386. COMBINED PRINTING-PRESS AND STEREOTYPE CASTING-BOX. MARSHALL J. WOODRUFF, Jersey City, N. J. Filed Sept. 19, 1881. (No model.)

253,386.

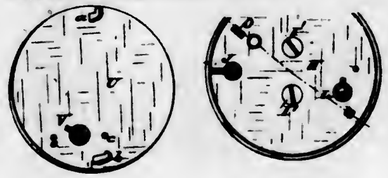


Claim.—1. In combination with the bed of a printing-press, the hollow platen B, provided with a steam-pipe, *d*, and removable bars or gages suitably arranged on its face for securing the stereotype-matrix and forming the sides of a stereotype casting-box, as shown and described.

2. In combination with the bed A of a printing-press, a platen, B, provided on its face with removable gages or bars, for the purpose specified, and with a heating appliance, whereby said bed and platen are adapted for use in forming stereotype-casts and drying-matrices for the same, as specified.

253,387. DYNAMO-ELECTRIC MACHINE. CHAS. A. HUSSEY, New York, N. Y., assignor to the Hussey Electric Company, same place. Filed Aug. 31, 1881. (No model.)

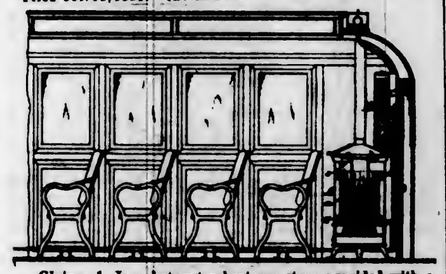
Brief.—The field-magnet is circular, inclosing the armature, and has the portion upon which the wire is wound offset, so that the inner surface of the coil is flush with the inner surface of the polar portions.



Claim.—1. A field-magnet for a dynamo-electric machine, composed of corresponding principal or main arc-shaped portions and intervening portions made continuous with the said principal or main portions wound with wire, and sufficiently offset from the main arc-shaped portions that when a proper quantity of wire is wound on them it will on the interior be approximately coincident with the interior surface of the main arc-shaped portions, substantially as specified.

2. The field-magnet composed of the corresponding arc-shaped portions A, the intervening offset portions made continuous with said arc-shaped portions A, the wire A^3, and the pins A^2, substantially as specified.

3. In a dynamo-electric machine, the combination, with a field-magnet composed of corresponding principal or main arc-shaped portions and intervening offset portions made continuous with said principal or main portions wound with wire, of an armature arranged to rotate within the same and consisting of a core wound longitudinally with wire, substantially as specified.

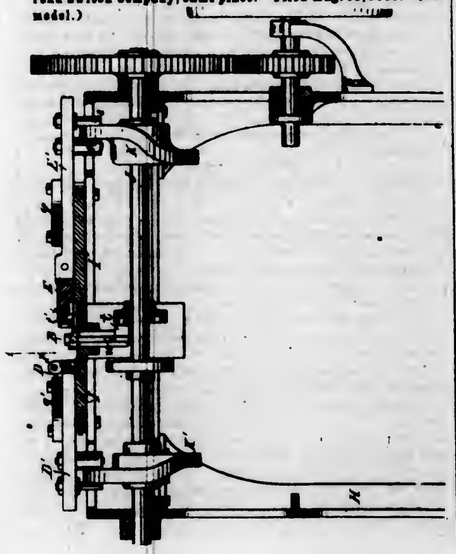


253,388. SEAL-LOCK. FRANCISCO P. IANNARONE, Washington, D. C. Filed Aug. 31, 1881. (No model.)

Claim.—1. In combination with the lock secured on the under side of the lid of the box and a cap-plate having a key-hole through which the lock-operating key is passed, a concealing guard-plate, U, provided with a key-hole, V, out of register with the key-hole of the lock and adapted to receive a different key, so that the guard-plate must be unlocked and removed before access can be had to the key-hole of the lock, substantially as hereinbefore set forth.

2. In combination with the plate H, provided with openings N O and latch P, and the guard-plate U, provided with hooks *a b*, the spring-stud R, substantially as and for the purpose set forth.

253,389. CAR-HEATER. JONATHAN JOHNSON, Lowell, Mass. Filed Oct. 18, 1881. (No model.)



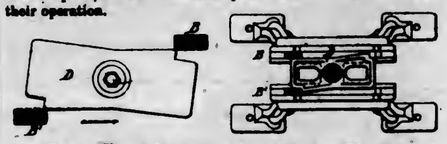
Claim.—1. In a hot-water heater, a stove provided with a space around the fire-pot to receive the heated gases, and with a fire-pot consisting of separate vertical pipes *a*, arranged to leave intervening air-passages and to hold the body of the fuel, and upper and lower water-chambers, F G, communicating with said pipes and with the outlet and inlet branches of a circulating and radiating system open to the air, all as specified.

2. The combination, with the circulating and radiating system of water-pipes open to the air, of a heater containing a fire-pot with vertical pipes exposed to the fuel, arranged to insure the passage of air between the same and a free, rapid, and straight upward flow of the water without pressure from the lower to the upper circulating-pipes and through the latter, as specified.

3. The combination with the stove, its fire-pot having vertical water-channels, water circulating and radiating pipes, and casing C, open at the top and arranged in the line of the water-circulation, as specified.

4. The combination of the circulating and heat-radiating pipes, heater, casing C, and condenser communicating with said casing and with the air, as set forth.

253,390. MACHINE FOR BENDING LINKS. EDWARD H. JOHNSTON, Philadelphia, Pa., assignor to the Wharton Railroad Switch Company, same place. Filed Aug. 15, 1881. (No model.)



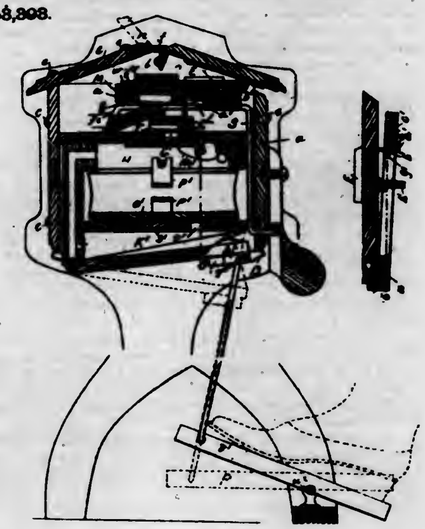
Claim.—1. The combination of the reciprocating dies D and E, and fixed die B, all constructed to form the link-blank A, substantially in the manner described.

2. The combination of the bar E' and its die E, the bar D' and its die D, with the shaft J and its cam-wheels K K', substantially as specified.

3. The combination of the fixed die B, the fingers *a a*, and knocking-off finger *g* with mechanism, substantially as described, for operating the said fingers.

253,391. INTERLOCKING SWITCH AND SIGNAL MECHANISM. EDWARD H. JOHNSTON, Philadelphia, Pa., assignor to the Wharton Railroad Switch Company, same place. Filed Aug. 23, 1881. (No model.)

Brief.—Switch and signal levers are interlocked by a pivoted notched plate, which is actuated by the contact of said levers in their operation.



Claim.—The combination of the switch-lever B' and signal-lever B with the pivoted safety-plate D, constructed to directly act on and to be directly operated by both levers, substantially as described.

253,392. DEVICE FOR HOLDING LETTERS, CARDS, PHOTOGRAPHS, &c. WALTER E. JONES and CLARK L. MIDDLETON, Flatbush, N. Y. Filed Apr. 8, 1881. (Model.)

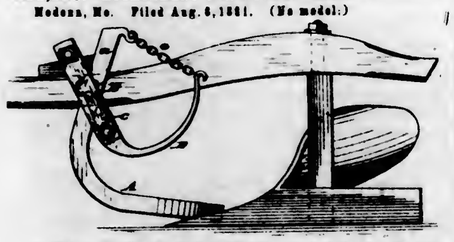
Claim.—A device for holding and supporting letters, cards, photographs, and similar articles, or for hanging light goods or other materials in show-cases, or for the purpose of holding articles used in dressing or decorating store or other windows or places, and for holding rods for that and for other purposes, and as a toy for lifting weights, as herein shown and described, the device being a combination consisting of a hollow or concave rubber cup of graded thickness so arranged in their proportions as to give the cup the greatest power of adhesion, a cap or ferrule, a clip-spring which is opened or closed and entirely regulated by the screw-knob and without automatic arrangement, a screw, a screw-knob, and a rod or bar, all adapted to the concave rubber cup, as described.

253,393.

253,393. REED-ORGAN. GEORGE E. KELLY, Boston, Mass., assignor to the Mason & Hamlin Organ Company, same place. Filed Oct. 18, 1881. (Model.) Patented in Canada Apr. 29, 1881.

Claim.—1. The combination, in a reed-organ, of the bellows located below the wind-chest and forming a continuation of the same, with the supplementary operating-exhausters K K', connected by rods to foot-treadles, and also connected to the boards *s'*, provided with air-inlets and valves, the air-passages *s'* connecting the wind-chest and bellows, and the exhauster and the spring *p'* acting upon the bottom board of the bellows, said members being constructed and organized substantially as described.

2. In a reed-organ, a key of reduced thickness supported at its rear end by the key board or frame, said key being provided with a long pin, *a'*, rigidly secured thereto and projecting downwardly therefrom into a slot in said frame, whereby the key is guided in its movement, substantially as and for the purpose specified.



3. In a reed-organ, a key-frame having a slot, *b'*, in the front portion, *c'*, for the pin *a'* of the key E, in combination with the strip *g*, secured to the portions *f* between said slots, substantially as and for the purpose specified.

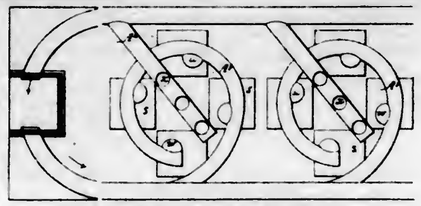
253,394. SUSPENDER-BUCKLE. GEORGE E. KELSEY, West Haven, Conn. Filed Dec. 24, 1881. (No model.)

Claim.—The herein-described buckle, consisting of the plate A with ears *b* at each side, said ears constructed with recesses *d* upon their inner side, combined with the lever constructed with the cylindrical ends *f*, to set into said recesses and form bearings upon which the lever may be turned, substantially as described.

253,395. ATTACHMENT FOR PLOWS. RULIF V. KENNEDY, Modena, Mo. Filed Aug. 6, 1881. (No model.)

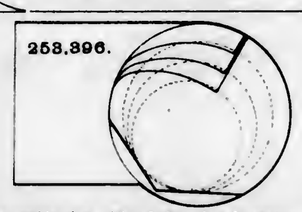
Claim.—1. The hook A, having the vertical shank *a*, in combination with the clip B, bolted to the plow-beam, and having the plate *c*, provided with a pin, *c'*, upon which the hook is hung or pivoted, substantially as and for the purpose set forth.

2. The combination, with the hook A, having the vertical shank *a*, of the clip B and spring D, connected to the hook-shank and the clip, substantially as and for the purpose set forth.



253,396. STORE-SERVICE SYSTEM. PATRICK KENNELLY, Bridgeport, Conn., assignor of one-third to Harris H. Hayden, New York, N. Y. Filed Mar. 20, 1880. (No model.)

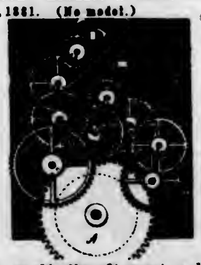
Brief.—The way is a semi tube or trough. Each has branches to the counters, the return-way also having pockets adjacent to the counters. Varying stops or slits in the ways govern the distance to which each carrier shall run. Said carriers are hollow balls.



Claim.—1. A way for a store-service apparatus, consisting of a tube or trough having graduated stops or passages adapted to discharge at different points hollow rolling carriers, substantially as set forth.

2. The combination, in a store-service apparatus, of a main desk, series of counters, and two ways, each extending from the desk past all the counters, one of the ways being provided with openings or stops arranged to arrest and discharge at their respective counters hollow rolling carriers running on said way, substantially as set forth.

3. The combination, in a store-service apparatus, of a desk, series of counters, two ways, extending each from said desk past all the counters, and a series of graduated hollow rolling carriers and graduated stops, whereby each carrier is discharged from the way at the counter from which it was sent, substantially as set forth.



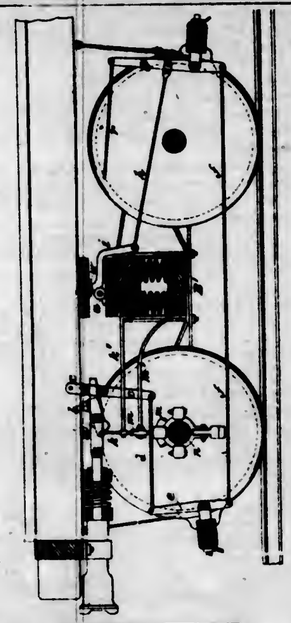
253,396.

4. The combination, with a desk, series of counters, and the ways of a store-service system, of lateral or branch ways arranged to conduct the rolling carriers between the main way and counters, substantially as set forth.

5. The combination, with the trough or tube having openings, of pockets *e*, substantially as specified.

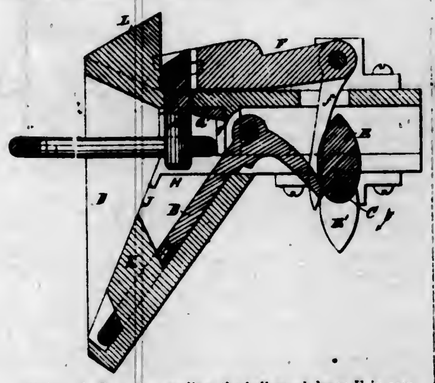
253,397. CLOCK. ALMERON H. LAKE, West Winsted, Conn. Filed Oct. 11, 1881. (No model.)

Claim.—The combination of two main or driving wheels upon the same shaft, concentric with each other, a mainspring arranged between the said wheels, so that one end engages with one wheel and the other with the other wheel, whereby one of the said wheels is caused to revolve in one direction and the other in the opposite direction, a train of gearing leading from one of said driving-wheels to impart rotation to the escapement-wheel shaft and to the hour and minute pointers, with a second train of wheels leading from the other driving-wheel to a shaft from which an arm projects outward, and so as to engage the teeth of a wheel on the escapement-shaft, and from which teeth it escapes by the rotation of the escapement-shaft produced by the first train, and by such escapement of the said arm an intermittent movement is given to the said second train and communicated through said second train to an independent second-pointer on the central shaft, substantially as described.



253,398. AUTOMATIC CAR-BRAKE. CHARLES W. LANPHER, Norwich, N. Y. Filed Oct. 18, 1881. (No model.)

Claim.—1. The combination, in an automatically-acting brake applying and relieving mechanism, of the push-bar *a*, pawl *b*, swinging lever *c*, rod *d*, lever *e*, rod *f*, lever *g*, connecting-rod *h*, bent lever *i*, or its equivalent, and a governor constructed substantially as shown and described, the parts being arranged substantially as set forth, and for the purpose specified.



2. In an automatic brake applying and releasing mechanism, the combination of a governor constructed substantially as herein described, a bent lever or equivalent device for raising the body of the car, and suitable intermediate mechanism, the operation being substantially as described.

3. The combination, in an automatically-acting brake mechanism, of a pivoted swinging push-bar carrying a pivoted pawl, a swinging pivoted lever for communicating the movements of the push-bar to the brakes, suitable levers and rods for operating the brake-shoes, and a rod, *h*, and lever *i*, the latter being pivoted to the transom-beam of the truck, the parts being arranged for joint operation, substantially as set forth, whereby provision is made for raising the car-body and its load, for the purpose set forth.

253,398.

253,399. CAR-COUPLING. AUSTIN LEYDEN, Atlanta, Ga. Filed Sept. 5, 1881. (No model.)

Claim.—1. In a car-coupling, the bell-crank lever F, in combination with the connecting-bolt A and the rod or shaft C, provided with the cam E', substantially as and for the purposes set forth.

2. The plate G, placed in the throat of the bumper and adapted to tip forward to support the connecting-bolt, substantially as and for the purposes set forth.

3. The hinged connecting-link B, formed with the extension *a*, in combination with the shaft C, provided with the cam E, as and for the purposes set forth.

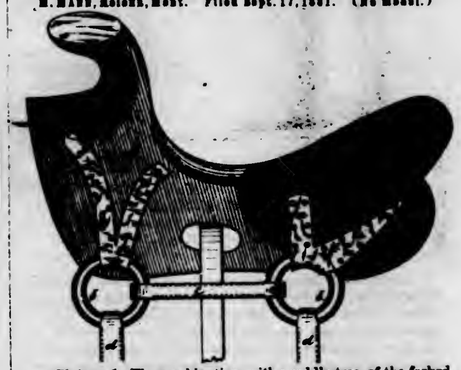
4. The bumper D, formed with the chamber H, in combination with the hinged connecting-link B, substantially as and for the purposes described.

5. The bumper D, provided with the chamber H, having a central plate, K, in combination with the hinged link B, whereby the link is protected from injury when not in use, substantially as herein shown and described.

6. The bumper D, provided with the top guide, L, in combination with the bolt A and the means for holding the same elevated, substantially as and for the purposes set forth.

7. In a car-coupler, the shaft or rod C, provided with the cams E and E', in combination with the bolt A and the hinged link B, substantially as and for the purposes set forth.

8. The shaft or rod C, provided with the cams E and E', in combination with the bell-crank lever F and the bolt A, and the hinged connecting-link B, provided with the extension *a*, substantially as and for the purposes set forth.



253,400. APPARATUS FOR DISINFECTING WATER-CLOSETS, &c. EDWARD J. HALLETT, Jr., New York, N. Y. Filed Nov. 12, 1881. (No model.)

Brief.—The receptacle E contains antiseptic or disinfecting liquid, which is taken up by the absorbent plunger G, and is diffused through the grating *h* in the face of the box D when said absorbent plunger is elevated from the well by manipulating the elevating devices.

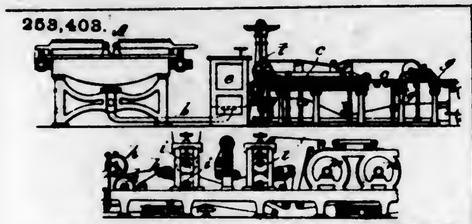
Claim.—The combination, with a water-closet or the like, of a vessel to contain antiseptic or disinfecting liquid, and an absorbent diffusing-plunger connected with and operated by the closet-lid or other appropriate part of the closet or closet-room, substantially as and for the purposes hereinbefore set forth.

253,401. GIRTH ATTACHMENT FOR SADDLE-TREES. WM. H. HAHN, Helena, Mont. Filed Sept. 17, 1881. (No model.)

Claim.—1. The combination, with a saddle-tree, of the forked metallic straps *a a*, secured to the tree near its ends and on each side thereof, and provided with rings *b b* at their ends, substantially as described.

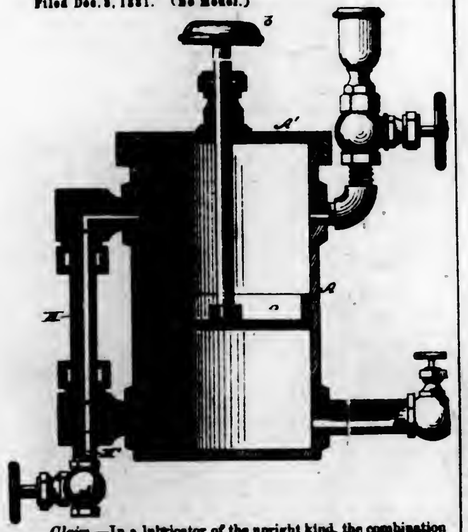
2. The combination, with the saddle-tree A, of the forked metallic straps *a a*, secured to the tree, as set forth, and not extending as high as the horn of the tree, rings *b b*, straps *c*, and girths *d d*, substantially as described, and for the purpose set forth.

253,402. FOOT-PROTECTOR. HERBERT W. MARTIN, Bennington, Vt. Filed Oct. 12, 1881. (No model.)



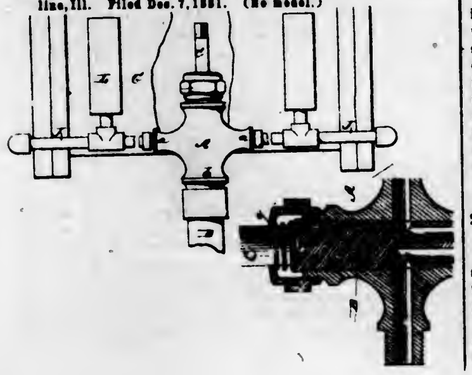
Claim.—A foot-protector having an elastic opening made up of the parts A B C and an elastic, D, all arranged and connected as shown and described.

253,403. MANUFACTURE OF BOARD FROM WOOD PULP. HERBERT M. MASON and GEORGE M. WORSTER, Bristol, N. H., assignors of one-half to David Mason and Benja. F. Perkins, same place. Filed Aug. 27, 1881. (No model.)



10. In combination with the coupling E, having arms *c c*, and the wheel D, the described bearing, consisting of the cones G and

253,403.

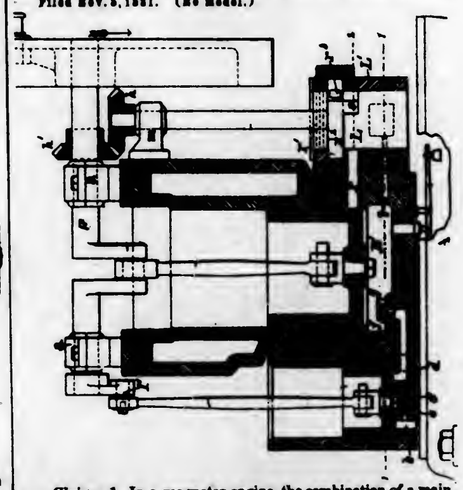


Claim.—In a machine for making boards from wood pulp, the combination of the vats A *e*, wire tables *c c*, shaker *t*, and suction-boxes *g g* of a Fourdrinier paper-machine with the endless felt aprons *h h* and press-rollers *i i*, whereby the soft board, being sufficiently dry, may be passed through said press-rollers *i i* without damage or structural change and a thick and uniform board be produced, substantially as shown and described.

253,404. LUBRICATOR. LEMUEL MAXFIELD, Moline, Ill. Filed Dec. 8, 1881. (No model.)

Claim.—In a lubricator of the upright kind, the combination of the cylinder A, the piston therein provided with a rod extended through the cylinder-head, the steam-supply pipe provided with a cock, the glass gage and oil-outlet pipe H, communicating with the oil-chamber above the piston, the pipe H', communicating with the lower end of the pipe H, and provided with a cock and means for allowing the refuse oil and water of condensation to be drawn from said cylinder A, all substantially as described.

253,405. STEAM-CYLINDER COCK. LEMUEL MAXFIELD, Moline, Ill. Filed Dec. 7, 1881. (No model.)



Claim.—1. The combination, with the steam-cylinder, of the drip-pipes J J, the two-way cock constructed with independent passages, the drip or discharge pipe D, and the air-chambers applied to pipes J J, substantially as described.

2. The combination, in a steam-cylinder cock, of the body A, having four limbs, the tapered plug B, fitted into two of these limbs, the independent L-shaped passages *g g*, and the spring *e*, substantially as described.

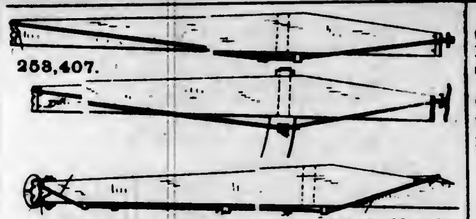
3. The combination of the body A, the tapered plug B, fitted into the body, the independent L-shaped passages *g g* through the plug, the pipe D, and the pipes J, communicating with the ends of the steam-cylinder.

253,406. GAS-ENGINE. THOMAS MCADOO, Baltimore, Md. Filed Nov. 5, 1881. (No model.)

Claim.—1. In a gas-motor engine, the combination of a main cylinder having the driving-piston and provided at its closed end with a cavity, a separate air-and-gas-compressing cylinder provided in the closed head with two independent valves, one serving to admit air and the other to admit gas, and a duct leading from the compressing-cylinder into the cavity in the main cylinder, as set forth.

2. In a gas-motor engine, the combination of a vertical main cylinder having the driving-piston, a vertical air-and-gas-mixing cylinder having a compressing-piston, a duct to connect the two cylinders, a rotary igniting-valve turning in a horizontal plane, and a crank-shaft mounted above the whole and directly connected with the two pistons and the rotary valve, as set forth.

3. In a gas-motor engine, a main cylinder having the driving-piston and provided with an exhaust-duct, *r*, and an ignition-duct, *q*, in combination with a rotary valve provided with means to effect the explosion in the main cylinder through the ignition-duct, and also provided with means to allow the exhaust from the main cylinder to escape, as set forth.



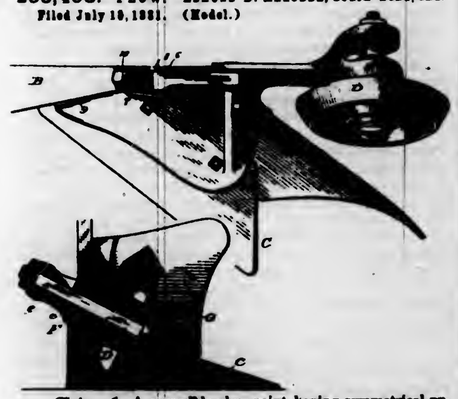
4. In a gas-motor engine, a main cylinder having the driving-piston and provided with an exhaust-duct, *r*, in combination with a cylindrical valve-case, L', having an inlet, *i*, for gas, a jet, *n*, for igniting the gas, an inlet, *p*, for air to maintain the ignition of the gas, an ignition-duct, *q*, communicating with the main cylinder, an outlet, r^2, for the escape of the exhaust, and a valve, L, to rotate within the cylindrical case, having a central interior gas-chamber, *k*, provided with an igniting-duct, *q'*, to coincide with the inlet *i* and duct *q* in the case, and also provided with a groove, r^3, to connect with the exhaust-outlet r^2, and a cavity on one side of the groove to coincide with the exhaust-duct *r*, as set forth.

253,407. CLAMP FOR PLOW-BEAMS. JOHN A. MCNEAL, Montgomery County, Md. Filed Dec. 28, 1881. (No model.)

Claim.—1. A strengthening-clamp for plow-beams, constructed substantially as described, combining a straining-rod, a tightening device, and bearings for the rod, and adapted to be applied to and removed from the plow-beam, as set forth.

2. The combination, with a plow-beam, of a strengthening-clamp composed of a straining-rod, a tightening device, and bearings for the rod, substantially as described, whereby the beam may

253,407.



be re-enforced temporarily or permanently, as desired, without interfering with the standard or attachments of the plow.

3. The combination, with the plow-beam, straining-rod, tightening device, and bearings, of a grooved metallic plate or plates applied at or near the end of the beam, substantially as described.

4. A strengthening-clamp for plow-beams, composed of a U-shaped straining-rod adapted to run each side of the plow-beam, a tightening device, and bearings for the rod, substantially as described.

5. In a clamp for strengthening a plow-beam, the combination of a U-shaped straining-rod, a tightening-screw or its equivalent, bearings for the rod, and bearing-plates at or near the ends of the beam, substantially as described.

253,408. PLOW. EDMUND D. MEACHEM, South Bend, Ind. Filed July 19, 1881. (Model.)

Claim.—1. A reversible plow-point having symmetrical upper and lower faces, upper and lower flanges, and a connecting-web at the rear edge adapted to the foot of the standard, substantially as described.

2. A plow-point removable and reversible, having symmetrical upper and lower faces, the thickened central portion adapted to rest against the notch in the tip of the foot, and the connecting-web, substantially as described.

3. The wedge-shaped plow-point, wide at the front end and tapering to the rear, having the thickened central portion, and web adapted to the foot of the plow-standard and to the wing, substantially as described.

4. In combination with the described plow-point, having upper and lower flanges and connecting-web 1, the hooked rod extending through the brace 8 and adapted to draw back the point upon its bearings, substantially as described.

5. The combination of the plow-point, having upper and lower flanges, with the foot of the standard having inclined upper and lower faces and side recesses, and shoulder and notch in the tip thereof, all adapted to furnish solid bearing for the point, substantially as described.

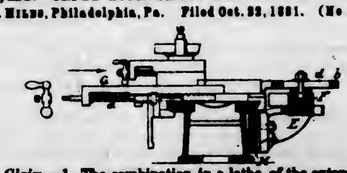
6. The reversible wing C, having the inclined bevels on opposite faces and ends tapering from upper to lower edge adapted to the recessed reversible point B, and in combination therewith, substantially as described.

7. The combination, in a plow, of a supporting landside-wheel and an elastic landside, substantially as described.

8. The combination, with a supporting and landside wheel adapted to be vertically adjusted, of a landside, H, having a rear portion partially overlapping the wheel and normally in a plane outside the vertical face of the wheel, as described.

9. The landside H, having the rear portion elastic and partially overlapping the wheel and the forward portion covering the recess in the point B, the parts being combined as described.

10. In combination with the coupling E, having arms *e e*, and the wheel D, the described bearing, consisting of the cones G and F, and the connecting-bolt adapted to draw upon both cones, substantially as described.



11. The combination of the wheel having the annular flange, the cones G and F, coupling E, and the connecting-bolt, substantially as described.

253,409. NECKTIE-FASTENING. LEON MICHAUX, Paris, France. Filed Nov. 16, 1881. (No model.)

Claim.—The necktie or cravat fastener herein shown and described, consisting of the plate *a*, having a vertical slot, *b*, with the enlargement *b'* at its lower end, the body of the plate being embossed at *c c*, on opposite sides of the slot, and bent at its lower end across the enlargement *b'* to form a right-angled knee, b^2, substantially as and for the purpose set forth.

253,410. TAPER ATTACHMENT FOR LATHES. FREDERICK B. HILDS, Philadelphia, Pa. Filed Oct. 22, 1881. (No model.)

Claim.—1. The combination, in a lathe, of the extension *b* of the slide G of the slide-rest with an adjustable guide-bar, F, and a block, *p*, adapted to the said bar and constructed for attachment to the said extension of the slide G, substantially as set forth.

2. The combination of the bracket E, constructed for attachment to the bed of a lathe, the guide-bar F, adjustable on the said bracket, the block *p*, adapted to the guide-bar, and the slotted extension *b* of the slide G of the slide-rest.

3. The combination of the bracket E, having segmental slots *s s*, with the guide-bar F, pivoted to the bracket and constructed for attachment to the same by bolts or screws passing through the said segmental slots.

4. The combination of the grooved bar H, constructed for attachment to the bed of a lathe, the bracket E, adjustable longitudinally on the said bar, and the guide-bar F, adjustable on the bracket, all substantially as set forth.

5. The combination of the bracket E, having segmental ends, and the indexes *e* and *f* with the guide-bar F, pivoted to the bracket, as set forth.

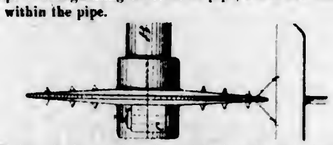
253,411. THILL-COUPLING. ROBERT J. MITCHELL, Girard, Ill. Filed Nov. 29, 1881. (No model.)

Claim.—The combination, with the bow A, lugs C, thill-iron D, the clamping device H J, and the packing strip of leather, K, of the angular recessed block G, made of compressible material, and provided with the rear slot, G, said block being removable or adjustable by simply loosening the clamp, as described.

253,412. HAIR-FRONT. EMMA HITTLEGARDT, New York, N. Y. Filed Nov. 21, 1881. (No model.)

Claim.—1. A hair-front composed of waves A, having strands

253,417.



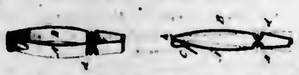
Claim.—1. The combination, with a felting-roller having grooves in its periphery, of lags pivoted within the said grooves,

Claim.—1. A hair-front composed of waves A, having strands *b* at the rear, connected by a transverse binding-weft, substantially as described.

2. A hair-front composed of waves A, having strands *b* at the rear, connected by a transverse binding-weft, provided with eyes and loops at the ends, substantially as described.

253,413. HEAT-ABSORBING APPARATUS. WM. M. MIXER, New York, N. Y., assignor to the De La Vergne & Mixer Refrigerating Company, same place. Filed Dec. 14, 1881. (No model.)

Brief.—The disks are cast solid in halves, their hubs bolted in close contact with the exterior of pipe B at any part of its length, and absorb and conduct heat from air through metal of disk, hub, and pipe to refrigerating contents of pipe, which are confined entirely within the pipe.



Claim.—1. In combination with pipes for the circulation of gas or liquid as a refrigerant, one or more heat-absorbing disks, when made in sections and attached to such pipes, substantially as described.

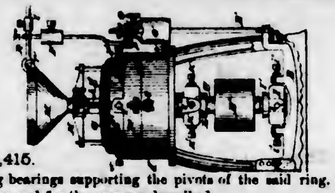
2. In combination with pipes for the circulation of gas or liquid as a refrigerant, one or more tapering heat-absorbing disks, when made in sections and attached to such pipes, substantially as described.

3. In combination with pipes for the circulation of gas or liquid as a refrigerant, one or more heat-absorbing disks, when made in sections having an enlarged bearing or hub, by which it is firmly attached to such pipes, substantially as described.

4. In combination with pipes for the circulation of gas or liquid as a refrigerant, and a series of heat-absorbing disks made in sections and closely secured to such pipes, one or more gutters, also attached thereto, substantially as described.

253,414. CLASP. BENJAMIN F. NEAL, Waterbury, Conn., assignor to the Steele & Johnson Manufacturing Company, same place. Filed Jan. 3, 1882. (No model.)

Claim.—1. The herein-described clasp, consisting of the two parts A B, the said two parts constructed with the transverse grooves *d* and corresponding internal ribs, with the wire loop placed in the groove of one part and closed into the groove of the other part to form the hinge between the two parts, the two parts forming jaws at one end, their other ends curved and brought together at the extremes to form springs to force the jaws together, substantially as described.



2. The two parts A B, each constructed with a transverse groove, *d*, and corresponding internal ribs, with a notch, *i*, in each side at the said grooves, the two parts forming jaws at one end, their other ends curved and brought together at the extremes to form springs to force the jaws together, and a wire loop set through the said notches *i* and closed into the grooves to form the hinge, substantially as described.

3. The herein-described clasp, consisting of the two parts A B, the said two parts constructed with the transverse grooves *d* and corresponding internal ribs, with the wire loop placed in the groove of one part and closed into the groove of the other part to form the hinge between the two parts, the two parts forming jaws at one end, their other ends curved and brought together at the extremes to form springs to force the jaws together, one of said parts constructed with an extension bent to form the hook C, substantially as described.

253,415. GRINDING-MILL. JOHN T. OHNESHAIN, Logansport, Ind. Filed Aug. 19, 1880. (No model.)

Claim.—1. The combination of the millstone and the annular ring in which it is arranged with an outer concentric ring arranged to create an annular space between the two rings for receiving weights, and partitions *c'*, arranged in said annular space to prevent the weights from shifting during the rotation of the stone, substantially as and for the purposes described.

2. In a grinding-mill, the combination, with the spindle, of the tram-pot I', the ring I, the pivots *i i*, supporting the tram-pot, the pivots *i' i'*, on which the ring is suspended, and the bridge-tree

253,415.

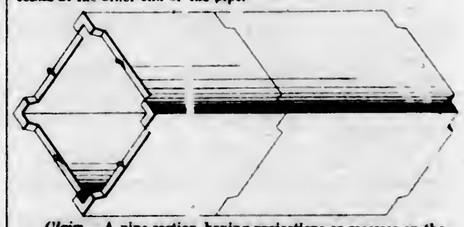
having bearings supporting the pivots of the said ring, substantially as and for the purpose described.

3. In a millstone-bush, the combination of the journal-bearing L, the ring K, the adjustable pivots K' K', supported by the ring, and on which the journal-bearing is suspended, the lugs *l*, and the pivots *l'*, passing through the lugs and sustaining the said ring, substantially as and for the purpose described.

4. In a two-part millstone-spindle, the combination, with the lower spindle, of the part c, constituting a feed-saucer, and detachably connected with the upper end of the lower spindle at a point below the face and within the body of the lower running-stone, substantially as and for the purpose described.

5. A balanced pivoted pressure-plate and lever arranged upon the hopper, with the float or plate portion adapted to be held down or kept from rising by the weight of the material or charge in the hopper, in combination with the swinging bridge-tree and devices adapted by connection with the pressure-plate lever to raise the bridge, and to admit, after their disconnection from said lever, of the shifting of the bridge, so as to remove the grinding-pressure from the millstone, substantially as herein set forth.

6. In combination with the pivoted lever R and float S, the tripping-rod P', scale-beam O, swinging bridge-tree B, and rod B', substantially as herein set forth.



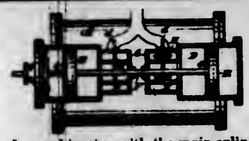
7. The pressure-plate S and lever R, in combination with tripping devices arranged to automatically remove the grinding-pressure from the millstone as the charge or grist leaves the hopper by shifting the bridge and the running-stone, substantially as herein set forth.

8. The combination, with the lower running-stone, D, the upper stationary stone, G, the outer surrounding curb, F, the hopper and the double feed-tube composed of the outer tube, *m*, and the inner tube, *m'*, of the vertically-adjustable spider U, connected with the outer tube and supported directly on the upper surface of the stationary stone, and the vertically-adjustable spider H, connected with the inner tube and supported by the curb, said members being arranged, substantially as described, for adjusting both parts of the double feed-tube, for the purposes set forth.

9. The combination, with the lower running and upper stationary stones, the surrounding curb, the hopper, and the double feed-tube, composed of the outer and inner movable tubes, of the spider U, connected with the outer tube, and having the arms *u u'* and adjusting-screw *e*, supported by the upper surface of the stationary stone, for adjusting the outer tube, and the spider H, supported by standards rising from the curb and connected with the inner tube, and provided with the set-screw *h*, for adjusting the inner tube, all substantially in the manner and for the purpose set forth.

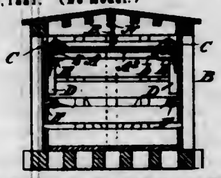
253,416. CONNECTING SMOKE, HOT-AIR, AND OTHER FLUES. SIMPSON O'BRIEN, New Cumberland, W. Va., assignor to Freeman Brothers, McCoy's, Ohio. Filed Aug. 11, 1876.

Brief.—One end of the pipe-section has projections and recesses which are the exact counterpart of the projections and recesses at the other end of the pipe.



Claim.—A pipe-section having projections or recesses on the end thereof set at an angle to one another, so as to lock against lateral displacement when the section is joined with its counterpart, substantially as set forth.

253,417. VALVE-GEAR FOR STEAM-ENGINES. JAMES O'DONNELL, Central City, Dak. Filed Oct. 12, 1881. (No model.)



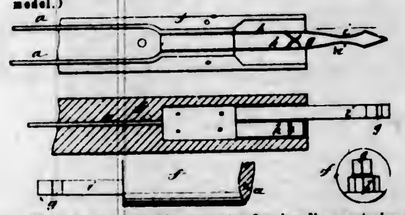
Brief.—The main piston-valves are connected to a small crank on the main shaft to assist engine over the dead-centers.

253,417.

Claim.—In combination with the main cylinder, cylinders D D, and the pistons E E, for controlling admission of steam to the former, the puppet-valves for controlling induction and exhaust of said cylinders D D, the gearing, cams, cam-shafts, and piston-rod F, substantially as shown and described.

253,418. STOCK-CAR. GEORGE F. ORNEL, Belle Vernon, Pa. Filed Dec. 15, 1881. (No model.)

Claim.—1. The combination, with the car B and the horizontal rods F, held a short distance from the inner sides of the car, of the vertically-sliding platform A, provided with the L-shaped hooks E on its under side, and means for raising and lowering said platform, substantially as and for the purpose set forth.



2. The combination, with the car B, the tracks D, and horizontal rods F, secured to the inner sides of the car, of the vertically-sliding platform A, provided with the rollers C and the hooks E, and means for raising and lowering said platform, substantially as and for the purpose set forth.

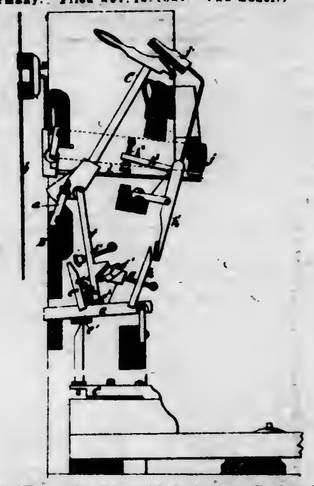
3. The combination, with the car B, provided with the tracks D, of the vertically-sliding platform A, provided with the rollers C, the pivoted L-shaped hooks S, and means for raising and lowering said platform, substantially as and for the purpose set forth.

4. The combination, with the vertically-sliding platform A, the doorway-standards *c*, and the sliding gate L, of the cattle-guards H, having the outer edges grooved, and the hooks J, secured to the said standards, substantially as and for the purpose set forth.

5. The combination, with the car B, provided with the tracks D, of the platform A, provided with the rollers C, the longitudinal rod N, the hand-wheel O, the pawl and ratchet P, and the chains R, substantially as and for the purpose set forth.

253,419. ELECTRIC COUPLING FOR TRAIN-TELEGRAPHS. EDWARD D. PARKER, Salina, Kans. Filed June 11, 1881. (No model.)

Claim.—In an electric apparatus for signaling on trains, the combination, with the electric wires *a a*, of the coupling formed with the springs *h h*, plates *i i*, and tongues *g g*, of non-conducting material, said plates *i* and springs *h* being integral and attached to the wires *a*, whereby, when the coupling is detached, the circuit is closed through the springs *h h*, when coupled electric continuity of the line-wires is secured, the plates *i i* being separated from each other at all times, substantially as shown and described.



253,420. MACHINERY FOR FELTING HAT-BODIES. AUGUSTE PELISSE, Newark, N. J., assignor to John T. Waring, New York, N. Y. Filed Apr. 6, 1881. (No model.)

Claim.—1. The combination, with a folding-roller having grooves in its periphery, of lags pivoted within the said grooves, substantially as herein described.

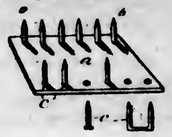
2. The combination, with the grooved roller A, of the pairs of pivoted lags B B, matched at their adjacent ends, and the springs *d d*, substantially as herein described.

253,421. PIANO-ACTION. GOTTLOB PHILIPP, Forst-in-the-Lausitz, Germany. Filed Nov. 19, 1881. (No model.)

Claim.—1. The combination, with the hammer C, of the lever *e*, the bar or piece *e'*, the jack or hopper *f*, provided with the screw *f'* and the spring *f''*, and regulating-screw *g*, substantially as specified.

2. The combination, with the damper D and its lever I, of the lever *e*, the bar h, the jack *h'*, provided with the arm *h²*, and the screw *h³*, substantially as specified.

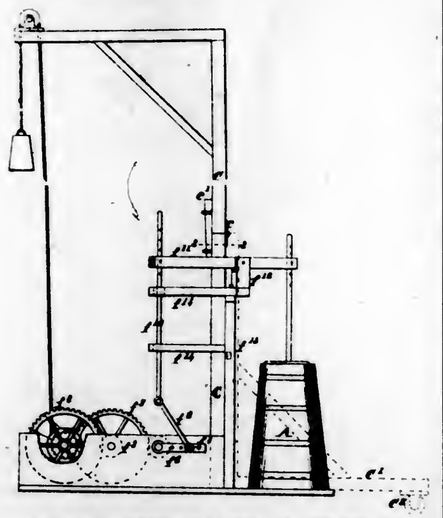
3. The combination, with the hammer C and lever *e*, of the jack *h'*, the check *f*, carried thereby, and the bar or piece h, fixed to the said lever *e*, substantially as specified.



4. The combination, with the hammer C, its flange *c*, and the jack or hopper *f*, of the spring *m*, arranged in said flange and having one end acting on said jack or hopper, and the screw *n*, for adjusting the tension of said spring, substantially as specified.

253,422. BREECH-LOADING FIRE-ARM. ALEXANDRE PICARD, Montaigu, France. Filed Mar. 16, 1880. (No model.) Patented in France Feb. 3, 1879.

Claim.—In a breech-loading gun, the combination of the rocking spring-actuated block B, having a hammer or piercing-point, *l*, made in one piece and provided with lever-arm *f*, the catch or sear h, pivoted to the rear portion of the breech-block, a fixed claw or shoulder, *j*, on the breech-piece, and the barrel having a hole in its under side to receive the hammer-point, as shown and described.



253,428. BELT-HOOK. ALFRED B. PITKIN, Hartford, Conn. Filed July 29, 1881. (No model.)

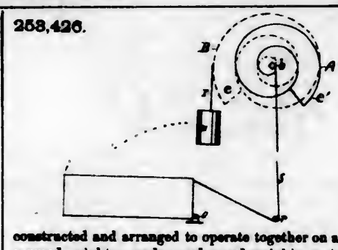
Claim.—1. The combination of the belt-hook plate *a*, having permanent teeth *b* on one edge and holes or perforations at its opposite edge, with the removable teeth *c*, all substantially as described, and for the purpose set forth.

2. The combination of the belt-hook plate *a*, having permanent teeth *b* on one edge and holes or perforations at its opposite edge, with the removable double teeth *c*, all substantially as described, and for the purpose set forth.

253,424. CHURN-MOTOR. GEORGE C. QUICK, Centralia, Ill., assignor of one-half to Thomas Quick, St. Louis, Mo. Filed Dec. 12, 1881. (No model.)

Claim.—The combination of churn A *a'*, connecting arm f^{11}, fulcrumed on post f^{10}, frame f^{10}, connecting-rod f^{12}, guide-arms f^{14}, arm f^{9}, crank f^{8}, box B *b*, gearing f^{7} f^{6} f^{5} f^{4} f^{3} f^{2} *f*, drum F, crank f', ratchet-wheel A, pawl *h'*, rope D, weight E, pulley C', and supporting-post C' C, all made substantially as and for the purpose set forth.

253,425. APPARATUS FOR EXPRESSING MALT EXTRACTS FROM THE REFUSE OF BREWERS' MASH. HENRY R. RANDALL, Brooklyn, N. Y., assignor of one-half to Charles G. Till, same place. Filed July 23, 1881. (No model.)

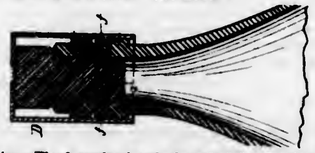


Claim.—1. The combination, with a reticulated or foraminous apron, of rollers arranged one above the other and both having faces of india-rubber or other elastic material, between which said apron passes and to which material is carried by said apron, and a receptacle for liquid under the lower roller and that portion of the apron which is between and adjacent to the rollers, substantially as and for the purpose specified.

2. The combination of a reticulated or foraminous apron having its edges bound with india-rubber or other suitable material, with rollers arranged one above another and having faces of india-rubber or other elastic material, between which the apron passes and to which material is carried by said apron, and a receptacle for liquid under the lower roller and that portion of the apron which is between and adjacent to said rollers, substantially as and for the purpose specified.

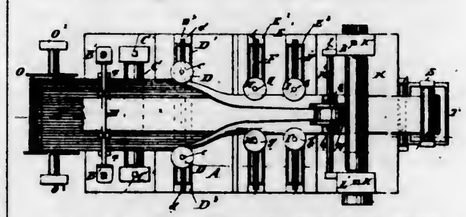
253,426. MECHANICAL MOVEMENT. JOHN W. REID, Chicago, Ill. Filed Nov. 18, 1881. (No model.)

Claim.—1. In combination with the spiral pulleys A and B,



constructed and arranged to operate together on a shaft, *b*, the fulcrumed weight *a*, cords *s* and *r*, and weight *w*, substantially as and for the purpose specified.

2. The fulcrumed weight *a*, suspended weight *w*, pulley *p*, and cords *s* and *r*, in combination with the spiral pulleys A and B, constructed and arranged substantially as specified.



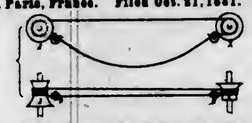
3. The spiral pulleys A and B, constructed as shown, provided with cords *s* and *r*, attached as shown, the cord *r*, provided with a weight, *w*, and the cord *s*, attached, as shown, to a fulcrumed weight, *a*, offering a variously increasing or decreasing resistance, substantially as specified.

253,427. BOTTLE-STOPPER FASTENING. H. L. CHARLES RENAULD, Brooklyn, and MARSHALL B. STAFFORD, New York, N. Y. Filed Nov. 3, 1881. (No model.)

Claim.—The fastening herein described for securing the stopper in bottles and other vessels, consisting of the cap D, adapted to pass over the stopper and mouth of the vessel, and provided at its lower portion with the slots *a b*, in combination with the ring *f*, composed of sections *g h*, having intermeshing ends and carrying the lugs *i*, the ring being applied on the neck of the vessel to turn and cause the lugs to lock or free the cap, substantially as set forth.

253,428. MACHINE FOR MAKING RUBBER BELTING. JOS. T. RIDGWAY, Trenton, N. J. Filed July 30, 1881. (No model.)

Claim.—1. In a machine for making rubber belting, the combination, with the bed-plate A and the grooved or flanged rollers D H I, of the open frames D' E' E', the sliding blocks D' G G', and screws D' F F', whereby each roller is adapted to have an independent adjustment, substantially as and for the purpose set forth.



2. In a machine for making rubber belting, the combination, with the bed-plate A and the open frames D', provided with the lugs d^3, of the blocks D^3, rollers D, and screws D^3 D^4, whereby the said rollers can be adjusted to or from each other or lengthwise of the bed, substantially as and for the purpose set forth.

3. In a machine for making rubber belting, the combination, with the bed-plate A and the roller D, of the frame D', provided with the lug d^3 and the screw D^4, whereby the said roller is adapted to be adjusted lengthwise of the said bed, substantially as set forth.

4. In a machine for making rubber belting, the combination, with the standards K', provided with brackets *l f*, of the shaft M', the adjustable spool M, shaft M', and adjustable flanged guide-roll M^5, substantially as and for the purpose set forth.

5. In a machine for making rubber belting, the combination, with the roll O, carrying the stock, and the roll O', carrying the covering, of the hinged arms Q and the rollers Q', substantially as and for the purpose set forth.

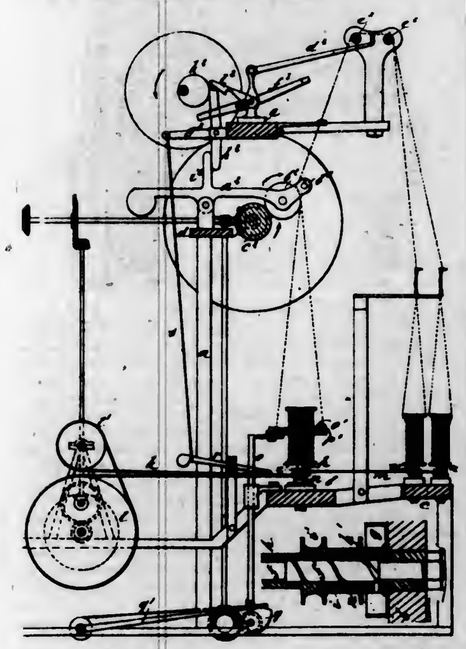
253,429. SYSTEM FOR TRANSMITTING MOTION. ANTONIO SAMPER, Paris, France. Filed Oct. 21, 1881. (No model.)

Claim.—1. The concaved pulleys having the rope or belt coiled around them, in combination with the tension-pulley D, substantially as and for the purposes set forth.

2. In combination with the conical motor-pulley X and the conical driven pulley A, the rollers B, placed near the pulleys and applied to each end of the rope or belt, so as to produce tension, as set forth.

3. In combination with the pulleys A and X, the pulleys B, C, and D, for rounding angles and for tightening the rope or belt, substantially as described.

4. The separated motor-pulley X, in combination with the pulleys *y y* and the rope or belt wound around the pulley X, and having its ends free and weighted, substantially as and for the purposes set forth.



253,430. SOFT-METAL LINING FOR DOVETAIL SOCKETS. JAMES A. SANDFORD, Albany, N. Y. Filed Sept. 26, 1881. (No model.)

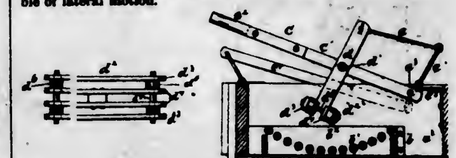
Claim.—1. A sheet-metal shell, C, having an inclined side or face, *a*, and having its ends partly closed by the turned-over metal of the shell, whereby it is adapted to form a part of the pattern for molding dovetail sockets and a lining for the sides or bearing-surfaces of the finished sockets, substantially as described.

2. The combination, in molding patterns for dovetail sockets, of fixed ribs or projections F and separate or disconnected sheet-metal shells C, substantially as and for the purpose described.

253,431. MACHINE FOR SPINNING, DOUBLING, AND TWISTING FIBROUS MATERIALS. FRANCIS SEYMOUR, Paterson, N. J. Filed Aug. 10, 1881. (No model.)

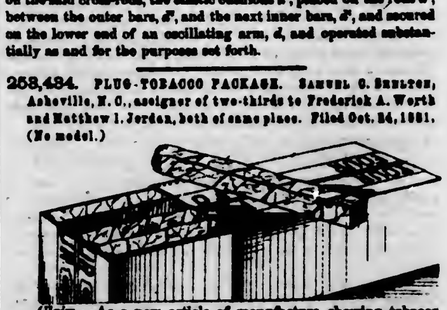
Claim.—1. The combination, with fallers d^3, lever f^3, cam k^2, roller c^3, and mechanism for operating said cam and roller, of lever g^3, provided with lug h^3, and lever d^3, provided with lug f^3, and carrying rolls b^3 b^3, substantially as and for the purposes specified.

2. The combination of the spindle *f f'*, the pulleys *i n*, the tube *h h'*, the rail *b*, and the oil-cup *g*, substantially as shown and described.



253,432. CAN-OPENER. FRANK SHARP, Socorro, N. Mex. Filed July 8, 1881. (Model.)

Claim.—A can-opener constructed substantially as herein shown and described, consisting of the handle A, the bar B, having a curved point, C, and a perforated lug, D, upon its forward end, the swiveled screw E, having thumb-wheel F upon its inner end, and the cutter H, having in its shank G a screw-hole to receive the screw E and a perforation to receive the bar B, as set forth.



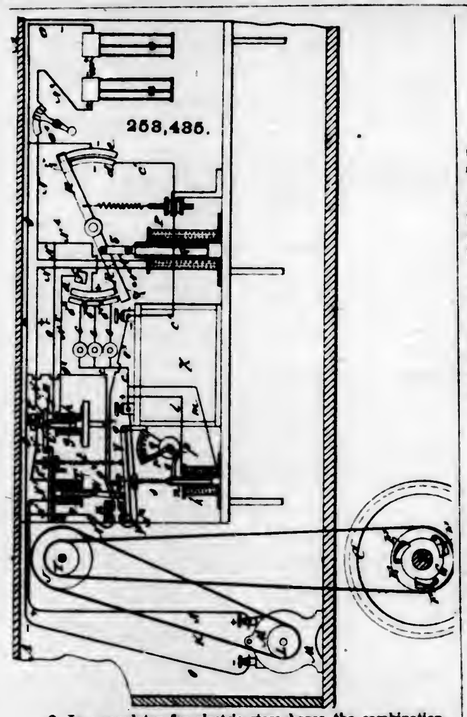
253,433. WASHING-MACHINE. HOWARD A. SHAW, Galena, Ohio. Filed Sept. 30, 1880. (Model.)

Brief.—The rubber is composed of a series of parallel bars held on cross-rods, the two outer being held loosely in place and having rubber cushions placed between them and the next inner bars, the said inner bars being immovable, while the outer ones are capable of lateral motion.

Claim.—In a washing-machine, the rubber d^5, composed of a series of parallel bars, d^2 d^3, arranged and held on cross-rods d^4, the bars d^3 being placed and held loosely, so that they slide inwardly on the said cross-rods, the elastic cushions d^7, placed on the rods d^4, between the outer bars, d^2, and the next inner bars, d^3, and secured on the lower end of an oscillating arm, *d*, and operated substantially as and for the purposes set forth.

253,434. PLUG-TOBACCO PACKAGE. SAMUEL C. SHELTON, Asheville, N. C., assignor of two-thirds to Frederick A. Worth and Matthew I. Jordan, both of same place. Filed Oct. 24, 1881. (No model.)

Claim.—As a new article of manufacture, chewing-tobacco formed into blocks, each composed of a definite number of plugs of equal size and weight, said plugs being separately enveloped in a wrapper of leaf-tobacco, with their opposite ends cut and twisted, respectively, and the entire block of adhering plugs packed in a box of paper or like material, substantially as shown and described.



253,435. REGULATOR FOR ELECTRIC STORE-BOXES AND LIGHTS. HENRY B. SHERIDAN, Cleveland, Ohio. Filed Aug. 11, 1881. (No model.)

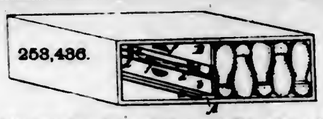
Brief.—A dynamo-electric generator and a secondary battery are mounted upon a railway-car, the generator being driven by band-and-pulley connections from the axle of one pair of wheels, and electric lights are placed in and operated by the main circuit. A derived circuit contains a secondary battery. This circuit is automatically opened when the charge in the secondary battery reaches its maximum, and the current from the latter is diverted through the light-circuit when the generator fails to supply the full complement of the required current or when it stops entirely, by reason of stoppage of the car.

Claim.—1. The combination, with the car-axle D and a dynamo-electric machine, of the pulley E, pawls F, ratchet-wheel G, and the belts and pulleys H K I J L, substantially as herein shown and described, whereby electricity will be generated by the advance of the car, as set forth.

7. The oil-pump arranged to slide into a recess in the door of

253,439.

2. In a regulator for electric store-boxes, the combination, with the dynamo-electric machine M, the circuit-wires N O, and the storage-box X, of the magnet T, the hinged lever V, connected with the core of the magnet T, the insulated connections Y Z, and the connecting-wires N' N' N³ O' N³ O', substantially as herein shown and described, whereby the excess of electricity beyond the amount necessary to keep the lamps alight will be automatically conducted into and stored in the said storage-box, as set forth.



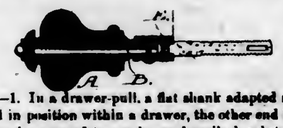
3. In a regulator for electric store-boxes, the combination, with the dynamo-electric machine M, the positive circuit-wire N, and the storage-box X, of the magnet P, the lever R, and the switch-blocks *a*, *b'*, *b'*, *b'*, and *d e*, and the connecting-wires *e c'* and N' O', substantially as herein shown and described, whereby the deficit of electricity below the amount necessary to keep the lamps alight will be automatically supplied from the storage-box, as set forth.

4. In a regulator for electric store-boxes, the combination, with the dynamo-electric machine M, the positive circuit-wire N, having switch, the storage-box X, the magnet P, the lever R, the switch-blocks *a*, *b'*, *b'*, *b'*, and *d e*, the connecting-wires *e c'* and N' O', of the magnet *g*, the arm *i* and spring *j*, the insulated connections *v w*, the connecting-wires N³ O', and the switch-block *f*, substantially as herein shown and described, whereby, when the generated current becomes very weak or stops and the lamps are kept alight from the storage-box, the main circuit is broken to prevent the current of electricity from passing back to the generator, as set forth.

5. In a regulator for electric store-boxes, the combination with the dynamo-electric machine M, the storage-box X, the magnet T, the lever V, the insulated connections Y Z, and the wire N' N' N³ O' N³ O' and wire *c*, included in the circuit of the storage box, of the magnet *k*, the arm *o*, the lever *p*, the hand *r*, the dial *q* and the springs *s t*, substantially as herein shown and described whereby the amount of electricity in the storage-box will be accurately indicated, as set forth.

258,486. DEVICE FOR SUPPORTING BOOTS IN BOOT-BOXES. E. H. SLAGLE, Algona, Iowa. Filed Oct. 5, 1881. (No model.)

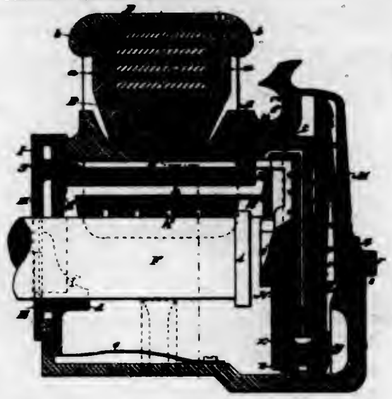
Claim.—1. An improved device for supporting boots in boxes, consisting of two boards having coiled springs interposed between them, substantially as herein shown and described, whereby the said boards will be forced against the sides of the box, as and for the purpose set forth.



2. The main board A, provided with the rods *c c*, in combination with the board B and the coiled springs *d d*, substantially as and for the purposes set forth.

3. The board B, provided with the points *i i*, in combination with the rods *c c*, springs *d d*, and the main board A, the main board being composed of the bottom piece, *a*, and the upright piece *b*, the board B and the upright piece being formed with the hand-opening *f f*, substantially as and for the purposes set forth.

258,487. DRAWER-PULL. FRIEND W. SMITH, Bridgeport, Conn., assignor to the Smith & Egge Manufacturing Company, same place. Filed Dec. 29, 1881. (Model.)



Brief.—A flat shank is riveted to a yoke, which in turn is secured to a tube and its ferrule, said tube passing through the handle, and being provided at its lower end with an ornamental plug.

Claim.—1. In a drawer-pull, a flat shank adapted at one end to be secured in position within a drawer, the other end being riveted or otherwise secured to a yoke, as described, substantially as and for the purpose specified.

2. In a drawer-pull, the tube B, arranged interiorly of the knob A, in combination with the ferrule E, yoke B, and shank C, substantially as and for the purpose set forth.

258,488. CAR-AXLE BOX. JOSEPH M. SMITH, New York, N.Y. Filed Nov. 1, 1881. (No model.)

Claim.—1. A detached saddle for an axle-box, having a rounded or convex seat for the spring and a socket to rest upon a ball on the top of the housing, whereby perfect freedom of movement without friction is attained, substantially as set forth.

2. The saddle provided with a rounded seat for the spring, arranged between raised guard-flanges, which have short laterally-projecting flanges to receive the clip, in combination with the said clip arranged to engage the lateral flanges, substantially as shown.

3. The combination, with the housing and the bearing-cap, of the slide or cap I, the washer-collar H, and the half-collar E, provided with oblique scraping-edges *f f* and a supporting-spring, *e*, all constructed and arranged substantially as set forth.

4. The bearing-cap provided with the serpentine oil-channel in its concave face, said channel being arranged to receive oil from the pump at the inner end of the bearing, as set forth.

5. The bearing-cap J, provided with the internal channel, *h*, the serpentine channel h^2, and the recess h^3 for the button on the axle-journal, substantially as specified.

6. The combination, with the housing, of the slide I, arranged to engage and rest upon the inner end of said housing, and the bearing-cap provided with bearings in the housing and with a projection to engage a recess in the said slide I, substantially as herein shown, and for the purposes set forth.

7. The oil-pump arranged to slide into a recess in the door of the box, and provided with a spring at its back to engage a shoulder on the said door, in combination with a door provided with a recess to receive the pump, a shoulder to engage the spring on the same, and an aperture near said shoulder, through which the spring may be released from said shoulder, substantially as set forth.

8. The combination of the housing constructed to receive the door, the said door provided with marginal flanges to take over the margin of the opening in the housing, with a recess and keeper to receive the oil-pump, a shoulder to engage the spring on the pump, and an aperture through which the disengagement of the spring is effected, and the oil-pump provided with a projecting part to take under the roof of the housing, and a spring on its back to engage a shoulder on the door, all arranged to operate substantially as set forth.

9. The combination of the housing provided with margins or marginal flanges *s s'*, the door provided with marginal flanges *r r' r²*, with a shoulder, *p*, and aperture *g*, the oil-pump provided with springs *o* and *n* of unequal length, and a projecting part, *t*, to take under the roof of the housing, and the stopping-bar arranged to be attached to and detached from the pump, all arranged to operate substantially as set forth.

10. The combination, with the housing and the door of the box, of the stopping-bar arranged to embrace the pump and to slide in keepers on the door, the said pump and the plate *j*, attached removably to the stopping-bar, all constructed and arranged to operate substantially as set forth.

11. The combination, with the pump-chamber and the outer valve-chamber, arranged to slip over its lower end, of the stopping-bar made to embrace the body of the pump-chamber, and provided with a flange to take under a projecting portion of the valve-chamber and prevent it from escaping, substantially as set forth.

12. The combination of the following coactive elements, namely: the housing, the bearing-cap provided with a projection, *g*, the slide I, having a provision to engage the projection *g*, the oil-pump, the stopping-bar connected with the pump, and the door M, all provided, constructed, and arranged to operate substantially as and for the purposes set forth.

13. The combination, with the housing having a ball-support for the saddle, of the saddle B, provided with a socket to rest on the said ball-support, a rounded convex seat for the spring C, two raised guards, *a a*, and two short lateral flanges, *b b*, on the guards *a*, and a clip, D, having curved ends to engage the flanges *b b*, all arranged to operate substantially as set forth.

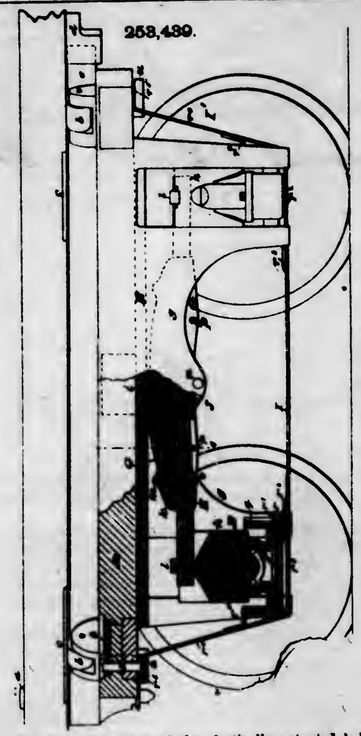
258,489. CAR-TRUCK. JOSEPH M. SMITH, New York, N.Y. Filed Nov. 1, 1881. (No model.)

Claim.—1. A car provided with two trucks, one under each end of the car-body, and each truck pivoted at its end to the end of the car-body, and having its free end arranged to swing under the body of the car, whereby, whichever end of the car be foremost, the wheels of the front truck will be behind the pivot-point and the wheels of the back truck in front of the pivot-point, substantially as set forth.

2. The evener provided with sockets to receive the springs, substantially as set forth.

3. The evener provided with sockets to receive the springs, and provided with a socket at the center to receive a ball on the housing or truck-frame, all constructed substantially as set forth.

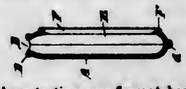
4. The combination, with the housing and pedestals, of the socketed evener, the springs secured in sockets in the same, the axle-boxes, and the saddles of the said boxes, having convex tops to receive the springs, all constructed and arranged substantially as set forth.



5. The combination, with the housing and pedestals, of the socketed evener mounted in the housing, the laminated springs secured in sockets in the evener, the axle-boxes, the saddles, removable from said boxes and provided with convex tops for the springs to rest on, and the clips which secure the springs to the saddles, all constructed and arranged substantially as set forth.

6. The combination, with the truck-frame, of the housings provided with side plates, *g*, and recesses or pedestals for the axle-boxes, the evener G, springs H, secured thereto, the axle-boxes, and their saddles, all arranged substantially as set forth.

7. The evener provided with sockets to receive the springs, and with cams *p*, substantially as set forth.



8. The evener provided with sockets to receive the springs, with cams *p*, and with pins or bolts *o*, all arranged substantially as and for the purposes set forth.

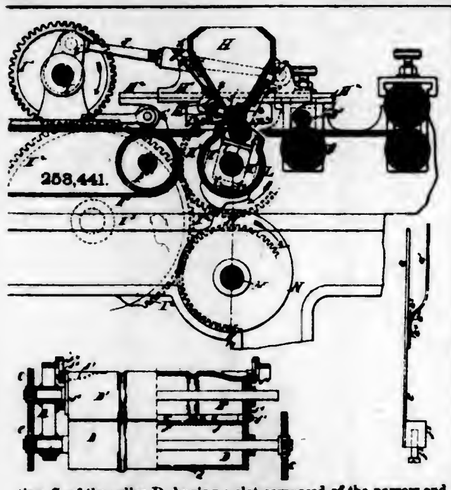
9. The stirrup-strap consisting of the stretcher I, provided with a lip, *r'*, and a hole to receive the pin on the strap I', and the said strap provided with a pin, *r²*, all arranged substantially as set forth.

10. The combination of the elastically-actuated bolt *o*, the button *u*, the strap I', provided with pin *r²* and bracket *r³*, and the stretcher I, provided with a lip, *r'*, and a hole to receive the pin *r²*, all constructed and arranged substantially as and for the purposes set forth.

258,440. RUBBER WATCH-CASE. GUSTAV SPECKHART, Nuremberg, Germany. Filed Nov. 12, 1881. (No model.)

Claim.—1. A protecting-case for watches, made, substantially as herein shown and described, of soft rubber, and with an aperture, B, for the pendant and an opening, E, for the dial, as set forth.

2. The combination, with the soft-rubber watch-protecting case A, provided with a pendant-aperture, B, and a dial-opening, E, of the beads D and F, surrounding these openings or apertures, respectively, substantially as herein shown and described, and for the purpose set forth.



3. The combination, with the soft-rubber watch-protecting case A, of the circumferential rib G, substantially as herein shown and described, and for the purpose set forth.

258,441. MACHINE FOR MAKING PAPER BAGS. EDWARD STANLEY, New York, N.Y., assignor to the National Paper Bag Company, same place. Filed Oct. 21, 1881. (No model.)

Claim.—1. A knife for a paper-bag machine, composed of a straight stock-piece, a bowed stock-piece detachably secured thereto, and a sectional blade, substantially as herein specified.

2. A knife for a paper-bag machine, composed of a straight stock-piece cut away upon the under side, a bowed stock-piece slitted at each end to form two fingers, the upper of which are detachably secured to the straight stock-piece and the lower of which lap under the same, and the sectional blade, substantially as herein specified.

3. The combination, with the roller D' and the reciprocating knife carried thereby, and composed of the main stock-piece *c* and blade-sections *f*, and the removable stock-piece *c'* and blade-sec-

tion *f'*, of the roller D, having a slot composed of the narrow end portions, *g*, and the wider intermediate portion, *g'*, substantially as herein specified.

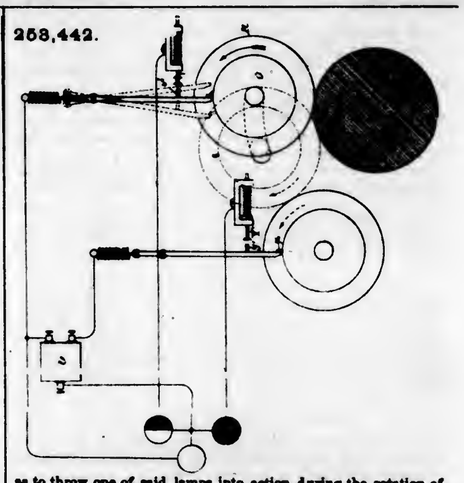
4. In a paper-bag machine, the combination of two rollers, between which the paper passes, having circumferential beads and corresponding grooves near each end, and having the portions on the outer sides of and between said beads and grooves of cylindric form and uniform diameter, and a reciprocating knife carried in one of said rollers, substantially as herein specified.

5. In a paper-bag machine, the combination of a paste-box, a reciprocating carriage supporting said box and guides therefor, and a crank-shaft and a connecting rod or rods for operating said carriage, substantially as herein specified.

6. In a paper-bag machine, the combination of a paste-box, a plate for supporting bags while paste is being applied, a shaft with which said plate rotates, and mechanism, substantially as described, for moving said plate toward and from the center of the shaft, substantially as herein specified.

7. In a paper-bag machine, the combination of a creasing blade or knife, an elastic creasing-roller, a shaft with which said roller rotates, and mechanism, substantially as described, for moving said roller toward and from said shaft, substantially as herein specified.

8. In a paper-bag machine, the combination of a paste-box, a creasing knife or blade, a plate for supporting the bags while paste is being applied, an elastic creasing-roller, a shaft with which said plate and creasing-roller rotate, and mechanism, substantially as described, for moving said plate and roller toward and from said shaft, substantially as herein specified.



9. In a paper-bag machine, the combination of a reciprocating paste-box, a plate for supporting bags while paste is being applied, a shaft with which said plate rotates, yokes to which said plate is attached, and cams for moving said yokes and plate from the center of said shaft, substantially as herein specified.

10. The combination of the paste-box H, the creasing blade or knife *p*, the plate P, the sliding yokes I', the elastic creasing-roller *p'*, and the cams N, substantially as herein specified.

253,442. APPARATUS FOR PRODUCING SIGNALS AND LIGHTS UPON RAILWAY-TRAINS. ELI T. STARR, Philadelphia, Pa. Filed Nov. 10, 1881. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, of a vehicle or train of vehicles, a rotating axle or moving part of said vehicle or train, an electric circuit including a source of electricity mounted upon said vehicle or train, an electric lamp, and mechanism operated by said axle or moving part, whereby said axle, when turning in one direction, throws said lamp into circuit to give out light, while when turning in the opposite direction said lamp is thrown out of circuit.

2. The combination, substantially as hereinbefore set forth, of a vehicle or train of vehicles, an axle or moving part of said vehicle or train, a source of electric supply mounted upon said vehicle or train, electric lamps, circuit-connections between said electric source and said lamps, and mechanism operated by the movement of said axle or moving part of the vehicle or train, so

as to throw one of said lamps into action during the rotation of said axle in one direction, and another of said lamps into action during the rotation of the axle in the opposite direction.

3. The combination, substantially as hereinbefore set forth, of a vehicle or train of vehicles, a source of electricity mounted upon said vehicle or train, two circuits including said source, and a switch automatically operated by the movement of said vehicle or train to close one of said circuits when the vehicle or train is advancing and to close the other of said circuits when said vehicle or train is backing.

4. The combination, substantially as herein before set forth, of a vehicle or train of vehicles, an axle or rotating part of said vehicle or train, electric lamps to indicate the direction of travel of said vehicle or train, circuit-connections including said lamps and a source of electricity mounted on said vehicle or train, mechanism operated by the movement of said axle so as to throw one of said lamps into action during the rotation of said axle in one direction and another of said lamps into action during the rotation of the axle in the opposite direction, and a third lamp to indicate when the vehicle is at rest.

5. The combination, substantially as herein before set forth, of an axle or rotating part of a vehicle, an arm carrying friction-wheels journaled therein, so as to be driven by the revolution of said axle, circuit-connections including electric lamps and a source of electricity, and circuit-breaking wheels turned by said friction-wheels to make and break said circuit-connections.

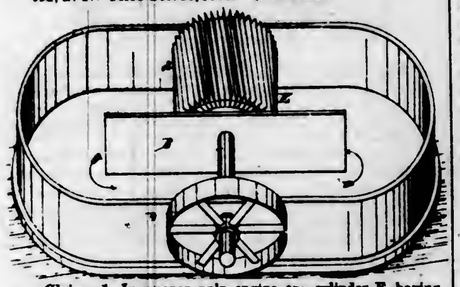
6. The combination, substantially as herein before set forth, of an axle or rotating part, a hanging arm, a roller journaled in said arm so as to rotate a circuit-breaker to make and break an electric circuit, a second roller journaled in said arm so as to be driven by said axle and capable of being moved into and out of contact with said first-mentioned roller, and a circuit-breaker rotated by said second roller to make and break an electric circuit.

253,443. COLORING-MATTER OR DYE-STUFF. JAMES H. STEBBINS, Jr., New York, N. Y. Filed Dec. 31, 1881. (Specimens.)

Claim.—The blue dye-stuff produced by the action of chloride of lime upon an alkaline mixture of dimethyl-paraphenylendiamine hydrochloride and orthocresol, substantially as set forth.

253,444. COLORING-MATTER OR DYE-STUFF. JAMES H. STEBBINS, Jr., New York, N. Y. Filed Dec. 31, 1881. (Specimens.)

Claim.—The blue dye-stuff produced by the action of dimethyl-paraphenylendiamine hydrochloride upon an alkaline solution of orthocresol in presence of an oxidizing agent, substantially as set forth.



253,445. COLORING-MATTER OR DYE-STUFF. JAMES H. STEBBINS, Jr., New York, N. Y. Filed Dec. 23, 1881. (Specimens.)

Claim.—As a new article of manufacture, the blue dye-stuff or coloring-matter herein described, and having the characteristics above set forth.

253,446. INSULATION OF ELECTRICAL CONDUCTORS. HENRY C. STRONG, Chicago, Ill., assignor of one-half to James Lloyd and Llewellyn R. Lloyd, same place. Filed Aug. 26, 1881. (No model.)

Claim.—As an improved article of manufacture, an annealed telegraph-wire coated with a sizing of adhesive preparation and wrapped in pure asbestos, said asbestos wrapping being coated with a covering of pulverized asbestos and oil, substantially as specified.

253,447. PAPER-PULP ENGINE. WILLIAM B. TAYLOR, Fulton, N. Y. Filed Dec. 23, 1881. (No model.)

Claim.—1. In a paper-pulp engine, the cylinder E, having the plain cutting-blades *d*, set diagonally across the surface of the cylinder, substantially as and for the purposes set forth.

2. The combination of the cylinder E, having the plain cutting-blades *d* set diagonally across its surface and the blades *f* arranged under the said cylinder and parallel with its axis, substantially as shown and described, whereby a shearing action or cut is given to the blades, as set forth.

253,448. HEAD-COVERING. RICHARD H. TRESEDER, Greenville, N. J. Filed Dec. 1, 1881. (Model.)

Claim.—1. As a new article of manufacture, a plush hat made of one continuous piece of plush having a nap on both sides, substantially as set forth.

2. A lady's or child's hat made of silk plush or cotton-napped fabric, napped on both sides, sized, and blocked into shape, substantially as specified.

3. The method herein described of making ladies' and children's hats by cutting a blank from a continuous piece of fabric napped on both sides, sizing the same, and then blocking it into shape, substantially as set forth.

253,449. LEATHER-SPLITTING MACHINE. GEO. L. TYLER, Lynn, Mass. Filed July 30, 1881. (No model.)

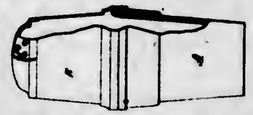
Claim.—1. In a leather-splitting machine, two adjusting-arms attached to the journals of two feed-rolls, said two adjusting-arms being held together by a connecting-bar at each end of the machine, and held firmly to the frame of the machine by a bar at each end of the machine, said adjusting-bars being adapted to spread and contract upon pivots, the whole constructed and arranged substantially as described, and for the purpose set forth.

2. In a leather-splitting machine, two equalizing-levers crossed at their centers, and held upon a pivot at said centers, said pivot forming a fulcrum for both levers, said levers being provided with an elongated slot at each end of each lever, each of said slots being adapted to receive a friction-bolt, which friction-bolts are attached to the adjusting-arms B and B', constructed and arranged substantially in the manner described and shown, and for the purpose specified.

3. In a leather-splitting machine, an elliptic tension-spring attached to and adapted to bear against the adjusting-arm B and to bear upon the adjusting-arms B', said spring being provided with an adjusting-screw, *d*, constructed and arranged substantially as described and shown, and for the purpose set forth.

4. In a leather-splitting machine, in combination with the two feed-rolls of a leather-splitting machine, the two adjusting-arms B and B', the connecting-bars G, with pivots *g* and *g'*, the bars H, held by the bolts *h* and *h'*, the friction-belts *d'*, attached to said adjusting-arms B and B', the two crossed equalizing-levers C, provided with the elongated slots *e* and with the pivot E, and the elliptic spring J, with the adjusting-screw *d*, all constructed and arranged substantially as described and shown, and for the purpose set forth.

253,450. JEWELRY. JOHN B. VAN HOUTEN, Newark, N. J. Filed Oct. 11, 1881. (No model.)



Claim.—1. The combination, with a crown-piece composed of the back plate, *d*, and cramps *b*, of the cylinder and stone held in combination by said cramps, substantially as and for the purposes set forth and shown.

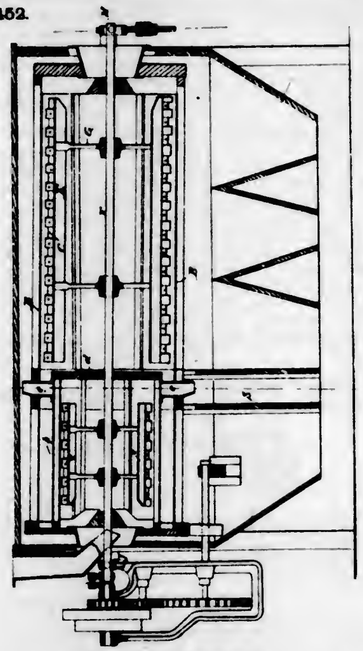
2. The combination of the back plate, *d*, having a pin and cramps thereon, of a tubular portion, *c*, and stone held in said combination by said cramps, substantially as and for the purpose set forth.

3. In a scarf-pin, the combination, with the back plate, *d*, of the crown-piece, of the pin *c* and supplementary pin, *f*, arranged and operating substantially as and for the purposes set forth and shown.

4. As a new article of manufacture, the scarf-pin having therein the crown-piece A, tubular bearing *c*, stone, pin *c*, and supplemental pin *f*, the whole being arranged and operating substantially as and for the purpose set forth.

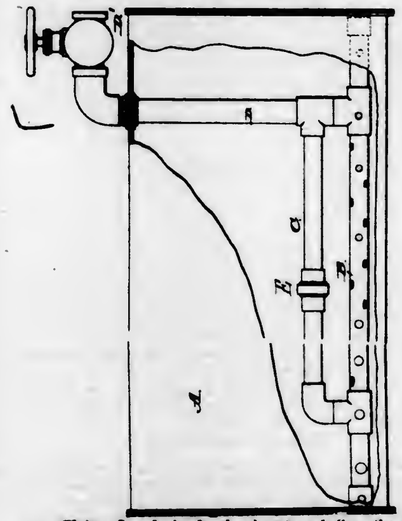
253,451. SHAKER FOR MIXING DRINKS. LEON WARD, SIDNEY A. SMITH, and GEORGE FACKLEY, Bridgeport, Conn. Filed Oct. 31, 1881. (No model.)

Claim.—1. The herein-described shaker for mixing drinks, consisting of the glass body A, provided with the metal neck *a*, combined with a metal cup constructed to fit upon said neck and close the mouth of the body, substantially as described.



2. The herein-described shaker for mixing drinks, consisting of the glass body A, provided with the metal neck *a*, combined with a metal cup constructed to fit upon said neck and close the mouth of the body, the said cup perforated at its closed end, and with the cap C, substantially as described.

253,452. FLOUR-DRESSING MACHINE. JOHN WEBER, Uster, Zurich, Switzerland, assignor to John Feichter & Sons, Minneapolis, Minn. Filed July 8, 1881. (No model.)

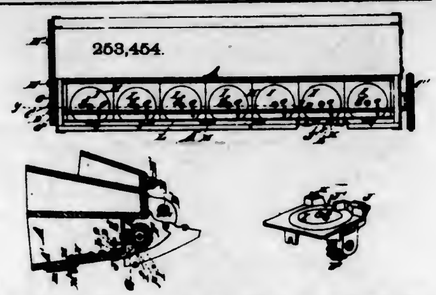


Claim.—1. In a machine for dressing flour, the scutchers C, constructed substantially as herein shown and described, and consisting of a series of metal plates or strips alternately bent forward and backward, the plates bent forward being provided with one or more perforations, as set forth.

2. In a machine for dressing flour, the combination of the adjustable and jointed shaft F, having arms G, carrying scutchers C, that are bent forward and perforated, and scutchers *c*, that are bent backward and not perforated, cylinder B, clothed with gauze, an inner cylinder, *b*, within cylinder B, occupying only a part of its length, and covered with gauze, radial tubes *c c*, and chutes S, as and for the purposes described.

258,452.

258,453. CLEANING STEAM-BOILERS. JOSEPH B. WEEKS, Barnesville, Ohio, assignor of one-half to Mathew C. McKeown, same place. Filed Aug. 27, 1881. (No model.)



Claim.—In a device for cleaning steam-boilers, the combination, with the boiler A, of the perforated pipe B, having perforations of unequal size arranged so that no two are opposed, and the pipe C, having the union-joint E, and being connected to the pipes B and D by ⊥ and ⊤ joints, and the pipe D, having the valved outlet D′, substantially as and for the purposes specified.

258,454. FERTILIZER-DISTRIBUTER. JOHN M. WHITCOTT, Richmond, Ind. Filed Feb. 22, 1881. (Model.)

Claim.—1. A fertilizer-distributing device composed substantially of a plain rotating disk, I, upon the face of which is

258,454.

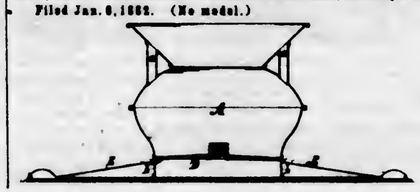
carried the fertilizer, in combination with an open discharge-chute formed on one side by the scraper J′ and the opposite side by the ledge J, the ends of which chute terminate vertically above the peripheral plane of the disk and forming the discharge-orifice, as set forth.

2. A fertilizer-distributing device composed substantially of a plain rotating disk, I, upon the face of which is carried the fertilizer, in combination with an open discharge-chute formed on one side by the scraper J′ and the opposite side by the ledge J, the ends of which project through the rear side of the hopper and form the discharge-orifice vertical above the peripheral plane of the disk, as and for the purpose specified.

3. A fertilizer-distributing device composed of the horizontal rotating disk I and a scraper, J′, and a ledge, J, forming a delivery-orifice, arranged in the box A, in combination with the agitator B, working in front of and in the same horizontal plane as the discharge chute and orifice *j*, substantially as herein set forth.

4. A fertilizer-distributing device composed of the horizontal rotating disk I and scraper J′ and ledge J, forming a discharge-chute arranged in the seed-box A, in combination with the agitator B, working in the rear of the vertical axial plane of the disk I and in front of the discharge-orifice, substantially as herein set forth.

5. In combination with the fertilizer-distributer I J′ K, the adjustable cut-off and regulating-gate L, arranged to operate in front of the discharge chute and orifice *j*, substantially as herein set forth.



6. The hopper-bottom provided with a vertical ledge, J, a vertical wall, K, and a discharge-orifice, *j*, the said ledge having an attached immovable scraper, J′, which extends inwardly and occupies a fixed position at all times, in combination with a plane-faced disk, I, supported by the hopper-bottom directly beneath the scraper, said disk extending through an opening in the rear side of the hopper and rotating under the extreme outer edge of the discharge-orifice *j*, all substantially as described.

7. In a machine for distributing fertilizing material, the combination of the following characteristics, namely: a hopper-bottom having a lateral discharge-orifice, *j*, open at its top, a plane-faced rotary disk extending through an opening in the rear side of the hopper and rotating under the extreme outer edge of the discharge-orifice, an immovable scraper, J′, extending longitudinally across the rotating disk, and forming also one of the stationary boundaries of the discharge-orifice, an agitator arranged to rotate between the discharge-orifice and the axis of the rotating disk, and an adjustable gate arranged within the hopper and extending across the mouth of the discharge-orifice, all substantially as described.

8. In a machine for distributing fertilizing material, the skeleton-spider connected with the hopper-bottom, and having a central recessed hub, G′, in combination with the rotating plane-faced disk I, having a central boss, *g*″, resting in the hub, and the bolt *g*, passing through and connecting the parts, substantially as described.

9. In combination with the horizontally-rotating disk I, the spindle G, having hub G′, provided with annular bearings *g*′, and openings *f*, for the escape of dirt, substantially as herein set forth.

258,455. CUSPIDOR. WILLIAM WHITLARE, Brooklyn, N. Y. Filed Jan. 6, 1882. (No model.)

Claim.—1. A cuspidor provided with tubes set in its body and adapted to hold umbrellas, substantially as described and shown.

2. In a cuspidor, the combination of tubes set in its body and adapted to hold umbrellas, and a base-plate or platform extending laterally beyond the body of the cuspidor, substantially as and for the purpose described.

3. A cuspidor provided with a base-plate or platform detachably secured to its bottom and extending beyond its body in a downward incline to form a bracing-support, substantially as and for the purpose described.

4. A cuspidor platform or base provided with a flat central portion, D, to receive the bottom of the cuspidor, and with an inclined bracing portion, E, substantially as and for the purpose described.

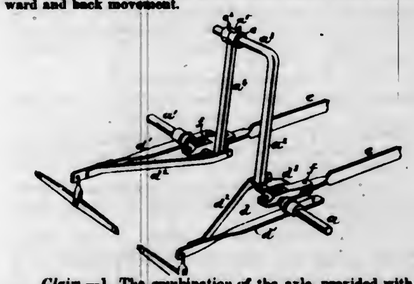
5. A cuspidor-platform provided with the bracing-incline E and a supporting hook or ring, *b*, substantially as and for the purpose described.

6. A china or earthenware cuspidor provided with a recess or cavity adapted to receive a screw-socket, substantially as and for the purpose described.

258,456. FISHING APPARATUS. MARCIENE H. WHITCOMB, Holyoke, Mass. Filed Jan. 5, 1881. (No model.)

Claim.—1. The combination of the tubular body, the spring-piston with its signal-top, the tripping-lever, and the fish-line, all substantially as described, and for purposes specified.

2. The combination of the tubular body, the spool thereon, the spring-piston, the tripping-lever, and the fish-line, all substantially as described, and for purposes specified.

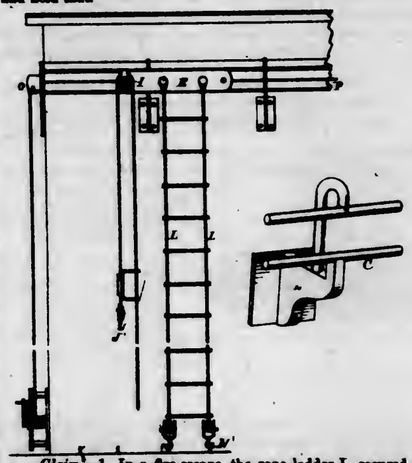


258,457. MIRROR-HANDLE. FRITZ WINDBERG, New York, N. Y. Filed Nov. 8, 1881. (No model.)

Claim.—The combination, substantially as hereinbefore set forth, of the eye for attachment to the back of the mirror, provided with notches at its opposite ends, those at one end alternating with those at the other end, and the wire handle sprung into the eye and provided with pins or projections adapted to automatically engage the notches of the eye, for the purpose set forth.

258,458. CULTIVATOR. JACOB WILLIAMS, Dublin, Ind. Filed Oct. 13, 1881. (Model.)

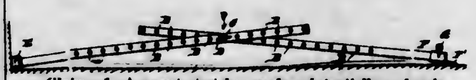
Brief.—Couplings with limited oscillation upon the axle, and kept horizontal by a cross-bar on the rear extension of the draft-bars. Arched axle made adjustable in width, and to allow a forward and back movement.



Claim.—1. The combination of the axle, provided with pin *f*′, the coupling *f*, journaled on said axle, and provided with slot *f*″, the beam *e*, pivoted to the coupling *f*, and the cross-bar *d*³ of the frame *d*, extended under and arranged to support the rear end of the coupling, substantially as set forth.

2. The combination, substantially as hereinbefore set forth, of the arched bar *a*² of axle *a*, provided with a series of vertical holes, the upright bar *a*⁴ of axle *a*′, provided with eye *a*³, and the clips *c*, provided with parallel ears projected part way across the flattened sides of bar *a*⁴, and the pin *c*², as set forth.

258,459. FIRE-ESCAPE. WILLIAM WINKLESS, Newport, Ky. Filed Sept. 13, 1881. (No model.)

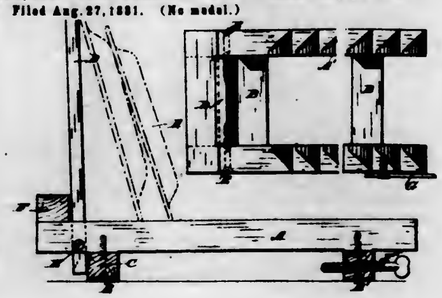


Brief.—The track upon which the carriage runs has an upper and lower rail, and the lower end of the rope ladder is provided with windlasses and ratchets and pawls, so that it can be drawn and held taut.

Claim.—1. In a fire-escape, the rope ladder L, secured to a movable carriage above, having at the lower end of each rope a windlass, M, or block and tackle, provided with suitable pawl, ratchet, and key, by means of which each rope may be drawn taut independently of the other, as and for the purpose herein set forth.

2. In a fire-escape, the movable carriage E F, having the wheels H H, in combination with the rods or tracks C D, secured to the building, substantially as and for the purpose herein set forth.

258,460. CARPET-STRETCHER. MICHAEL WIENER, Sr., Union City, Ind. Filed Jan. 6, 1882. (No model.)



Claim.—1. A carpet-stretcher made substantially as herein shown and described, and consisting of two crossed and adjustably-pivoted rods or bars, one of which is provided at its outer end with a cushion, the other being provided at its outer end with a serrated carpet-griping plate, as set forth.

2. In a carpet-stretcher, the combination, with the crossed bars or rods A, each provided with a series of apertures, B, of the pintle or bolt C, the winged nut D, the cushion E, on the outer end of one of the rods, and a carpet-griping plate, F′, on the outer end of the other rod, substantially as herein shown and described, and for the purpose set forth.

3. In a carpet-stretcher, the combination, with the crossed bars or rods A, of the detachable ferrule or cap F, mounted on the end of one of the rods, and provided with a griping-plate, F′, substantially as herein shown and described, and for the purpose set forth.

258,461. DISH-DRAINER. GEO. B. WOLD, Bridgeport, Conn. Filed Aug. 27, 1881. (No model.)

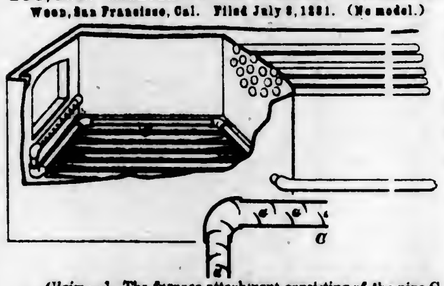
Claim.—1. A dish-drainer composed of two bars, A A, provided with a series of dish-notches, A′, substantially such as de-

258,465. ATTACHMENT FOR MAGAZINE-STOVES. THOMAS D. WOOLSON, Buffalo, N. Y., assignor of one-half to Henry C.

258,468.

the ejection of the finished bale automatically operates the wire-inserting devices, as set forth.

20. In a baling-press, the wire-inserters automatically oper-

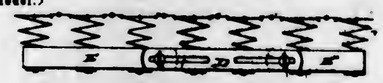


Claim.—1. A dish-drainer composed of two bars, A A, provided with a series of dish-notches, A′, substantially such as described, and connecting cross-pieces B B′, secured in place in the manner and for the purposes set forth.

2. In combination with the bars A A and cross-pieces B B′, the head-board D, pivoted between the bars, and adapted to operate in the manner and for the purpose set forth.

3. In combination with the bars A A and head-board D, the upper cross-piece or check, E, substantially as and for the purpose set forth.

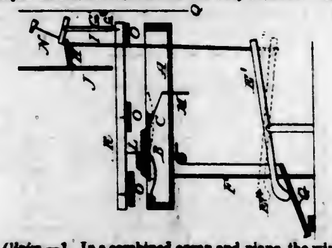
4. In combination with the cross-pieces B B′, adjusting-screws F′, substantially as and for the purpose set forth.



253,462. ATTACHMENT FOR FURNACES. MORTIMER F. WOOD, San Francisco, Cal. Filed July 8, 1881. (No model.)

Claim.—1. The furnace-attachment consisting of the pipe C, with its alternately oppositely placed blades or flanges G, said pipe entering the fire-box and having the apertures *a*, when arranged and used substantially as and for the purpose herein described.

2. The pipe C, connected with the exhaust of an engine, and having the alternately oppositely placed blades or flanges G, for muffling the sound of the exhaust, substantially as herein described.

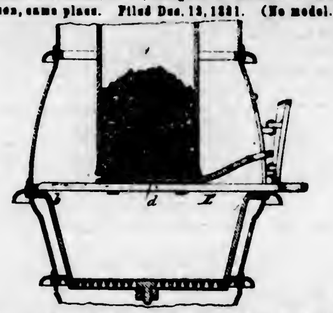


253,463. BED-BOTTOM. FRANK H. WOODS, Harrisburg, and THOMAS J. CURLEY, Reading, Pa. Filed July 12, 1881. (No model.)

Claim.—1. A folding bed-bottom consisting of detachable sections, each having slats, springs, and flanged end pieces, which latter pieces are adjustably connected by thumb-screws working in slots in the middle end piece and binding on the other end pieces, in the manner as and for the purposes herein set forth.

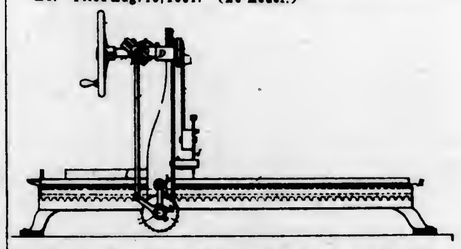
2. A folding bed-bottom consisting of sections D, E, and E′, each provided with flanges, slats, and springs adjustable to fixed positions with respect to each other, all in the manner and for the purpose described and illustrated.

253,464. COMBINED ORGAN AND UPRIGHT PIANO. WILLIAM CARLOS WOODWARD, Marseilles, Ill., assignor of one-half to Elijah Yelles, Union, Wis. Filed July 21, 1881. (No model.)



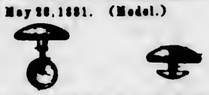
Claim.—1. In a combined organ and piano, the wind-chest A, having valves B and D, in combination with the pedal E and rods D′ and M, substantially as and for the purposes specified.

2. In a combined organ and piano, the combination, with the piano-action N G′ and hinged strip H, of the pedal E′ and connecting-rod I, substantially as and for the purposes specified.



3. In a combined organ and piano, the combination of the divided piano-action C² C³ N² N³, connected to the strip A′ by buttons D², with the slides B² B³ and stops E² E³, substantially as and for the purposes specified.

253,465. ATTACHMENT FOR MAGAZINE-STOVES. THOMAS D. WOOLSON, Buffalo, N. Y., assignor of one-half to Henry C. Woolson, same place. Filed Dec. 13, 1881. (No model.)



Claim.—A device for closing the base of the magazine of a base-burning stove, consisting of a supporting-bar, E, and a plate, *d*, sliding on the bar E and adapted to close the lower end of the magazine, substantially as set forth.

253,466. CARAMEL-CUTTER. ISAAC H. WRIGHT, Baltimore, Md. Filed Aug. 19, 1881. (No model.)

Claim.—In a caramel-cutter, a frame carrying a pair of revoluble crank-wheels, connected by gearing to effect their uniform rotation, a knife secured to a frame attached to pins projecting from the faces of the said crank-wheels, and a sliding plate adapted to have an intermittent longitudinal motion, carrying a removable cutting-board, to the upper surface of which the edge of the said knife descends at each stroke or revolution of the crank-wheels, all combined substantially as specified.

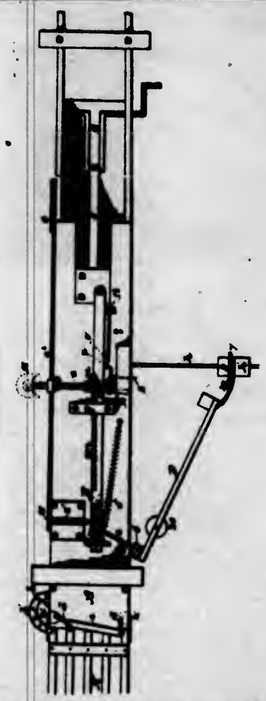
253,467. BUTTON OR STUD. JOHN HENRY WRIGHT, Newark, N. J. Filed May 28, 1881. (Model.)

Claim.—An improved button or stud provided with an extensible post consisting of an outer cylindrical portion and an inner sliding and inseparable portion, in combination with a back flexibly connected to the inner sliding portion, all arranged to operate substantially as set forth.

253,468. BALING-PRESS. FARVIN WRIGHT, Hayden's Station, Colo. Filed Jan. 17, 1882. (No model.)

Claim.—1. The combination, in a baling-press, of a series of wire-inserters arranged to be automatically operated by the traverser, substantially as described.

2. In a baling-press, an independent adjustable tension device whereby the ejection of the finished bale may be retarded, as and for the purpose set forth.



3. In a baling-press, means for operating the wire-inserters through the gravity of the ejected bale, as and for the purpose set forth.

4. In a baling-press, a series of wire-inserters operated by the power applied to the traverser, said operation and insertion being controlled by an independent hand mechanism, as and for the purpose set forth.

5. In a baling-press, a series of wire-inserters operated by the traverser at a right angle to the line of compression, as and for the purpose set forth.

6. A baling press arranged to continuously and automatically compress, tie, and eject completed bales by the power applied to the traverser, as and for the purpose set forth.

253,468.

7. In a baling-press, a wire-inserting device arranged to insert the tying-wire so that the subsequent process of completing the bale will cause the wire to encompass three of the sides thereof, and a second operation of the inserters cause the tie-wire to be carried completely around the bale, as set forth.

8. In a baling-press, a wire-inserting device arranged to automatically insert the tie-wire, so that the process of completing the bale will cause the wire to partially encompass said bale, as set forth.

9. In a baling-press arranged to automatically press and tie bales, an intermediate means for operating the tying mechanism by and through the power derived from the traverser, as set forth.

10. In a baling-press arranged to press and tie bales, a wire-inserting device which, when in use, causes the wire-tying mechanism to operate, as set forth.

11. In a baling-press provided with a wire tying and twisting mechanism, a series of wire-inserters arranged to be simultaneously operated with the traverser, as set forth.

12. The combination, in a baling-press, of the rollers *a a′*, provided with cranks *d d* and rod *e*, lever *b*, rack *b′*, and pin *b²*, as set forth.

13. The combination, in a baling-press, of the crank *d*, connecting-rod 3, and traverser C, provided with horizontal recesses, as set forth.

14. The combination, in a hay-press, of the traverser, its connecting-rod, and means for operating the same with the rod B, arm *e*, and the frame D, arranged to operate the wire-inserters *i*, as set forth.

15. In a hay-press, the combination, with the traverser and means for operating the same, of the rod B, arm *e*, frame D, and wire-inserters *i*, and the hand-lever G, rod *d′*, and shaft *d′*, as set forth.

16. The combination, in a hay-press provided with wire cutting and twisting mechanism, of the gate H, crank 13, rod *d²*, spring 19, shaft *d′*, frame D, rod B, and traverser C, as set forth.

17. The combination, in a hay-press, of the traverser and means for operating the same, of the rack *m*, pinion *n*, clutch *p*, rod *q*, stud *s*, dog *s*, and pawl *o*, and the frame D, provided with the shaft *e* and spring *f*, as set forth.

18. The combination, in a baling-press, of a series of wire-inserters arranged to be automatically operated by the forward motion of the traverser, as set forth.

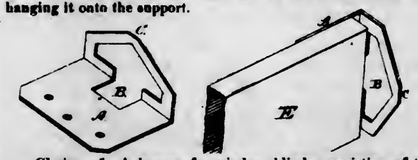
19. In a baling-press, the combination of the means whereby the ejection of the finished bale automatically operates the wire-inserting devices, as set forth.

20. In a baling-press, the wire-inserters automatically operated in and by the forward motion of the traverser, in combination with a baling-chamber provided with orifices arranged to receive the wire-inserters, as set forth.

21. In a baling-press, a bale-chamber provided with orifices for the reception of the wire-inserters, in combination with the devices for automatically operating the same, as set forth.

22. In a baling-press, the traverser C, having the recess 18, for the reception of the end of the pitman 3, as set forth.

23. In a baling-press, the combination of the crank 4, connecting-rod 3, and traverser C, having slots 17 and recess 18, as set forth.

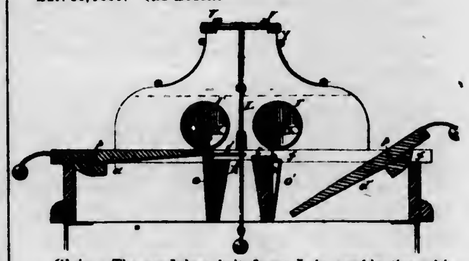


24. In a baling-press, a bale-chamber provided with circular orifices for the insertion of the wire for tying the bale, as set forth.

25. In a baling-press, a bale-chamber having rigid parallel sides, in combination with a tension device whereby the ejection of the finished bale may be controlled, as set forth.

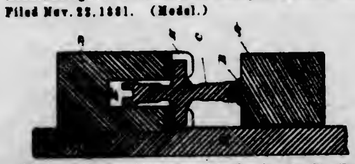
26. In a baling-press, a slotless bale-chamber having orifices for the insertion of the tying-wires, as set forth.

253,469. HANGER FOR INSIDE BLINDS. CHAS. M. YOUNG, Lockport, N. Y. Filed Dec. 8, 1881. (No model.)



Brief.—The plate is bent at right angles and attached to the end of the upper slat, projecting therefrom and with the slot for hanging it onto the support.

Claim.—1. A hanger for window-blinds, consisting of the plate A, bent at right angles, so as to be applied directly to the end of the top slat, E, and having the slotted triangular end B C, in combination with the support D, placed inside of the window-frame, substantially as shown.



2. The combination of the plate A, having a slot, B, and triangular end C, and adapted to be fastened directly to the end of the slat E and project beyond its side, with a support, D, secured to the inside of the frame, substantially as set forth.

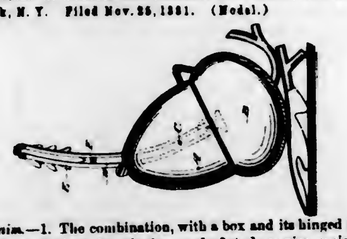
253,470. RAT-TRAP. HENRY YOUNGER, Austin, Tex. Filed Mar. 26, 1881. (No model.)

Claim.—The pendulum bait-frame L, in combination with triggers *t* and *t′*, attached to cam-springs O and O, weighted trap-doors *d* and *d′*, and rollers *r* and *r′*, substantially as shown and described.

253,471. DOOR-HANGER. WILLIAM B. CROSBY, Minneapolis, Minn., assignor of one-half to Henry A. Hamlin, same place. Filed Nov. 23, 1881. (Model.)

Claim.—In combination with the longitudinally-grooved block D, the grooved metallic frame H, having a flat bearing-surface on its lower side for the journals of a friction-roller and abutments at each end, the friction-roller C, grooved on its periphery, and the rail B and support A, substantially as and for the purposes specified.

253,472. EAR-WIRE LOCK. P. K. DE MUR, New York, N. Y., assignor to Van Houten, Sayre & Co., Newark, N. J. Filed Aug. 3, 1881. (No model.)



Claim.—1. The combination, in an ear-ring, of a revolving lock, *d*, with a ring secured to said ear-ring, having an opening therein, said parts being arranged to operate substantially as and for the purposes set forth and shown.

2. In an ear-ring, a locking device adapted to receive and hold the ear-wire, composed of a ring, *c*, having an opening therein, and a revolving piece, *d*, having a notch therein adapted to coincide with said opening, substantially as and for the purposes set forth and shown.

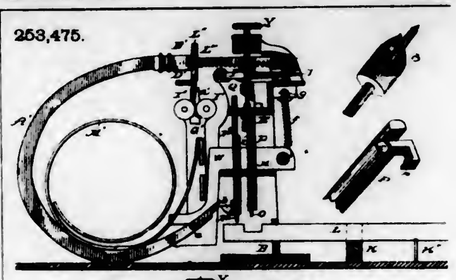
3. In an ear-ring, a revolving piece, *d*, having an annular groove therein, working within a ring, *c*, secured upon a wire, *a*, and adapted to receive the ear-wire, substantially as and for the purposes set forth and shown.

253,473. JEWEL-BOX. GUSTUS GOUGH, Brooklyn, assignor to Elisur G. Webster and Adelbert A. Webster, both of New York, N. Y. Filed Nov. 25, 1881. (Model.)

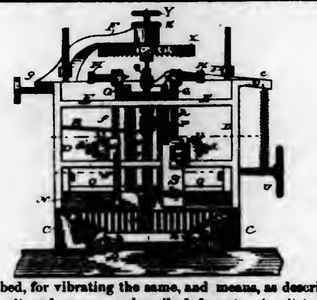
Claim.—1. The combination, with a box and its hinged lid or cover, of a bail pivoted to the box, and of studs or pins projecting from the sides of the hinged lid or cover, substantially as herein shown and described, and for the purpose set forth.

2. The combination, with the box B and the hinged lid A, of the longitudinally-slotted bail E, pivoted to the box B, and of the studs or pins C, projecting from the lid A through the slots of the bail E, substantially as herein shown and described, and for the purpose set forth.

3. The combination, with a box and its hinged lid or cover, of a bail pivoted to the box, of lateral studs or pins on the lid or cover, and of a checking device on the bail, against which checking device the pins are to strike to prevent the cover from being opened too far, substantially as herein shown and described, and for the purpose set forth.



4. The combination, with the box B and its hinged lid or cover A, of the bail E, pivoted to the box, the studs C on the lid A, and the check button or knob F on the bail E, substantially as herein shown and described, and for the purpose set forth.



253,474. THREAD-CUTTER FOR SEWING-MACHINES. CHAS. H. GREEN, Philadelphia, Pa., assignor of one-half to Joseph R. Clausen, same place. Filed Sept. 2, 1881. (No model.)

Claim.—The combination of the slotted bars A A', each having a lug, *a*, with the blades B B', secured to and between the bars, and the whole being otherwise constructed, as set forth.

253,475. TYPE-WRITER. JAMES B. HAMMOND, New York, N. Y. Filed Jan. 10, 1880. (No model.)

Claim.—1. A type-wheel provided with a double series of arresting-surfaces on either side of a zero-point, and facing in opposite directions, substantially as described, and a stop-lever, I, which arrests the wheel moving in opposite directions.

2. In combination with the feed-pawl *z*, constructed as described, and the paper-carriage, the double combs H'.

3. In combination with the paper-carriage of a type-writing machine, the wheel N'', with its cords *o o'* and spring *r*, arranged and operating substantially as and for the purposes set forth.

4. In combination with the carriage and guiding-rails, the rolls I' I'', worm L', weighted pawl-lever *d''*, and pinion *b'*, for raising the paper, substantially as set forth.

5. A type-wheel, in combination with means, substantially as described, for vibrating the same, and means, as described, for retaining it, and means, as described, for returning it to normal position, said wheel having the letters or characters arranged on its periphery on either side of a zero-point, in manner set forth, whereby those most frequently used shall be nearest to the said zero-point, all as described.

6. The helical paper-holders M', secured to the carriage-frame, and adapted to receive the paper.

7. The type-wheel X, formed with a suitable shaft and a double-faced cam, and secured in position independently by means of bearings Y *i*.

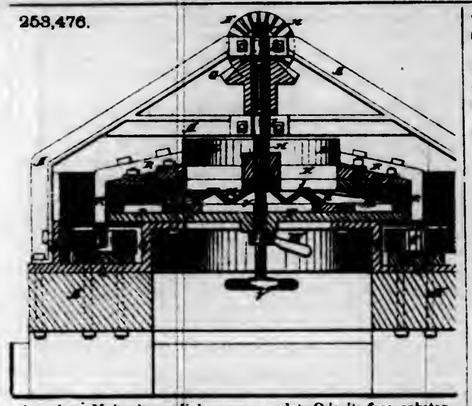
8. In combination with the type-wheel and double-faced cam Q, the frames O, posts P, and operating-levers L.

9. In combination with the levers L, frames O, and type-wheel X, the frame N, provided with lifting-pawl *b* and hammer A'.

10. In a type-writing machine, the combination, with a type-wheel adapted to turn on its bearings in either direction from a normal position through a series of characters to present any given letter to the paper, of finger key-levers by which the operating power is applied, of intermediate mechanism, as described, between said key-levers and the wheel, by which the proper motion is imparted to said wheel, and of a stop mechanism, substantially as described, set in motion by the key-levers, and acting in opposition to the motion imparted to the type-wheel to arrest said type-wheel at the proper point, as set forth.

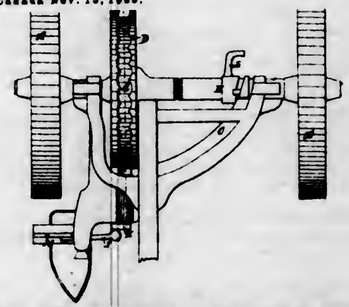
11. A type-wheel adapted to turn on its bearings from a normal point in either direction through a series of characters to bring any one of said series of characters to said point, key-levers, and intermediate mechanism, substantially as described, whereby said right and left hand motion is communicated to said wheel, a stop mechanism set in motion by the key-levers, and adapted to arrest the said wheel at a series of points on the right or left, substantially as set forth.

253,476. ORE-GRINDING MILL. WILLIAM E. HARRIS, New York, N. Y., assignor to himself and HENRY C. Hepburn, same place. Filed May 25, 1881. (No model.)



Claim.—1. In an ore-grinding apparatus constructed substantially as herein shown and described, the combination of the shafts C H, the gear-wheels F G, the upper grinding-plate, J, attached to the shaft H, having its lower side or face concaved and provided with V-shaped or angular grooves N, and having a strengthening-plate, K, attached to its upper side, the lower grinding-plate, M, having radial grooves or slots in its face, the strengthening-plate P, attached to the grinding-plate M, the trough Q, provided with facing-plates T U, and the ring-plates S, carried around by the angular bars R, attached to the plate K, as set forth.

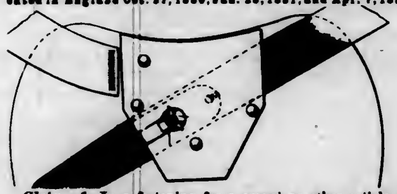
2. In an ore-grinding apparatus, the upper grinding-plate, J, made with V-shaped grooves N in its concaved face, substantially as herein shown and described.



3. In an ore-grinding machine, the combination, with the upper grinding-plate, J, having V-shaped grooves N in its concaved face, and its supporting and driving mechanism, of the lower grinding-plate, M, having radial grooves or slots O in its face, substantially as herein shown and described, whereby the ore is crushed, as set forth.

4. In an ore-grinding apparatus, the combination, with the grinding-plates J M and the ring-trough Q, of the angular bars R, the ring-plates S, and the facing-plates T U, substantially as herein shown and described, whereby the grinding of the ore is completed, as set forth.

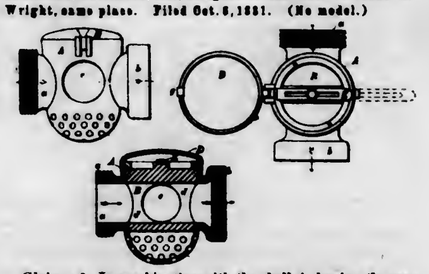
253,476.



253,477. REAPER AND MOWER. FREDERICK J. HARRIS, Belleville, Ontario, Canada, assignor of one-half to Thomas Fuller, same place. Filed Dec. 10, 1880. (Model.) Patented in Canada Nov. 15, 1880.

Claim.—The combination of the drive-wheel D, having the peripherical undulating groove *d*, with rounded shoulders *a*, horizontal rock-shaft G, having cross-head F, and a pair of rollers, E E, journaled upon said cross-head in contiguity to one another, so that the axis of the rock-shaft, if produced, shall be coincident with the peripheries of both rollers across a line drawn between their centers, as shown and specified, for the purpose set forth.

253,478. FASTENING FOR CRAVATS, NECKTIES, &c. JOHN HINKS, THOMAS HOOPER, and FRANCIS B. BAKER, Birmingham, County of Warwick, England; said Baker assignor to said Hinks and Hooper. Filed Aug. 23, 1881. (No model.) Patented in England Oct. 27, 1880, Jan. 26, 1881, and Apr. 7, 1881.



Claim.—1. In a fastening for a cravat or other article, the combination of the carrying-plate for the body of the fastening and operating or griping lever with one or more springs made in one piece with the said plate or body, and adapted to operate with said lever, substantially as described.

2. The combination, with a carrying or supporting plate and an operating or griping lever, of a spring-tongue the elasticity of which tends to draw the free end inward, all substantially as described.

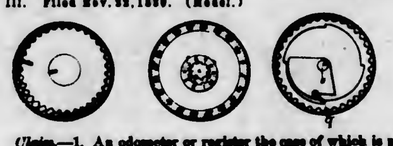
3. A fastener for a cravat or other article, comprising a carrying-plate or supporting-frame, a spring-tongue, and an operating or griping lever, said tongue passing through a slot in said lever, substantially as described.

253,479. RELIEF-COCK FOR FIRE-ENGINES. JOHN T. HOUGHES, Baltimore, Md., assignor of one-half to Isaac H. Wright, same place. Filed Oct. 6, 1881. (No model.)

Claim.—1. In combination with the shell A, having the nozzles *a* and *b* and the lateral discharge-aperture *c*, the key B, provided with the opening *d*, branch opening *e*, and the groove or depression *f*, substantially as specified.

2. In combination with the shell A and key B, the latter having means whereby it may be turned in the shell, the cap D, hinged to the shell and fitted with a locking device, substantially as specified.

3. The shell A, having suitable nozzles and a perforated chamber at a point below the lower end of the key B, combined with the said key, the same having a groove or depression whereby one of the nozzle-openings may be placed in communication with the said perforated chamber, substantially as specified.

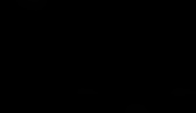


4. The key B of the cock, having an extension handle or lever which may be closed so as to not extend beyond the periphery of the said key, combined with the shell A and hinged cap D, substantially as specified.

253,480. CHUCK. EDGAR KNIGHT, Bridgeport, Conn., assignor of two-thirds to Charles E. Smith and Oliver C. Smith, same place. Filed Nov. 2, 1881. (No model.)

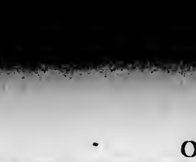
Claim.—The jaws A, having their heel-surfaces *c* inclined in the manner herein described, in combination with the stock C, recessed to receive and form an abutting wall, *d*, for the heel-surfaces *c* of jaws when they are brought into working position by the sleeve E, substantially as herein set forth.

253,481. CYCLOMETER. PATRICK E. MCDONNELL, Lawndale, Chicago, assignor of one-half to Bernard McMANUS, Chicago, Ill. Filed Nov. 23, 1880. (Model.)



Claim.—1. An odometer or register the case of which is provided with internal gears, in which mesh wheels of a less number of gears, each wheel controlling the next by an eccentric having a slot or a shoulder, in which meshes a slot or a shoulder of the wheel rotating it, substantially as and for the purpose set forth.

2. In combination with an odometer or register the case of which is provided with internal gears, in which mesh wheels of a less number of gears, each wheel controlling the next by an eccentric having a slot or a shoulder in which meshes a slot or a shoulder of the wheel rotating it, the weighted eccentric *e w*, pawl *g*, and ratchets *r*, substantially as and for the purpose set forth.



3. In an odometer or register substantially as described, the combination of the wheel *i*, dial *d*, and shoulders *n n*, as and for the purpose set forth.

253,482. FLANGE-UNION FOR REFRIGERATING OR ICE-MACHINES. JOHN A. HOLLY, Lockport, N. Y., assignor to Holly Manufacturing Company, same place. Filed Nov. 14, 1881. (No model.)

Claim.—The combination, with the body of a shell of an ice-machine, of the flanged pipe-sections, the flanged union-nut, and the packing-ring, substantially as described.

253,483. SAFETY-VALVE. JOHN A. HOLLY, Lockport, N. Y., assignor to Holly Manufacturing Company, same place. Filed Nov. 14, 1881. (No model.)

Claim.—1. The combination, with the valve-seat, of the valve, the stem, the spring, and the adjusting-nut, substantially as described.

2. The combination, with the valve-seat, of the valve, the stem, the spring, the adjusting-nut, and the lever, substantially as described.

253,484. SAFETY-VALVE. JOHN A. HOLLY, Lockport, N. Y., assignor to Holly Manufacturing Company, same place. Filed Nov. 14, 1881. (No model.)

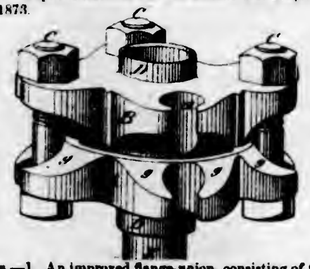
Claim.—1. The combination, with the valve-seat, of the valve, the stem, the spring, and the adjusting-nut, substantially as described.

2. The combination, with the valve-seat, of the valve, the stem, the spring, the adjusting-nut, and the lever, substantially as described.

253,485. REED-ORGAN. CHARLES AUSTIN, Lowell, Mass. Filed Dec. 15, 1881. (No model.)

Claim.—1. The combination, with the reed-bar, of the tuning-screw, the nut, and the spring, substantially as described.

2. The combination, with the reed-bar, of the tuning-screw, the nut, and the spring, the latter being arranged to bear upon the nut, substantially as described.



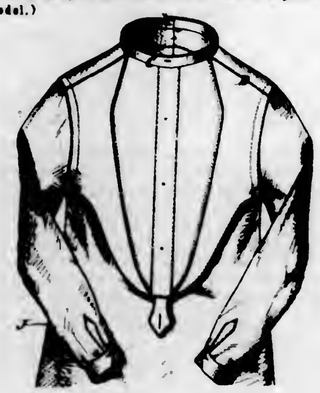
3. The combination, with the reed-bar, of the tuning-screw, the nut, and the spring, the latter being arranged to bear upon the nut, and the nut being provided with a groove, substantially as described.

253,486. BORING DEVICE. JOHN A. HOLLY, Lockport, N. Y., assignor to Holly Manufacturing Company, same place. Filed Nov. 14, 1881. (No model.)

Brief.—The boring device is supported from braced verti-

253,482. FLANGE-UNION FOR REFRIGERATING OR ICE-MAKING MACHINERY. WILLIAM M. MIXER, New York, N. Y., assignor to the De la Vergne & Mixer Refrigerating Company, same place. Filed Jan. 10, 1882. (No model.)

Brief.—Improvement on Letters Patent No. 139,877, dated June 17, 1873.



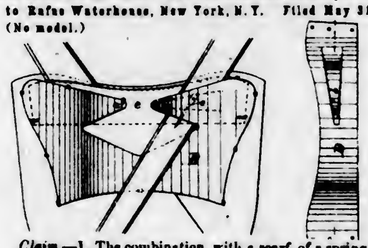
Claim.—1. An improved flange-union, consisting of the male and female blocks A and B, each having a threaded pipe-aperture and interlocking surfaces, corresponding bolt-holes, *a*, exterior to the washer *c*, an interposed gasket, *i*, and bolts C, the female block having a depressed gasket-seat with an annular ring or raised washer, *d*, upon its inner side, and another annular ring or raised washer, *e*, upon its outer side, and the male block having a raised washer, *h*, corresponding in location to the depressed gasket-seat *b*, substantially as described.

2. An improved flange-union, consisting of a male and female block and an interposed gasket and bolts, each block having a dished or cut-away flange or sections of a flange, *g g*, a threaded pipe-aperture, and corresponding bolt-holes exterior to their interlocking parts, the female being provided with a raised washer or annular ring both upon the inside and outside of a depressed gasket-seat, and the male block with a raised washer or annular ring corresponding in location to the gasket-seat of the female block, substantially as described.

3. An improved flange-union, consisting of a male and female block, an interposed gasket and bolts, each block having corresponding bolt-holes, a threaded pipe-aperture, and an annular recess or recessed collar surrounding either extremity of such aperture, the female block being provided with a depressed gasket-seat having a raised washer both upon the inner and outer side of said seat, and bolt-holes exterior thereto, the male with a washer or annular ring corresponding in location to the gasket-seat of the female block, substantially as described.

4. An improved flange-union, consisting of the female block A, with the raised washers *e* and *d*, a depressed gasket-seat, *b*, bolt-holes *a*, exterior to the washer or ring *c*, a threaded pipe-aperture, a recess or recessed collar, K or D, surrounding either end of the pipe-aperture, and dished or cut-away flanges or sections of flanges *g g*, the male block having a raised washer or ring, *h*, corresponding in location to the gasket-seat of the female block, bolt-holes *a*, corresponding to those of the female block, a recess or recessed collar, K or D, surrounding either end of the pipe-aperture, and dished or cut-away flanges or sections of flanges *g g*, in combination with a gasket, *i*, and bolts C, substantially as described.

253,483. SHIRT. FRANKLIN C. MOTT, Catskill, assignor to Frederick S. Gwyer, New York, N. Y. Filed Sept. 22, 1881. (No model.)



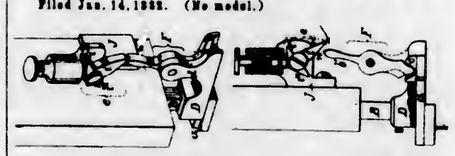
Claim.—1. The combination, with the body of a shirt, of an extra front attached at the shoulder-seams and to a part or the whole of the front sleeve-seams, but unattached to the shirt-body below, and a bosom united to the extra front, substantially as specified.

2. The combination, with the body of a shirt having an opening in the back, of an extra front attached at the neckband, the shoulder-seams, and to a part or the whole of the front of the sleeve-seams, but unattached to the shirt-body below, and a bosom united to the extra front and to the neckband, but unattached to the shirt-body elsewhere, substantially as specified.

253,484. BED-COMFORT, BLANKET, RUG, &c. CHARLES D. MURDOCK, Nashville, Tenn. Filed Nov. 28, 1881. (No model.)

Claim.—The herein-described method of manufacturing bed-comforts, blankets, rugs, and analogous articles, consisting in first joining the edges of the outside material, with the exception of a single orifice, then stuffing the article with raw cotton, then sewing up the receiving-orifice, and finally beating the cotton smooth within the covering and quilting the whole together, substantially as specified.

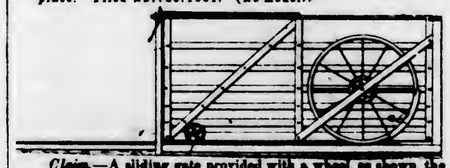
253,485. NECKSCARF. HOWARD SELVAGE, Brooklyn, assignor to Rufus Waterhouse, New York, N. Y. Filed May 31, 1881. (No model.)



Claim.—1. The combination, with a scarf, of a spring, *b*, constructed and arranged as described, so that the neckband may be passed edgewise under said spring and thereby held, as specified.

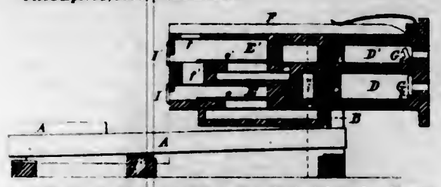
2. The combination, with a scarf, of a shield, B, having the central upper portion cut away, leaving the projections *a a'*, with space *c* between their points, as and for the purpose described.

3. The combination, with a scarf, of the shield B, having the central upper portion cut away, leaving the projections *a a'*, with space *c* between their points, the projection *a* being provided with a detaining-pin, *e*, as and for the purpose described.



253,486. SEWING-MACHINE ATTACHMENT. JAS. F. SUDDINS, Philadelphia, Pa., assignor to John C. Love, same place. Filed Jan. 14, 1882. (No model.)

Claim.—1. In a sewing-machine attachment, the combination of a retaining-spring, pivoted tappet or lever, needle-carrying bar or slide *a*, block D, arm or lever F, and devices for operating said tappet or lever.



2. The combination of the needle-bar and its block D, having a slide, *a*, and lever F, with the plate J, carrying a pivoted spring-lever, *e*, with three arms, *i i' i²*, as specified.

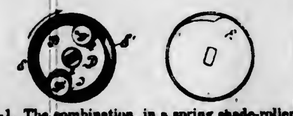
253,487. FARM AND YARD GATE. GEORGE W. FOULDS, Newman, Ill., assignor of one-half to William J. Huffman, same place. Filed Nov. 29, 1881. (No model.)

Claim.—A sliding gate provided with a wheel, as shown, the circumference of which is equal to or greater than the length of the gate, part of the rim of said wheel being weighted, substantially as described.

253,488. REED-ORGAN. CHARLES AUSTIN, Lowell, Mass. Filed Apr. 11, 1881. (No model.)

Claim.—1. The combination of a single inlet-valve, F, with a plurality of connected reed-boxes, E E', all arranged substantially as described, and for the purpose specified.

2. The combination of a single inlet-valve, F, and a plurality of connected reed-boxes, E E', with a single tracker-pin, B, and key-lever A, all arranged substantially as described, and for the purpose specified.



3. The combination of a plurality of reed-boxes, E E', connected with each other, and an equal number of independent wind-chests, D D', each having a separate exhaust-valve, G G', as and for the purpose specified.

4. The combination of the wind-chests D D' with the reed-boxes E E', arranged in front of the wind-chests and one over another as and for the purpose specified.

REISSUES.

10,026. SPRING CURTAIN-ROLLER. CHAS. DE QUILLFELDT, New York, N. Y. Filed Nov. 17, 1881. Original No. 168,802, dated Feb. 16, 1876.

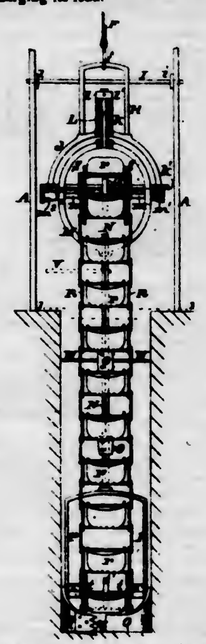
Brief.—The pivoted pawls are thrown out by centrifugal force between a stationary stop and the stops on the end plate and lock the spindle.

Claim.—1. The combination, in a spring shade-roller, of the end plate, having pivoted centrifugal pawls and stops for the pawls, with a stationary contact-stop exterior to the end plate, against which and the stops of the end plate the pawls are thrown whenever the centrifugal force overcomes the gravity of the pawls, substantially as set forth.

2. In a spring-roller, the combination of the end plate, having pivoted centrifugal pawls and stops for the pawls, with a stationary exterior contact-stop which is engaged by the pawls when they are thrown out by centrifugal power, but which is cleared by the same when their gravity overcomes the centrifugal force, substantially as and for the purpose set forth.

3. In a spring shade-roller, the combination of centrifugal pawls pivoted to the end plate of the roller, a stop for each pawl, and a stationary contact-stop secured to the fixed axle or shaft of the roller, said contact-stop projecting into the path of the centrifugal pawls, so that the roller is stopped by the pawls when they are thrown by centrifugal force against the stops, as described.

4. In a spring shade-roller, the combination of centrifugal pawls applied to pivots of the end plate of the roller, a stop for each pawl, a stationary contact-stop within the path of the centrifugal pawls, the pivot of each pawl, the stop of each pawl, and the stationary contact-stop being so arranged relatively to each other as to form three binding-points for the pawl and lock the spring-roller when the centrifugal force exerted on the pawls overcomes the gravity of the same, substantially as set forth.



5. The combination, in a spring shade-roller, of an end plate, having eccentrically-pivoted centrifugal pawls and a fixed stop for each pawl, with a stationary contact-stop secured to the fixed axle or shaft of the roller, substantially as set forth.

6. The combination, in a spring shade-roller, of the end plate, D, having pivoted centrifugal pawls D' and fixed stops *d*, with a stationary exterior cam or stop, E', substantially as described.

7. The combination, in a spring shade-roller, of the end plate, D, having centrifugal pawls D' and stop-recesses *b d*, with an inclosing-cap, E, secured to the shaft *a*, and provided with a cam or stop, E', substantially as specified.

10,027. EARTH BORER AND EXCAVATOR. JOHN W. CARLEY, Cotton Gin Tex., assignor of part interest to Julius W. Storey and Andrew B. Carley, same place. Filed Nov. 9, 1881. Original No. 234,532, dated Nov. 16, 1880.

Brief.—The boring device is supported from braced vertically-slotted posts, which guide a cross-bar, on which is a ball, secured to the hub of the main gear-wheel. The under side of said wheel has a toothed surface and a smooth bearing-flange, against the latter of which bears a steadying-wheel. To one or more of the shaft-couplings is secured a recessed guide-disk, through which passes the endless bucket-chain. A tappet-lever actuated by pins on one of the upper chain-wheels strikes the bottom of each bucket, to assist in discharging its load.

Claim.—1. The combination of guide-posts A A, having slots *a a*, bracing devices C B D, the cross-bar I, having cross-heads *i i*, the ball H, vertical ring M, and shaft L, as set forth.

2. In combination with the auger and endless chain and buckets and driving mechanism, the rapper X *x*, secured to the ring M and operated upon by pins on one of the chain-wheels, substantially as and for the purpose set forth.

3. The combination of ball H, carrying toothed rim K, the vertical ring M, horizontal elevator-shaft m, carrying wheels m' and m², and the connecting-shaft L, as set forth.

4. The combination of ball H, having rim K, formed with toothed portion and a smooth portion, *k'*, and the ring M, having shaft m, carrying rollers m' m², as set forth.

5. The disk-guide W, having openings *w w*, and the shaft N, having couplings O, for supporting the disk-guides, in combination with chain of buckets and auger, as set forth.

6. In an earth-digging auger wherein an endless chain of buckets is employed, a guide for the said chain, in combination with the auger-shaft or its coupling, substantially as set forth.

7. The combination, with a sectional shaft, N, of the coupling O, having lugs *o*, provided with orifices for receiving the hook of the hoisting-chain, as set forth.

10,028. CUTTING-NIPPERS. THOS. G. HALL, New York, N. Y., assignor, by mesne assignments, to the Interchangeable Tool Company, of New York. Filed Jan. 16, 1882. Original No. 209,877, dated Nov. 6, 1878. Patented in England Sept. 24, 1878, in Germany June 13, 1879, and in France Feb. 20, 1880.

Claim.—1. A cutting-nipper consisting of the following parts, constructed and combined as described, viz: two jaw-levers, *c d*, upon one end of each of which a jaw and cutting-edge is made, and each of which is suspended upon an independent fulcrum, *e f*, between two side plates, *p p*, two handle-levers, *i k*, each of which is also suspended upon an independent fulcrum between said side plates, and each of which is provided with a short toe, *n o*, set between the long ends of the jaw-levers, but not connected to them, for the purpose of closing the nippers, and a spring, *g*, held between said side plates and set between the jaw-levers, for the purpose of opening the nippers, substantially as shown and described.

2. The combination, with the levers *c d* and plates *p*, of the pin *q*, arranged between said levers and in front of their fulcrums, as and for the purpose specified.

10,029. RAZOR-STROP. JOHN LAMONT and ALEXANDER P LAMONT, Rochester, N. Y., assignees of James Lamont, deceased. Filed Oct. 7, 1881. Original No. 173,477, dated Feb. 15, 1876. Reissue No. 8,181, dated Apr. 18, 1878.

Claim.—1. The combination, in a razor-strop, of the four-sided oblong or prismatic body A, with the suspended belt passing over two sides of said body and attached to a nut at the handle end of the strop, guides rigid with and projecting from the body at one end of the strop and bearing against the nut, and the adjusting-screw passing through a bearing secured to the outer ends of said guides at a point between the nut and the handle, said screw also having a bearing at its end in one end of the bone-body, substantially as described and shown.

2. The combination, in a razor-strop, of the four-sided oblong or prismatic body A, with the suspended belt passing over two sides of said body, and attached to a nut at the handle end of the strop, guides rigid with and projecting from the body at one end of the strop and bearing against the nut, and the adjusting-screw passing through a bearing secured to the outer ends of said guides at a point between the nut and the handle, substantially as described and shown.

3. The combination, in a razor-strop, of the body A, with the suspended belt passing over two sides of said body and attached to a nut at the handle end of the strop, means rigid with the body and opposing the edge of the nut to prevent the rotation of the latter, and the screw provided with a handle and passing through the nut, and a bearing for the screw secured to the outer ends of the guides at a point between the nut and the handle, substantially as shown and described.

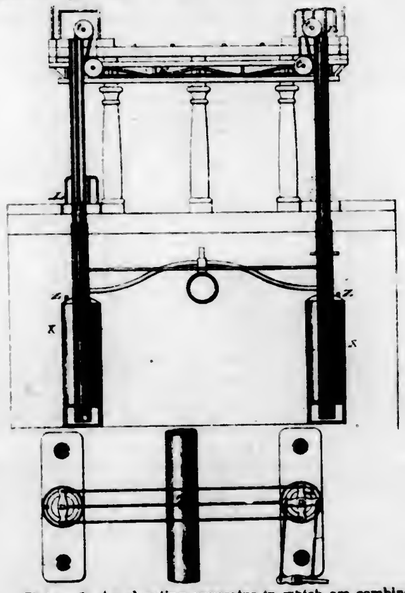
4. The combination, in a razor-strop, of the bone-body A, having a recess, *d*, formed at one end, with a suspended belt passing through said recess and over two sides of the bone-body, and applied to an adjustable nut that is fitted upon the adjusting-screw and is arranged between the walls of the recess, substantially as set forth and shown.

5. The combination, with the bone-body A, of the belt passing over two of the sides of said body, and also through a recess in one end of the latter, the nut for holding and tightening the belt arranged and guided within the recess, and the screw passing through the nut and working in bearings at opposite sides of the nut, substantially as shown and described.

6. A body, A, constructed with the bone-sides *a a*, recess *d*, and channels *b*, in combination with the belt or strap *b*, with means to adjust the tension of said belt or strap, substantially as shown and described.

7. A bone-body, A, provided with a recess, *d*, and suspended belt *b*, in combination with the nut-block *c*, screw *g*, handle B, and block A, substantially as shown and described.

10,030. POROUS PENETRABLE TILE FOR PLASTERING, &c. SANFORD H. LOBING, Castleton, Vt., assignor to Thomas A. Johnston, Boston, Mass. Filed Oct. 8, 1881. Original No. 180,361, dated Oct. 27, 1876.



Claim.—1. A method of rendering walls, columns, beams girders, floors, and roofs fire or water proof by applying (as a substitute for other and ordinary methods and material used for plastering and deadening sounds, &c.,) porous and penetrable earthenware or terra-cotta directly to or around the constructive framework and securing it in any suitable manner, then to be afterward covered with plaster, cement, paint, or other suitable finish or water-proof covering.

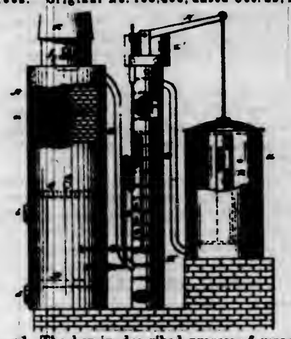
2. In the construction of water-proof walls, floors, roofs, &c., the combination of iron, wood, or combined iron and wood with spongeous or porous and penetrable earthenware and a water-proof cement, paint, or other water-proof coating or covering, fastened together in a suitable manner.

3. In the construction of fire-proof columns, beams, walls, floors, and roofs, the combination of iron, wood, or combined iron and wood with porous and penetrable earthenware or terra-cotta, the earthenware covering the columns or other parts of the structure and secured to or around them in any suitable manner.

10,031. HYDRAULIC AND PNEUMATIC ELEVATOR. OTIS BROTHERS & COMPANY, Yonkers, N. Y., assignees of Sarah Gould Day, Executrix of Horace H. Day, deceased. Filed Mar. 31, 1881. Original No. 113,886, dated Sept. 5, 1871.

Brief.—Compressed air is the motive power, and it is furnished by apparatus actuated by steam, wind, or water. It is transmitted to water contained in suitable chambers, causing it to flow into the working-cylinders containing the plungers or pistons, thereby raising said pistons and carrying with them suitable platforms, upon which persons and merchandise may be placed. By means of valves and connections the operator perfectly controls the movements of the platform.

Claim.—1. An elevating apparatus in which are combined the following elements, namely: a cylinder and piston, means for affording a supply of compressed elastic fluid in quantities sufficient to propel the pistons, a chamber containing an inelastic fluid communicating with the cylinder and with the elastic-fluid pipe or reservoir, and valve arrangements, whereby the elastic fluid may be admitted to, cut off, or exhausted from said chamber, substantially as set forth.



2. In an elevator, the combination, with the cylinder and piston, of a tank containing inelastic fluid communicating with the cylinder and with an inlet for compressed elastic fluid, and inlet and outlet ports and valve appliances, whereby the admission and discharge of the elastic fluid and the consequent operating of the platform is effected, substantially as set forth.

3. The combination, with the piston and cylinder of an elevator, or a chamber containing an inelastic fluid, and suitable ports and valve appliances, whereby the admission and discharge of an elastic fluid to and from said chamber is made the means of carrying the inelastic fluid to and from the same, and thereby operating the piston which actuates the platform, substantially as set forth.

4. The combination, with an elevated railway, of the receiver A, containing compressed elastic fluid, the chambers X, containing an inelastic fluid, the valves, cylinders, and pistons, the platforms L, and the connecting devices, substantially as described.

5. A water-supply pipe, Z, combined with the receptacle for the inelastic fluid, arranged between the elastic-fluid supply-pipe and the piston, substantially as set forth.

10,032. PROCESS OF AND APPARATUS FOR THE MANUFACTURE OF GAS. THEODORE C. SPRAGUE, New York, N. Y. Filed Jan. 10, 1882. Original No. 196,495, dated Oct. 23, 1877.

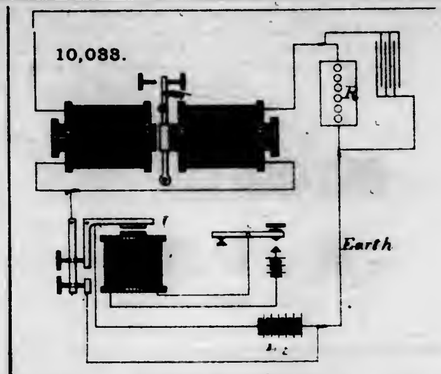
Claim.—1. The herein-described process of manufacturing gas, the same consisting in the following steps, to wit: raising to incandescence a mass of carbonaceous material by a current of air, producing carbonic oxide; then burning the carbonic oxide by means of air above the bed of carbonaceous material and causing the products to pass into a mass of refractory material for highly heating the same; then decomposing water and naphtha by the incandescent carbonaceous material, producing water-gas; and finally fixing such gas by passing it through the mass of highly-heated refractory material, substantially as specified.

2. The method herein described of producing gas by storing up in a mass of refractory material the heat generated and carried off by the ignited gas evolved from the burning fuel while it is being prepared to decompose the liquid gas stock into mixed gases, and subsequently utilizing such heat by converting the mixed gases produced from liquid gas stock in contact with incandescent fuel into a fixed gas by passing such gases into and through the refractory material, substantially as described.

3. A cupola or gas-generating apparatus having a combustion and decomposing chamber for burning solid hydrocarbons, wherein water and hydrocarbon may be mutually decomposed, and a fixing-chamber partly or wholly filled with some refractory material for absorbing heat and converting the hot gases from the combustion-chamber into a fixed gas, the two chambers being formed in one structure, substantially as and for the purpose specified.

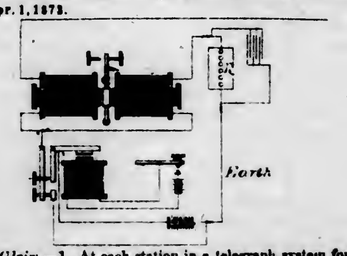
4. A cupola or gas-generating apparatus having a decomposing and combustion chamber, a perforated diaphragm at the top thereof, and a fixing-chamber containing refractory material above, and provided with an air-supply pipe for supplying air to support combustion of gases from the lower chamber for storing heat in the fixing-chamber, for the purpose specified.

5. The process of making a fixed illuminating-gas by feeding hydrocarbon liquid and water automatically in proportion as the gas is consumed, into an incandescent body of coal in the combustion-chamber of the cupola or generator, and forcing the gas and water there generated through a heat-absorber for making a fixed gas, as set forth.



6. In combination with a gas-holder and an automatic regulator, a gas-generator consisting of an exterior shell and interior lining, with air-space between them, and a perforated division or diaphragm inside the lining, forming a heat-absorber above a combustion-chamber below the division, whereby the heat may be stored during the day-time for use in the manufacture of illuminating-gas at night in the proportion as such gas is being consumed, as set forth.

7. The generator consisting of the outer shell, A, inner brick lining, B, and space *a* between them, and provided with doors *b d*, perforated diaphragm C, grate D, air-pipe *e*, valve *f*, and stack E, all substantially as and for the purposes set forth.



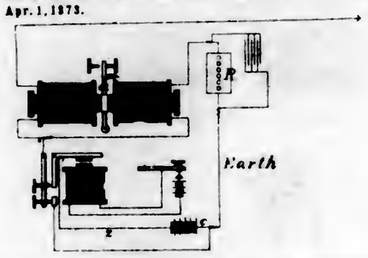
10,033. DUPLEX-TELEGRAPH APPARATUS. JOSEPH B. STEARNS, Boston, Mass., assignor to the Western Union Telegraph Company, New York, N. Y. Filed Nov. 23, 1881. Original No. 126,847, dated May 14, 1872; Reissue No. 5,344, dated Apr. 1, 1873.

Claim.—The method of preventing the return-current or static discharge from a telegraph-line from producing false signals upon the receiving-instrument at the home station in the process of transmitting signals therefrom, which consists in the simultaneous production at the home station of an artificial static discharge capable of exerting an effect substantially equal but opposite to that of the main line upon the receiving-instrument at the home station.

10,033.

10,034. DUPLEX-TELEGRAPH APPARATUS. JOSEPH B. STEARNS, Boston, Mass., assignor to the Western Union Telegraph Company, New York, N. Y. Filed Nov. 23, 1881. Original No. 126,847, dated May 14, 1872; Reissue No. 5,344, dated Apr. 1, 1873.

Claim.—1. At each station in a telegraph system for double transmission, the combination of the main line, a branch electrically connected with the main line, provided with means for giving said branch an artificial electro-static capacity, a receiving-instrument responsive to signals sent from a distant station only, and transmitting apparatus whereby the effects of static induction of the branch shall prevent the effects of static induction of the main line due to the transmission of signals from the home station from producing false signals upon the associated instrument.



2. The combination, in a telegraphic apparatus for double transmission at each station, of a receiving-instrument always in circuit and responsive to signals from a distant station only, a condenser electrically connected therewith, and a transmitting device, whereby the effects of static induction caused by and accompanying the transmission of signals to a different station shall not produce false signals upon the associated receiving-instrument.

3. At each station in a telegraph system for double transmission, the combination of a receiving-instrument constantly in the main line, and responsive to signals from a distant station only, and a condenser electrically connected therewith, whose static discharge shall prevent the static discharge from the main line from producing a false signal upon said receiving-instrument at the termination of each signal sent to a distant station.

4. A transmitting device and a receiving-instrument at each station, which is responsive to signals from a distant station only, in combination with a branch conductor, and means for giving said branch an artificial electro-static capacity, said branch conductor being electrically connected with the associated transmitting and receiving apparatus, whereby the current of static charge and current of static discharge set up in the branch accompanying the transmission of a signal to a distant station shall prevent the current of static charge and the current of static discharge of the main line from producing false signals.

5. A receiving-instrument at each station, in combination with a branch, and means for giving said branch an artificial electro-static capacity, said means consisting in a metallic conducting-surface in electrical connection with said branch, and an additional conducting-surface in close proximity to the first one, but insulated therefrom, and electrically connected with the earth, whereby the inductive reaction between the metallic plates of the branch and the earth may be made to correspond to that between the main line and the earth.

10,035. **DUPLEX-TELEGRAPH APPARATUS.** JOSEPH B. STRAUSS, Boston, Mass., assignor to the Western Union Telegraph Company, New York, N. Y. Filed Nov. 23, 1881. Original No. 136,247, dated May 14, 1873; Reissue No. 5,344, dated Apr. 1, 1873.

Claim.—1. The combination, in a duplex telegraph substantially as hereinbefore set forth, of a receiving-instrument responsive to signals from a distant station only, a main telegraph-line, a branch or compensating line, and means for giving said branch an artificial capacity for storing electricity, and a key or transmitter for charging and discharging the main and branch lines simultaneously.

2. The combination, in a duplex telegraph substantiallly as hereinbefore set forth, of a battery, a main line, an artificial or compensating line, a rheostat in said artificial line, and a condenser having its terminals respectively connected with said artificial line and the earth.

3. The combination, substantially as hereinbefore set forth, of a battery, a main line, an artificial or compensating line, a differential electro-magnet having two coils capable of producing simultaneous, equal, and contrary effects upon its armature, one of said coils being in the main and the other in the artificial line, and a condenser having one of its terminals electrically connected with the artificial line and the other with the earth.

DECISIONS
OF THE
COMMISSIONER OF PATENTS
AND OF UNITED STATES COURTS IN PATENT CASES.

DECISIONS OF THE U. S. COURTS.

U. S. Circuit Court—Northern District of Illinois.

WILSON PACKING COMPANY *et al. v.* CHICAGO PACKING AND PROVISION COMPANY. SAME *v.* ST. LOUIS BEEF CANNING COMPANY. SAME *v.* HUNTER *et al.*

Decided November 25, 1881.

1. LETTERS PATENT—COOKED MEATS.
Reissued Letters Patent No. 6,370, dated April 6, 1875, and issued to William J. Wilson, for a new and useful improvement in the process for preserving and packing cooked meats for transportation, consisting in thoroughly cooking the meat by boiling it in water, removing the bone and gristle, then placing it while yet warm with cooking into a box or case, and pressing it by some suitable apparatus with sufficient force to remove the air and all superfluous moisture and make the meat form a solid cake, and finally closing the box or case air-tight upon the meat, are void for want of novelty.

2. SAME—SAME.
Claim 1 of Reissue No. 7,923, dated October 23, 1877, and issued to John A. Wilson, for an improvement in metallic cases for containing cooked meats, which is for a can for packing food hermetically sealed, and constructed of pyramidal form, with rounded corners and offset ends to support the heads, and claim 3, which is a claim, as an improved article of manufacture, of solid meat compressed and secured within a pyramidal case or can, so that said can forms a mold for the meat and permits its discharge as a solid cake, are also void for want of novelty.

3. SALES OF PRODUCT OF PATENTED PROCESS—EVIDENCE OF VALIDITY.
In all doubtful cases involving the validity of a patent the fact that the article made by the use of the process described in the patent has been extensively sold is a consideration of great weight with the court, but it is not enough *per se* to sustain the patent.

Messrs. West & Bond and *Messrs. Munday, Evarts & Adcock* for the Wilson Packing Company.
Mr. John N. Jewett and *Messrs. Offield & Towle* for Libby, McNiell & Libby.
Mr. William H. Clifford and *Mr. B. F. Thurston* for all the complainants.
Messrs. Noble & Orrick, Messrs. Coburn & Thatcher, and *E. N. Dickinson* for the defendants.

Before DRUMMOND, *C. J.*, and BLODGETT, *D. J.*
PER CURIAM:
The cases have all been argued together, and involve the same questions of law and fact, and are founded upon the reissued patent of William J. Wilson, No. 6,370, of April 6, 1875, for a new and useful improvement in the process for preserving and packing cooked meats for transportation, and in the reissued patent of John A. Wilson, No. 7,923, of October 23, 1877, for a new and useful improvement in metallic cans for containing cooked meat.
The reissued patent of William C. Marshall, No. 6,451, of May 25, 1875, for a new and improved process for preserving meats, although set forth in the pleadings, is not relied on in the argument, and need not be further considered as an independent ground of relief. These patents were before us in 1879 in the case of *Wilson Packing Company* v. *Clapp*. (11 Chicago Legal News, 353.)
The most important questions in the case grow out of the patent of William J. Wilson. In his original patent he stated that in carrying out his invention the meat was to be first cooked thoroughly at a temperature of 212° Fahrenheit, so that all the bone and gristle could be removed and the meat yet retain its natural grain and integrity; that a measured quantity of this cooked meat was then, while yet warm with cooking, pressed by any suitable apparatus into a previously-prepared box or case with sufficient force to remove the air and all superfluous moisture and make the meat form a solid cake, and that then the box or case was closed air-tight upon the meat. It will be observed that he did not distinctly set forth in this original patent in what manner the meat was to be first cooked. There is in the reissue no change in the description of carrying out the invention, except he declares it is a "preferable" mode of putting the meat cooked into a box or case while yet warm with cooking. The implication, of course, is that it was not an indispensable part of his description of the invention that it should be thus put in warm.
There were two claims in the original, as there are in the reissue, and the only difference between them is that in the original the first claim states that the cooked meat is to be pressed into an air-tight package "while heated with cooking," these last words being omitted in the first claim of the reissue.
While these suits have been pending the plaintiffs have filed a disclaimer of the use of the word "preferably" of the reissue, thus eliminating it from the description therein contained and leaving the patent in this respect as it was in its original form. They have also disclaimed the use of the following words of the description in the reissued patent: "The meat is first cooked thoroughly at a temperature of 212° Fahrenheit, so that all the bone and gristle can be removed and the meat yet retain its natural grain and integrity;" and, instead thereof, insert the following words, viz: "The meat is first cooked thoroughly by boiling it in water, so that all the bone and gristle can be removed and the meat yet retain its natural grain and integrity."
Waiving the objections which have been made to the validity of these disclaimers, we may now state what the invention of the William J. Wilson patent is. The meat is to be first thoroughly cooked by boiling it in water, so that all the bone and gristle can be removed and the meat yet retain its natural grain and integ-

and if it is also implied that the box, as we have here-

a represents the body of my can made in the form of a truncated

rity. While yet warm with cooking it must, by some suitable apparatus, be pressed into a box or case previously prepared with sufficient force to remove the air and all superfluous moisture and make the meat form a solid cake. The box or case is then to be closed air-tight upon the meat. So that the invention contains these elements: (1) Thoroughly cooking the meat by boiling it in water, removing the bone and gristle; (2) placing it while yet warm with cooking into a box or case, and pressing it by some suitable apparatus with sufficient force to remove the air and all superfluous moisture and make the meat form a solid cake; (3) closing the box or case air-tight upon the meat.

It will thus be observed that the first requisite is that the meat must be thoroughly cooked by boiling it in water, that mode of cooking called "stewing" not being necessarily excluded, unless the words declaring that "the meat yet retain its natural grain and integrity" have that effect. The patent limits the cooking to this particular mode, baking, roasting, and steaming being excluded as modes of cooking meat. After the bone and gristle are removed there is no description given of any particular manner in which the meat is to be treated before it is put into the box or case, unless the use of the language that "it is then wholesome and palatable" has that effect. And although the evidence shows that all the meat, put up by the plaintiffs, and which has entered so extensively into the markets of the country for sale, is corned meat that is not a part of the patent, and fresh meat, without antiseptics of any kind, if thoroughly cooked by boiling in water, with the bone and gristle removed, and if, while yet warm with cooking, put into a box or case closed air-tight, would be within the description of the patent. Neither is anything said of the extent of the pressure to which the meat is to be subjected when placed in the box or case, except that it must be with sufficient force to remove the air and all superfluous moisture, so that the meat will form a solid cake. Nor is the degree of warmth named which must exist when the meat is put into the box or case. Neither is any description given of the manner in which the box or case is to be closed air-tight upon the meat.

It is claimed by the plaintiffs that this combination of the manner of cooking and preserving meats for transportation is new, and entitled William J. Wilson to a patent.

It should be stated that in the original, as well as in the reissued patent of William J. Wilson, it seems to be implied by the second claim, which is made in each, that the box or case must be "hermetically" sealed. Some criticism has been made upon the use of this word. We do not understand it to mean the same as if it were employed in describing anything as hermetically sealed in a laboratory, but only that the package should be so sealed as to exclude the passage of air into or out of the box or case. The patentee says that this box or case may be made of wood or metal, or both combined, of any suitable form or shape, and of any desired dimensions. It is, perhaps, unnecessary for us to inquire, as all the parties in this case use metal, whether or not the box or case could possibly be made of wood, or whether, in order to accomplish the object which the patentee had in view, it must always be made of metal. We will therefore direct our attention, in the first place, to the question whether or not what William J. Wilson describes in his specifications, as just stated, was the proper subject of a patent.

The cooking of meat thoroughly by boiling it in water, so that the bone and gristle can be removed, has always been known. If it be admitted that the box or can must be hermetically sealed in order to be air-tight, that was an old device. The Appert process, described in Durand's English patent of 1810, required that the vessel (case or box) in which the food was placed should be air-tight, and that has ever since been regarded as indispensable in any process for preserving such food as is the subject of controversy here. Before the date of the patent to William J. Wilson meat was placed in a package and subjected to pressure to remove the air, and it is clear any superfluous moisture was thus also removed from the meat. This is shown in the Marshall patent of 1864, because it is manifest his description of the process necessarily implies the removal of the superfluous moisture from the meat, as well as the removal of the air from the meat by pressure, and the hermetical sealing of the box or case in which the meat is placed for preservation, transportation, and sale. De Lignac (1855) submitted meat to a high pressure in the tin cans in which it was to be preserved, and which apparently were hermetically sealed. Lyman (1869) roasted his meat before putting it into the box or can, and he speaks in his specifications of stewing, boiling, or roasting the meat as being the ordinary mode at that time employed for preserving meat before packing it in cans. It will thus be seen that prior to the issuing of William J. Wilson's original patent, in 1874, meat was cooked in various ways; was subjected to pressure, by which the air and the superfluous moisture were expelled from it, both before and after it was put in the case or box for preservation, and these boxes or cases were hermetically sealed, in order to make them air-tight.

The evidence seems to show that at the present time, in order most surely to preserve meat, it is necessary to subject the case or can in which the meat is packed to what is called "processing," which we understand to mean this: There is an opening in the can through which the meat is introduced. When the can is filled the hole is soldered up. It is then subjected to heat, a puncture made, the air and steam permitted to escape, and then the puncture also soldered up. This is not a new operation, but has long been known. In fact, it is substantially described in the Durand patent as a part of the Appert mode of preserving meat; for, although the details here described are not fully given in the Durand patent, still they are necessarily implied from the statement that the aperture is left in the vessel until the heat shall have produced the proper effect, when it is to be closed. In Appert's method of preserving animal and vegetable food, vessels containing it were placed in a boiler filled with cold water, and then heat was applied up to the boiling-point, and vegetables were to be put into the vessels in a raw or crude state—animal substances raw or partly cooked. The "processing," as it is termed, is not set forth in the William J. Wilson patent, unless necessarily implied from the statement that in thus preparing and packing the meat in an air-tight box or case it is a part of the operation. All that the patent says is that after the meat is put into the box or case and the proper pressure is applied the box or case is then closed air-tight upon the meat;

and if it is also implied that the box, as we have heretofore assumed, is hermetically sealed, still it is not stated that it is to be subjected to the "ordinary process" in canning. It seems to be conceded that the reasons which render this necessary, in order to properly preserve meat or vegetables, were not well known at the time it was adopted. The theory at present received upon this subject is that it is necessary to expel from the can or case the air and what are called the germs of fermentation and putrefaction, which exist in the air, and which are destroyed when a high degree of heat is applied; and the air being thus expelled before it can re-enter, the box is made air-tight. These invisible germs, supposed to be floating in the air, must be killed or removed, or they will enter into the vegetable or animal substances, and in a short time produce putrefaction, and, of course, destroy them as an article of food. There seems to be, therefore, nothing left in the description of the mode of preserving meat pointed out in the patent of William J. Wilson unless it is in putting the meat while warm with cooking into the box or case. Can that be said to be patentable as a part of the mode of preserving meat, even if it be conceded it had never been done before? We think not; no more than if, prior to the date of the William J. Wilson patent, in order to preserve meat, it had never been put into a can or case thoroughly cooked. Neither of them seems to require ingenuity or the exercise of the inventive faculty. It is manifest, when we consider what was known at the date of the William J. Wilson patent, that these or other methods could be adopted of putting the meat into the case or can for preservation without encroaching upon the domain of the invention of any one.

There can be no doubt that within a few years past the method of preserving meat adopted by William J. Wilson has caused the article to be extensively used and sold in the markets of this and other countries. That argument has been pressed with great force upon the court in this case.

It may be admitted that in all doubtful cases involving the validity of a patent the fact that a mode described in the patent has gone into extensive use has and often will induce courts to decide in favor of the patent. But while this is so courts ought not, merely because of such use, to sustain a patent. The rights of the public are to be protected as well as those of individuals, and a monopoly should not be allowed unless the right to it is clearly shown. But the true explanation of the success which has attended this and similar modes of preserving meat may be in the fact that there has been a tendency in the public of late years to use all kinds of canned meats and fruits to a much greater extent than formerly, owing to the increased care and skill in their preparation and packing; and we think all William J. Wilson and those who act under him can claim is that they have been particularly careful in selecting, preparing, seasoning, cooking, and canning their meat, by which it has acquired a high reputation; and upon that, in our opinion, they must rely, and not upon a monopoly under the patent law.

The John A. Wilson patent of October 23, 1877, Reissue No. 7,923, is for an improvement in metallic cans for containing cooked meats, and, as he describes it—

> Consists in a pyramidal-shaped can having rounded corners and both ends slightly flaring to form shoulders, against which the head or end pieces rest. * * *
>
> a represents the body of my can made in the form of a truncated pyramid, with rounded corners, and of any desired number of sides, though I prefer to make with four sides. * * *
>
> In packing cooked meats it is done by means of a plunger through an aperture in the large head B, which opening is afterward hermetically sealed by means of a cap or plate, D. * * * The can is to be opened at the larger end, at or near the shoulder e, by means of a suitable can-opener, so that when the can is reversed a slight tap on the smaller head C will cause the solidly-packed meat to slide out in one piece, so as to be readily sliced, as desired.

The claims in controversy here are the first and third:

> 1. A can for packing food, hermetically sealed, and constructed of pyramidal form, with rounded corners and offset ends to support the heads, said heads being secured as shown and described.
>
> 3. As an improved article of manufacture, solid meat compressed and secured within a pyramidal case or can, so that said can forms a mold for the meat and permits its discharge as a solid cake, substantially as specified.

And to these claims defendants interpose two defenses: (1) That the patent is void for want of novelty so far as the two features or claims in question are concerned; (2) that defendants do not infringe.

It will be seen that the case or can covered by this patent must have certain features or characteristics: (1) It must be of "pyramidal form, with rounded corners;" (2) it may have "any number of sides," although the patentee "prefers four sides;" (3) it must have "rounded corners," and the ends must be "slightly flaring," to form shoulders, against which the "head or end pieces rest."

There are some further details of construction, such as the mode of fastening in the heads by turning the flaring edge of the can inward over the flange of the head, so as to make three thicknesses of metal, and, as he said, make a tight joint "with or without solder," and leaving an aperture or stud-hole in the large head through which the meat is to be forced, which hole is to be closed by a cap. But as no notice is taken of these in the claims, we presume they are not considered as of the substance of the patent.

By a stipulation filed in these cases, found on page 942 of defendants' record, it is admitted that "conical tin cans were made and used for canning alimentary substances, and sealed air-tight, prior to the date of the Wilson patents that are the subject of controversy in these cases."

The proof also shows that the French patent of one Emile Peltier was recorded in April, 1859, wherein he described pyramidal-shaped cans for the preservation of food by hermetically sealing such cans. We may also add to this, from our common knowledge, the well-known glasses and molds used by housekeepers in domestic life for preserving jellies, boned turkey, head-cheese, &c., which were all, from the very necessity of the uses to which they were applied, more or less flaring, conical, or pyramidal in shape, and made so, presumably, for the purpose of turning out or discharging the contents in a solid cake. If therefore there was occasion at the time this patentee entered the field of improvement to use a pyramidal or conical-shaped can or case, there was no need to call in the aid of inventive genius to secure or contrive its construction. Those who wanted such a can or case had only to take those forms of cans then in general use and adapt them, by mere mechanical changes, to the purpose for which they were designed. With these conical and pyramidal-shaped cans, well known and described in the art of preserving food, there was not only no room, but absolutely no need, for invention in applying them to the purposes of preserving cooked meats. There is nothing in the proof showing, or tending to show, that cooked

meats require any different-shaped cans to contain or preserve them than do other alimentary substances. The only advantage gained by this shape suggested in the patent, is that the solidly-packed meat can be more compactly turned out of this form of can in a cake, so as to be readily sliced; but it could be equally well turned out of a conical can. In fact, a conical or pyramid shaped or flaring can would seem naturally to suggest itself, from kindred uses in domestic life, almost as part of the idea or suggestion of packing meat solidly in a can for preservation. To come within this claim of the patent, the can must not only be pyramidal in shape, but it must have "rounded corners" and "offset ends to support the heads." The cans shown in the proof to have been used by the St. Louis Beef Canning Company and by Robert D. Hunter and others are eight-sided pyramidal-shaped cans—that is, they are made with four narrow sides or panels and four wider ones—while those used by the Chicago Packing and Provision Company are pyramidal-shaped cans with rounded corners. But this peculiarity of construction alone can hardly be deemed the subject-matter of a patent. In making a pyramidal-shaped can of sheet metal it is obvious that the corners would be naturally more or less rounded, unless special pains were taken to avoid that shape and turn the corners squarely; and with conical and pyramidal shaped cans, known to the art, it would not seem to be invention to vary the form of construction by turning the corners with a curve instead of forcing the sheet metal forming the shell of the can into an angle more or less obtuse.

In his specifications describing the mode of constructing his can this patentee says:

> Both ends of the body are made slightly flaring, so as to form shoulders or offsets, against which the heads are to rest.

Waiving the question whether this feature of construction in a sheet-metal can could be the subject-matter of a patent, it is sufficient to say that we do not find this feature in the cans used by any of the defendants, while the complainants' cans put in evidence show that they do not confine themselves to this form of construction. All the defendants' cans which are shown as exhibits in the case are made by turning a rim of the head down over the outside of the body or shell of the can and fastening the head in place with solder, and none of them have the "offset" ends called for by the specifications of this patent; and, as we have already said, this seems to be the form of construction practically adopted by the plaintiffs, probably because all packers find they can make a can just as tight and useful, and more cheaply, by turning the head over the outside of the shell than by following the exact description of the patent. But we also find in the proof that the cans shown to have been used by Gibbie and by Perl as early as 1872 show the offset ends claimed by this patent. The "Gibbie" can has both the "rounded corners" and "offset ends," while the "Perl" can has "offset ends" as a distinctive feature of construction. We have therefore conical and pyramidal shaped cans, and the "Gibbie" and "Perl" cans, with flat sides, but rounded corners and offset ends, known and in use long before this inventor entered the field, and feel compelled to reach the conclusion that there was no novelty in the device of a pyramidal-shaped can with rounded corners and offset ends, as described in this claim; so that it seems clear to us that the first claim of this patent must be held void for want of novelty.

As to the third claim, the proof shows that Marshall packed meat solidly in a can in 1864. He says:

> I then subject a given quantity of the meat to pressure in a box or cylinder under until all air is driven out, and the space occupied by the meat agrees with the size of the package it is intended to fill. When the meat is in its place the box is hermetically sealed, and in this state, retaining all its nutritive qualities, the meat will remain perfect as long as the package remains intact.

So Lyman, in his patent of 1870, described his process of packing meats solidly in cans as follows:

> I grind or otherwise reduce the roughest parts to about the consistency of thick mortar or putty, and then pack the best pieces in this reduced meat and press it all into a compact mass in the can, the interstices being filled with the reduced meat firmly pressed in, so as to expel the air, instead of filling them with the gravy or with water, as by the common modes. Sometimes I grind the whole of the meat and pack the can with it, compressing it into a solid mass, then heat and seal it up from the air, and reheat it to combine any free oxygen that may possibly be left in the can.

Here we have in both cases solid meats, and in one case cooked meats, packed in cans for preservation. Neither of these patentees tell us the shape of their cans. But we cannot see how, with conical and pyramidal cans well known in the art as packages for the preservation of meats and other food, and the old art of packing or compressing meats solidly into cans, there can be any invention which should be protected by a patent in taking these well-known shaped cans and pressing into them cooked meat, so as to form a solid mass or cake. The can was old and the meat cake was old.

The result is that the bills will be dismissed.

29

ANNUAL REPORT
OF THE
COMMISSIONER OF PATENTS
TO CONGRESS,
FOR THE YEAR ENDING DECEMBER 31, 1881.

Laid before the House of Representatives by the Speaker February 2, referred to the Committee on Patents, and ordered to be printed.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., January 31, 1882.

To the Senate and House of Representatives of the United States of America in Congress assembled:

In compliance with the requirements of section 494 of the Revised Statutes, I respectfully submit to Congress the following report for the year ending December 31, 1881.

RECEIPTS.

Detailed statement of all moneys received for patents, for copies of records or drawings, or from any source whatever.

Applications (including caveats, trade-marks, and disclaimers):		
Cash received	$703,986 00	
Cash refunded	1,895 00	
Net cash	702,091 00	
Certificates of deposit	57,535 00	
Total cash and certificates		759,626 00
Copies:		
Cash received	60,014 82	
Cash refunded	1,644 70	
Net cash	58,370 12	
Certificates of deposit	925 70	
Total cash and certificates		59,295 82
Recording assignments:		
Cash received	24,424 38	
Cash refunded	1,006 10	
Net cash	23,418 28	
Certificates of deposit	306 55	
Total cash and certificates		23,724 83
Subscription to Official Gazette:		
Cash received	9,328 79	
Cash refunded	170 15	
Net cash	9,158 64	
Certificates of deposit	166 60	
Total cash and certificates		9,319 24
Registration of labels:		
Cash received	2,103 00	
Cash refunded	480 00	
Net cash	1,623 00	
Certificates of deposit	77 00	
Total cash and certificates		1,700 00
Aggregates.		
Cash received	$799,850 99	
Cash refunded	5,195 95	
Net cash	794,655 04	
Certificates of deposit	59,010 85	
Total cash and certificates		853,665 89

EXPENDITURES.

Amount expended under the several appropriations from January 1, 1881, to January 1, 1882.

Salaries	$467,478 49
Contingent expenses	17,965 38
Official Gazette	21,240 86
Photolithographing	55,177 80
Copies of drawings	34,517 39
Scientific library	5,373 98
Abridgment of patents	2,819 88
Total	605,173 28

Statement of contingent expenses in detail.

Furniture and labor connected therewith	$2,209 40
Repairing and extra labor	5,317 82
Painting	335 46
Carpets	267 00
Ice	500 63
Engraving and printing patent-heads	529 00
Extra labor on indexes	56 00
Other contingencies, viz:	
Subscription to journals, washing towels, keeping horse, shoeing, repairing carriage and harness, rent of telephones, lumber, copies of court decisions, paste, file-wrappers, file-holders, Bristol board, &c.	8,590 07
Total	17,965 38

RECEIPTS OVER EXPENDITURES.

Total receipts	$853,665 89
Total expenditures	605,173 28
Receipts over expenditures	248,492 61

Statement of balance in the Treasury of the United States on account of the Patent fund.

Amount to the credit of the fund January 1, 1881	$1,631,696 71
Amount of receipts during the year 1881	853,665 89
Total	2,485,292 60
Deduct expenditures for year 1881	605,173 28
Balance January 1, 1882	1,880,119 32

SUMMARY OF THE BUSINESS OF THE OFFICE.

Number of applications for patents for inventions	24,878
Number of applications for patents for designs	678
Number of applications for reissues of patents	503
Total number of applications relating to patents	26,059
Number of caveats filed	2,406
Number of applications for registration of trade-marks	611
Number of applications for registration of labels	363
Number of disclaimers filed	14
Number of appeals on the merits	789
Total	4,183
Total number of applications requiring investigation and action	30,242

Number of patents issued, including designs	16,113
Number of patents reissued	471
Number of trade-marks registered	834
Number of labels registered	202
Total number of patents granted and certificates issued	17,620
Number of patents expired during the year	4,638
Number of patents withheld for non-payment of final fee	1,511

PATENTS ISSUED.

1881	26,059	2,406	16,584	853,665 89	605,173 28	248,492 61

The receipts of the Office during the past year exceed those of any previous year by nearly $100,000, or more than fourteen per cent., and the excess of receipts over expenditures ($248,492.61) has been correspondingly greater. In no former year have there been so many applications for patents or so many patents granted.

The ratio between the number of applications and the number of grants, as gathered from the Commissioners' reports since 1836, has varied from time to time, and it is matter of interest to trace briefly the causes of this variation. At first, although the number of patents which could serve as references was comparatively small, yet the proportion of rejections was far greater than it is to-day, approaching in 1847 two-thirds the whole number of applications. This is largely attributable to the fact that the means of learning the little that had actually been done were in the hands only of those having special opportunities, such as were possessed by the Commissioner of Patents and his subordinates. Hence many crude inventions were presented in application, and the same invention many times by different persons. Afterward, when the publications of the Patent Office became more widely disseminated and inventors had at command facilities for making independent investigations before applying for patents, the number of rejections became proportionately smaller. During the past fifteen years, however, the variation in the ratio has been small. This essential stability manifestly represents a like stability in the requirements fixed by the Office as prerequisite to the grant of a patent. It is equally manifest that such stability tends to strengthen public confidence in the decisions of the Patent Office as being prompted, not by personal whim, but by conformity to fixed principles of judgment. In order, however, to secure this end there must be permanence in the examining force.

In his report for the year 1874 Mr. Commissioner Leggett says:

> It is well known that complaints from many sections of the country against our whole patent system arise almost exclusively from patents that are improperly granted because of the want of proper supervision in their examination; and with so many persons examining and passing applications for issue it is an impossibility to establish anything like a uniformity of practice in the Office.

The confusion here noted is largely augmented when to the differences of mental make-up is added the lack of special knowledge to which those are subject who take the place of retiring officers. It is worthy of note that the few exceptional years since 1867 during which there has been any considerable variation in the number of patents granted as related to the number of applications have been marked by frequent resignations.

In this connection, the attention of Congress is called to the fact that there has been no increase in the salary of principal examiners since 1848, when it was fixed at $2,500. Since 1877 the appropriations for the salaries of these officers has been only $2,400. The salaries of First and Second Assistant Examiners were fixed in 1855 and have not since been increased. As a result the best men not unfrequently leave the Office for more lucrative positions, much to the detriment of the service. It is unnecessary to say that the qualities required to make a good examiner are of the very highest order, such as command the largest salaries in positions outside the Office. In view of these considerations, it is hoped that Congress will consider the expediency of increasing the salaries of the examining officers in this Bureau, with a view to greater permanence in the force and the consequent increase of its efficiency.

INCREASE OF FORCE NECESSARY.

The needs of the Office as regards working force and room for the force actually employed have been so often and so forcibly pressed upon the consideration of Congress that it might be deemed a work of supererogation to renew reference to them here were it not that the cumulative character of the reasons for such pressure must rescue any words of mine from the criticism of presenting a mere repetition of what has already been said. Even were that the case, the necessity for action would be sufficiently urgent. The request for an increase of force which Mr. Commissioner Paine made to Congress in 1879 was repeated by Mr. Commissioner Marble in 1880 and emphasized with the words, "The force employed * * * is entirely inadequate to the amount and character of work required." Since that time the work has increased more than fourteen per cent., and the force, which was then inadequate, has received an addition of about three per cent. At the present rate of increase in the number of applications for patents either the work must accumulate upon the examiners' desks or the quality of the work done must be such as to bring discredit upon the thoroughness of official examinations. The annual increase alone represents a number two-thirds as great as the entire number of patents applied for in the year 1861, at which time Congress appropriated money for the support of sixteen principal examiners, each to be provided with a first and second assistant.

I cannot refrain from pursuing this comparison still further. The Office now has twenty-six principal examiners, twenty-four of whom have first, second, and third assistants. The Examiner of Trade-Marks and the Examiner of Interferences have no assistants. The full examining corps, then, numbers ninety-eight, while in 1861 it numbered forty-eight. Now, the total number of applications for patents in 1861 was 4,643 as against 26,059 during the year just past. It is, however, only fair to suppose that the act by which Congress fixed the number of examiners at forty-eight was based upon an estimated advance upon the business of the preceding year. Granting, then, that the force provided by Congress in 1861 was adequate to the proper examination of 9,000 applications, (the number for 1860 was 7,653, and that for 1859, 6,225,) the present force could only be expected to dispose of 18,000 cases, whereas the actual number of cases presented for action during the year 1881 is fifty per cent. greater. If to this be added the fact that the field of search becomes every year more extended; that, instead of the 31,000 American patents existing in 1861, the examining corps now has to become familiar with 250,000, and if it be considered that a similar increase has taken place in the number of foreign patents to be reviewed, and that scientific publications, which every examiner should read, have multiplied in like proportion, it will be obvious that all the increased facilities furnished by the printing of the specifications and the reproduction of the drawings in convenient form cannot offset the enormous disproportion shown by the above comparison. The mere mass of the work, however much the facilities for examination might be multiplied, would require a larger force than is provided for by the annual appropriations of Congress.

In view, therefore, of all these considerations, I recommend that Congress authorize the appointment and provide for the compensation of four additional examining divisions, each to consist of a principal examiner and three assistants.

ROOM.

Scarcely less urgent is the need of room. This need is particularly felt in the Draftsman's Division and in the Library. The former is now distributed in three widely-separated parts of the building, an arrangement which is especially inconvenient for this division, owing to the constant need on the part of examiners and attorneys of consulting it in all its branches. A large number of messengers is thus required, whose services could otherwise be dispensed with. The Library can neither shelve all its books and pamphlets nor properly accommodate those persons who would gladly make use of its stores. The Record Room and the Attorneys' Room should, for obvious reasons, be closely connected with the Library; but both are far removed from it, and are also apart from each other. Owing, too, to lack of space, work is now being done in rooms which are unfit for occupancy.

The evils of overcrowding in examiners' rooms have been fully set forth in the reports of former Commissioners. It is manifestly impossible for the assistants properly to attend to their own work while the examiner is conducting a hearing in the same room; yet only

three of the examiners have consulting-rooms apart from those occupied by their assistants. Besides, it should be noted that the custom of keeping the photolithographs and specifications in each room—a custom which lack of space elsewhere would have compelled if convenience had not recommended it—has necessitated the employment of shelves and drawers, which narrow very considerably the desk capacity of all the rooms. For this reason most of the rooms now in use are overcrowded to a degree of great inconvenience. More than double the space now available for the examining force is absolutely required for the proper dispatch of business and the health of the employés.

DIGESTS.

The digest of American patents, for which a provisional appropriation was made by Congress at its last session, has been in progress since the beginning of August last. It is proposed to furnish to the Office and the public at large classified briefs of all American patents. The classification in the body of the work will conform in general to that already existing in the several examining divisions, while the indices will contain cross-references to every sub-device which is of sufficient importance to be described in the specification of the invention to which it belongs. Thus the examiner or the inventor will not only have at hand an adequate digest of each case under its proper classification, but he can dispense with a search that is often very laborious for references in the broader classes under which the special invention is comprised. It is hardly possible to overestimate the benefit that will inure to the Office and to inventors from the prosecution of this work. A specimen of the work already done will soon be laid before Congress, and it is believed that when its nature becomes clearly understood from actual examination there will be no doubt as to the desirability of completing it.

AMENDMENTS OF THE LAW.

Section 4886 of the Revised Statutes provides, as one of the conditions necessary to the obtaining of a patent, that the invention shall not have been "in public use or on sale for more than two years prior to the application;" and section 4920, relating to the grounds of defense in an action for the infringement of a patent, provides that the defendant may plead "that it had been in public use or on sale for more than two years before his application for a patent or had been abandoned to the public." The theory of our patent system is that it is the duty of the Commissioner to determine in advance the right of an applicant to a patent. The plea of public use, if sustained, operates to defeat a patent. Notwithstanding the theory above stated, and notwithstanding the fact that public use is made a bar to the grant and to the validity of a patent if granted, the Commissioner has no means of ascertaining the fact except in cases of notorious public use. It frequently happens that the fact is alleged by parties interested in the defeat of an application, and affidavits to that effect are filed, coupled with a protest against the granting of the patent. As these protests are prompted by self-interest, and as the only practical means of bringing the matter to the attention of the Commissioner is by *ex parte* affidavits procured by interested parties, and as the affiants cannot be compelled to appear for cross-examination by any process of law, this kind of evidence is of a very unsatisfactory character, and applicants may well object, as they do, to having their rights determined upon such questionable evidence. I therefore recommend a provision of law for taking testimony in cases where the question of public use is raised similar to that already existing for taking testimony in interference cases.

Serious question has arisen as to the proper construction to be put upon that part of section 4887 which provides that—

> Every patent granted for an invention which has been previously patented in a foreign country shall be so limited as to expire at the same time with the foreign patent; or, if there be more than one, at the same time with the one having the shortest term, and in no case shall it be in force more than seventeen years.

It is contended by many lawyers practicing before this Office that the limitation here indicated applies only to inventions which were patented abroad before the application was filed for an American patent, while others of equal authority hold that the priority contemplated by the provision is priority of grant, and this corresponds with the later rulings of the Office. As a matter of fact, it is often impossible to ascertain whether a given invention has been patented in a foreign country or not. The case may be pending in several countries at once, and after the American patent has been granted it may be discovered that the same invention was patented abroad on the day before it was issued here. If it is the desire of Congress to limit in any case the duration of the American patent by that of a previous foreign patent for the same invention, it is hoped that the statute will be so amended as to leave no room for doubt. But when it is considered that our patent system is intended to "promote the progress of the useful arts," and when it is remembered what our liberal patent system has already done for the accomplishment of this end, it may well be doubted whether all proper inducements should not be offered the foreign inventor to patent his invention in this country. There would seem to be no valid reason why an invention that has been patented elsewhere should not, if found new and useful, be protected in this country for the same number of years as any other invention. The statute (sec. 4887, part 1) furnishes a sufficient inducement to promptness in making application by providing that such an invention shall be patentable, "unless the same has been introduced into public use in the United States for more than two years prior to the application." Besides, the statute operates in effect to discriminate against the American inventor. In some foreign countries a patent cannot be maintained for an invention which has been previously patented in the United States. American inventors may thus be debarred from protection in those countries; or, if they choose to secure that, are deprived of some at least of the privileges which were meant to foster the spirit of domestic invention. I therefore recommend that that part of section 4887 of the Revised Statutes which limits the term of the American patent by that of the foreign patent be repealed.

Section 4897 of the Revised Statutes is ambiguous, the application for patent therein referred to being designated "an application," "second application," and "renewed application." In order to make the section consistent with other parts of the law and all parts of it compatible with each other, I recommend that the same be amended so as to read:

> SEC. 4897. Any person who has an interest in an invention or discovery, whether as inventor, discoverer, or assignee, for which an *application was made and* a patent was ordered to issue upon the payment of the final fee, but who fails to make payment thereof within six months from the time at which it was passed and allowed and notice thereof was sent to the applicant or his agent, shall have a right to *renew such* application *and obtain* a patent for such invention or discovery *upon the payment of the fee required by law* the same as in the case of an original application. But such *renewed* application must be made within two years after the allowance of the original application. But no person shall be held responsible in damages for the manufacture or use of any article or thing for which a patent was ordered to issue under such renewed application prior to the issue of the patent. And upon the hearing of renewed applications preferred under this section abandonment shall be considered as a question of fact.

PRINTING.

Provision is made by statute for the sale of printed copies of specifications and drawings of patents at a minimum price of ten cents per copy. There is no provision of law for the gratuitous distribution of the same. A custom, however, has grown up in the Office of furnishing without charge to the several governmental departments and bureaus such copies of patents as they may desire for actual use. Furthermore, in order to reciprocate the courtesies extended to this Office by the corresponding bureaus of other governments, we are now supplying England, France, Belgium, Germany, Austria, and Italy with complete sets of printed specifications and drawings as they are issued. These copies, added to such as are required for the use of examiners and other officers of the Bureau in the discharge of their duties, exceed in number the copies sold. In the absence of any legal sanction for the free distribution of copies, it is recommended that express authority be given the Commissioner of Patents to exercise his discretion in this regard. The necessity for printing the specifications from No. 1 to No. 48,126, issued prior to June 6, 1865, has already been referred to in previous reports of the Commissioner of Patents. This action is necessary in order to continue the international exchange, and at the same time to meet the demands of the Office and the general public.

REPORTS.

I repeat here the following from Mr. Commissioner Marble's report for the year 1880:

> Through some inadvertence the illustrations of the Patent Office Reports for the year 1870 have not been printed. If printed, the reports of this Office would be complete. It is estimated that these illustrations can now be reproduced by the photolithographic process at a cost of about six thousand dollars. The propriety of having the reports of this Office complete must be apparent to all. I therefore recommend an appropriation of the sum of six thousand dollars to complete this work, the same to be immediately available.

During the year an International Electrical Exposition and Congress of Electricians was held in the Palais de l'Industrie, at Paris, France, under the auspices of the French Government. Mr. Frank L. Freeman, Principal Examiner of the Class of Electricity, was appointed by the honorable Secretary of State as one of the honorary Commissioners of the United States, and was also designated by the Commissioner of Patents, with the approval of the honorable Secretary of the Interior, to represent this Office. A complete set of copies of all United States patents relating to electricity granted prior to July 1, 1881, was compiled and indexed, making sixteen large volumes, and this was sent to the Exposition as the exhibit of this Office. This exhibit attracted much attention, and helped very materially to show the leading position occupied by the inventors of this country in the development of the arts appertaining to the science of electricity. A diplome d'honneur was awarded the Office for this exhibit by the jury of awards.

In concluding this report, I again call attention to the showing made by the tables with which it opens. The large increase in the receipts of the Office argues great activity in the field of invention and continued confidence in the measures taken by our Government to encourage the inventive spirit. There is every reason to believe that the record of the present year will furnish even greater cause for congratulation in both particulars than is afforded by the report which I have the honor now to submit.

Respectfully submitted,

V. D. STOCKBRIDGE,
Acting Commissioner.

WASHINGTON, D. C., *January* 31, 1882.

Statement showing the number of the first patent, design-patent, and reissued patent, and the number of the first certificate of registration of a trade-mark and a label issued in each calendar year since 1843, together with the total number of each issued during the year.

DESIGNS.

12,760 and 12,761.—KNIT FABRIC.—*Scits Condé*, Oswego, N. Y. Applications filed November 7, 1881 Term of patents 7 years.

12,762 to 12,765, inclusive.—KNIT FABRIC.—*Scits Condé*, Oswego, N. Y. Applications filed December 12, 1881. Term of patents 7 years.

12,766.—WATCH-CHAIN.—*William Marckstine*, Irvington, assignor to *William O. Edge*, Newark, N. J. Application filed November 2, 1881. Term of patent 14 years.

12,767.—BLOUSE.—*Nathan J. Schloss*, New York, N. Y. Application filed January 13, 1882. Term of patent 3½ years.

12,768.—HEATING-STOVE.—*George G. Thomas*, Philadelphia, Pa. Application filed January 13, 1882. Term of patent 7 years.

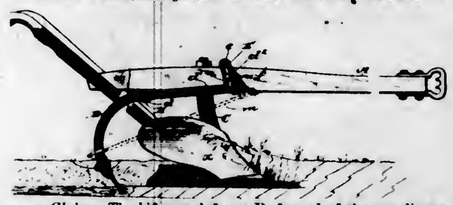
12,769.—CORSET.—*Horace H. Chittenden*, New Haven, Conn., assignor to *Foy, Harmon & Co.*, same place. Application filed January 16, 1882. Term of patent 3½ years.

12,770.—HANDLE FOR SPOONS, FORKS, OR KNIVES.—*Arthur W. Lyman*, Montague, Mass. Application filed December 9, 1881. Term of patent 7 years.

12,771.—LAMP.—*Edward J. Orington*, Brooklyn, N. Y. Application filed January 17, 1882. Term of patent 3½ years.

TRADE-MARKS.

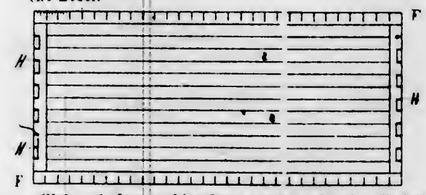
[Certificates of registration of Trade-Marks numbered 8,191 and upward are registered under the act of March 3, 1881.]



9,102.—LEAD-PENCILS.—*The Eagle Pencil Company*, New York, N. Y. Application filed January 17, 1882.

"The word-symbol 'AUTOMATIC.'"

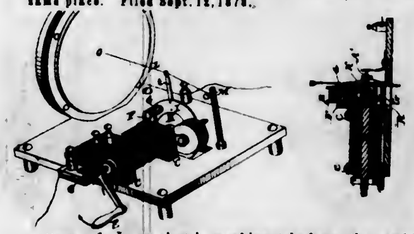
PATENTS



GRANTED FEB. 14, 1882.

253,489. PLOW. JOEL J. ADCOCK, GEORGE J. LUMPKIN, and MILTON WHITE, Subligna, Ga. Filed Nov. 23, 1881. (No model.)

Claim.—The bifurcated frame D, formed of the two diverging arms *d'*, cross-heads E, having slots *e*, and pivoting-bracket H, combined with the beam A, pivotal bolt *d*, adjusting-bolt *f*, and tie-rod *m*, the frame being adapted to be applied to ordinary mold-board plows, as and for the purposes herein set forth.

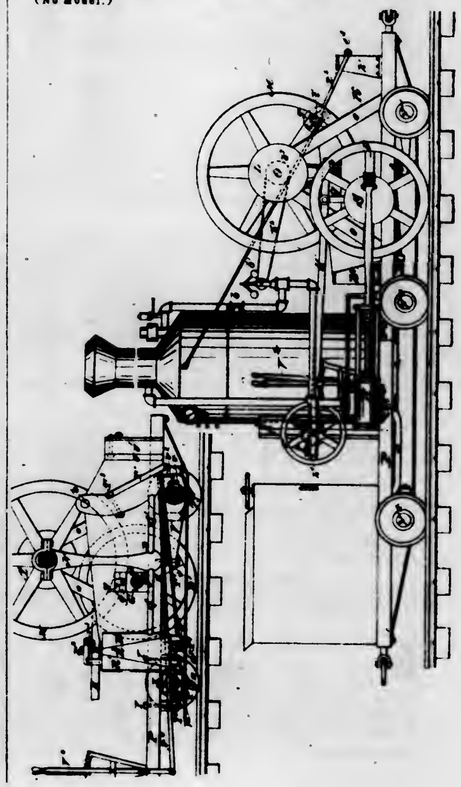


253,490. DEVICE FOR MARKING CLOTH, &c. ALFRED W. ALLEN, Grand Rapids, Mich., assignor to Danford M. Crosby, same place, and John Mann, Chicago, Ill. Filed Apr. 23, 1881. (No model.

Claim.—1. In a marking-frame constructed as described, the frame provided with the series of notches H H H, in combination with the marking-cord *a a*.

2. The frame F F, provided with notches H H, in combination with the cord *a a* and intermediate pins, c c c, when constructed as and for the purpose described.

253,491. TELEPHONE-RECEIVER. GARDNER L. ANDREWS, Boston, Mass., assignor to American Bell Telephone Company, same place. Filed Sept. 12, 1878.



Claim.—1. In an electric speaking-telephone, the combination of a diaphragm, a cord connected therewith, a device for regulating the tension of said cord, and consequently that of the diaphragm, and means for causing vibrations in said diaphragm by variations in the friction between a moving magnetic body and a magnetic body connected with said diaphragm and cord, said friction being varied by the varying magnetic attractions between the surfaces of said magnetic bodies caused by a varying current of electricity, substantially as described.

2. The combination, with a diaphragm, of a ring of magnetic material connected therewith, a revolving core, and a helix arranged as explained, so that the friction between the ring and core is varied by electric currents traversing the helix, substantially as described.

3. The combination of the diaphragm O, the iron ring I, mounted so as to be capable of rotation in a plane perpendicular to the diaphragm, and connected at a point on its circumference to the center of the diaphragm, a revolving core, G, in contact at one extremity with the surface of the iron ring I, and the helix P, surrounding said core G and placed in an electric circuit, substantially as and for the purpose as set forth.

4. The combination of the rotating shaft A, piece F, cylinders G, coil P, disk H, iron ring I, spring K, diaphragm O, and the stretched cord L, connecting the center of the diaphragm to a point on the circumference of the ring I, substantially as and for the purpose as set forth.

253,492. LOCOMOTIVE BALLAST-CRUSHING MACHINE. ANONAMOUS B. AUSTIN, Fort Wayne, Ind. Filed Mar. 1, 1881. (No model.)

Claim.—1. The combination, substantially as described, of the drivers D D', provided with sliding boxes and levers H H, and con-

2. In a barrel-support, the combination of the pivot B, socket c, roller C, casters D and E, and hooks *e* and *f*, substantially as

Claim.—1. In a vapor-burner, the combination of the four-way needle-valve seat D, compound injector C, and burner A, as and for the purpose set forth.

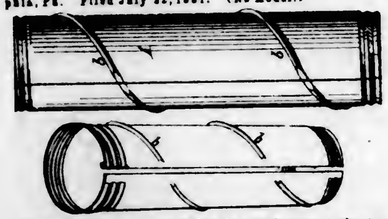
Claim.—The herein-described sportsman's game-ring, constructed from a single piece of wire bent to form a circular ring, A, an eye, *e*, for suspending said ring, an opening, *g*, for the re-

Claim.—1. The combination, substantially as described, of the drivers D D', provided with sliding boxes and levers H H, and connecting mechanism for enabling the power used for propelling the machine to be transferred to the crushing mechanism without any stoppage of the engines, substantially as and for the purposes set forth.

2. In combination with a supporting-vehicle, an engine, and a ballast-crushing mechanism, the friction-pulley L, and the friction-driver D, and connecting mechanism for enabling the driver D to be shifted so as to be brought against the friction-pulley L or the track or ground, substantially as and for the purposes set forth.

3. In combination with a supporting-frame, an engine, a ballast-crushing mechanism, the friction-pulley L, and friction-driver D, and lever V, axle V', toothed wheel V², double pawl c', lever V⁴, and supporting and operating mechanism, substantially as and for the purposes set forth.

4. The hand-wheel I, lever H, pinion I², rack I², and pawl i, in connection with the springs h² h² and pitman g, for operating the sliding box G, as herein described, and for the purposes specified.



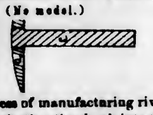
5. The hand-wheel I, lever H, pinion I², rack I², and pawl i, in connection with the springs h² h² and pitman g, for operating the sliding box G, axle S, driving-wheel D, and the friction-pulley L, substantially as and for the purposes specified.

6. The combination of the lever V, toothed wheels V², double pawls c', levers V⁴, and connecting mechanism, as herein described, and for the purposes specified.

7. The combination of the levers V V, toothed wheels v², double pawl c', lever V⁴, pitman N, and pivot and nut connections v³, substantially as and for the purposes specified.

8. The sliding box G, composed of the cross-head g', straps g², boxes g³ g³, key g', and set-screws g⁴ g⁴, and set-screw g⁵, combined and operating as herein described.

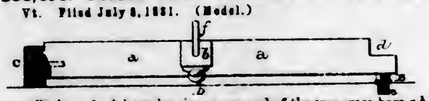
253,493. SHEET-METAL PIPE. WILLIAM AUSTIN, Philadelphia, Pa. Filed July 22, 1881. (No model.)



Claim.—1. As a new article of manufacture, a sheet-metal pipe having its body-sections stiffened by means of a spiral rib formed by pressing up the metal, substantially as shown and described.

2. The improved pipe-section, consisting of a single sheet of metal folded into tubular form, with its edges united longitudinally and having a spiral rib formed thereon, as described and shown.

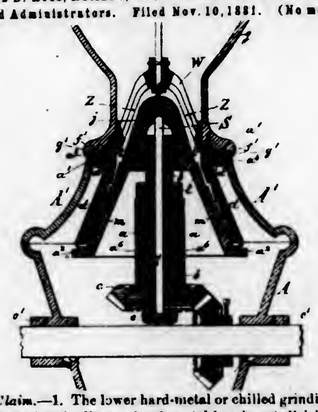
3. A blank for a sheet-metal pipe, consisting of the curved sheet of metal having the oblique ribs *b* raised thereon.



4. The improved pipe-blank, consisting of a curved sheet of metal having one flat and one folded edge, and having also the oblique ribs *b* formed thereon, as described and shown.

253,494. RIVET. ERSKINE L. BABCOCK, Cuyahoga Falls, Ohio. Filed Oct. 6, 1881. (No model.)

Claim.—The process of manufacturing rivets by inserting the end of a short rod constituting the shank into the opening through a common metallic washer and welding the rod and washer together, and forming the latter into a suitable shape for the rivet-head, substantially as described.

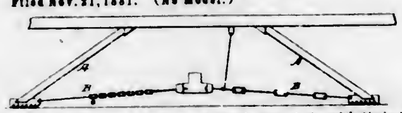


253,495. BARREL-SWING. JUDSON A. BALDWIN, Shelburne, Vt. Filed July 8, 1881. (Model.)

Claim.—1. A barrel-swing composed of the two cross-bars *a b*, in combination with a pivotal support and the rollers C D E, the tread of the roller C being lower than that of the other two, substantially as shown.

2. In a barrel-support, the combination of the pivot B, socket c, roller C, casters D and E, and hooks *e* and *f*, substantially as shown and described.

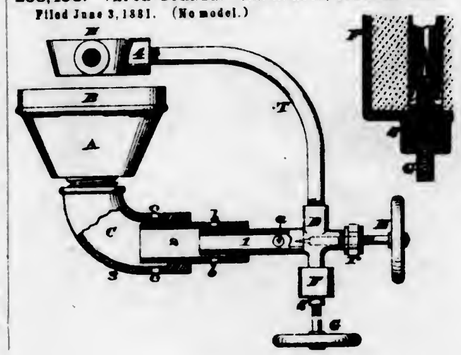
253,496. GRINDING-MILL. ROCKWOOD BARRETT and JAMES G. DUNN, Administrators of THOMAS ROSS, deceased, and CRAWFORD D. ROSS, Rutland, Vt.; said Crawford D. Ross assignor to said Administrators. Filed Nov. 10, 1881. (No model.)



Claim.—1. The lower hard-metal or chilled grinding-cone, m, provided with the lip *o* and soft-metal bearing-shell *j*, in combination with the hollow upright shaft *b*, adjusting-rod *s*, grooved collar *t*, and outer grinding-cone, *d*, substantially as and for the purpose described.

2. The upper or outside stationary grinding-shell, *d*, provided with lips *a'*, coated with soft metal *i*, in combination with the outer case, A', provided with flange a^2 and annular recess a^4, substantially as and for the purpose described.

3. The outer grinding-shell, *d*, provided with lips *a'* and soft metal *i*, in combination with the case A', provided with flange *f'*, and the hopper *g*, provided with annular recess *g'*, substantially as described.

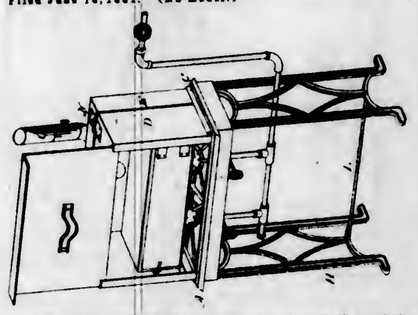


4. The combination of the hollow stationary perforated feed-cone Z, the upper movable and correspondingly-perforated cone, W, hopper *g*, rod *k'*, and grinding-cones *d* and m, substantially as and for the purpose described.

253,497. MACHINE-BRACE. MOSES BEAL, Elyria, Ohio. Filed Nov. 21, 1881. (No model.)

Claim.—The combination of two braces A A, with their top ends inclined toward each other, connected at or near the bottom with the rods B B or other suitable device of suitable strength, and so constructed as to be shortened or lengthened at pleasure, the whole to be constructed and operated in the manner and for the purpose substantially as described.

253,498. VAPOR-BURNER. JOS. E. RUAN, Bond Hill, Ohio. Filed June 3, 1881. (No model.)



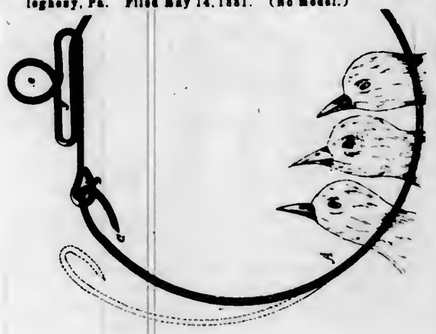
Claim.—1. In a vapor-burner, the combination of the four-way needle-valve seat D, compound injector C, and burner A, as and for the purpose set forth.

2. In a vapor-burner, a lighting-cup filled with an absorbent and combined with and arranged in relation to the oil-pipe in the manner described, so that the gasoline from the needle valve or fount may be made to enter at or near the bottom of the cup, instead of at the top, as and for the purpose set forth.

3. The burner described, consisting of the bowl A, perforated lid B, compound injector C, needle-valve seat D, heating-cup F, needle-valves E and G, pipe T, and retort H, substantially as described, and for the purpose set forth.

253,499. GAS COOK-STOVE. JOS. E. RUAN, Bond Hill, Ohio. Filed June 18, 1881. (No model.)

Claim.—As a combination, the gas-stove described, consisting of the plate A, with its flange C, the hood E D, shield B, band M, hinges N, elbow F, pipe G, damper P, and legs H, substantially as and for the purpose set forth.

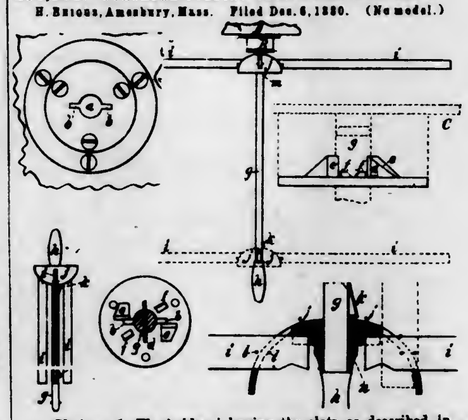


253,500. WRENCH. WILLIAM H. BIELSFELD and DAVID C. BIELSFELD, Moulton, Ohio. Filed Dec. 28, 1881. (Model.)

Claim.—1. In a wrench, the stock A, having laterally-projecting lugs C and transverse pin F, in combination with the jaws D, having recesses G and perforations E, and mechanism for operating said jaws, substantially as set forth.

2. In a wrench, the combination of the stock A, having laterally-projecting lugs C and transverse pin F, the jaws D, having perforations E and recesses G, the thumb-screw I, and the spring K, all arranged and operating substantially as and for the purpose set forth.

253,501. SPORTSMAN'S GAME-RING. EDWARD BOURNE, Allegheny, Pa. Filed May 14, 1881. (No model.)



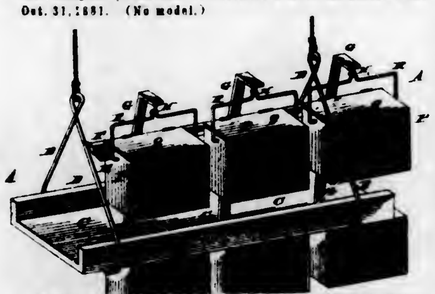
Claim.—The herein-described sportsman's game-ring, constructed from a single piece of wire bent to form a circular ring, A, an eye, *e*, for suspending said ring, an opening, *g*, for the reception of a shoulder-strap, a loop, D, and a pointed end, C, bent to form an open loop or hooked end to engage said loop D, as specified.

253,502. CRADLE AND CRIB COMBINED. CHARLES H. BOUTWELL, Leominster, Mass. Filed June 27, 1881. (No model.)

Claim.—In combination with the bed of a crib or cradle, the levers *b*, the links *a*, the slotted cross-bars *a*, with shoes A' and bolts a^3, the rocking-springs *g*, the rockers C', the bases A, with shoes or tracks a^2, the swivel connecting-rod D, the corresponding connecting-rod with screws *d'*, the treadle E, and treadle-arm E', all constructed and arranged substantially as described and shown, and for the purposes set forth.

253,503. PORTABLE FOLDING CLOTHES-DRIER. GEORGE H. BRIGGS, Amesbury, Mass. Filed Dec. 6, 1880. (No model.)

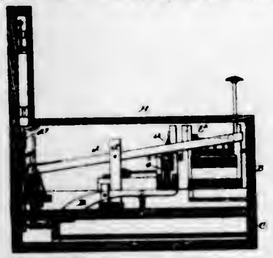
Claim.—1. The holder *j*, having the slots, as described, in combination with the arms *i*, adapted to such slots, and the pins *l l*, arranged in pairs and passing through said arms, one pin of each pair being inside of the holder, the other pin outside of the holder, whereby the arms are held pivotally in the slots between the pins, all substantially as set forth.



2. In a vertically-supported clothes-drier, the combination of plate A, formed with passage *a*, slots *b*, studs *c c*, and the minor studs *f f*, and the supporting-rod *g*, with its locking-pin *d*, substantially as specified.

253,504. SADDLE FOR BICYCLES. FRANKLIN G. BURLEY, Boston, Mass. Filed June 6, 1881. (No model.)

Claim.—The improved bicycle-saddle consisting of the base A, turned up at the front and having a cross-piece, B, at the rear, and having slots *d* through cross-piece B, and a slot, *d'*, at the front and the strap-seat C reeved through the slots, all as set forth.



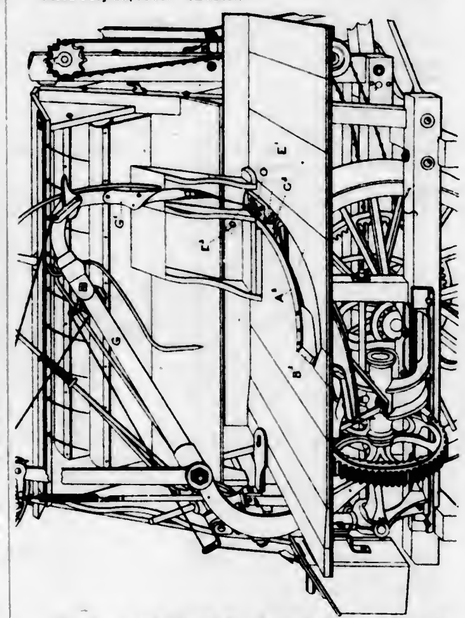
253,505. PROCESS OF AND APPARATUS FOR APPLYING WATERPROOFING MATERIAL. ROBT. M. CAFFALL, St. Louis, Mo., assignor of one-half to Theodore Hunt, same place. Filed Oct. 31, 1881. (No model.)

Claim.—1. The process of treating the walls of buildings with waterproofing and preserving compounds, which consists in first heating the wall, next applying the compound in a fluid and heated state, and, finally, reheating the wall to cause the complete absorption of the compound, substantially as described, for the purpose set forth.

2. The scaffold A, having stirrups B, provided with brackets E, side guards, D, rail F, uprights G, having hooks H, and the hooks I, in combination with the fire-cages I', suspended upon the hooks H I above and below the scaffold, as described, for the purpose set forth.

253,506. CASH-REGISTERING APPARATUS. MICHAEL CAMPBELL, Boston, Mass. Filed Aug. 1, 1881. (No model.)

Claim.—1. In a cash-registering apparatus, a series of keys provided with type designating certain amounts, a strip of paper to be marked by the said type, and a series of toggle-levers, *x*, one for each key, combined with a pawl-carrying bar common to all the said keys, and levers to operate the said strip of paper and move it intermittingly below the type of the said keys, substantially as described.



2. In a cash-registering apparatus, a series of keys to designate certain amounts, a pawl-carrying bar, *c*, and a series of toggle-levers, *x*, intermediate between each key and the said pawl-carrying bar, the toggle-lever *b*, actuated by the bar *c*, combined with the drawer-holder D and drawer C, substantially as described.

3. In a cash-registering apparatus, a series of keys to designate certain amounts, combined with the drawer, the draw-holder D, mediately connected with said keys, and the spring to throw the drawer open when released by the drawer-holder, substantially as described.

4. In a cash-registering apparatus, a series of keys indicating certain amounts, and a series of slides indicating corresponding amounts, combined with bars connected with said keys by cords and pulleys to lift the slides when the keys are depressed, and with a series of hooks and arms to retain the said slides in elevated position until the keys are again lifted, substantially as described.

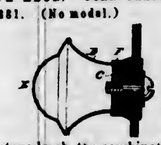
5. The series of keys to correspond with numbers thereon, type carried by the said keys, a pawl-carrying slide common to all the said keys, a ratchet, and strip to be numbered by the said type, combined with a series of numbered slides, and intermediate devices, substantially as described, between the said keys and slides to operate them as the said keys are actuated to impress a figure or number on the said strip.

253,507. GRAIN-BINDER. HENRY J. CASE, Auburn, N. Y. Filed July 23, 1881. (Model.)

Claim.—1. The lifting-bar A', attached at one end to the grain-table, and provided at its outer end with the block B', in combination with the oscillating knotter-arm O', substantially as and for the purpose described.

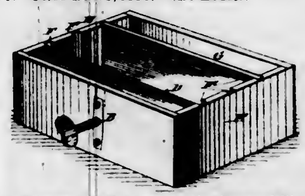
2. The oscillating knotter-arm O', provided with the roller C', in combination with the lifting-bar A', substantially as described.

3. The combination of the binder-table E', the lifting-bar A', and the oscillating knotter-arm O', substantially as and for the purpose described.



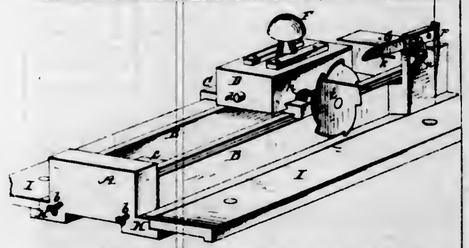
253,508. MOUNTING FOR GLOBES. FLAVIUS CHERRY, Seneca Falls, N. Y. Filed June 21, 1881. (No model.)

Claim.—1. The combination, with the semicircular meridian-bar D, adjustable in channels in the lugs I upon the semicircular bar G, and the semicircular meridian-bar E, hinged as shown, of the globe A, having its axis C journaled in the ends of bar D and supported thereby, as set forth.



2. The combination, with the globe, of the circular horizon-bar F, hinged to the bar G, substantially as specified.

253,509. STOVE-KNOB. JOHN CHESTER, Providence, R. I. Filed Dec. 12, 1881. (No model.)

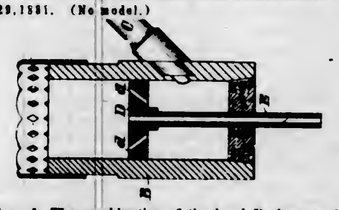


Claim.—In a stove-knob, the combination of the nut C, body-piece D, re-enforcing cap F, and end cap, E, substantially as described.

253,510. STEREOSCOPE-VIEW CASE. ALLEN J. CLARK, Norwich, N. Y. Filed Nov. 1, 1881. (No model.)

Claim.—A box or case for stereoscopic views and like articles, having thumb-screw C, carrying a swiveled follower, D, and partition-plate G, having notches H, said plate being adjustable in grooves F in the sides E, extending from the upper edge nearly to the bottom of the box, as described, for the purpose set forth.

253,511. MILLSTONE-DRESSING MACHINE. WALLACE W. CLEAVELAND, Marshall, Mich. Filed Dec. 15, 1881. (No model.)

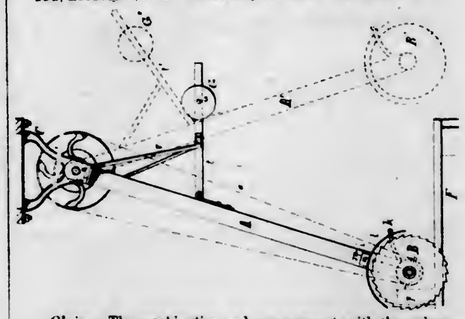


Claim.—1. In a millstone-dressing machine, the frame A and adjustable tracks or ways B, in combination with the bed C, carriage D, screw-rod E, carrying diamond *f*, and handle F, for adjusting the height of the screw-rod, said carriage having suitable spring-buffers, *d*, connected thereto, substantially as and for the purpose set forth.

2. In a millstone-dressing machine, the combination, with the movable bed C, carriage D, screw-rod E, screw-handle F, adjusting-screw *h*, carrying toothed wheel *i*, of the pivoted arm G, carrying pin *k* and set-screw *m*, and the spring *p*, constructed to operate substantially as and for the purpose set forth.

3. In a millstone-dressing machine, the combination, with the frame A, of the removable weights I, substantially as and for the purpose set forth.

253,512. SMOKING-PIPE. JAMES COLE, St. Louis, Mo. Filed Nov. 29, 1881. (No model.)

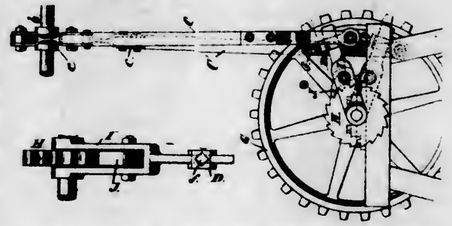


Claim.—1. The combination of the bowl B, the stem C, the movable bottom D, having the perforations *d d d*, and the hollow stem E, substantially as described.

2. The combination of the bowl B, the adjustable perforated band G, and the movable bottom D, substantially as described.

3. A smoking-pipe bowl having an adjustable perforated band, for the purpose described.

253,513. SWING-SAW. JOHN CONNELL and VALENTINE DENOLER, Rochester, N. Y. Filed May 31, 1880. (No model.)



Claim.—The combination and arrangement, with the swing-saw frame A, pivoted vertically over the work-supporting table F on the line of the driving-shaft E, and provided with saw B and belt *a*, of the arm *t*, projecting laterally from the frame and carrying the weight G, operating substantially as and for the purposes set forth.

253,514. DRAWING-SLATE ATTACHMENT. DANL. S. COOKE, Providence, R. I. Filed Nov. 2, 1881. (No model.)

Claim.—The slate A, with its grooved frame B, in combination with the ruler and eraser C and elastic bands D D, the whole combined, constructed, and arranged substantially as described.

253,515. POWER-CONVERTER FOR CONVERTING RECIPROCATING INTO ROTARY MOTION. HENRY CROFT, Jr., Springfield, Ohio, assignor of one-half to Francis M. Bookwalter, same place. Filed Dec. 27, 1881. (No model.)

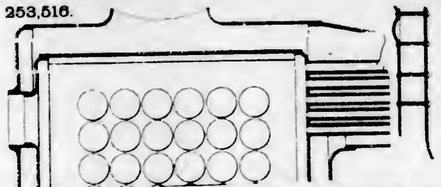
Claim.—1. In a power-converter, the combination, with a driving-wheel whose shaft is provided with ratchets arranged on each side of the driving-wheel, of a vibrating pivoted beam actuated by the reciprocating rod and carrying at its ends beams provided at their lower ends with dogs and connecting mechanism, substantially as described, whereby the vibration of the pivoted beam causes a continuous revolution of the driving-wheel.

2. In a power-converter, the combination, with the ratchets H and the beams C C', of the links I, provided with dogs J, and adjustably connected to the beams by the slotted pivoted blocks D and set-screws *f*, substantially as described.

3. In a power-converter actuated by a reciprocating prime mover, the driving-wheel provided with sprockets or engaging-points for a driving-chain, substantially as described.

253,516. FURNACE-SHEET FOR STEAM-BOILERS. HENRY C. DARBY, Wyandotte, Kans. Filed Jan. 28, 1881. (Model.)

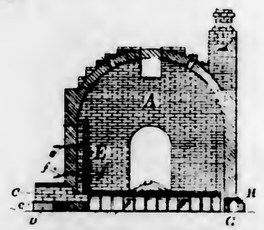
Claim.—A furnace-sheet for fire-boxes, presenting on its anterior surface, or that side facing the water-space, a series of shallow spherical depressions or recesses closely grouped in lines at right angles to each other, and on its posterior surface, or that pre-



253,516.

Claim.—In a combined commode and slop-pail constructed

sides of the car, and the openings *r*, for producing hot-air currents and conducting the same to the inside of the car, substantially in

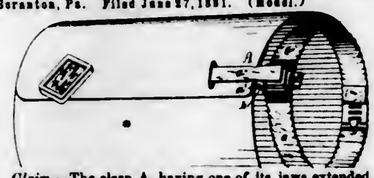


253,522.

253,516.

sented to the furnace, a series of raised or projecting surfaces corresponding to the depressions first mentioned, for the purposes and objects named, and substantially as described.

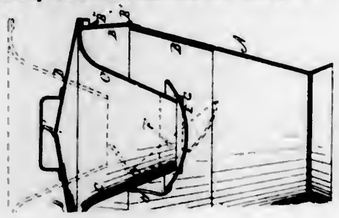
253,517. KILN FOR BURNING ARTICLES MANUFACTURED FROM CLAY. JOHN DAWSON, Colfax, Ind. Filed Jan. 3, 1882. (No model.)



Claim.—1. The combination, in a kiln, of the fire-spaces and two sets of fires, one set of which runs underneath the articles to be burned in the kiln and the other to a point at or near their top, each being capable of being cut off from the fire-space, so that the products of combustion will necessarily pass through the other, whereby both an up and down passage thereof may be secured from the same set of fires, substantially as set forth.

2. The combination, in a kiln, of the fire-spaces C, flues F, having dampers *f*, and flues E, having dampers *e*, all substantially as shown and described, and for the purpose specified.

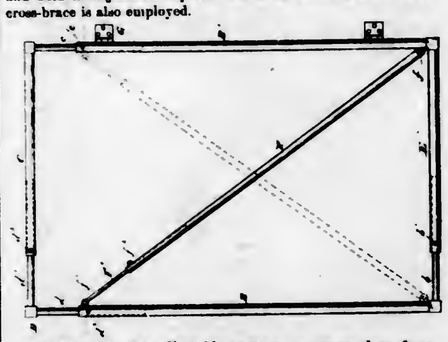
3. The combination of the fire-spaces C, flues F, flue G, and openings H, all substantially as shown and described, and for the purposes specified.



253,518. CUFF HOLDER AND ADJUSTER. HENRY E. DEACON, Scranton, Pa. Filed June 27, 1881. (Model.)

Claim.—The clasp A, having one of its jaws extended rearward, and provided with the bend or shoulder *a'*, and having also the spring *c*, in combination with the socket and the band on which the socket is secured, said band being adapted to pass around the arm of the wearer, and the whole arranged to operate substantially as described.

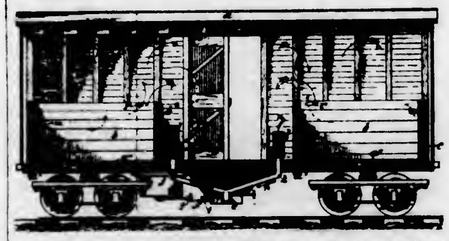
253,519. PORTABLE COMMODE AND SLOP-PAIL COMBINED. J. W. DREW, Boston, Mass. Filed Aug. 17, 1881. (No model.)



Brief.—Upon the upper flange of the vessel A is supported a shell, B, whose upper flange, in its turn, supports a seat, C, which may be covered by a lid, D, whose flange overhangs the side of the vessel. Communication between C and A is regulated by a pan-valve pivoted on a rod, F, secured in brackets G, and which is operated by the insertion and removal of the seat C.

Claim.—In a combined commode and slop-pail constructed as herein described, the shell or casing B, adapted to removably fit within the upper part of the slop-pail A, and provided with the valve E, having arm H, and pivoted by means of the rod F in brackets G, in combination with the removable seat C, substantially as and for the purpose specified.

253,520. ADJUSTABLE VENTILATING-DOOR. JOSIAH S. DU BOIS, Haddonfield, N.J. Filed May 26, 1881. (No model.)



Brief.—Consists of tubes and rods sliding upon one another and held in adjustment by set-screws. A similarly-constructed cross-brace is also employed.

Claim.—1. An adjustable summer or screen door frame adapted to both vertical and horizontal adjustment, in combination with the screen and means to brace said frame, as and for the purpose specified.

2. In an adjustable summer or screen door frame, the combination of side tubes, B B', bottom tube, E, rod *b*, top tube, C, provided with leg *c*, corner-piece D, provided with legs *d d'*, brace-tube F, rod F', and means to secure said parts together, as and for the purpose specified.

253,521. APPARATUS FOR HEATING FREIGHT-CARS. WM. E. EASTMAN, Boston, Mass., assignor to the American Freight Car Heater Company, Portland, Me. Filed Nov. 25, 1881. (No model.)

Claim.—1. In combination with a stove or heater placed under the body of a car, the flues or passages beneath the floor, and the air-spaces at the ends of the car, adapted, as described, to discharge the heated air into the perforated air-spaces at the sides of the car, substantially as shown and described.

2. In combination with a stove or heater placed under the body of the car, and provided with the safety-tube *t*, for the purpose specified, the flues or passages beneath the floor, and the air-spaces at the ends of the car, adapted to discharge the heated air into the air-spaces at the sides of the car, substantially as shown and described.

3. In the stove or heater placed under the body of the car, and provided with the safety-tube *t*, for the purpose specified, the tubes O', passing through the oil-chamber in the heater for the purpose of supplying fresh air and keeping the oil cool.

4. In combination with a stove or heater for burning liquid fuel, supplied automatically by a tank, *j*, said tank operated by atmospheric pressure in the manner set forth, the flues or passages beneath the floor, the closed air-spaces at the ends, and the open air-spaces at the sides of the car, all connected and operating substantially as described.

5. The stove or heater *c*, arranged to form the floor of the hot-air chamber *d*, and the automatic tank *j*, having tubes 3 and 4 and stopper 2, constructed and operating together, as described, in combination with the flues beneath and the air-spaces at the ends and sides of the car, and the openings *r*, for producing hot-air currents and conducting the same to the inside of the car, substantially in the manner and for the purpose described.

6. A heater for burning liquid fuel, attached to a vehicle, and provided with a safety-tube for the overflow of superfluous fuel.

7. The stove or heater so placed under the car that its top surface forms the floor of a hot-air chamber, and provided with tubes O', passing through the oil-chamber in the heater for the purpose of supplying fresh air and keeping the oil cool.

8. The stove or heater so placed beneath the car that its top surface forms the floor of a hot-air chamber, and provided with tubes O', passing through the oil-chamber in the heater for the purpose specified, in combination with the pipes *k*, which supply air to the hot-air chamber from the inside of the car, substantially in the manner described.

9. The heater, in combination with the flues C, registers *l*, and pipes *k*, for effecting complete circulation of air in a car or other vehicle.

10. The stove or heater placed under the car in such a manner that its top surface forms the floor of a hot-air chamber, and provided with tubes O', passing through the oil-chamber in the heater, for the purpose described, in combination with the flues beneath the floor, the air-spaces at the end, and the air-spaces at the sides of the car.

11. The combination of the pipes or return-flues *k* and a stove or heater for burning liquid fuel, placed beneath the body of a car and provided with a safety-tube, *t*, substantially as described.

12. The combination of the pipes or return-flues *k*, a stove or heater placed under the body of a car, and the hot-air flues C, substantially as described.

13. The stove or heater placed under the body of a car in such a manner that its top surface forms the floor of a hot-air chamber, in combination with the hot-air passages or flues beneath the floor of the car, the closed air-spaces at the ends, the open air-spaces at the sides of the car, and the pipes or return-flues *k*, substantially as described.

14. In combination with a stove or heater for burning liquid fuel, supplied automatically by a tank, *j*, said tank operated by atmospheric pressure in the manner set forth, the flues or passages beneath the floor, the closed air-spaces at the ends, the open air-spaces at the sides of the car, and the pipes or return-flues *k*, all connected and operating in the manner described.

15. The combination of the stove or heater provided with the tubes O', which pass through the oil in the heater for the purposes described, the hot-air passages or flues beneath the floor of the car, and the closed air-spaces at the ends, adapted to discharge the hot air into the open air-spaces at the sides of the car, for the purpose described.

16. The combination of the stove or heater provided with the tubes O', which pass through the oil in the heater for the purposes described, the hot-air passages or flues beneath the floor of the car, the closed air-spaces at the ends, adapted to discharge the hot air into the open air-spaces at the sides of the car, and the pipes or return-flues *k*, all operating in the manner and for the purpose described.

17. The combination of the stove or heater provided with the tubes O', which pass through the oil in the heater for the purposes described, and also provided with the safety-tube *t*, for the purpose specified, the hot-air passages or flues beneath the floor, the closed air-spaces at the ends, and the open air-spaces at the sides of the car, for the purpose specified.

18. The combination of the stove or heater provided with the tubes O', which pass through the oil in the heater for the purposes described, and also provided with the safety-tube *t* for the purpose specified, the hot-air passages or flues beneath the floor, the closed air-spaces at the ends, the open air-spaces at the sides of the car, and the pipes or return-flues *k*, all operating substantially as described, and for the purposes specified.

19. The stove or heater for burning liquid fuel, placed beneath the body of a car in such a manner that its top surface forms the floor of a hot-air chamber, and provided with the safety-tube *t*, for the purpose specified, in combination with the hot-air passages or flues beneath the floor, the closed air-spaces at the ends, the open air-spaces at the sides of the car, and the pipes or return-flues *k*, substantially as described, and for the purpose specified.

20. In combination with the stove or heater for burning liquid fuel, supplied automatically by a tank, *j*, said tank operated by atmospheric pressure in the manner set forth, and furnished with the safety-tube *t*, for the purpose specified, the hot-air passages or flues beneath the floor, the closed air-spaces at the ends, and the open air-spaces at the sides of the car, for the purposes specified.

253,522. CURRY-COMB. O. CALVERT ESBATES, Baltimore, Md. Filed Nov. 22, 1881. (No model.)

253,522.

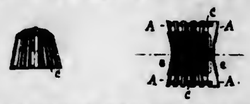
Claim.—1. A curry-comb having a slotted plate, through which the teeth project, adjustable so as to expose the teeth to any desired extent, and mechanism for rigidly securing the said plate in any position to which it may be brought, as set forth.

2. In combination with the top plate and teeth, the slotted movable lower plate and actuating-screw, as set forth.

253,523. BORING-BAR. LUTHER R. FAUCHT, Philadelphia, Pa. Filed Sept. 15, 1881. (No model.)

Claim.—1. The combination, substantially as set forth, of a transversely-slotted boring-bar, a tool or cutter fitting in the slot of the bar and bearing against one end of said slot, a gib having a segmental face bearing centrally against the opposite end of the slot, and a clamping-key interposed between the cutter and gib.

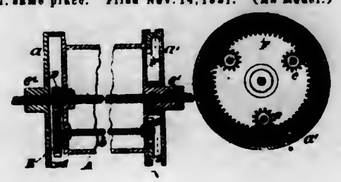
2. The combination, substantially as set forth, of a boring-bar having one or more pairs of transverse slots, the slots of each pair being at right angles one to the other, a cutter fitting in one of said slots, a cutter fitting in the corresponding slot at right angles thereto and held in position by a clamping-key, and a yielding or elastic pad or cushion interposed centrally between the two cutters and transmitting the thrust of the clamping-key to the cutter first specified.



3. The combination, substantially as set forth, of a longitudinally-grooved and transversely-slotted boring-bar, a removable sectional cutter-head secured upon said bar, and one or more facing-cutters secured in said cutter-head.

4. The combination, substantially as set forth, of two blocks or sections adapted to be clamped together upon a boring-bar, two tool-holders, each fitted in a slide in one of the blocks and carrying a facing-cutter, and two feed-screws of respectively reversed lead, each mounted in one of the blocks and engaging a female screw on the tool-holder therein.

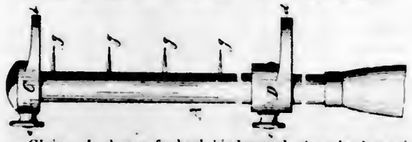
5. The combination, substantially as set forth, of a longitudinally-grooved boring-bar, a two-part facing cutter-head, two clamping-bolts uniting the sections of the head, and a key fitting in the groove of the bar and in a recess of the head.



6. Jointly with a sectional cutter-head, a segmental sleeve or bushing fitting within the recesses of the sections on each side of a key fitting between said sections, substantially as and for the purpose set forth.

253,524. PROCESS OF MANUFACTURING GEM-SETTINGS. JAMES R. PEMBLEY, Providence, R.I. Filed Sept. 29, 1881. (No model.)

Claim.—The improved method of constructing gem-settings herein described, consisting in cutting a series of blank prongs, A, shouldered and recessed, as shown, and them in assembling and temporarily binding said blanks A upon a grooved hub, B, and then soldering the ring C within the series of blanks A, and finally cutting said blanks to form gem-settings, substantially as specified.

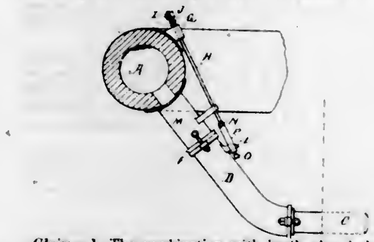


253,525. HOISTING AND WINDING DRUM. PRENDRICK A. GARDNER, Buffalo, N.Y., assignor to himself and R. Dunbar & Son, same place. Filed Nov. 14, 1881. (No model.)

Claim.—1. In a hoisting or winding drum, the hollow head *a*, having the gearing D and E, in combination with the shafts *b*, winding-drum A, and hollow head *a'* at the opposite end, having the gearing *c* F and their operating mechanism, substantially as and for the purposes specified.

2. A winding or hoisting drum composed of the parts *a* A *a'*, and provided with the driving-shaft, pulley, and gearing, substantially as specified, in combination with a brake, I, and its connecting and operating parts, substantially as described.

253,526. GAGE FOR BOOK-BINDERS AND OTHERS. JOHN J. ORIGER, Chicago, Ill. Filed Nov. 1, 1881. (No model.)



Claim.—1. A gage for book-binders and others, having points that are held between the coils of a spring and are guided in a slotted tube, so as to be moved proportionally with the expansion of said spring, substantially as set forth.

2. The combination, with a gage consisting of the slotted tube A, head-piece C, and adjustable sleeve D, of a coiled spring, F, inserted in said tube and connected to the head-piece and sleeve, and of cylindrical plugs G, inserted in such spring, and having points *g*, that project from between the coils of the spring and through the slot of the tube, all substantially as described and shown.

3. The combination, with the slotted tube A, having handle B, removable head-piece C, with gaging-arm *b*, and adjustable sleeve D, with gaging-arm *d*, of coiled spring F and plugs G, with points *g*, the whole being constructed and arranged substantially as and for the purpose described and shown.

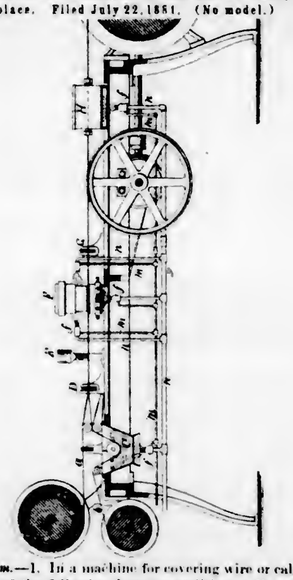
253,527. TUYERE FOR FURNACES. FREDERICK W. GORDON, Pittsburg, Pa. Filed Aug. 8, 1881. (No model.)

Claim.—1. The combination, with bustle-pipe A, belly-pipe D, joint F, and tuyere-pipe C, of the rod H, attached to the bustle-pipe and belly-pipe, substantially as and for the purpose set forth.

2. The combination, with bustle-pipe A, belly-pipe D, joint F, and tuyere-pipe C, of the rod H and spring J, substantially as and for the purpose set forth.

3. The combination, with bustle-pipe A, belly-pipe D, joint F, and tuyere-pipe C, of the tension-rod H, having flexible joint N, substantially as and for the purpose set forth.

4. The combination, with bustle-pipe A, ball-joints F and E, and tuyere-pipe C, of the belly-pipe D, arranged at an inclination, and the rod H or equivalent device for maintaining the parts in position, substantially as and for the purpose set forth.

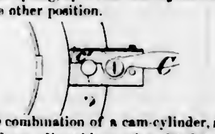


5. The combination, with a bustle-pipe, of a blow-pipe projecting downward and inward from the bustle-pipe toward the furnace, and sustained by its attachments to the bustle-pipe, independent of the furnace, substantially as and for the purpose set forth.

253,528. SAIL-HANK. TIMOTHY HAGGERTY, Fall River, Mass. Filed Dec. 17, 1881. (No model.)

Claim.—The improved sail-hank herein described, consisting of a clutch, B, having a ring, D, to confine the bolt-rope E of a sail, and formed with a bifurcation on each side, whereon are mounted friction-rollers C C C C, to run in the external vertical ways, *a a*, upon the opposite sides of a mast, substantially as specified.

253,529. MACHINE FOR COVERING ELECTRICAL CONDUCTING-WIRES WITH METALLIC ARMOR. WILLIAM HALKYARD, Providence, R. I., assignor of one-half to Henry A. Church, same place. Filed July 22, 1881. (No model.)

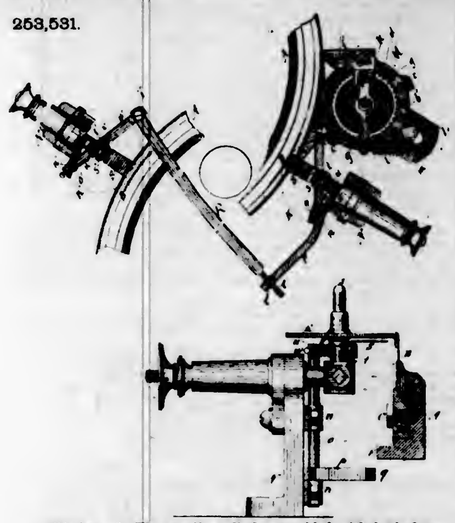


Claim.—1. In a machine for covering wire or cable, the combination of the following instrumentalities: a die constructed to form the strip of sheet metal around the wire or cable so as to lap over at the edges, a device for soldering or brazing the wire, and a drum or barrel to receive the wire, as described.

2. The combination, with the wire-drum A and sheet-metal strip *b*, of the tinning-vessel C', the die D, the flux-supply E, the soldering-block F, the die G, and means for drawing the wire through the machine and guiding the same so as to cover the wire by a sheet of metal which is lapped and soldered longitudinally, as described.

253,530. KNITTING-MACHINE. HOWARD W. HARLEY, Philadelphia, Pa. Filed Nov. 4, 1881. (No model.)

Brief.—The invention is designed to knit either plain or tuck work, as desired. The cam is composed of a fixed section and an adjustable section fitted to slide in a guide therein. A stem fitted to move longitudinally in bearings attached to the cylinder is connected to the adjustable portion of the cam, and a spring is secured around said stem, by which it is moved in one direction, holding the adjustable portion of the cam in one position. A latch or locking-plate is pivoted to one of the bearings of the stem, and is adapted to lock or hold said stem in its depressed position against the tendency of the spring, by which the adjustable portion of the cam is held in the other position.



Claim.—The combination of a cam-cylinder, a cam having a fixed portion and an adjustable portion fitted to slide thereon, bearings connected to the exterior of the cam-cylinder, a stem fitted to move longitudinally in said bearings and connected to the adjustable portion of the cam, a spring adapted to move said stem longitudinally in its bearings, and a locking-plate by which said stem is secured in position, these members being combined for joint operation substantially as and for the purpose set forth.

253,531. CIRCULAR-KNITTING MACHINE. PETER I. HARVEY, Amsterdam, N. Y., assignor of one-half to Augustus Clark and Perry Kline, same place. Filed July 26, 1881. (Model.)

Brief.—An auxiliary plain presser is arranged underneath and close to the common figured presser, and operated to engage and press down the barbs of the needles at intervals, by which alternate circumferential strips of plain and figured fabric are knitted. A single-pattern mechanism is made to operate the pressers in two heads of the machine.

253,531.

Claim.—1. The needle-cylinder provided with barbed needles and cam E, combined with a feed-stand containing a loop or sinker burr, thread-guide, and presser G, a stand, N, provided with a figured circular presser, an auxiliary plain presser, rock-shaft *o*, arm *w*, spring *r*, lever *p*, and a cam ratchet-wheel consisting of a grooved disk having secured therein the cam *c*, ratchet-wheel *d*, spring *l*, pawl *m*, lever *f'*, and stand L.

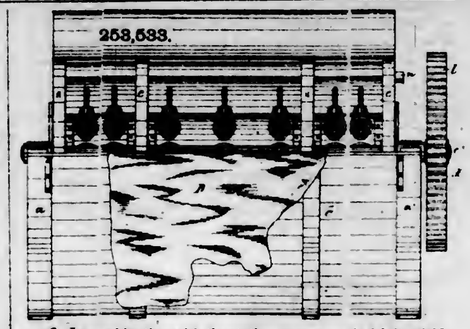
2. The combination of the needle-cylinder having barbed needles and cam E attached thereto with loop or sinker burrs H, thread-guides I, and pressers G at the quarters or headings containing the figured and auxiliary plain pressers, and the stands N and N', having attached thereto the rock-shafts *o o'*, arms *w w'*, springs *r r'*, rods *u u'*, figured pressers K K', auxiliary pressers S S', connecting-rod R, and the cam ratchet-wheel M, constructed as described.

3. The combination of the cam ratchet-wheel, constructed as described, with the needle-cylinder provided with needles and a cam, E, attached, a series of feed-stands F F F F, containing loop or sinker burrs, thread-guides, and pressers, a series of presser-stands provided with plain and figured pressers S S' and K K', rock-shafts *o o'*, arms *w w'*, rods *u u'*, springs *r r'*, levers *p p'*, rod R, and a series of presser-stands containing plain circular loop-pressers J J, as specified.

253,532. CHECK-LINE GUIDE FOR CORN-PLANTERS. GEO. D. HAWORTH, Decatur, Ill. Filed Oct. 31, 1881. (No model.)

Claim.—1. In a check-line guide for corn-planters, the swiveling and jointed pulley-holder provided with pulleys arranged in pairs, substantially as described.

2. A check-line guide for corn-planters, composed of the jointed bar B and B' and the pulleys *a a' b b' c c'*, arranged in pairs, substantially as and for the purpose described.



3. The combination, with the main frame bar of a check-row attachment to corn-planters, of the jointed and swiveling pulley-holder, with its guide-pulleys arranged and operating substantially as described.

4. The jointed and swiveling pulley-holder provided with guide-pulleys, and constituting the check-line guide, in combination with stops limiting the throw of the parts of the holder, substantially as described.

253,533. LEATHER BOARDING AND GRAINING MACHINE. JNO. H. HOVEY, Woburn, Mass. Filed Dec. 5, 1881. (No model.)

Claim.—1. In a boarding or graining machine, the stationary concave bed *b*, having an elastic or yielding inner surface, *b''*, and the reciprocating worker composed of frame *e e' e''*, with outer yielding surface, *e⁴*, and a holding device, *d d'*, for securing the leather to one end of the worker, as and for the purpose set forth.

253,533.

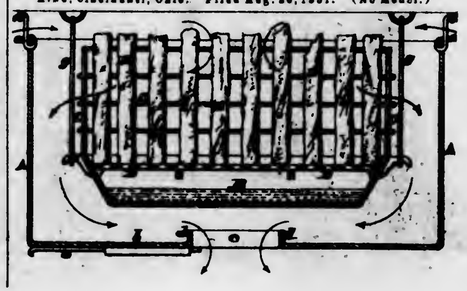
2. In combination with the stationary concave bed *b*, its yielding surface *b''*, and reciprocating worker *e e' e''' e⁴*, and holding device *d d'*, the rotary brush or roll *g*, arranged on the frame *e e* in advance of the holding device, as and for the purpose set forth.

3. In a graining or boarding machine, as described, the holding device consisting of the grooved bar *d*, movable bar *d'*, attached to levers *d'' d'''*, movable on fulcra *d''''*, and provided in their outer ends each with a hinged foot, *d⁵*, and spring *d⁶*, in combination with the dog *e* and the locking and releasing lever *f*, and connecting mechanism to the sliding rod *f'*, as and for the purpose described.

4. In a graining or boarding machine, a reciprocating worker, *e e''*, having adjustable outer surface, *e''' e⁴*, and a positive pressure device for regulating the pressure on the leather that is operated upon, as set forth.

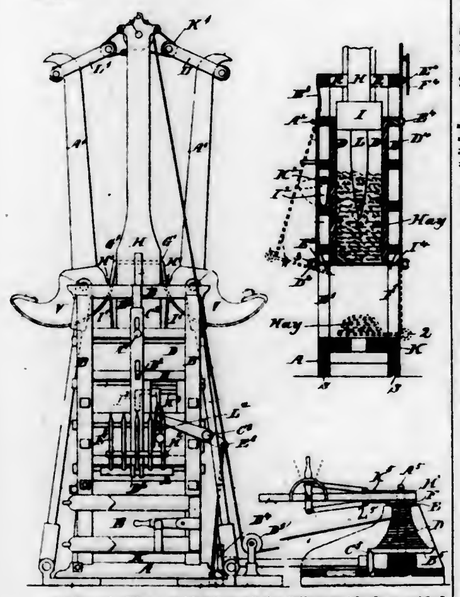
5. A graining and boarding machine consisting of a stationary concave bed, *b b' b''*, reciprocating worker *e e' e''' e⁴*, a holding device for securing one end of the side of leather, and an automatic reversing device, as and for the purpose set forth.

253,534. FASTENER FOR MEETING-RAILS OF SASHES. JOHN E. HOWARD, Reading, Mass. Filed Dec. 23, 1881. (No model.)



Brief.—The spring engages a notch on the bolt, the said bolt being provided with a bevel on its under side to allow of the disengagement of the spring when operated by the key. The parts are contained in a slotted case and the bolt operated by a finger-piece projecting through the slot.

Claim.—1. The herein-described improved window-fastener, consisting of the case C and screw or pin C', the case D, provided with the pivot E and opening P, and having the spring-catch H secured to it at the point *h*, and the bolt F, provided with the bevel K and notch I, all arranged and constructed substantially as and for the purpose set forth.

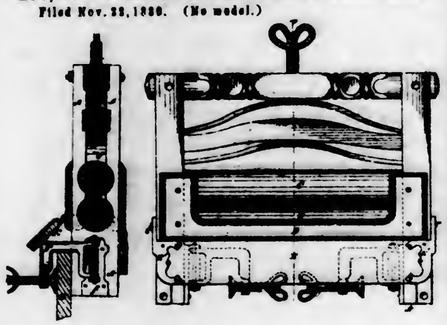


2. The combination of the case D, provided with the spring-catch H, secured thereto as shown, with the bolt F, provided with the bevel K and notch I, substantially as and for the purpose described.

253,535. DEVICE FOR COOLING DWELLINGS. JOHN A. B. KING, Cincinnati, Ohio. Filed Aug. 20, 1881. (No model.)

Claim.—The combination of the ice-rack C, suspended from the ceiling by the links *g g*, and open for the free circulation of air around the ice contained in it, and having the grated bottom D and drip-pan B, with the outer case, A, also suspended from the ceiling by the hooks *a a*, and inclosing the sides and bottom of the ice-rack, so as to leave an air-space between the two, and having the valve *e* at its bottom for controlling the size of its cold-air-exit opening *c*, the whole constructed and arranged for operation substantially as described.

253,586. HAY-PRESS. PETER LORD, Montreal, Quebec, Canada, assignor of two-thirds to Rosebe Mignault and Jean Baptiste Vinet, both of same place. Filed Oct. 26, 1881. (No model.)

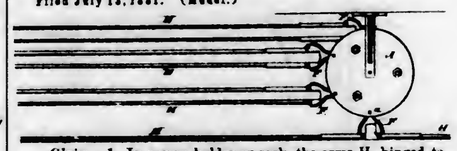


Claim.—1. The combination of the follower-block provided with an operating device by which said follower-block is moved, as described, and having pin L, with bed-block K, provided with an opening, as shown and described, and inclosing-casing and doors, the whole constructed and arranged substantially as described, for the purposes set forth.

2. The combination of the rakes E' I' and their operating mechanism, substantially as described, with casing D and follower-block I, substantially as set forth.

3. The combination of the ram H, provided with the follower-block I, cables G' I', segments of eccentrics V, levers A', line and pulleys and blocks, as described, bed-block K, casing, and doors, the whole constructed and arranged substantially as and for the purposes set forth.

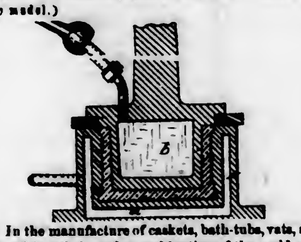
253,587. CLOTHES-WRINGER. MELVIN N. LOVELL, Erie, Pa. Filed Nov. 22, 1880. (No model.)



Claim.—1. A clothes-wringer having an apron pivoted to swing below the guide-board, in combination with clamp-arms located and arranged as shown, whereby they can swing laterally and automatically lift said apron and support it in an inclined position when the clamp-arms are in position for clamping, in the manner described.

2. A clothes-wringer having a gravity clothes-board, in combination with a clothes-guide located above the board, said board being pivoted above and to the rear of the lower edge of said guide, substantially as described, so that when the board has been raised into position for use its inner edge will be above the lower edge of the guide, for the purposes mentioned.

3. In a clothes-wringer having two semi-elliptical springs, the combination therewith of an intermediate movable bar having its upper and lower faces formed to conform to said springs when they are compressed to a certain degree of tension, substantially as and for the purposes described.



253,588. MAP-RACK. GEORGE A. MCLAWS, Chicago, Ill. Filed July 13, 1881. (Model.)

Claim.—1. In a map holder or rack, the arms H, hinged to a support, F, that is in turn hinged to its supports, whereby a double joint is provided, by means of which a map can be opened to view or folded over vertically at or near the middle and turned around to one side, substantially as specified.

2. The hinged arms H, in combination with the hinged irons F and rotating disks A B, substantially as and for the purpose specified.

253,589. MANUFACTURE OF GLASS COFFINS, BATH-TUBS, &c. CHRISTOPHER W. MCLEAN, New Berne, N. C. Filed Oct. 4, 1881. (No model.)

Claim.—1. In the manufacture of caskets, bath-tubs, vats, and other analogous articles of glass, the combination of the mold provided with a heating-chamber, with the plunger provided with a heating-chamber, whereby the glass is prevented from chilling in the mold and the article annealed or toughened while in said mold.

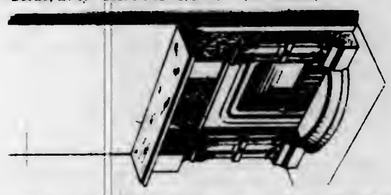
2. As a new article of manufacture, bath-tubs, caskets, vats, and other analogous articles of glass annealed or toughened throughout their entire structure, as set forth.

253,590. MANUFACTURE OF GLASS FITTINGS AND TRIMMINGS OF BUILDINGS. CHRISTOPHER W. MCLEAN, New Berne, N. C. Filed Oct. 4, 1881. (No model.)

Claim.—1. The method herein described of molding the interior trimmings, &c., of buildings—as sections of wainscoting, window seats or caps, stairs, door-frames, &c.—by pressing, annealing, and hardening them in molds having the base provided with a heating-chamber, and the plunger also provided with a heating-chamber, substantially as set forth.

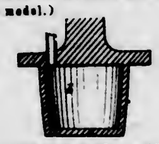
2. The interior fittings, decorations, or linings of buildings, made of glass, annealed through the entire structure, substantially as specified.

3. An interior finishing part of a building—as a section of wainscoting, a window seat or cap, a stair, a door-frame, or the like—constructed integrally or in sections of glass, and adapted to be held in position without the use of bands or stiles made of metal or wood, said stiles or bands to be made of glass or analogous material, substantially as specified.



253,541. MANUFACTURE OF ANNEALED AND TOUGHENED GLASS SLABS. CHRISTOPHER W. MCLEAN, New Berne, N. C. Filed Oct. 13, 1881. (No model.)

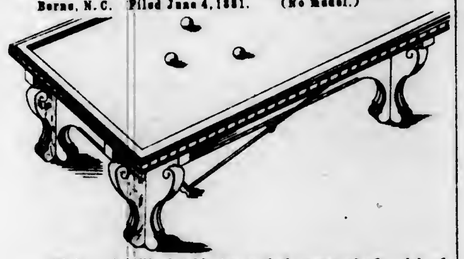
Claim.—1. As a new article of manufacture, a glass furniture-top slab possessing the properties hereinbefore set forth.



2. The method of tempering and toughening glass furniture-top slabs, which consists in subjecting the same to annealing or tempering heat in the mold in which they are formed and during the molding operation, substantially as hereinbefore set forth.

253,542. GLASS MANTEL. CHRISTOPHER W. MCLEAN, New Berne, N. C. Filed June 4, 1881. (No model.)

Claim.—A mantel composed entirely of glass molded to form, either as a whole or in parts, substantially as described.

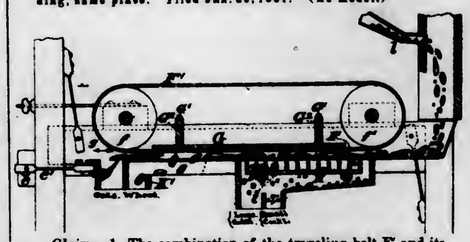


253,543. MANUFACTURE OF CASKS, BARRELS, &c., OF GLASS. CHRISTOPHER W. MCLEAN, New Berne, N. C. Filed Oct. 4, 1881. (No model.)

Claim.—1. The combination of a mold having a heating-chamber with a plunger, also provided with a heating-chamber, for the manufacture of casks, barrels, &c., and for the purpose of annealing them through the entire structure, substantially as specified.

2. A cask, barrel, or analogous article made of glass and annealed through its entire structure, and provided with strengthening and protecting hoops or surfaces, substantially as specified.

253,544. BILLIARD-TABLE. CHRISTOPHER W. MCLEAN, New Berne, N. C. Filed June 4, 1881. (No model.)

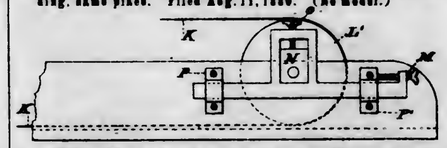


Claim.—A billiard-table top or bed composed of a slab of glass cast in one piece, as set forth.

253,545. GLASS COFFIN. CHRISTOPHER W. MCLEAN, New Berne, N. C. Filed Oct. 4, 1881. (No model.)

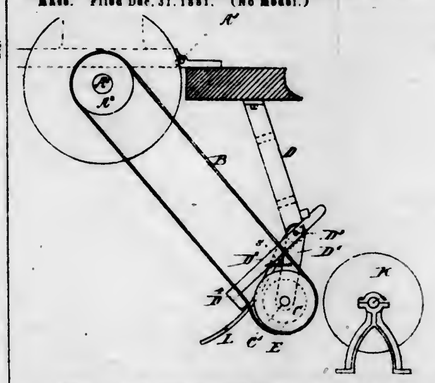
Claim.—The combination, in a glass coffin or casket, of the handle-supporting posts or stanchions D, provided with the tenon *d*, with the lid B, strip C, ledge *f*, and bolts *b* and *g*, as set forth.

253,546. SEPARATOR FOR GRAIN. CHARLES E. MCNEAL, Silver Creek, N. Y., assignor to himself and Albert H. Spaulding, same place. Filed Jan. 20, 1881. (No model.)



Claim.—1. The combination of the traveling belt F' and its supports *f f'* with a screen, E, a plate or rack, H, and means for vibrating the screen between the belt and rack, for the purposes described.

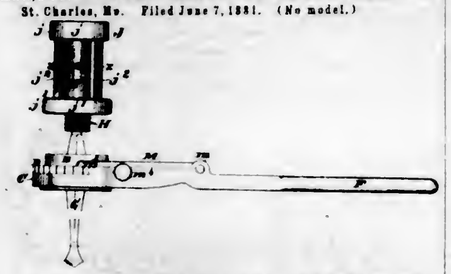
2. The traveling belt F', adjustable plate or rack G, the bars G', and the bolts or screws G', in combination with the vibrating screen and a stationary rack, H, arranged below it.



3. The combination of the vibrating screen and a rack arranged below it having a series of transverse bars, *i*, and a series of thin longitudinal strips, *i'*, for the support of and for limiting the distance between the transverse bars *i* and the screen, as and for the purpose specified.

253,547. SEPARATOR FOR GRAIN, &c. CHARLES E. MCNEAL, Silver Creek, N. Y., assignor to himself and Albert H. Spaulding, same place. Filed Aug. 11, 1880. (No model.)

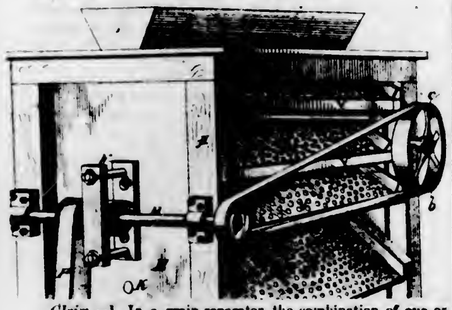
Claim.—The combination of a grain-screen, H, and a movable endless belt, K, on rollers L L, arranged in boxes N in a frame supported by the caps P' P', and provided with the adjusting-screws O M, whereby the belt and its supporting-rollers may receive both a horizontal and vertical adjustment, substantially as and for the purposes described.



253,548. BELT ATTACHMENT. BENJAMIN MERRITT, Newton, Mass. Filed Dec. 31, 1881. (No model.)

Claim.—1. The combination of the pulley A' and belt B with the pulley C, swinging counter-shaft C', friction-pulley K, jointed housing D' D' D, and foot-lever L, all operating together in conjunction with the friction-pulley K, substantially as described, and for the purpose set forth.

2. The combination of the brake D' D' with the belt B, pulley C, counter-shaft C', and jointed housing D' D' D, all operating together substantially as described, and for the purpose set forth.



253,549. COMBINED WRENCH AND DRILL. JOHN A. MILLER, St. Charles, Mo. Filed June 7, 1881. (No model.)

Claim.—1. The combination of the wrench B, drill G, screw H, and holder J, having the heads *j j'*, bars *j*², pin K, and perforated nut I, said holder and screw being detachable from the drill and wrench, substantially as described.

2. The combination of the handle F, plate M, having the perforated tongue *m*', the recess *m*², and arms *m' m'*, the pawl E, having the projection *e*, the screw *m*³, the holder C, wrench B, and ratchet C, substantially as described.

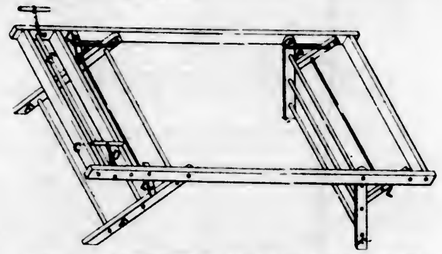
253,550. GRAIN-SEPARATOR. LYMAN MORGAN, Port Washington, Wis. Filed Dec. 8, 1881. (No model.)

Claim.—1. In a grain-separator, the combination of one or more sets of screens, W, W'', &c., with the automatic tilting indented table W', arranged to catch the smaller impurities and detain and empty them automatically during the movement of the machine, and mechanism suitable for operating the same, substantially as and for the purposes set forth.

2. In a grain-separator, the combination of the two tilting indented tables W' W' and the vibrating tongue X, serving to direct the stream of grain over each alternately, substantially as and for the purposes set forth.

3. The combination of the intermittent gear E, spur-gears G G', eccentrics H H', links J J', and arm I, tongue X, and links e e, substantially as and for the purposes set forth.

4. The combination of shaft S, worm R, worm-wheel T, intermittent gear E, spur-gears G and G', eccentrics H and H', connecting-rods e e, arm I, links J and J', tilting indented tables W' W', and tongue X, substantially as and for the purposes set forth.



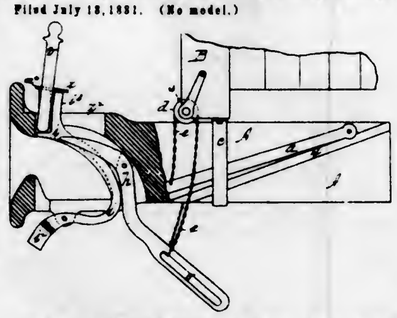
253,551. WASH-BASIN. FRED. A. PALMER, Westmoreland, S. C. Filed Mar. 23, 1879. Renewed July 2, 1881. (Model.)

Claim.—1. The one-piece Delft or crockery ware basin with its overflow C, strainer J, trap B and G, and coupling-sockets F H, constructed substantially as and for the purpose described.

2. The combination of the ring *a* and plug *b* with the basin provided with the trap B and socket F, having slots at S, substantially as and for the purpose described.

253,552. COT-BED. ISAAC S. PEAR, Cambridge, Mass. Filed Dec. 31, 1881. (No model.)

Claim.—1. The combination, with the side rails of a cot-bed having pivoted incline legs and braces, of a connecting rod or bar pivoted to said legs and braces near their upper ends, as and for the purposes set forth.



2. The combination, with the side rails of a cot-bed, of the head-rest supports, pivoted at their lower ends to the inner faces of the said rails and pivoted at their upper ends to the head-bars sustaining the flexible head-rest, all being constructed and arranged for operation substantially in the manner shown and described, as and for the purposes set forth.

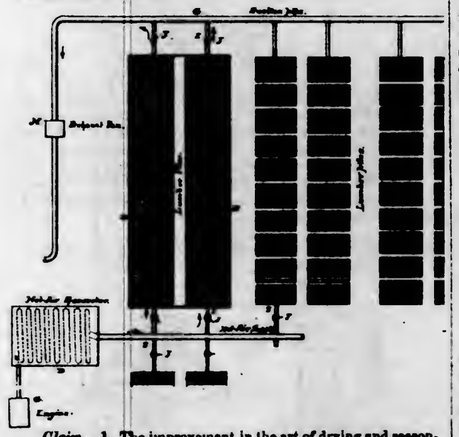
253,553. DRIVING-REIN. ADAMS T. PRINCE, Dover, N. H. Filed Dec. 9, 1881. (No model.)

Claim.—A driving-rein made as herein described, having the stiffening substance applied to that part grasped by the hand in driving at intervals, as set forth, held in position by stitching, the said stiffening material being covered by and confined within the material comprising the rein, as set forth.

253,554. CAR-COUPLING. DANIEL P. PRESCOTT, Vernon, Vt. Filed July 18, 1881. (No model.)

Claim.—1. The combination, with the draw-bar A, of the link-lever A, pivoted in said draw-bar and having the transverse slot *o* therein, the chain *c*, and the shaft *d*, substantially as set forth.

2. In combination, the draw-bar A, the pin-latch *i*, having the counter-weight *i*³ and the arm *i*² thereon, the pin-lifter *a*, having the arm *z* and appliances, substantially as described, for raising up said pin-lifter, substantially as set forth.

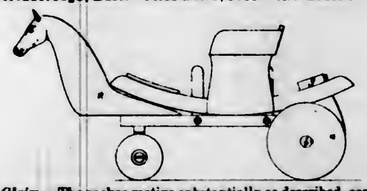


253,555. DEVICE FOR JOINTING SAWS. EDWARD PRESTON, Winona, Minn. Filed Oct. 1, 1881. (Model.)

Claim.—1. The combination, with the file-holder, of the inclined files, supported by pivoted adjustable bearings, and the intermediate file, arranged to be adjusted vertically between the inclined files, substantially as described.

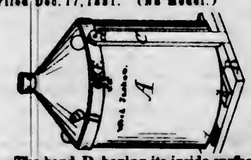
2. The combination, with the file-holder A, having spring-jaws for embracing the saw-blade, of the inclined file-plates B, secured in brackets that are pivoted to set-screws passing through the sides of the holder, the intermediate file-plate, supported between the inclined file-plates by set-screws, and the springs, arranged to act against the inclined file-plates, substantially as described.

253,556. PROCESS OF AND APPARATUS FOR DRYING LUMBER. JAMES RANDALL, San Francisco, Cal. Filed May 25, 1881. (No model.)



Claim.—1. The improvement in the art of drying and seasoning lumber, consisting in erecting a temporary cover or housing over the lumber after it is piled and passing a current of heated air through the lumber, substantially as above described.

2. The improvement in mill and lumber yards, consisting in laying permanent pipes E G between the piles of lumber, each of which pipes is provided with branch tubes I, extending toward the ends of the piles of lumber, and then connecting one of the pipes with a hot-air generator or heater and the other with a fan-blower, H, substantially as and for the purpose described.

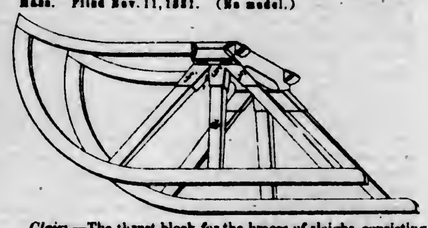


3. In the construction of piles of lumber in yards, the combination of the timbers built or placed at intervals in the piles, a clamping device, and a temporary cover, substantially as described.

253,557. HOBBY-HORSE OR ROCKER MOTIVE. HERBERT M. SMALL, Baldwinsville, assignor to himself and SUMNER SMALL, Northborough, Mass. Filed Dec. 3, 1881. (No model.)

Claim.—The rocker motive substantially as described, consisting of the four-wheeled truck, the rockers, their connecting-boards and seat, and the ratchet-wheel and pawl, all arranged substantially in manner and to operate as set forth.

253,558. TILTING OIL-CAN. HENRY C. SMITH, Cleveland, Ohio. Filed Dec. 17, 1881. (No model.)



Claim.—The band D, having its inside surface roughened by punching holes from the outside, and provided with the lips *e e* for the thumb-screw E, and having the trunnions *d d*, in combination with the posts C C, set apart to permit the movements of the can to and from the base, and jacketed can A, as shown and described, and for the purpose set forth.

253,559. NAIL-BOX. THOMAS L. SMITH and WILLIAM S. DOTY, Brooklyn, N. Y. Filed Dec. 5, 1881. (No model.)

Claim.—In a box-nailing machine, the combination, with the nail-box, of the clamps or dies C C and supporting-springs D D, the upper ends of which are attached to the box and the other end supporting the clamps or dies and allowing them to yield laterally crosswise with the box, substantially and for the purpose set forth.

253,560. SLEIGH. ROMUALD J. TALBOT, North Attleborough, Mass. Filed Nov. 11, 1881. (No model.)

Claim.—The thrust-block for the braces of sleighs, consisting of the metal block F, having the central socket extending into it, and the lateral inclined sockets extending from inclined faces on each side of said central socket, and between which inclined faces and the upper portion of said central socket are thick solid portions integral with the main block, substantially as described.

253,561. WEATHER-STRIP. WILSON THOMPSON, Belleville, Kans. Filed Nov. 16, 1881. (No model.)

Brief.—The trough is braced by a bent spring-rod and the weather-strip is secured to the door under the trough. A fixed trough upon the door-jamb receives the drip from that upon the door and discharges it beyond the sill.

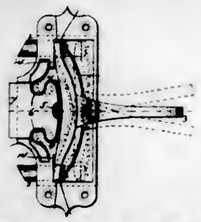
Claim.—The combination, with the door, of the trough secured thereto, the bent spring-rod for bracing the trough, the spout secured to the door-frame, and the weather-strip secured to the door below the trough, substantially as described.

253,562. MUSICAL CHART. EDWARD E. THRESHER, Reed City, Mich. Filed Apr. 23, 1881. (No model.)

Claim.—1. A music-chart having a carved surface, and provided with cords of a different color drawn across it and arranged to represent the lines of a musical staff, substantially as set forth.

2. The combination of a music-chart having a carved surface, and provided with adjustable cords drawn across it and arranged to represent the lines of a musical staff, holding in position adjustable notes and characters used in teaching and writing music.

253,563. SASH-FASTENER. HENRY P. TYLER, North Brookfield, and JAMES B. ATWOOD, Three Rivers, assignors of one-half to H. D. Sleeper, Springfield, Mass. Filed July 1, 1881. (No model.)



253,565.

253,566. BOTTLE-STOPPER. CHAS. A. WARFIELD, Philadelphia, Pa., assignor of one-half to Conrad Semper, same place.

253,569.

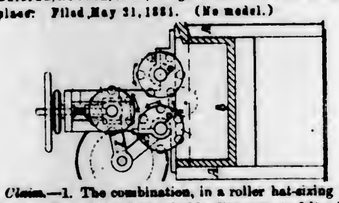
Claim.—1. The combination, substantially as hereinbefore described, with a spindle-rail, of a sleeve-whirl driven spindle and a

253,563.

Claim.—1. The combination, in a sash-holder, of a case, a lever provided with two oppositely-projecting arms, each having a bearing in said case, a spring secured to said lever between said arms, and with the ends of the spring against a bearing in the frame, with a friction-pad secured to said spring, whereby the friction-pad is operated by the movement of the lever in either of two directions, substantially as described.

2. The combination, in a sash-holder, of a case, a lever provided with two oppositely-projecting arms, each having a bearing in said frame, a spring secured to said lever between said arms, and with the ends of the spring against a bearing in the case, a friction-pad secured to said spring, with a sliding bolt adapted to engage with the end of either arm, and a spring secured in the case and bearing against the bolt, whereby the pad and bolt may be drawn away from engagement with the window-frame by the movement of the lever and the bolt thrown into engagement with the window-frame independent of the movement of the lever, substantially as described.

253,564. CONDUCTOR-PIPE. EZEKIEL VAN NOORDEN, Boston, Mass. Filed Oct. 14, 1881. (No model.)



Claim.—1. A water-conductor pipe made in sections, each section provided with an expansion-joint and externally wound with wire, substantially as and for the purpose set forth.

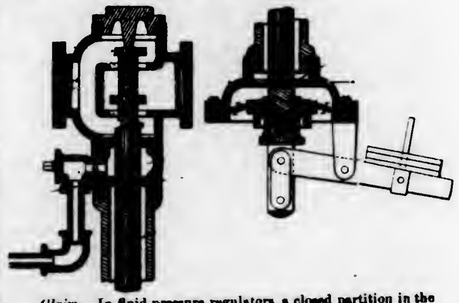
2. In combination with the pipe A, the wire B, wound spirally around it and provided with the hooked ends B', said wire being fastened immovably to the pipe, substantially as and for the purpose described.

3. In combination with the sections A A' of pipe, the wire B, provided with the hooked ends B', the adjacent ends of two wires being connected by the wire loop D, substantially as and for the purpose specified.

253,565. ROLLER SIZING-MACHINE. AUGUST L. WARCKMEISTER, Newark, N. J., assignor to Charles A. Wharton, same place. Filed May 31, 1881. (No model.)

Claim.—1. The combination, in a roller hat-sizing machine, of three rollers adjusted at suitable distances to felt a bundle of hats by rolling and pressing it in the cavity between them, the felts being inserted into and removed from the cavity without altering the distances of the rollers, substantially as herein described.

2. The combination, in a roller hat-sizing machine, of one felting-roller mounted in vertically-adjustable boxes in housings over two felting-rollers revolving in fixed bearings, the upper roller being located nearer to the rear roller than to the front roller, for the purpose set forth, and the felts being inserted into and removed from the cavity without altering the distances of the rollers, substantially as herein set forth.



3. The combination, in a machine having felting-rollers operated in fixed positions, as herein described, of the anti-friction rolls r with the main felting-rollers, to remove the resistance of the main rollers to the removal of the felts from the cavity between them.

253,566. BOTTLE-STOPPER. CHAS. A. WARFIELD, Philadelphia, Pa., assignor of one-half to Conrad Semper, same place. Filed Oct. 26, 1881. (No model.)

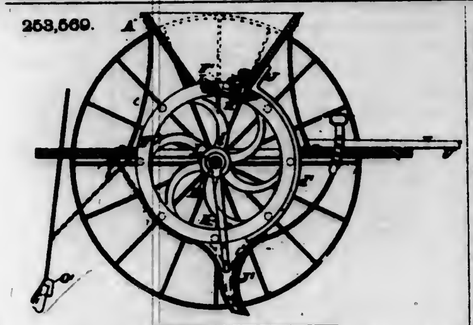
Claim.—In a bottle-stopper device in which a bail-lever hinged about and encircling the neck of the bottle is connected with the stopper by means of a bail pivoted to said lever at points in advance of its fulcrum, a trigger or lever of the first order pivoted at or near its center to the front of the bail-lever and adapted to lock the stopper by pressure exerted upon its upper arm and to unlock said stopper by pressure exerted upon its lower arm, substantially in the manner set forth.

253,567. PRESSURE-REGULATOR. JOSEPH E. WATTS, Lawrence, Mass. Filed Dec. 24, 1881. (No model.)

Claim.—In fluid-pressure regulators, a closed partition in the steam-space of the water-well below the mouth of the equilibrium-pipe which connects the water-well with the delivery-pipe of the regulator, this partition having a passage to permit fluctuations in pressure at the point of connection with equalizing-pipe to be communicated to the column of water in the well, and through the latter to the elastic diaphragm.

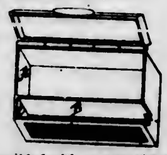
253,568. AWNING. JOHN WILLIS, Wilmington, Del. Filed Dec. 1, 1881. (No model.)

Claim.—1. In a window-awning, the roller B, provided on its ends with depressions *b* and axle-pins E, in combination with bearing-blocks provided with corresponding extensions, provided with holes for the axle-pins, substantially as and for the purpose specified.



2. In a window-awning, the roller B, provided on its ends with depressions *b* and axle-pins E, in combination with grooved wheels D, flanges *d*, bearing-blocks C C', provided with recesses having conical extensions *c'*, provided with holes in the middle for the axle-pins, and cord G, blocks C being provided with hole or slot *c*, through which the cord G travels, substantially as and for the purpose specified.

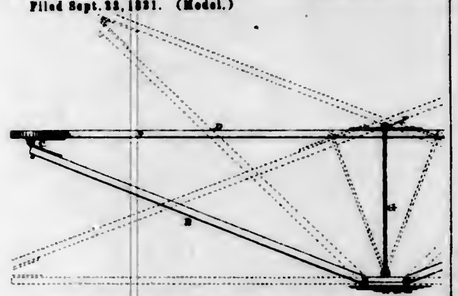
253,569. POTATO-PLANTING AND FERTILIZING MACHINE. CHARLES L. WOODWARD, Angola, N. Y. Filed Nov. 5, 1880. (No model.)



Claim.—1. The wheel F, secured to the shaft E and provided with a series of adjustable pockets, F', having a loose roller, I, for the purposes specified, in combination with a hopper, A, a shield, I', and a leg, J', for the purposes described.

2. In a planting and fertilizing machine, a wheel, F, having a series of pockets, F', provided with a loose roller, I, in combination with a hopper having a roller, C, and a suitable mechanism, substantially as specified, for operating it, for the purposes described.

253,569.



253,570. MATCH-BOX. JOSEPH WOODWARD, New York, N. Y. Filed Dec. 22, 1881. (No model.)

Claim.—A box provided with a compartment for matches and a compartment, C, for a wick or flexible punk, such latter compartment open throughout its entire length when the box is open, and having an opening at one end, through which the end of the wick can project, and a pin or catch to hold the wick in the box when the box is closed, substantially as described and shown.

253,571. SEESAW. LUTHER J. ADAMS, Leominster, Mass. Filed Sept. 22, 1881. (Model.)

Claim.—1. In a seesaw, the combination of the board D with rocking supports, to which the board is loosely attached, substantially as shown.

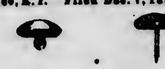
2. The combination of the base, the two supporting-boards B, the two hinged top boards, and the metallic supporting-brace, substantially as described.

3. In a seesaw, the combination of the board D, jointed at its center, with the hinges C, the supports B, loosely connected to the base A, and the pivoted brace G, the parts being adapted to be folded together, substantially as specified.

253,572. SUPPORT FOR SPINDLES FOR SPINNING-MACHINES. JOHN E. ATWOOD, Stonington, Conn., assignor to George Draper, Hopedale, Mass., and Stephen A. Jenks, Lincoln, R. I. Filed Feb. 27, 1880.

Brief.—The supporting-tube for the spindle is flexibly mounted on the rail, by which the spindle and all its bearings can to a certain limited extent move in all directions to adjust itself while in revolution to an unbalanced load.

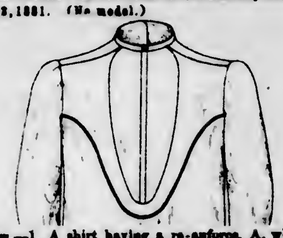
Claim.—1. The combination, substantially as hereinbefore described, with a spindle-rail, of a sleeve-whirl driven spindle and a combined bolster and step mounted loosely on the spindle-rail and secured with relation to the rail by yielding attachments, as set forth, whereby the spindle is capable while in revolution of adjusting itself to an unbalanced load.



2. The combination, substantially as hereinbefore described, with a spindle-rail, of a sleeve-whirl driven spindle, a base-piece rigidly fixed to the spindle-rail, and a combined bolster and step mounted loosely in said base-piece and secured thereto by a yielding attachment, as set forth.

3. The combination, substantially as hereinbefore described, of a spindle-rail of a spinning-machine, a spindle, and a supporting-tube flexibly mounted with relation to the spindle-rail and containing step and bolster bearings.

4. The combination, substantially as hereinbefore described, of a spindle-rail, a spindle, a supporting-tube containing step and bolster bearings, flexible connections between said tube and the spindle-rail, and adjusting devices for varying the degree of flexibility of the supporting-tube and spindle therein.



5. The combination of the spindle-rail, the spindle, the supporting-tube, loosely mounted with relation to the rail and containing the step and bolster bearings for the spindle, the spring, and the nut for compressing it, substantially as described.

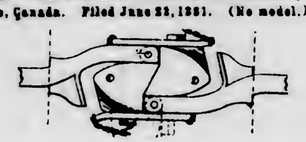
253,573. BUTTON. CHARLES E. BAILEY and WILLIAM B. TALBOT, Providence, R. I. Filed Dec. 7, 1881. (No model.)

Claim.—That improvement in the art of forming the eyes or shanks of buttons consisting in embedding the head of a metallic nail or pin within the body of the button and then bending the projecting end over upon itself and into contact with the button-head to form an eye or shank, all substantially as set forth.

253,574. SHIRT. ALFRED BAXTER, Grand Rapids, Mich. Filed Nov. 22, 1881. (No model.)

Claim.—1. A shirt having a re-enforce, A, which extends around the sides and bottom of the bosom, substantially as set forth.

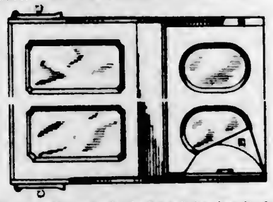
2. The improved seam for shirt-bosoms, formed by bringing the edges of the bosom, re-enforce, and body together, as described, stitching them, folding the body and bosom back into their final position, and then stitching around the edge of the bosom to secure the parts, as set forth.



3. The combination, substantially as herein set forth, of the bosom, the re-enforce, and the body, the bosom being placed between the re-enforce and body, as described, the parts securely stitched, the body and re-enforce folded back, and the parts finally secured by stitching.

4. A shirt having a bosom which is secured to the shirt-body entirely around its edge, and the corners of which are curved or cut away, substantially as set forth.

5. The combination of a shirt body and bosom, which is secured to the body entirely around its edge, and having its upper corners curved or cut in and not included in the shoulder-seam.



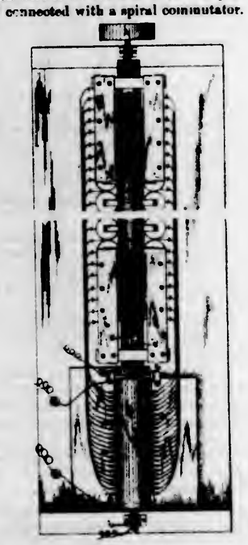
6. The combination of the shirt-body, the bosom having its upper corners curved in, as described, and a re-enforce which extends entirely around the sides and bottom of the bosom, substantially as set forth.

253,575. CAR-COUPLING. MICHEL A. BRESSETTE, Iberville, Quebec, Canada. Filed June 22, 1881. (No model.)

Claim.—In a car-coupler, the combination of the following elements: a curved draw-bar, a hooked head pivoted to the end of the draw-bar and arranged to slide horizontally past the meeting draw-head, and a swinging bar pivoted to the draw-bar and fitting into a catch projecting from the head, all substantially as herein set forth.

253,576. WARDROBE-BEDSTEAD. HENRY O. BICKNELL, Chicago, Ill. Filed Dec. 8, 1881. (Model.)

Claim.—1. A wardrobe-bedstead having its lower front corners made rounding and provided with hinged feet, substantially as described.



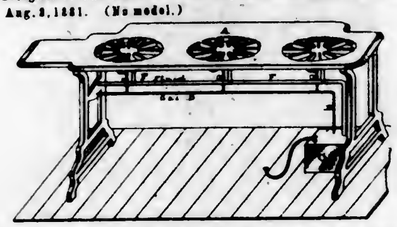
2. A wardrobe-bedstead having its lower front corners rounded away and provided with the hinged feet, in combination with the folding legs, which are pivoted to the sides of the upper end of the frame, the frame being made to support one end of the bed, while the pivoted legs support the other, substantially as set forth.

3. In a wardrobe-bedstead which rests solidly upon the floor at its lower end, removable head and foot boards, and suitable straps for holding the parts in place while the bed is raised against the wall, substantially as specified.

4. A wardrobe-bedstead which rests solidly upon the floor at its lower end, and which has its lower front corners rounded away and provided with hinged feet, the back portion of the frame being left entirely open for the reception of the bed, and made to close against the wall, substantially as shown and described.

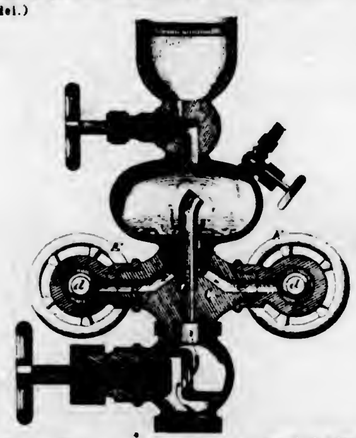
253,577. MAGNETO-ELECTRIC MACHINE. JOHN B. BLAIR, Chicago, Ill., assignor of six-tenths to Aaron P. M. Jeffers and William S. Coffman, both of same place. Filed Sept. 27, 1881. (No model.)

Brief.—An elongated field-magnet having spiral grooves in which insulated wire is wound is surrounded by a series of fixed armatures, all connected with a spiral commutator.



Claim.—1. In a magneto-electric machine, the rotating cylindric field-magnet A, consisting of a shaft spirally grooved on opposite sides and apertured as shown, and provided with the coil A', combined with a series of surrounding stationary armatures, substantially as described, and for the purposes set forth.

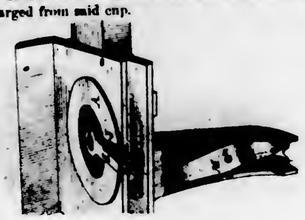
2. In combination with the field-magnet A, the series of secondary magnets C C', arranged in alternation and surrounding the field-magnet, as shown, and for the purposes stated.



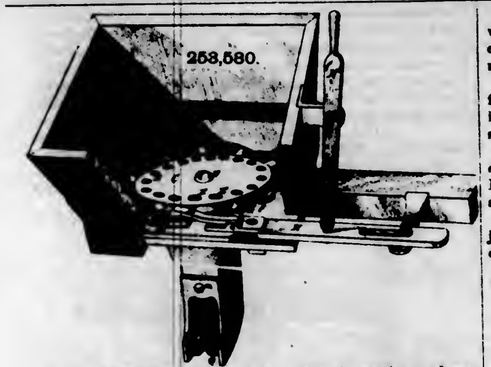
3. In combination with the field-magnet A, the series of secondary magnets C C', arranged in alternation about and in proximity throughout their length with the field-magnet, substantially as and for the purposes described.

253,578. VAPOR-STOVE. WILLIAM B. BLAKE, Canton, Ohio, assignor of one-third to Garson Myers, Pittsburg, Pa. Filed Aug. 3, 1881. (No model.)

Claim.—The combination of a vapor-stove, A, the reservoir C, provided with a pipe for the introduction of air, the fluid-pipe F, provided with a series of burners, and a gas-pipe, D, which extends along under the stove and has a branch pipe and regulating-cock for each burner, the branch pipes extending up close to the burners for the purpose of heating them, substantially as shown.



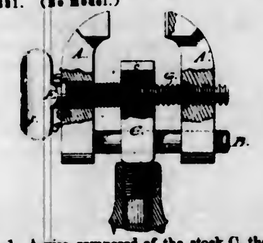
253,579. OILER FOR LOCOMOTIVES. ALVA O. BROOKS and PHILIP A. BOWER, Milwaukee, Wis. Filed Oct. 1, 1881. (No model.)



Claim.—The combination of oil-cup, reservoir having vent, the valve-chamber C, steam-inlet and oil-outlet, and valves or stop-cocks, as set forth.

253,580. CORN-PLANTER. GEORGE W. BROWN, Galesburg, Ill. Filed Sept. 18, 1879.

Claim.—1. In combination with a seed-cup disk having an intermittingly-rotating motion in one direction imparted to it by a reciprocating bar, H, which acts upon it by its throw in one direction and allows it to remain at rest while its throw is effected in an opposite direction, a cut-off slide, I, adapted to move with the forward movement of the bar H and seed-cup disk and act as a bottom to a seed-cup, and to be removed from beneath said seed-cup by the backward movement of the bar H, to allow the seed to be discharged from said cup.

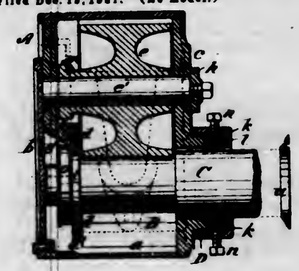


2. In combination with an intermittingly-rotating seed-cup disk in which two seed-cups are brought beneath the cut-off at each movement of the disk, a sliding bottom adapted to hold the seed in one seed-cup while another discharges its seed, and to be moved from beneath the seed-cup which it closes to allow it to discharge its contained seed while the seed-cup disk is at rest.

3. In combination with the intermittingly-rotating seed-cup disk C and sliding seed-cup bottom I, the bar H, adapted to give a partial rotation to the disk C by its alternate throws and to move before its action on the slide I at each throw, so as to properly place, retain, and remove said slide in relation to one of the seed-cups.

4. In combination with the intermittingly-rotating seed-cup disk C, and bar H, which acts upon it at alternate throws of the slide, the sliding seed-cup bottom I and valve M, arranged to operate in relation to each other and to the seed-cup disk substantially as and for the purpose specified.

5. In combination with the seed-cup disk C, and bar H, alternate throws of which act on said slide, a sliding seed-cup bottom located close beneath the seed-cup disk, and a vibrating valve located in the seed-tube, both of which are vibrated in one direction at each throw of the bar H, substantially as and for the purpose specified.



253,581. VISE. CALVIN L. HUTLER, Greenfield, Mass. Filed Dec. 23, 1881. (No model.)

Claim.—1. A vise composed of the stock C, the jaws A' A, and a differential screw operating the same, as and for the purpose specified.

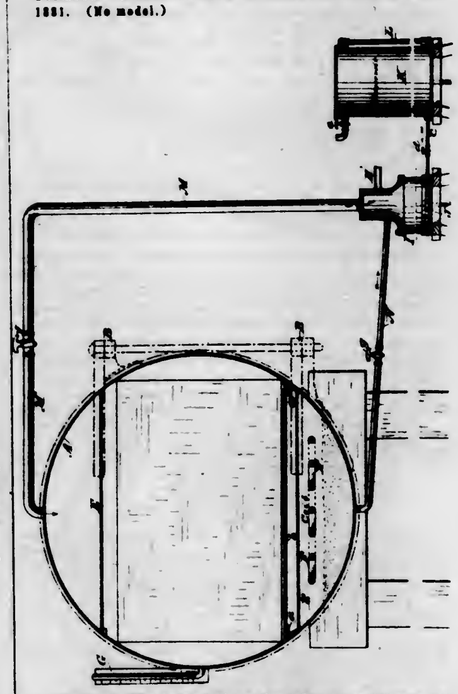
2. The differential screw E, in combination with the jaws A A', the stock C, and guide-bar B, as and for the purpose set forth.

253,582. CAR-AXLE BOX. CHARLES E. CARDER, New York, N. Y. Filed Dec. 19, 1881. (No model.)

Claim.—1. The anti-friction roller e, provided with toothed wheel m, the loose wheel o, fitted in the oil-compartment, and the chain or band q, substantially as shown and described, in combination with the box A, for operation as specified.

2. The combination, with the box A and the axle C, of the friction-rollers *e f g*, placed loosely upon the spindles *e' f' g'*, having bearings in the front and rear plates of the said box, and the set-screws *t*, substantially as and for the purpose set forth.

3. The combination, with the box A, provided with partition *d*, and the axle C, provided with the shoulder *i*, of the stuffing-box D, the lapped circular flexible metal band *k*, the gland *l*, and the set-screw *n*, substantially as and for the purpose set forth.



4. The anti-friction roller e, provided at one end with a projecting gear-wheel, m, for receiving and giving motion to a lubricating chain or band, substantially as described.

253,583. TOWEL-RACK. THOS. C. CLAPP, Gouverneur, N. Y. Filed Nov. 25, 1881. (Model.)

Claim.—The combination of the bracket-frame A, having curved grooves made in the inner sides of its ends, with a curved towel-rack, D, which fits in the grooves, and which is provided with stops to prevent the rack from being drawn out too far, substantially as shown and described.

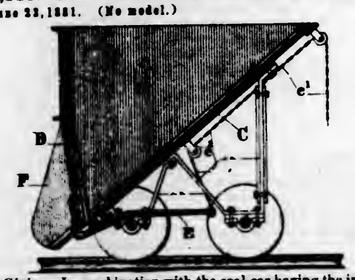
253,584. METHOD OF AND APPARATUS FOR TREATING TOBACCO. GEORGE CLARK, New York, N. Y. Filed Oct. 11, 1881. (No model.)

Claim.—1. The method of treating tobacco, consisting essentially of establishing a vacuum within the containing-chamber and admitting vapor thereto in limited and regulated quantities at a comparatively low degree of temperature, whereby the moisture of the vapor is forced into the tobacco, in contradistinction to the process of absorption, as hereinbefore fully explained.

2. In an apparatus for treating tobacco, the cylinder A, adapted to have the air exhausted therefrom, whereby a vacuum is produced therein, in combination with a vapor-generator and water-reser-

Claim.—1. In a hand-cutter for thrashing-machines, the se-

253,585.



voir arranged at one side, and connected by pipes M N e, substantially as and for the purpose described.

3. The vapor-generator I, provided with the coil J, and the curing-chamber A, connected by the vapor-pipe M at the top of each, and a return water-pipe, g, inclined as described, in combination with suitable means for supplying water to the vapor-generator, substantially as and for the purpose set forth.

4. The curing-chamber A, connected with the vapor-generating apparatus, and provided with a steam-coil, F, to produce fermentation, substantially as hereinbefore set forth.

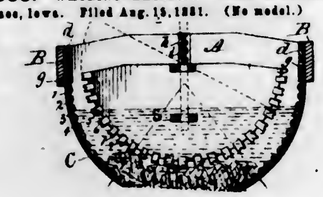
5. The curing-chamber A, adapted to be connected with suitable vacuum-producing apparatus, and provided with the barometer G, in combination with the vapor-generator and reservoir, the latter being provided with the water-gage L, whereby the pressure in the chamber A and amount of water vaporized are determined, substantially as hereinbefore set forth.

253,585. COAL-CAR. JOHN B. COLLIS, Altoona, Pa. Filed June 23, 1881. (No model.)

Claim.—In combination with the coal-car having the inclined bottom C and guide-boards F F, the upwardly-swinging door D and the catch-lever E, as described.

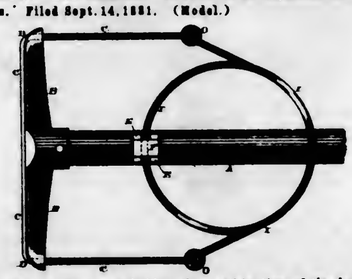
253,586. BOOT OR SHOE. WILLARD COMBY, Westborough, assignor to the Improved Sole Sewing Machine Company, Boston, Mass. Filed Dec. 19, 1881. (No model.)

Claim.—The improved shoe above described, consisting of the upper A, channeled insole B, partial belt or middle sole, C, and channeled outer sole, D, the welt or middle sole, C, being sewed to the fore part of the upper and insole, as described, by one line of stitches, and to the fore part of the outer sole by a second line of stitches, and the shank of the outer sole being sewed to the shank of the upper and inner sole by a third line of stitches, as described.



253,587. JEWELER'S BRAIDED METALLIC STOCK. AUGUSTUS S. CRANE, Newark, N. J. Filed July 19, 1881. (No specimens.)

Claim.—1. The process of manufacturing rigid metallic braided stock, consisting in binding the strands to a mandrel, and in applying while braiding an upward and circumferential pressure, substantially as and for the purpose specified.

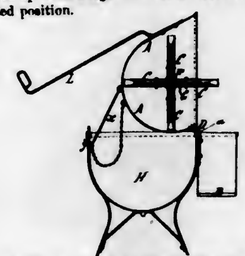


2. The rigid metallic braided stock when constructed substantially as set forth.

253,588. WASHING-MACHINE. MARK O. CUMMISON, Des Moines, Iowa. Filed Aug. 15, 1881. (No model.)

Claim.—In combination with a washing-machine tub composed of semicircular wooden side pieces, A, wooden end pieces, B, and a sheet-metal bottom, C, the fixed re-enforcing pieces d, the detachable wash-board surface composed of series of wooden bars 1 2 3 4, and the adjustable and detachable keying-pieces g, substantially as shown and described, to operate in the manner set forth, for the purposes specified.

253,589. MOP-HOLDER. REUBEN T. DAVIS, North Adams, Mass. Filed Sept. 14, 1881. (Model.)



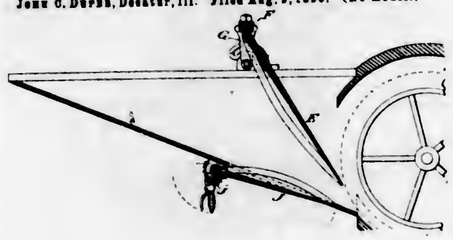
Claim.—1. In a mop-holder, the combination of the handle A, the head B, and the holder C with a separate spring which has a partial rotary movement, substantially as shown.

2. In a mop-holder, the combination of the head and the holder with a separate spring which has its ends attached to the holder, so as to always exert its pressure in drawing the holder tightly against the cloth, substantially as described.

3. The combination of the handle A, the head B, the holder C, the grooved block and clamp, and a separate spring which has a partial rotary movement, substantially as set forth.

253,590. ROOT AND VEGETABLE WASHER. LUDOVIC EDISH RAOUL, COMTE DE BRAUEPAIRE DE LOUVAGNY, Grivesnes, France. Filed Oct. 28, 1879. Renewed Nov. 23, 1881. (Model.)

Brief.—A sieve provided with revolving beaters is suspended in an outer casing by hinges at the side. A removable drainer is hung at the side of the casing to receive the roots, &c., when the sieve is turned up on its hinges. A chain and rod sustain the sieve in its elevated position.

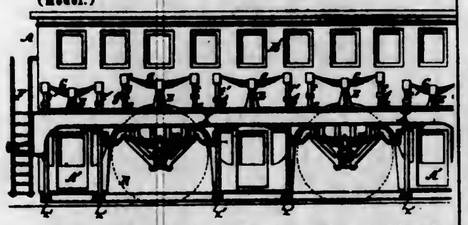


Claim.—1. The casing H, in combination with the overturning sieve A, provided with the beaters C, substantially as and for the purpose set forth.

2. The casing H and overturning sieve A, with beaters C, in combination with the removable drainer B, suspended from the side of the casing H, adjacent to the hinges D of said overturning sieve A, substantially as and for the purpose set forth.

3. The sieve A and casing H, in combination with the hook x and chain z, substantially as and for the purpose set forth.

253,591. BAND-CUTTING ATTACHMENT FOR THRASHERS. JOHN C. DUPEE, Decatur, Ill. Filed Aug. 9, 1880. (No model.)



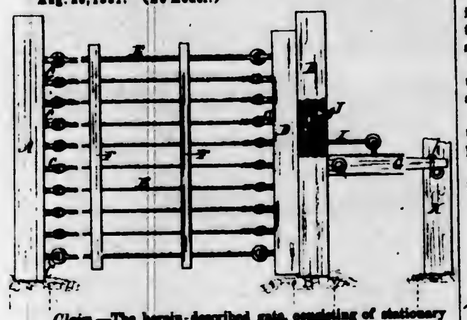
Claim.—1. In a band-cutter for thrashing-machines, the series of adjustable blades E E, in combination with the hopper and cylinder, substantially as shown and described.

2. In a band-cutter for thrashing-machines, the series of adjustable blades E E and J J J, in combination with the hopper and cylinder, substantially as shown and described.

3. The blades E E, in combination with the bar F, shoe G, and support H, substantially as and for the purpose set forth.

4. The blade for a band-cutter for thrashing-machines, consisting of the body O, blade P, and plate Q, substantially as shown and described.

253,592. RAILWAY-VEHICLE. AUGUSTE HUTRARD, near Perpignan, France. Filed Nov. 10, 1879. Renewed Dec. 13, 1881. (Model.)



Claim.—1. The car-body having upper and lower apartments, A' B', and a duplex system of springs, G r, substantially as and for the purpose set forth.

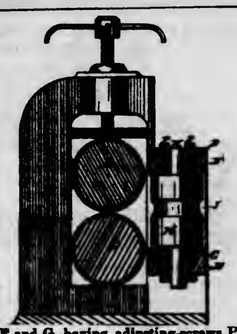
2. The body A, in combination with a duplex system of springs, G r, and the intermediate frame, X, substantially as and for the purpose set forth.

3. The body A and frame X, in combination with the upper springs, G, uprights t, pedestals E, and lower springs, r, substantially as and for the purpose set forth.

4. The body A, with upper and lower apartments, A' B', in combination with the double set of springs G r, standards t, pedestals E, frame X, and extended standards t', substantially as and for the purpose set forth.

253,593. SWINGING GATE. LINDLEY H. EVANS, Cass Township, (Reeder's Mills P. O.,) Harrison County, Iowa. Filed Aug. 26, 1881. (No model.)

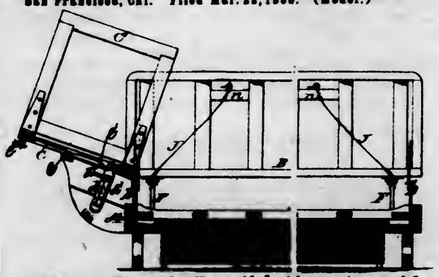
Claim.—The herein-described gate, consisting of stationary upright A and movable upright D, connected together by wires E, mortised upright B, lever G, fulcrumed to said upright B, and connected to upright D by hook I, substantially as specified.



253,594. HAIR-TONIC. LEWIS FORBES, San Francisco, Cal. Filed Nov. 8, 1881. (No specimens.)

Brief.—The distillate of water and animal hides is obtained by subjecting distilled water and depilated hides to a boiling heat in a close vessel. The vapor arising is condensed. This is then mixed with alcohol and salt.

Claim.—A hair-restorer consisting of the herein described distillate of water and animal hides, in combination with alcohol and salt in substantially the proportions named, and for the purpose set forth.

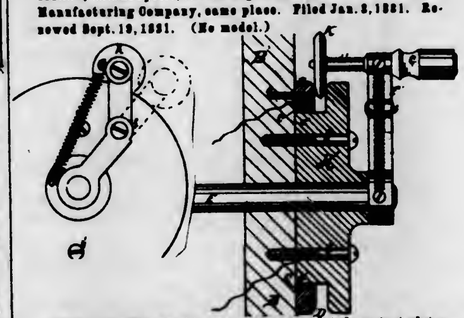


253,595. MILL FOR ROLLING IRON. CHARLES FORSTER, Pittsburg, and BENJAMIN WEAVER, Allegheny, Pa. Filed June 22, 1881. (No model.)

Claim.—1. The combination, with a pair of horizontal rolls, of the pair of vertical grooved guide-rolls, supports D and E, adjustable bearings F and G, having adjusting-screws P, plates N, and screws M, substantially as herein described, and for the purpose set forth.

2. In a mill for rolling iron, the combination, with a pair of horizontal grooved rolls, of a pair of vertical revolving grooved guide-rolls, adjusting-screws M, plates N, and adjusting-screws P', substantially as and for the purpose specified.

253,596. SOFA-BED AND LOUNGE. ALBERT S. I. GARDE, San Francisco, Cal. Filed Mar. 28, 1882. (Model.)



Claim.—1. The ratchet F, provided with an outer guard facing the row of notches, and having an enlarged notch or stop at the bottom, in combination with the pin K and the back B, substantially as set forth.

2. The combination of the stay-rods J, ratchets F, and clips under the back B, for attaching the ratchets with the stays b, substantially as set forth.

3. The combination of the back B, supporting and adjusting means, and drawer capable of being drawn out and forming a support for the back when down in a horizontal position, as set forth.

253,597. TELEPHONE-SIGNAL GENERATOR. JAMES F. GILLILAND, Indianapolis, Ind., assignor to the Gilliland Electric Manufacturing Company, same place. Filed Jan. 3, 1881. Renewed Sept. 19, 1881. (No model.)

Claim.—1. The combination of two insulated contact-plates, A A', with an extensible spring-retracted crank carrying a contact-ping, substantially as specified.

2. The combination, in a magneto-electric machine, of a crank consisting of arms pivoted together, a contact-piece carried by the outer arm, and a retractible spring, whereby the shunt-circuit is closed when the crank is at rest and opened and held open automatically when power is applied to turn the crank.

3. The combination of an extensible spring-retracted crank

253,602.

253,604.

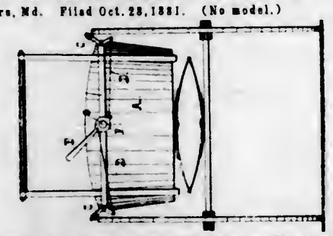
3. The combination of an extensible spring-retracted crank with metallic disk K, and insulated contact-plates so placed as to form a groove in which said disk is held by the spring when the crank is at rest, so as to close the shunt-circuit around the armature, said disk, when power is applied to the crank, being lifted from the groove, so as to open and hold open the shunt.

253,598. MANUFACTURE OF YELLOW COLORING-MATTERS. FRIEDRICH GRAESSLER, Cannstadt, Germany. Filed Mar. 13, 1880. (Specimens.) Patented in England Jan. 3, 1879, and in Germany Feb. 13, 1879.

Claim.—As a new product, the coloring-matter of a yellowish shade, which consists of the sulpho-acid of amidoazo-benzole, substantially as described.

253,599. MODE OF HEATING PILES. JOHN HALDEMAN, Philadelphia, Pa., now residing in London, England. Filed Jan. 12, 1882. (No specimens.) Patented in Belgium Oct. 30, 1880.

Claim.—This mode of heating piles or boxes composed of a steel core of any shape, said core surrounded by an envelope of puddled or other iron—viz., by first subjecting these piles to a low slow heat, such as will not injuriously affect the iron until the heat penetrates the whole body of steel degree by degree until it becomes partially, or preferably entirely, molten, and then, in the second place, changing the character of the heat, so as rapidly to bring the iron envelope to a high white welding-heat, and then by compression completing the process, and thus producing an absolute fusion instead of a weld of the two metals—substantially for the purpose described above.



253,600. DEVICE FOR ATTACHING PLATES OR TABLETS TO STOVES. ROBERT HAM, Troy, N. Y., assignor to O. H. Phillips & Co., same place. Filed Jan. 3, 1882. (No model.)

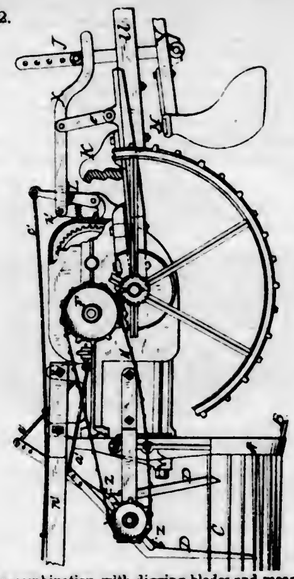
Claim.—1. The device consisting of the combination of a lug, *b*, on a stove-plate, A, a support, *g*, attached to or forming a part of a plate, E, and arranged in a space, *f*, formed in the body of such plate E, and adapted to be secured to the lug *b* in a manner substantially as set forth.

2. The device consisting of the combination of a lug, *b*, on a stove-plate, A, a support, *g*, having an eye, *h*, and hole and slot *j k* therein, and arranged in a space, *f*, and connected with a plate, E, and a cap-piece, I, provided with a nut and screw, *l m*, all being disposed and adapted to be secured together substantially as described.

253,601. CHILD'S CARRIAGE. JOSEPH N. HAZELIP, Baltimore, Md. Filed Oct. 28, 1881. (No model.)

Claim.—1. In combination with the lever E and clamp, the bell-crank levers C, as and for the purpose set forth.

2. In combination with the rear standards and cross-bar, the brake-levers pivoted thereon and connected with the lever E, as set forth.



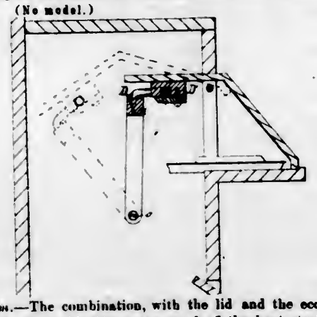
3. In combination with the lever E and clamping-disks F *f*, the bell-crank levers C, having shoes *c*, and the wires D, as set forth.

253,602. POTATO-DIGGING MACHINE. HENRY D. HERRINGTON, Hoosac, N. Y. Filed Aug. 10, 1881. (No model.)

Claim.—1. The combination, with a semicircular digging-blade, A, of a potato-digger, of a series of cutting-blades, B, attached to the circular blade A, as shown, and for the purpose stated.

2. The combination, with the plows of a potato-digging machine, of the adjustable upright J, secured to the plow-beam V, arms X, and fulcrum-support *e'*, substantially as described, and for the purpose set forth.

253,602.

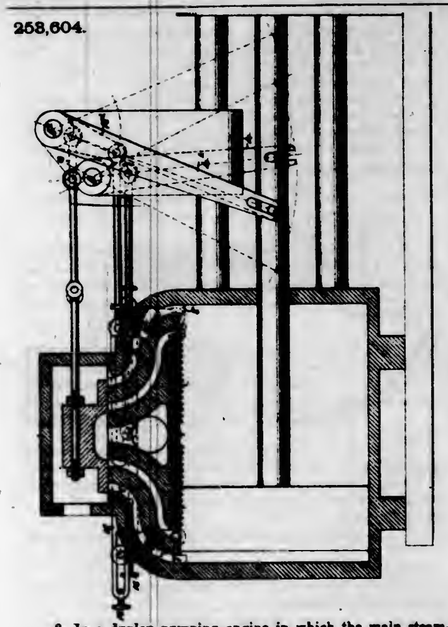


3. The combination, with digging-blades and means for oscillating said blades, of plows arranged in advance of the digging-blade and arranged to run at each side of the row of potatoes to be dug, cutting away the sides of the row and siding in removing the vines, substantially as described, and for the purpose set forth.

4. In a potato-digger, the combination, substantially as hereinbefore described, of the digging-blade A with the series of cutting-blades B and separating-fingers C, having an oscillating motion, cleaning-fingers D, and mechanism for operating the fingers, substantially for the purpose set forth.

5. The combination, in a potato-digger, of the digging-blade A, separating-fingers C, cleaning-fingers D, endless sprocket-chain, sprocket-wheels *d* F, cranks Z, and pivoted arms *s'*, substantially as described, and for the purpose set forth.

253,603. CABINET-ORGAN LID. JACOB HESSLER, Chicago, Ill., assignor to William W. Kimball, same place. Filed Nov. 2, 1881. (No model.)



Claim.—The combination, with the lid and the eccentric frame, of the separable hinge composed of the bent staple, the slotted block, and the button, substantially as described.

253,604. DUPLEX PUMPING-ENGINE. DAUPHIN S. HIBBS, Brooklyn, N. Y. Filed Sept. 15, 1881. (No model.)

Claim.—1. In a duplex pumping-engine in which the main steam-valve of one engine is operated by the other engine, the combination, with each induction-port of the high-pressure steam cylinder or cylinders, of an intermediate valve operated to close such port during the pause on the reversal of the movement of the piston, substantially as described.

2. In a duplex pumping-engine in which the main steam-valve of one engine is operated by the other engine, the combination, with each induction-port of the high-pressure steam cylinder or cylinders, of an intermediate valve, and mechanism for operating the same, substantially as described.

253,604.

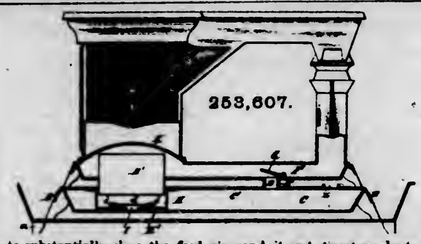
3. In a duplex pumping-engine in which the main steam-valve of one engine is operated by the other engine, the combination, with each induction-port of the high-pressure steam cylinder or cylinders, of an intermediate valve, with mechanism for operating the same, provided with means for adjusting the opening and closing of the same, substantially as described.

4. In a duplex pumping-engine in which the main steam-valve of one engine is operated by the other engine, the combination, with the high-pressure steam cylinder or cylinders, of ports 7 8, intermediate valves, 9 10, slotted bar 15, provided with adjusting-screws, and means for timely reciprocating said bar, substantially as described.

253,605. LEATHER BOX. AUGUSTUS HOFF and HENRY HOFF, Brooklyn, N. Y. Filed Dec. 10, 1881. (No model.)

Claim.—A leather box the body and cover of which are each made of a continuous binding, A, an end piece, B, stitched to the inner edge of the binding, and of a side portion, C, secured to the turned-over outer edge of the binding and made of one straight piece of leather having the ends secured together, substantially as and for the purpose described.

253,606. ROLL-BAR FOR PULP-ENGINES. JOHN HENRY HOBBS, Lawrence, Mass. Filed Jan. 9, 1882. (No model.)



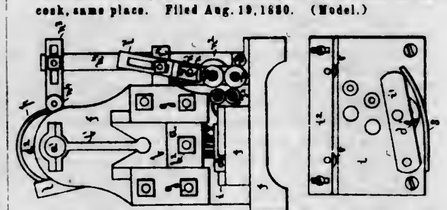
Claim.—1. The method of producing bars for pulp-engine rolls, which consists in rolling steel into a band of uniform size and shape and of the form of the destined roll, such band being cut into bars of the desired length as occasion requires.

2. A bar for pulp-engine rolls, having its sides upon opposite edges tapering, for purposes stated.

253,607. OIL-STOVE. JOHN M. IRWIN, Horton, Pa. Filed Sept. 13, 1881. (No model.)

Claim.—1. In a hydrocarbon-oil-burning stove of the character herein specified, an opening in the oil-pot having communication with the feed air-conduit to the burners, said opening being provided with a trap, hinged at one side, and adapted and arranged

253,607.



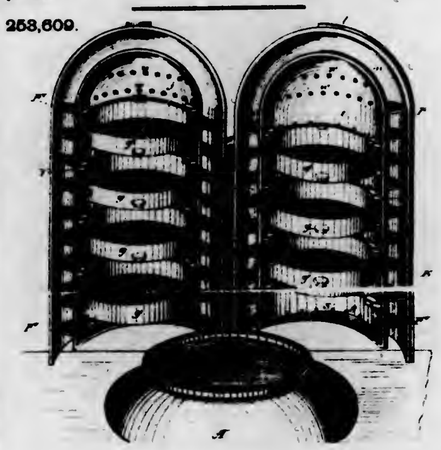
to substantially close the feed air-conduit and direct products of combustion escaping from the oil-pot toward the burners in case of explosion, substantially as shown and described.

2. In a hydrocarbon-oil-burning stove of the character herein specified, the combination, with the oil-pot, of outlet D, trap G, and air-conduit F, substantially as shown and described.

3. In a hydrocarbon-oil-burning stove, an oil-pot having a chamber surrounding the wick-tubes, and extending nearly to the bottom of the oil-pot, an opening for the passage of the fluid to the wicks being located in the bottom of said chamber, with a plate placed thereabove and secured to the bottom of said chamber, substantially as shown and described.

4. In a hydrocarbon-oil-burning stove, the combination, with the oil-pot, of jacket H, the same being perforated at bottom, and having a plate, I, located therein, substantially as and for the uses and purposes shown and described.

253,608. MACHINE FOR PUNCHING METAL. ANDREW J. JOHNSON, Cuyahoga Falls, Ohio, assignor to Erskine L. Babcock, same place. Filed Aug. 19, 1880. (Model.)



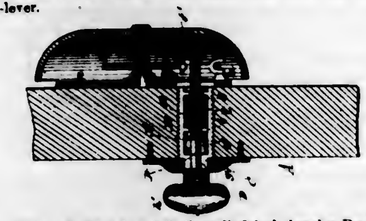
Claim.—1. The feed-rolls *m m'*, one of them having an intermittent motion away from the other, in combination with shaft *g'*, rock-shaft m^2, arms m^3 m^4 n^4, and cam d^3, substantially as described.

2. The jaws *n n'*, in combination with flanged wheel n^2 and arm l^2, provided with pin i^2, substantially as described.

3. The cam *d'* and lever *l*, in combination, and adjustably connected with arm *l*, jaws *n n'*, wheel n^2, and feed-rolls *m m'*, substantially as described.

4. The punch-holder *a*, in combination with pitman *b'*, shaft *a'*, cams d^2 d^3, lever *l*, arms l^2 m^4 m^5, jaws *n n'*, adjusting gnide-roll *o'*, and feed-rolls *m m'*, one of the feed-rolls having an intermittent motion away from the other, substantially as and for the purpose specified.

253,609.



253,609. FRUIT-DRIER. JAMES J. JOHNSTON, Columbiana, Ohio. Filed Dec. 24, 1881. (No model.)

Claim.—1. A cylindrical fruit-drier consisting of a base forming a section of a hollow sphere, having a vertical flange and opening, a drying-chamber having perforated walls, and surrounded with a heating-chamber having spiral partitions and a flue, said chambers divided vertically into two parts, and hinged together on said base, substantially as herein described, and for the purpose set forth.

2. In a fruit-drier, the combination of the hollow base A, drying-chamber D, and heating-chamber E, having spiral partitions F, said chambers divided vertically into two parts and hinged together on the base A, substantially as herein described, and for the purpose set forth.

253,610. DOOR-BELL. JAMES J. JOHNSTON, Columbiana, Ohio. Filed Jan. 12, 1881. (No model.)

Brief.—The reciprocating movement of the operating-bar actuates the hammer by means of inclines on said bar and hammer-lever.

Claim.—1. In a door-bell, the cylindrical chamber B and B', made in two parts, having compartments *e* and *f*, partition *i*, square projection C, projections *h*, and recesses *g*, with openings D, *k*, and *l*, the outer walls of said parts B and B' furnished with screw-threads *j*, in combination with the operating-lever A', having a square portion, *p'*, round portion *p*, with collars *r s*, and spiral spring *t*, substantially as herein described, and for the purpose set forth.

2. In a door-bell, the combination of the cylindrical chamber constructed in two parts, B and B', operating-lever A', having detachable and adjustable piece *f'*, disk *s*, having projections *w* and *u*, hammer *x*, having projections *c'*, and springs *d* and *l'*, and the bell *o*, secured to the projection *u* of said disk, substantially as herein described, and for the purpose set fo.th.

253,611. MONUMENTAL VASE FOR FLOWERS. JAMES J. JOHNSTON, Columbiana, Ohio. Filed Dec. 23, 1881. (No model.)

Claim.—1. A monumental vase consisting of the base B, hard and porous shaft D, and vase A, having a water-chamber, *i*, arched wall *e*, having opening *h*, and a curved wall, *f*, substantially as herein described, and for the purpose set forth.

2. A monumental vase consisting of the base B, hard and porous shaft D, vase A, having recessed side walls for the reception of inscription tablet or tablets, water-chamber *i*, arched wall *e*, having opening *h*, an arched wall, *f*, and cap C, forming air-space *j*, substantially as herein described, and for the purpose set forth.

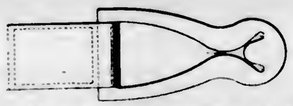
253,612. BRACELET. WILLAT A. JOHNSON, Phœnix, assignor to himself and P. & A. Liston, Providence, R. I. Filed Dec. 31, 1881. (No model.)

Brief.—The hinge is soldered to the outer side of the back plates and located at one side of the joint. To one of the plates is secured a flat catch-stud having a notch on its inner edge and on its outer edge a spring. The notch receives the catch on the opposite plate.

Claim.—1. In a bracelet, the combination of the back and front plate with a separately-formed hinge-joint placed to one side of the joint between the two arms of the bracelet, and concealed from view within the inner and outer plates and edges of the bracelet, substantially as described.

2. In a bracelet, the combination of the flat catch-stud D, provided at its edges with a notch, *d*, and spring E, attached to one arm of the bracelet, with the catch *e*, attached to the end of the opposite arm, to be operated by the edgewise movement of the arms, substantially as described.

253,613. WAGON-BRAKE. JOHN C. KIMES, Wodesville, W. Va. Filed Oct. 19, 1881. (No model.)

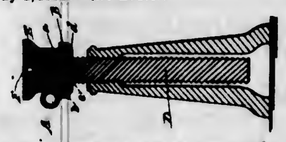


Claim.—The bounds C, supporting the plate D, having brackets or bails E, in combination with the brake-bar F, rods I, springs G, flexible protecting-straps F', and mechanism for operating the brake-bar, all arranged substantially as herein described, for the purpose set forth.

253,614. BAG OR SATCHEL. LUDWIG LOWENBERG, New York, N. Y. Filed Dec. 27, 1881. (Model.)

Claim.—A bag or satchel the body of which is made of longitudinal straw braids sewed sidewise of each other to a strengthening-backing, substantially as set forth.

253,615. GARMENT-SUPPORTER. MORRIS MARCUS, New York, N. Y. Filed Dec. 10, 1881. (Model.)



Claim.—The garment-supporter composed of a plate with a main opening and two branch slots that pass at the edges of a round-ended finger, *i*, the ends of the slots being the widest, and there being three narrow places to nip and hold the fabric, substantially as set forth.

253,616. PREPARING TALC AND COATING ARTICLES THEREWITH. HUGH MCCORMICK, San Francisco, Cal. Filed Nov. 12, 1881. (No specimens.)

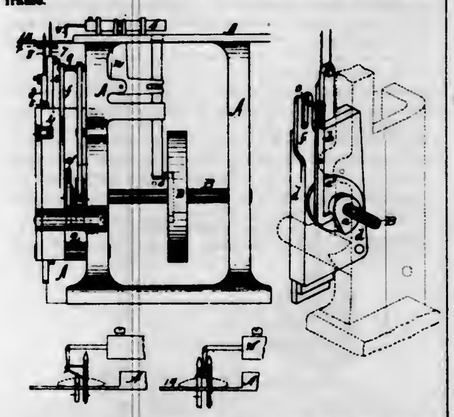
Claim.—The method herein described for preparing talc for coating articles therewith, consisting in first cleaning it with water, then drying it and again moistening it with water, and then adding some substance to give it adhesion and cause it to dry hard—such as linseed-oil, varnish, glue, gelatine, silicates of soda or potassa, &c.—and reducing it to the required consistency with water, alcohol, or turpentine, &c., and then applying it with a brush or pen to any substance, substantially as herein described.

253,617. JACK-SCREW. SERVINE C. MCGILL, Chicago, Ill. Filed May 3, 1881. (No model.)

Claim.—1. The purchase-ring and pawl-carrier A, with socket K on the side to receive the purchase-lever, and socket *f*, in which the pawl acts, substantially as described and shown.

2. The removable head with holes or ratchet-teeth *h* and center socket, *d*, substantially as described and shown.

3. The pawl C, with handle *i*, in combination with spring *j*, substantially as described and shown.



4. The screw D, with tenon *e*, in combination with ratchet and removable head B, substantially as described and shown.

5. The screw D and the ratchet-ring cap B, rigidly secured thereon, combined with the pawl-ring A, seated on the exterior periphery of said cap, and removable therefrom without disturbing the connection of cap B with the screw.

6. The screw D, the ratchet-ring cap B, rigidly secured thereto, and the pawl-ring A, seated on the exterior periphery of said cap, combined with the removable swivel-table or cap E, resting upon the cap B, and capable of turning thereon to support the weight to be lifted without contact with the screw.

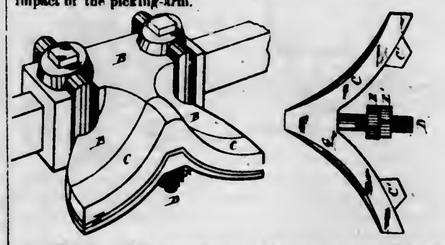
253,618. MACHINE FOR SEWING FLAT BUTTONS TO FABRICS. JAMES H. MORLEY, Holyoke, Mass., assignor to the Morley Sewing Machine Company, of Maine. Filed Mar. 25, 1881. (No model.)

Brief.—The thread carried up through one hole in the button by an eye-pointed needle is carried by a looper across the path of a hooked needle, passing up through another hole and down, and enchained on the under side of the fabric. The buttons and fabric are fed along by the needles, which are carried by a swinging frame.

Claim.—1. The combination, in a needle-feed machine for sewing flat or drilled eyed buttons to fabrics with an eyed needle and a hook-needle, two independent needle-bars, a pivoted needle-bar case carrying both needle-bars side by side, and operating mechanism, of a loop-carrier located above the work on the cloth-plate to move forward and back across the line of the feed-motion of said needles, substantially as set forth.

2. The combination, in a needle-feed sewing-machine, of the needle-bar case *d*, pivoted in frame A, a hook-needle and an eyed needle, two needle-bars standing side by side, and of appliances, substantially as described, for imparting to said needle-bars differential vertical movements, and for imparting to said needle-bar case a vibratory movement in said frame, substantially as set forth.

3. The combination, in a sewing-machine, with a movable needle-bar case, of the crank-disk *a'*, having fixed in it the crank-pin *c*, and two needle-bars having cam-slots in them of varying form, in both of which slots said crank-pin operates simultaneously, substantially as set forth.



4. The combination, with the needle-bar case pivoted to frame A, and having the slotted arm *f* thereupon, of the feed-lever *b*, having the stud *e* adjustably secured thereto, cam *a* on shaft B, and spring 10, substantially as set forth.

5. In a needle-feed sewing-machine, the combination, with two independent needle-bars arranged side by side, and mechanism to operate said needle-bars vertically, and needle-feed mechanism, substantially as described, of a loop-carrier to catch and hold the thread-loop while the ends of the needles swing away from it, substantially as set forth.

6. The combination, in a sewing-machine, of two needle-bars, a hook-needle and an eyed needle, and operating mechanism, of a movable needle-bar case and feed mechanism, and of a loop-carrier having a reciprocating movement across the line of movement of said needles, substantially as set forth.

253,619. PICKING-SHOE FOR LOOMS. HERBERT E. MORLEY, Rockville, Conn. Filed June 3, 1881. (No model.)

Brief.—A detachable protecting-plate for receiving the blow of the picking-arm is secured to the body of the shoe by means of a screw-bolt attached to the plate, which is passed through and secured below the body by nuts. Studs upon the plate fit into sockets in the body to prevent displacement, and an elastic packing between the body and protecting-plate modifies the shock of impact of the picking-arm.

Claim.—1. The combination of the separate plate C, having a screw-bolt, D, and studs C', with the body of a picking-shoe for a loom, substantially as described.

2. The combination of the separate cam-plate C with its screw-bolt D and studs C', the elastic packing F, and the body of the shoe B, substantially as described.

253,620. TREADLE-POWER FOR GRINDSTONES. JOSHUA M. NELSON, Oakdale, Cal. Filed Dec. 19, 1881. (No model.)

Claim.—1. The stand A, with its mounted grindstone C, having a shaft, B, in combination with a driving-shaft, F, journaled under said stone and carrying ratchets J, and the levers K K, with their pawls N and treadles L L, and an intermediate means for transmitting the motion of the driving-shaft to the stone, substantially as herein described.

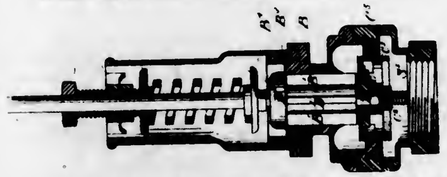
2. The stand A, with its grindstone C, shaft B, and trough D, in combination with the shaft F, journaled in bearings E, ratchets J, levers K K, pawls N, and swinging treadles L L, and the intermediate means for transmitting motion, consisting of the sprocket-wheels G and I and the chain-belt H, substantially as herein described.

3. The combination of the shaft F, ratchets J, and the levers K K, journaled on said shaft, and having the block M, with side

sockets, *m*, containing pawls N and springs *n*, substantially as herein described.

4. The stand or frame A, having a grindstone, C, operated by the treadle-levers K K through mechanism as shown, in combination with the seat P, having a stem, *p*, with notches or grooves *c*, and the support O, having its end bent upward and perforated to receive said stem, substantially as described.

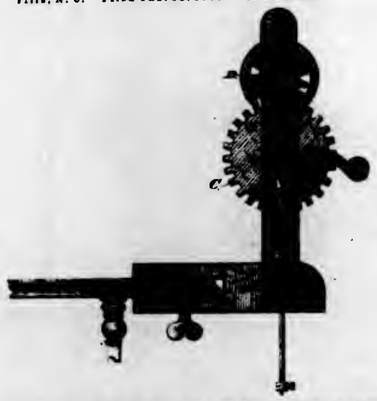
5. The support O, with its upturned end, and having holes *o*, in combination with the seat P, having a stem, *p*, with notches or grooves *c*, arranged substantially as and for the purpose described.



6. The combination and arrangement of the stand A, grindstone C, shaft B, trough D, sprocket-wheels G and I, chain-belt H, side supports or bearings, E, shaft F, with its ratchets J, levers K K, with their pawls N and the treadles L L, and the seat P, with its stem *p*, supported by the hanging piece O, as and for the purpose herein described.

253,621. SEWING-MACHINE SHUTTLE. WIDELOW R. PARSONS, Waterloo, Iowa. Filed July 28, 1881. (Model.)

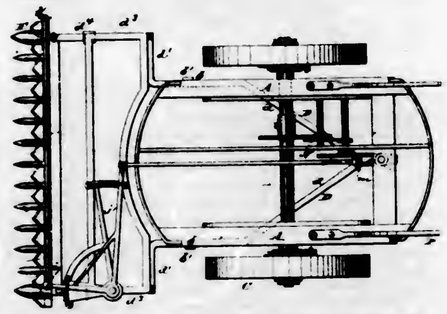
Claim.—The shuttle A, provided with the notch B, projection C, and shoulder D, in combination with the spring F, provided with the hole G, hook J, and the points I, and the set-screw O, which is passed through the spring into the shuttle between the ends of the spring, substantially as shown.



253,622. POP SAFETY-VALVE. WM. E. PEARSON, Boston, Mass., assignor to Samuel F. Pearson, Portland, Me., and John O. Cheever, Boston, Mass. Filed Sept. 12, 1881. (No model.)

Claim.—1. In a safety-valve device, the combination of the valve B with the piston C, having an annular lateral opening, and an adjustable cylinder, C^2, all operating together substantially as described, and for the purpose set forth.

2. In a safety-valve device, the combination of the piston C and adjustable cylinder C^2 with the recurved walls of the chamber S, all operating together substantially as described, and for the purpose set forth.



253,623. MOTIVE POWER. M. ALEXANDER PEELAND, Asheville, N. C. Filed Jan. 16, 1882. (No model.)

Claim.—1. In a mechanism for driving light machinery, the combination of the bracket, having at one end a pair of rigid jaws, with the set-screw for securing the bracket to a stand or table, the standard rising from the bracket, and supporting a pair of intermeshing gear-wheels, the fly-wheel upon the axle of one of these gear-wheels, and the reciprocating rod connected by a link with a wrist-pin upon the fly-wheel, substantially as described.

2. The combination, with the bracket having at one end a pair of rigid jaws and at its remaining end a slotted standard, with the set-screw passing through one of said jaws, the intermeshing gear-wheels C D, arranged in the slotted standard, and having their axles extended out from the standard on opposite sides thereof, the crank-handle upon the axle of one gear-wheel, and the vertical reciprocating rod working through guides attached to the standard, and connecting by a link or connecting-rod with a wrist-pin upon the fly-wheel, substantially as described.

253,624. WEED AND LAWN MOWER. ALONSO T. PIER and PERRY A. LOY, Clarinda, Iowa. Filed Sept. 17, 1881. (No model.)

Claim.—1. In a weed and lawn mower, the combination of the pivoted main frame A, having the depending upright rigid bars *b b*, provided with hooked or right-angled ends *b' b'*, and the bifurcated or forked shaft D, constructed substantially as shown, and flexibly connected to the main frame A, substantially as and for the purposes specified.

2. In a weed and lawn mower, the combination, with the main frame A, of the bifurcated or forked shaft D, suspended from said frame near its rear end by a flexible connection, the arms *d d* of said shaft extending forward of said frame and bent upward on substantially a horizontal line therewith and connected by the frame G, and the sickle-driver and operating mechanism, substantially as and for the purpose herein shown and described.

3. In a weed and lawn mower, the combination of the sickle-bar, flexibly connected to the arms of the bifurcated shaft, and the sickle-bar supporting-shoes flexibly connected to vertically-adjustable upright bars *f f*, connected to the arms of the bifurcated shaft, substantially as and for the purpose herein shown and described.

4. In a weed and lawn mower, the combination, with the supporting-shaft and wheels having pawl-and-ratchet connections, of the pivoted main frame provided with the supporting-arms *b b b' b'*, the bifurcated shaft D, flexibly connected at its rear end to the frame A and carrying at its forward end the sickle-bar and sickle, the sickle-driver connected to and extending over the entire length of sickle, and mechanism, substantially as described, for connecting said sickle-driver with the operating-gear of the machine, substantially as and for the purpose specified.

253,625. INSECT-DESTROYER. FRANCIS T. PISTER, Schulenburg, Tex. Filed Dec. 19, 1881. (No model.)

Claim.—The combination of the frame, collar, or ring, grooved upon its top so as to hold an absorbent material, and provided with the flange upon its under side, to be pressed into the earth, with a can provided with a stop-cock for holding the poisonous liquid, the can being placed in such relation to the collar that the fluid will drop from the cock into the collar, substantially as described.

253,626. CAR-COUPLING. JOHN A. PORTER, St. Louis, Mo. Filed Oct. 7, 1881. (No model.)

Claim.—1. The combination of the draw-heads B B', having the laterally-elongated mouths *b'* and the shoulders *b'* at the top and bottom, respectively, of the chambers *b*, and the bolt C, having the flattened heads *c c*, substantially as described.

253,626.

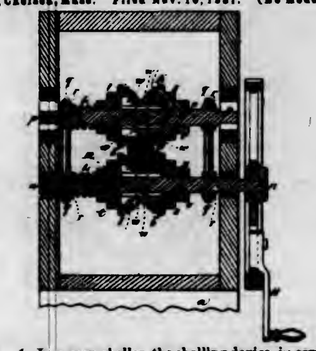
2. The combination of the draw-heads B B', having the laterally-elongated mouths *b'* and the shoulders *b'* at the top and bottom, respectively, of the chambers *b*, and the bolt C, having the flattened heads *c c* and the handle D, said handle being extended and shaped substantially as described.

3. The draw-head B, having the shoulder *b'*, shaped as shown, for the purpose of supporting the handle D of the bolt C, substantially as described.

253,627. BUTTON-FASTENING. GEORGE W. PRENTICE, Providence, R. I., assignor to the Heaton Button Fastener Company, same place. Filed Dec. 28, 1881. (No model.)

Claim.—As an improved article of manufacture, the herein-described button-fastener, consisting of the blank or plate A, provided with the fastening-prongs B, arranged upon the sides thereof, and with the curved spring-jaws C C', formed from the central part of said plate and bent at right angles thereto, substantially as and for the purpose specified.

253,628. MAGAZINE SPRING-GUN. ABRAHAM LINCOLN RICH, Water Cure, Pa. Filed Oct. 11, 1881. (No model.)

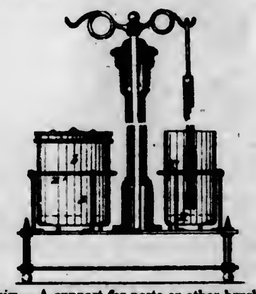


Claim.—1. In a spring-gun, the stock *a*, having its bore *b* formed by a top groove and the covering-plate *c*, and a magazine formed by a bottom parallel groove, *j*, and a bottom cover, *k*, the latter being of a less length than said bottom groove, *j*, in combination with the driver, its projecting spring *m*, the spring-trigger *g*, and the spring-feeder, all constructed and arranged substantially as described.

2. The magazine-forming groove in the under side of the stock, having a length greater than that of its bottom cover, *k*, in combination with a spring-feeder secured within said groove by the leather strip *n*, provided with the thumb-pin *n'*, substantially as described, for the purpose specified.

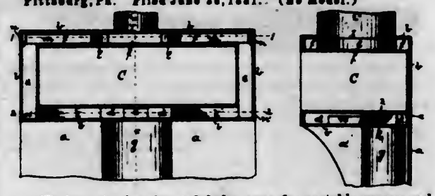
3. The target-practice gun herein described, consisting of a stock having parallel grooves formed in its top and bottom sides, and covered to form respectively the bore and a magazine, the shouldered driver, its inclosed spring, the spring-trigger, and the spring-feeder, the latter secured by the leather strip seated within the uncovered part of the bottom groove, and all constructed and combined as shown and described.

253,629. CORN-SHELLER. JOHN W. RICKER and TRISTRAM S. LEWIS, Chelsea, Mass. Filed Nov. 10, 1881. (No model.)



Claim.—1. In a corn-sheller, the shelling device, in combination with a pair of feed-rollers formed of a pair of conical-faced toothed portions, *e f*, one of each pair fixed upon its shaft and one of each pair sliding on its shaft, and the springs L, bearing against said loose portions, substantially as and for the purpose set forth.

2. In a corn-sheller, the combination of the feed-rolls I K, shafts *n p*, each of said rolls being composed of a portion, *e*, fixed upon its shaft, and a sliding portion, *f*, and springs L, bearing against the portions *f*, said rolls being also provided with the pointed bars *w*, projecting from each portion into the opposite hollow portion, said bars being provided with curved or inclined holding-edges 13, which fit around the cob when the portions *f* are separated from the portions *e*, and adapted to overlap and interlock with each other, whereby the rotary motive of the portions *e* is communicated to the portion *f*, all constructed to operate substantially in the manner and for the purpose set forth.



3. In a corn-sheller, the combination of the shelling device, the shafts *n p*, the latter movable in its bearings and adapted to be forced toward the former by springs *g*, the separable feed-rolls I K, having adjustable toothed bearing-faces, and interlocking bars *w*, having holding-edges 13, mounted upon said shafts *n p*, all constructed to operate substantially in the manner and for the purpose described.

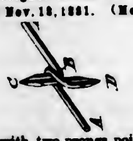
253,630. BRUSH-SUPPORTER. ALBERT RITTMEYER, St. Gallen, Switzerland. Filed Dec. 27, 1881. (No model.)

Claim.—A support for paste or other brushes, consisting of a base-plate, a vertically-adjustable post having one or more supporting-arms at the upper end, and a vessel for the adhesive substance below the supporting arm or arms, substantially as set forth.

253,631. ELEVATED OVEN FOR RANGES. J. J. HENRY SCHLAG, Millvale, and THOMAS J. GRAFF and JAMES F. MCKEE, Pittsburg, Pa. Filed June 26, 1881. (No model.)

Claim.—1. An elevated bake-oven for portable ranges and stoves, provided with an inner baking-chamber, flues around said chamber, a smoke-entrance having its greatest diameter lengthwise of the oven, and a smoke-discharge having its greatest diameter crosswise of the oven, substantially as and for the purposes set forth.

2. An elevated bake-oven for portable ranges and stoves, provided with an inner baking-chamber, C, a bottom flue, *d*, end flues, *e*, and top flue, *f*, around said chamber, said bottom flue having a smoke-entrance, *g*, and deflecting-plates *h*, for throwing the products of combustion forward in the flue, substantially as set forth.



3. An elevated bake-oven for portable ranges and stoves, provided with an inner baking-chamber, C, a bottom flue, *d*, end flues, *e*, and top flue, *f*, around said chamber, said top being provided with the deflecting-plates *l* and *m*, for distributing the products of combustion in the flue, substantially as set forth.

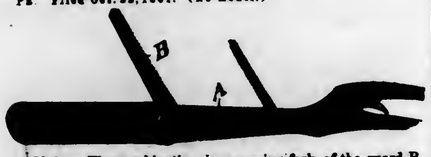
4. In an elevated bake-oven for portable ranges and stoves, the inner baking-chamber, C, in combination with the bottom flue, *d*, having deflecting-plates *h*, end flues, *e*, and top flues having deflecting-plates *l m*, substantially as and for the purposes set forth.

5. In an elevated bake-oven for portable ranges and stoves, the top flue, *f*, provided with the discharge-opening I, having its greatest diameter crosswise of the oven, in combination with the deflecting-plates *l* in said flue around said opening, substantially as and for the purposes set forth.

Claim.—1. The actuating-train and its hand-operated main

253,632. BARB FOR WIRE FENCES. HENRY J. SCHNEIDER, Burlington, Iowa, assignor of one-third to Otto V. Hoffmann, same place. Filed Nov. 18, 1881. (Model.)

Claim.—A barb with two prongs pointing in opposite directions in one piece with the strand A, formed by bending the strand A at points B, C, and D, and twisting the same backward, over, under, and around the double wire at B, and leading it forward in the line of the strand A, the ends of C and D being trimmed to points in such manner as not to cut through the wire, substantially as and for the purpose described.



253,633. COMBINED MEASURE AND FUNNEL. O. SCHOMER, Milwaukee, Wis. Filed Oct. 10, 1881. (No model.)

Claim.—1. In the construction of measuring-cups, the method of fixing the gage-point, consisting in placing a cross wire or rod at the supposed point and bending this rod at the center until its apex coincides with the surface of an exact quantity of liquid from a standard measure, as described.

2. As a new article of manufacture, the combined measuring-cup and funnel described, consisting of the cup A, extension C, bent rod B, half-cover D, and spout E, arranged relatively to each other as shown, and for the purpose set forth.

253,634. CARVING-FORK. THORNTON A. SMITH, Philadelphia, Pa. Filed Oct. 22, 1881. (No model.)

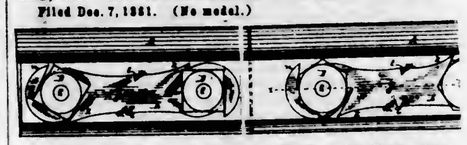
Claim.—The combination, in a carving-fork, of the guard B, with file-teeth cut thereon, and the shank A, formed to operate as a steel, both substantially as set forth.

253,635. BUTTON-FASTENER. FRANKLIN A. SMITH, Jr., Providence, R. I., assignor to the Heaton Button Fastener Company, same place. Filed Dec. 15, 1880. (No model.)

Claim.—1. The herein-described button-fastener, consisting of the two prongs B B', provided respectively with an eye or loop, C, and a table or plate, D, substantially as and for the purpose specified.

2. The herein-described blank for button-fasteners, consisting of the plate provided with a front and rear prong, an intermediate nock or loop, and an enlarged base or table, substantially as and for the purpose specified.

253,636. BUTTON-FASTENING. FRANKLIN A. SMITH, Jr., Providence, R. I., assignor to the Heaton Button Fastener Company, same place. Filed Dec. 15, 1881. (No model.)

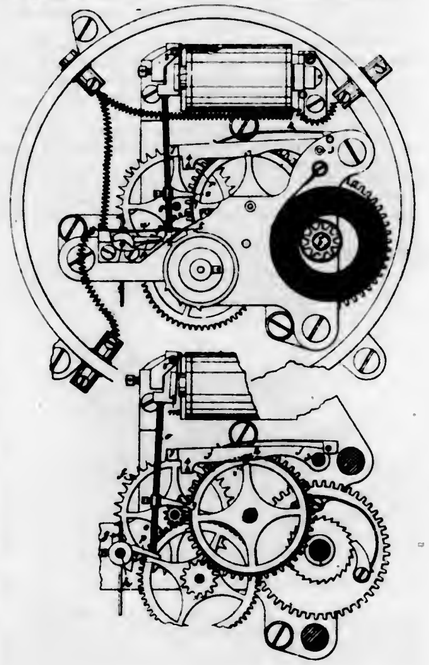


Claim.—As an improved article of manufacture, the herein-described button-fastener, consisting of the plate A, provided with the curved arms or wings B, having spurs *a*, adapted to interlock within the said wings or arms, substantially as and for the purpose specified.

253,637. BUTTON-FASTENER. FRANKLIN A. SMITH, Jr., Providence, R. I., assignor to the Heaton Button Fastener Company, same place. Filed Dec. 13, 1881. (No model.)

Claim.—A button-fastener formed as described, and composed of the intermediate table, A, one end whereof is bent up to form a loop or staple, C, terminating in a downwardly-projecting prong, B, and the opposite end provided with a similar prong bent upward and at right angles to the said plate A, substantially as and for the purpose specified.

253,638. NUT-LOCKING PLATE. JOHN SMITH, Verona, Pa. Filed Dec. 7, 1881. (No model.)



Claim.—1. The nut-locking plate E, adapted to fit over two adjacent bolts, and having the spring-lips *k*, the edges whereof extend into the plate beside the bolt-holes and diagonally of its length, and the auxiliary spring-lips *n*, the edges whereof are at a different angle from those of the spring-lips *k*, substantially as and for the purposes set forth.

2. The nut-locking plate E, adapted to fit over two adjacent bolts, and having the convex washers *f*, spring-lips *k*, the edges whereof extend into the plate diagonally of its length, and the auxiliary spring-lips *n*, having their edges differing in line from those of the spring-lips *k*, substantially as and for the purposes set forth.

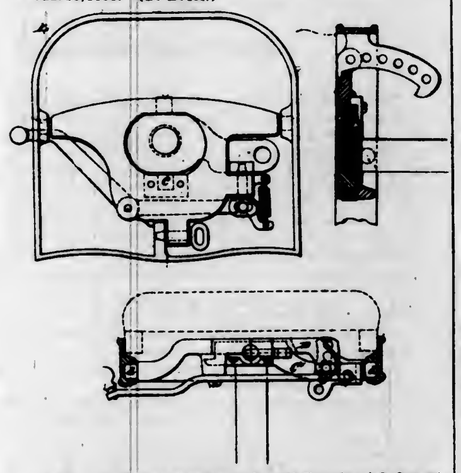
3. A nut-locking plate having the spring-lip *k* extending into the plate beside the bolt-hole and diagonally of the length of the plate, and the fulcrum-point *m*, adapted to hold up the spring-lip, substantially as and for the purposes set forth.

4. The locking-plate E, adapted to fit over two adjacent bolts having convex washers *f* at each end, being formed concave in its length, as at *g*, between said washers, and having spring-lips *k*, the edges whereof extend into the plate beside the washers and diagonally of its length, substantially as and for the purposes set forth.

253,639. NON-INTERFERING FIRE-ALARM BOX. JOSEPH W. STOVER, Newton, Mass. Filed June 9, 1881. (No model.)

Claim.—1. The actuating-train and its hand-operated main stopping device, combined with the secondary or non-interfering stop for the said train and controlling electro-magnet therefor, arranged and to operate substantially as and for the purpose described.

2. The actuating-train and hand-operated main stopping device therefor, combined with the secondary stop, properly located to engage a different portion of the said train from the said main stopping device, and the controlling electro-magnet for the said secondary stop, substantially as and for the purpose described.



3. The actuating-train and its hand-operated main stopping device, and the secondary stopping device therefor and its controlling electro-magnet, combined with the holding device for the said secondary stopping device, substantially as and for the purpose described.

4. The actuating-train, including the stop-wheel and escapement, and the stop-engaging arm connected with the latter, combined with the main stop-arm and starting-lever therefor, and the electro-magnet, its armature, and stop-rod connected therewith, substantially as and for the purpose described.

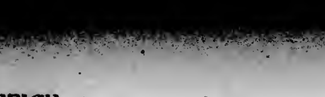
5. In a non-interfering signal-box, the actuating-train, combined with the electro-magnet, its armature, and the non-interfering stopping device for the said train operated by the said armature, substantially as and for the purpose described.

6. The actuating-train and electro-magnet and its armature, provided with a stopping device for the said train, and the hooked finger connected with the said stopping device, combined with the train-wheel and its notched holding-flange, substantially as described.

253,640. DENTIST'S CHAIR. JOHN S. THOMPSON, Greenville, S. C., assignor to Melville M. Johnston, New York, N. Y. Filed Jan. 15, 1881. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, of the post or plunger, the oscillatory cross-head swiveled thereto, the oscillatory seat-frame swiveled to the said cross-head so as to be capable of moving in a plane at right angles to the plane of oscillation of the cross-head, and independent locking mechanisms, substantially as described, the one locking the frame to the cross-head, the other locking the cross-head to the plunger.

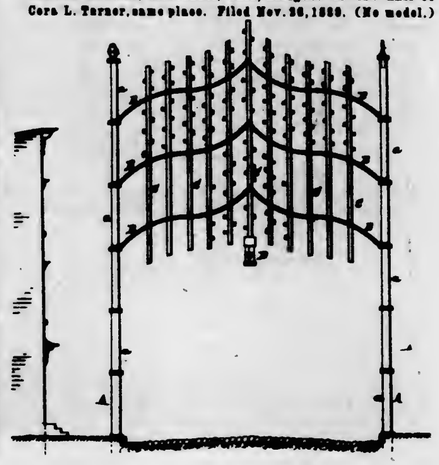
2. The plunger or post and its hub, provided with a lateral extension for supporting the spittoon and bracket attachment, in combination with the oscillatory cross-head carried by and swiveled to the hub, the seat-frame carried by and jointed to the cross-head so as to be capable of independent oscillatory movement in a plane at right angles to the plane of oscillation of the cross-head, and independent locking mechanisms, substantially as hereinbefore shown and set forth.



253,641. MAGAZINE FIRE-ARM. WILLIAM TRAUER, Louisville, Ky. Filed July 25, 1881. (No model.)

Claim.—In a magazine-gun provided with guides, as described, for directing the head of the shell into position, the combination therewith of a bolt provided with a longitudinal finger or extension adapted to travel underneath the shell and lift its forward end, substantially as and for the purpose set forth.

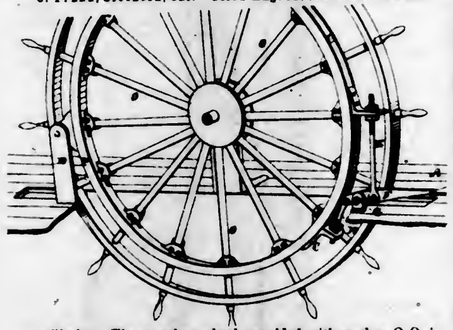
253,641.



253,642. CLASP FOR CORSET-STIFFENERS. CHRISTIANA V. TURNER, Nicola Valley, British Columbia, Canada, assignor of one-half to David K. McMullen, San Francisco, Cal. Filed May 19, 1881. (Model.)

Claim.—The device for securing the stiffeners in corsets and protecting the cloth from wear at the ends of the stiffeners, consisting of the clasp or fastener C, having a perforated head, *c*, fitted with an eyelet, E, and having the points *e e*, when constructed and adapted to be applied substantially as herein described.

253,643. MEANS FOR SUPPORTING TELEGRAPH-WIRES. SAMUEL TURNER, Cincinnati, Ohio, assignor of one-half to Cora L. Turner, same place. Filed Nov. 26, 1880. (No model.)



Claim.—1. The arches, as B, and stanchions, as C, vertically arranged upon said arches, and provided with insulators carrying the wires, combined and located substantially as and for the purposes specified.

2. The arches, as B, stanchions, as C, arranged upon said arches substantially as described, and constructed in sections and provided with insulators, all combined and located substantially as and for the purposes set forth.

3. The posts A, consisting of sections *a*, said sections being provided with shoulders *b b'*, in combination with the arches B, the latter being provided with Y-shaped extremities, substantially as and for the purposes specified.

253,644. FRICTION-BRAKE FOR STEERING-WHEELS. W. C. TYLER, Stockton, Cal. Filed Aug. 31, 1881. (No model.)

Claim.—The steering-wheel provided with spokes O O, in combination with the removable brake-rim P, provided with fastening-lugs, in combination with the fastening-stirrups straddling the spokes and secured to the lugs, and the brake-lever and compression-band, all constructed, arranged, and operated as set forth.

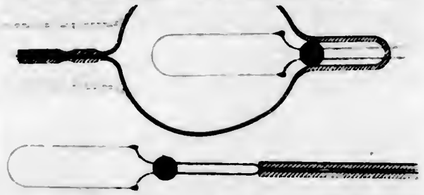
253,645. ELECTRIC LAMP. WILLIAM L. VORLEEB, Morton, Pa. Filed June 24, 1881. (No model.)

Claim.—1. In an electric lamp of the character herein specified, the incandescing filament of carbon A, plated at its extremities and united by means of solder to the extremities of platinum conducting-supports B, extending to the exterior of the lamp and held in place by a spherical mass of non-conducting material, C, seated in the neck of the globe, said conductors B and incandescing filament A forming a continuous unbroken conductor, substantially as shown and described.

2. In an incandescent electric lamp of the character herein specified, the combination, with the transparent bulb and neck formed in one piece, of a spherical mass of non-conducting material seated in the neck, the two conducting-supports for the carbon filament secured in said mass and passing downward side by side a slight distance apart from each other through the neck of the bulb, said neck being sealed around the conductors at its lower extremity, substantially as shown and described.

253,646. INCANDESCENT ELECTRIC LAMP. WILLIAM L. VORLEEB, Morton, Pa. Filed Dec. 13, 1881. (No model.)

Claim.—1. In an incandescent electric lamp of the character herein specified, a support for the incandescing filament of carbon, resting in the neck of the globe and held firmly in place by sealing the conductors firmly in the solid portion of the tube passing to the bulb or globe, substantially as set forth.

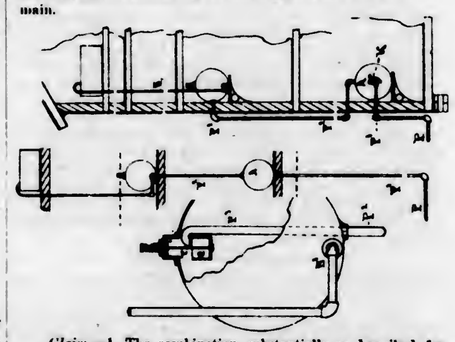


2. In an incandescent electric lamp, a support for the incandescing filament of carbon, constructed of glass, said support being provided with an enlargement fitting into the neck of the globe, and an arm containing one of the conductors extending upward within the globe, substantially as shown and described.

3. In an incandescent electric lamp, a support for the incandescing filament of carbon, formed of non-conducting material, said support being provided at bottom with an enlargement fitting into the neck of the globe and with an arm containing one of the conductors to the incandescing filament of carbon, adapted and arranged to support the carbon, substantially as shown and described.

4. The support for the incandescing filament of carbon F, having enlargement B' fitting into tube A', and arm B, extending upward within the lamp-bulb, the conductors to said carbon passing through the enlargement and supporting-arm, and being fused therein at *a*, substantially as shown and described.

5. In an incandescent electric lamp of the character herein specified, the combination, with the bulb or globe A, of the tube A', having a solid portion, A", at its lower extremity sealed around the conductors E, and the support for the incandescing filament of carbon, having enlargement B' and an arm B, the whole combined and arranged to operate substantially as shown and described.

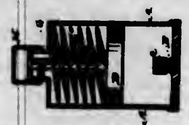


253,647. INCANDESCENT ELECTRIC LAMP. WILLIAM L. VORLEEB, Morton, Pa. Filed Dec. 12, 1881. (No model.)

Claim.—The herein-described improvement in manufacturing incandescent electric lamps, consisting in forming the glass bulb with an enlarged opening at the top and a contracted opening at the bottom, securing the platinum wires connected with the filament of carbon in a ball or mass of non-conducting material larger in diameter than the mouth of the opening from the small tube into the bulb, attaching the ends of the conductors to a rod or holder, and then passing the filament and the platinum wires thus prepared into the bulb at its enlarged opening and bringing the ball of refractory material against the neck of the bulb, and sealing the conductors in the extremity of the small tube and closing the lamp in the usual manner.

253,648. AUTOMATIC WATER-LIFTER. ADDISON G. WATERHOUSE, New York, N. Y., assignor of one-half to D. A. Schuyler, same place. Filed Sept. 1, 1881. (No model.)

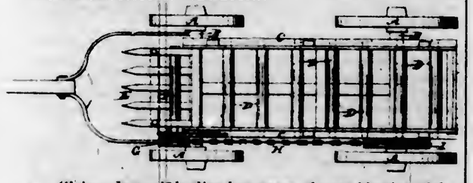
Brief.—Water from the main is forced into the relay-tank B, the float-valve c opening to allow the escape of the air. The water is then withdrawn from the lower tank, A, the said tank and connecting-pipe filling with air, when water is again admitted to A, which forces the air into tank B, thereby forcing the water in B into the reservoir C. Fig. 2 shows a modification whereby the same result is obtained by the varying pressure of water in the main.



Claim.—1. The combination, substantially as described, for an automatic water-lifting apparatus, of a relay-tank placed at or near the level to which the water naturally rises, a pipe opening into said tank at or near its top, and having free and constant communication therewith, as described, an automatic air-valve in the top of the tank, and a pipe connected with the tank at or near its bottom and leading to a reservoir-tank.

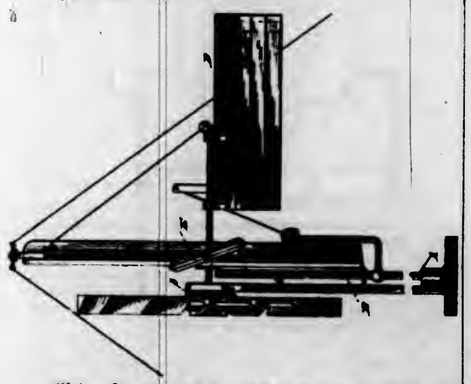
2. The combination, substantially as described, of relay-tank B, pipe $P^{\prime\prime}$, in constant and free communication therewith at or near its top, so that it may either supply water thereto or may receive air therefrom introduced into said tank through an automatic air-valve at its top, an automatic air-valve for said tank controlling an air-vent, a supply-tank, A, and a two-way cock, K.

3. The combination, substantially as described, of the relay-tank provided with automatic air-vent, pipe $P^{\prime\prime}$, in free and constant communication with said tank at or near its top, supply-tank A, means for connecting and disconnecting said tank with the pipes supplying water under pressure and for drawing water from said tank, and outlet-pipe opening into the relay-tank at or near its bottom and leading to a storage-tank.



253,649. EXPLODER FOR FIRING BLASTS. ALEXANDER WATSON, San Francisco, Cal. Filed Nov. 5, 1881. (No model.)

Claim.—1. In a cartridge-exploder, a soldered firing device, in combination with a cap or receptacle adapted to receive and apply to the solder a body of mercury for the purpose of releasing the firing device, for the purpose set forth.



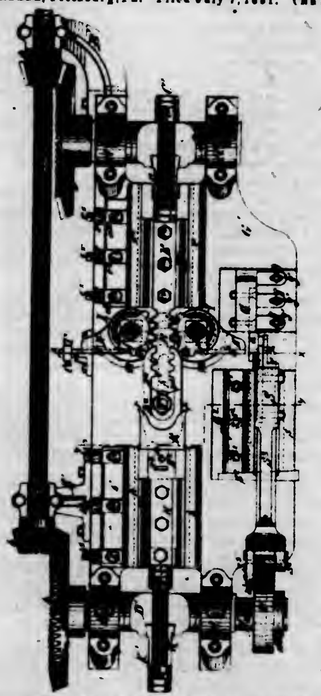
2. The cylinder A, having within it the anvil B, the hammer D, and the spiral or other spring F, against which the hammer is forced back, and held by a solder or cement, as shown, in combination with a receptacle, H, to contain quicksilver, and by which it may be applied to the solder, so as to release the hammer, substantially as and for the purpose herein described.

253,650. HAY-WAGON. WILLIAM H. WHITE, Elbi, Wash. Filed Oct. 25, 1881. (No model.)

Claim.—In a self-loading hay-wagon, the combination of the bent axle B, carrying the body or bed of the wagon close to the ground, the series of rollers D D, the rake E, roller F, pulley G, belt or chain H, and pulley I, substantially as and for the purposes set forth.

253,651. WINDMILL. JAMES M. ADAMS, Sterling, Kans. Filed Sept. 12, 1881. (No model.)

Claim.—In a windmill, the combination, with the shaft *a*, having the wheel C, the arm having the vane E, and the swinging vane D, having an arm, *d*, of the fixed shaft A, having the fixed right-angled hooked arm *f*, and the cord *e*, connecting the vane D to the arm *f*, substantially as shown and described, for the purpose set forth.



253,652. KNITTING-MACHINE. WALTER AIKEN, Franklin Falls, N. H. Filed Nov. 21, 1881. (No model.)

Brief.—The invention is an improvement upon the class of devices shown in Patents No. 15,435 and No. 211,743. The narrowing-slides are fitted to slide between the cam-bar and the needle-bed, and engage the auxiliary shanks of the needles from which the loops have been removed for narrowing the fabric, and hold the same back in their grooves, so that they do not reciprocate, as heretofore, after the yarn-loops have been removed.

Claim.—The cam-bar provided at its under side with the knitting-cam, combined with the narrowing-slides C C', fitted to slide under the said cam-bar as described, or between it and the needle-bed, and with the needle-bed and the series of needles provided with main and auxiliary shanks or projections, whereby some of the said needles may be held back and at rest in the grooves of the needle-bed during the reciprocation of the cam-bar, substantially as and for the purpose described.

253,653. MACHINE FOR BENDING CAR-COUPLING LINKS. J. B. ALEXR, Pittsburg, Pa. Filed July 7, 1881. (No model.)

Claim.—1. In a machine for bending car-coupling links, a bending-mandrel, F, arranged to move longitudinally with reciprocating motion, in combination with rotary moving dies I, arranged on either side of the path of motion of the mandrel, such dies having their working-faces formed of a curved part, *u*, and a straight tangential part, *u'*, substantially as and for the purposes set forth.

2. In a machine for bending car-coupling links, the combination of a reciprocating mandrel, rotary moving bending-dies ar-

ranged on either side of the path of motion of the mandrel, and adapted with the mandrel to bend the blank into U form around and clamp it upon the mandrel, and a reciprocating die arranged to press upon and bend the ends of the U-shaped blank together around the end of the mandrel, substantially as set forth.

3. The combination of reciprocating rack-bar E, rotary moving bending-dies I I, geared with the rack, mandrel F, secured to the rack-bar, and reciprocating die R, substantially as set forth.

4. In a machine for bending car-coupling links, the combination of a reciprocating mandrel, rotary moving dies arranged on either side of the mandrel and adapted therewith to bend the blank into U form, a reciprocating die for bending together the ends of such blank, and an anvil or rest adapted to support the blank as against the pressure of the latter die, substantially as set forth.

5. The combination of rack-bar E, rotary moving dies I I, geared with the rack-bar, reciprocating mandrel F, reciprocating die R, and anvil or rest V, substantially as set forth.

6. The combination of reciprocating mandrel F, rotary moving dies I I, arranged on either side of the path of motion of the mandrel, such dies having arc faces *n* and straight faces *n'*, and end-supporting anvil or rest V, having mandrel-recess *r* and link-recess *s'*, substantially as set forth.

7. The reciprocating bending-mandrel F, having a concave seat or shoulder, *f*, extending part way around the same above the plane or line of bending, in combination with rotary bending-dies I I, having straight bending-faces *n' n'*, with grooves n^3 therein, such grooves being adapted to register with the blank-seat on the mandrel formed by shoulder *f*, substantially as and for the purposes set forth.

8. The combination of reciprocating rack E, dies I I, geared with the rack, such dies having straight bending-faces *n'*, with grooves n^3 therein, which incline downward, as described, feed-supports *m m*, reciprocating mandrel F, and reciprocating die R, having divergent horns *r r*, substantially as and for the purposes set forth.

9. The combination of rack-bar E, mandrel F, yoke C', and cam C, adapted to give reciprocating motion to the mandrel, with a period of rest after each stroke, dies I I, geared with the rack, anvil V, reciprocating die R, arranged to bend together the ends of the blank while the mandrel is at one position of rest, and a shear device for severing blanks from a rod while the mandrel is at its other position of rest, substantially as set forth.

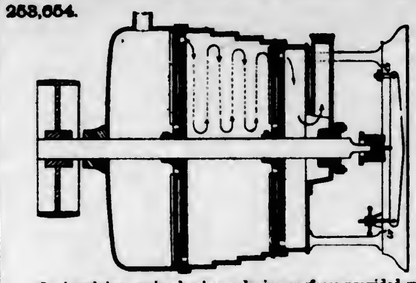
10. The combination of reciprocating mandrel F, rotary moving bending-dies I I, reciprocating die R, and means for separating die R and the mandrel on their back stroke to facilitate discharge of the bent blank, substantially as set forth.

11. The rotary moving bending-dies I I, having central pivots, O, and circular grooves *m' m'* in their under side faces, in combination with curved projections *m m*, adapted to enter the grooves and afford lateral support for the dies, mandrel F, and rack-bar E, the latter being geared with the dies and carrying the mandrel, substantially as set forth.

12. In combination with the bending mechanism of a machine for bending car-coupling links, the shear-head G and shear-blade *a*, reciprocating shear-head S, and blade *a'*, such shear heads and blades being adjustable in the direction of the line of feed, and gage or stop T, also adjustable in position in the line of feed, substantially as set forth.

13. In a machine for bending car-coupling links, the combination of fixed shear-head G and blade *a*, reciprocating shear-head S and blade *a'*, such shear-blades having inclined cutting-faces a^2, for giving an oblique cut to the blank, and reciprocating shear-guide Z, substantially as described.

14. The combination of table G', shear-head G, and blade *a*, such head having a slot-and-bolt connection, *g g'*, with the table, reciprocating shear-head S and blade *a'*, plate S^2, wedge S^3, removable guide-strip *s'*, and bolts s^4, substantially as and for the purposes set forth.



15. The combination of shaft D', yoke K', and cam K, the latter being arranged to give the yoke motion in a horizontal direction, rest *q'*, for the under side of the yoke, bar H, slide-block H', and die R, substantially as set forth.

253,654. APPARATUS FOR REDUCING WOOD AND OTHER MATERIAL TO PULP FOR PAPER. STEPHEN H. ALLEN, Duxbury, Mass. Filed Aug. 17, 1881. (No model.)

Claim.—1. The improvement in reducing wood and other material to fiber for paper-pulp, consisting in crushing or jamming the same between broad-faced bars, substantially as described.

2. The improvement in reducing wood and other material to fiber, consisting in crushing the material between metallic bars, plates, or other devices, and at the same time tearing or disintegrating the fiber by abrading material—such as natural or artificial stone—substantially as described.

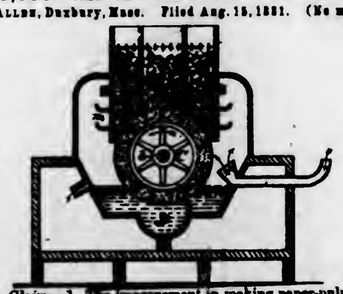
253,664.

3. A pulping-engine having reducing-surfaces provided with broad-faced bars for crushing the fibrous material between them, substantially as described.

4. The combination, in a pulping-engine, of bars, blades, or other metallic devices with blocks or filling-pieces of natural or artificial stone, substantially as described.

5. The combination of the top and bottom plates or their equivalents, provided each with broad-faced bars arranged so that the bars on one plate cross those on the other, and means for removing one or both plates, substantially as described.

6. A series of reducing-plates arranged in pairs, in combination with a shaft carrying one plate of each pair and a casing supporting the other plate, substantially as described.



7. The combination, with the shaft and casing and a series of reducing-plates arranged in pairs, and attached one plate of each pair to the shaft and one to the casing, of means for raising and lowering the shaft and attached plates, so as to bring them closer to or farther from those attached to the casing, substantially as described.

8. A pulping-engine for reducing wood and other material to fiber for making pulp, comprising, in combination, a casing, supporting-frame, shaft, reducing-plates arranged in pairs and attached to said shaft and casing, an inlet for introducing the material into the engine and an outlet for the pulp, substantially as described.

9. The combination, with each other, of two or more pairs of reducing-plates or their equivalents—such as cylinders and concaves—provided each with bars, blades, or other metallic devices, with or without blocks or filling-pieces of abrading material, arranged in series with the space between the plates or their equivalent gradually diminishing, substantially as described.

10. A reducing-plate or its equivalent provided with bars, blades, or other metallic devices on its surface, and with blocks or filling-pieces of abrading material—such as natural or artificial stone—between the bars or blades, substantially as described.

253,655. MANUFACTURE OF PAPER-PULP. STEPHEN H. ALLEN, Duxbury, Mass. Filed Aug. 15, 1881. (No model.)

Claim.—1. The improvement in making paper-pulp, consisting in grinding or reducing to pulp wood and rags or similar material simultaneously in the same machine, substantially as described.

2. The method of preparing wood pulp so that it may be run off directly into paper by grinding wood and rags together and introducing sizing or coloring-matter, or both, into the pulp in the grinding apparatus, substantially as described.

3. The improvement in making wood pulp, consisting in reducing the wood to pulp by grinding it in the manner explained, introducing sizing between and around the fiber as it is reduced or disintegrated, and carrying off the pulp with a stream of water, substantially as set forth.

4. The combination, with a grinding-cylinder, of hoppers arranged as near as may be tangential to the periphery of the cylinder on opposite sides of the center, so that on one side the cylinder revolves against and on the other with the pressure of the stock, substantially as described.

5. The combination, with one or more grinders, of three or more hoppers arranged side by side, substantially as described.

6. The combination, with one or more grinders and two or more hoppers, of feed mechanism and a feed shaft or shafts common to the several hoppers, substantially as described.

7. The combination of one or more grinders, two or more hoppers, a feed shaft or shafts common to said hoppers, and a spiked feeder, substantially as described.

8. The combination, with the feed-shaft of a grinder for reducing wood or other stock to paper-pulp, of a set of cone-gears and means for changing at will the speed conveyed to the feed-shaft through said gears, substantially as described.

9. The combination of a pit, one or more grinders revolving in or above the same, two or more hoppers for each grinder, and one or more pipes or troughs for introducing water or other fluid, substantially as described.

10. The combination, with two or more grinding-cylinders, of a hopper between each adjacent pair of grinding-cylinders, and one or more additional hoppers for the several cylinders, substantially as described.

11. The combination, with a grinding-cylinder, of a hopper having a straight position as near as may be tangential to the periphery of the cylinder, and terminating in a tapering pocket, substantially as described.

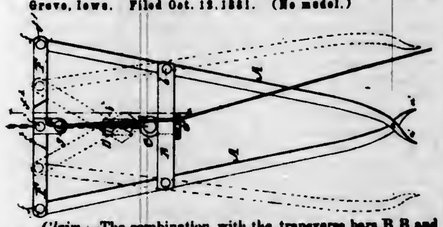
12. A machine for reducing stock to pulp, comprising, in combination, a pit, one or more grinding-cylinders, two or more hoppers to each cylinder, a spiked feeder, and a pipe or pipes for introducing water or other fluid, substantially as described.

13. Pulp of wood and rag fiber ground or reduced to pulp by the same grinder or reducing-surfaces, substantially as described, said pulp being distinguishable by the character of the felting and interlacing of the fibers, as set forth.

253,656. MANUFACTURE OF PAPER-PULP, &c. STEPHEN H. ALLEN, Duxbury, Mass. Filed Aug. 30, 1881. (No specimens.)

Claim.—1. The method of making pulp from bark by separating the rough from the fibrous portion, tearing the latter into shreds by a picker, soaking, and beating, substantially as described.

2. The method of making bark pulp by removing the bark in sheets, separating the rough bark from the fibrous portions by planing, and then tearing the fibrous portions to shreds in a picker, soaking them, and beating them into pulp, substantially as described.

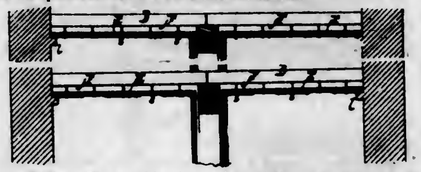


3. The method of preparing bark pulp for making paper, paper-board, and like articles by mixing the bark pulp with or without pulp from solid wood or other material while hot with asphalt sizing or other sizing, substantially as described.

4. Paper-pulp, paper, paper or leather board, or other manufacture of paper containing bark pulp alone or with other fiber sized with asphalt sizing, substantially as described.

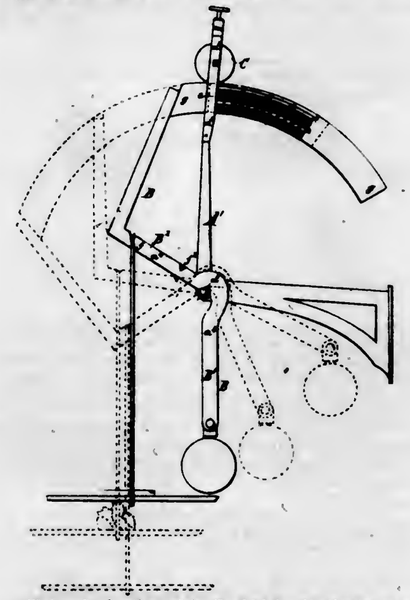
5. The combination in paper-pulp, paper, paper or leather board, and the like, of bark pulp and solid-wood pulp, substantially as described.

6. A paper or leather board of bark pulp and solid-wood or other pulp, sized and colored with asphalt sizing or other sizing and coloring materials, substantially as described.



253,657. HORSE HAY-FORK. WILLIAM ANDREWS, Buffalo Grove, Iowa. Filed Oct. 12, 1881. (No model.)

Claim.—The combination, with the transverse bars B B and bar C, secured between them, and provided with the end rings, *c c'*, of the tines A, pivoted between said transverse bars, bifurcated arms F F, pivoted to the upper ends of the tines at their outer ends, and to each other at their inner ends, and each provided with oppositely-inclined inner ends, *f'*, and recesses having oppositely-inclined shoulders *f'*, and trip-plate G, pivoted to the toggle-arms by the same pin that pivots the toggles together, substantially as described.



253,658. FIRE-PROOF BUILDING. JOHN ARBUCKLE, Brooklyn, N. Y. Filed Dec. 28, 1881. (No model.)

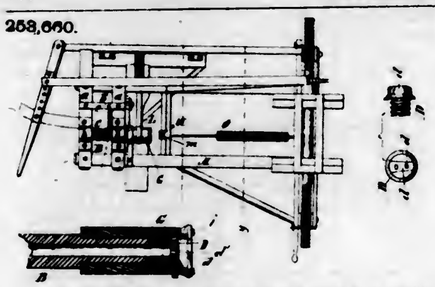
Brief.—The wooden parts of the building are covered by outer metallic plates and an inner layer of cement, secured so as to leave an air-space between the wood and the cement.

Claim.—The combination, substantially as hereinbefore described, with the wooden parts of a building, of a fire-proof covering which is composed of outer metallic plates and an inner layer of cement, and which is secured to the parts at a distance therefrom, leaving an air-space between the cement and the wood, for the purpose specified.

253,659. WEIGHING-SCALE. JOHN B. ATWATER, Chicago, Ill. Filed Nov. 12, 1881. (No model.)

Claim.—1. A roller-weight, C, which is self-adjusting to and acts as a brake upon a vibrating scaled plate of a weighing-scale, substantially as and for the purpose set forth.

2. A pressure device in combination with the roller-weight C, whereby the lever-beam B and scaled plate *g* may at will of the operator be temporarily held stationary, substantially as and for the purpose set forth.



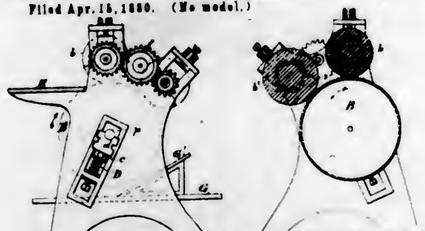
253,660. MACHINE FOR BARBING WIRE. JAMES AYARS and ALEXANDER C. DUCKER, Bushnell, Ill., assignors to the Washburn & Moen Manufacturing Company, Worcester, Mass. Filed June 14, 1879.

Claim.—1. The combination of the non-rotating holder for the main wires, the coiler, and the spring, the said parts being connected and arranged as explained, so that in operation the said holder and coiler are capable together of endwise movement against the pressure of said spring, substantially as described.

2. In a machine for barbing fence-wire, a tubular wire-holder, B, provided with holes at its tip end for two main wires, in combination with the coiling-shell G, mounted loosely on the wire-holder, about which it is arranged to revolve, and projecting over the tip end of the holder, substantially as described.

3. The tubular wire-holder B, in combination with the detachable tip D and the removable holding-die *d*, substantially as described.

253,660.

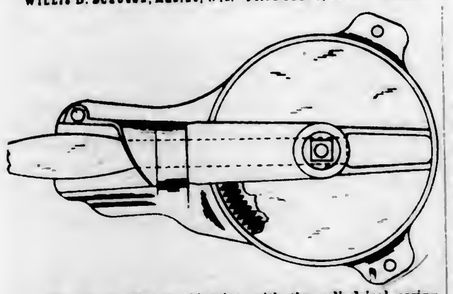


4. The coiling-shell G, provided with a notch, *g*, in combination with the adjustable lug H and the wire-holding tube B, substantially as described.

5. The face-plate I on the end of the coiling-shell, widened on one side to provide a flange, *i*, to hold the inner end of the barb, substantially as described.

6. The cylinder F, mounted on the wire-holder B, in combination with the detachable coiling-shell G, substantially as described.

7. The coiling-shell G, in combination with the wire-holder B, and the pivoted wire-support M, substantially as described.



253,661. MANGLE. JOSEPH F. BALDWIN, Cambridge, Mass. Filed Apr. 15, 1880. (No model.)

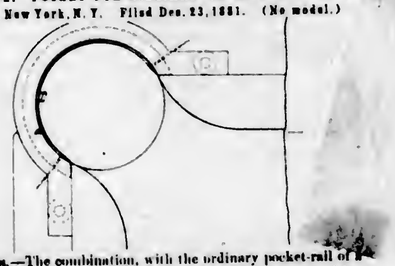
Claim.—1. In a mangle, the smooth-faced heated metallic surface B, combined with the elastic-faced pressure-rolls *b b'*, having successively greater surface velocities, whereby the fabrics are stretched over and held closely against the heated polishing-surface, the elastic facings of the pressure-rolls facilitating the grasping and feeding of the fabrics, as set forth.

2. In a mangle, the combination of the polishing-surface, the pressure-rolls, a feeding-table to receive the articles to be ironed, the table G to arrest the ironed articles, and the inclined plane G' on said table to deflect the articles to the front, all constructed and arranged as shown.

253,662. WAGON-BRAKE LEVER. JOHN L. BARKER and WILLIS D. STAGGERS, Racine, Wis. Filed Jan. 3, 1882. (Model.)

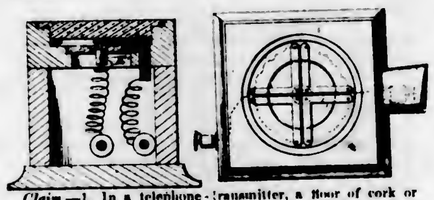
Claim.—1. The combination, with the cylindrical casing adapted to be secured to the wagon or vehicle, of the friction-clutch adapted to work in said casing, the oscillating cover and its lugs, and the spring for holding the clutch in a normal position, and the lever fulcrumed to the outer face of the cover and adapted to bear against a lug on the clutch projecting through an opening in the cover, substantially as and for the purposes specified.

2. In combination with the casing provided with an internal segment and central boss, the friction-clutch located in said casing, the oscillating cover provided with lugs and a central boss, the spring for holding the parts normally, and the lever for moving the clutch, the whole arranged to operate substantially in the manner specified.



3. In combination with the casing provided with an internal segment and central boss, the friction-clutch located in said casing, the oscillating cover provided with lugs and a central boss, and the lever for moving the clutch, the whole arranged to operate substantially in the manner specified.

253,663. LOCK ESCUTCHEON. JOHN H. BARNES, New Haven, Conn., assignor to the Barnes Manufacturing Company, same place. Filed Jan. 3, 1882. (No model.)



Claim.—The herein-described escutcheon, having the key-hole diametrically across its center, in width at the center substantially equal to the thickness of the key, to serve as a guide for the key, and expanded above and below to permit the turning of the key for the withdrawing of the bolt, substantially as described.

253,664. POCKET FOR BILLIARD-TABLES. PATRICK H. BARRY, New York, N. Y. Filed Dec. 23, 1881. (No model.)

Claim.—The combination, with the ordinary pocket-rail of a billiard-table, of an independent or separate cushion arranged below said rail and projecting inwardly beyond the inner edge of the rail to intercept and break the force of the ball before the latter strikes the rail, substantially as shown and described.

253,665. TRANSMITTER FOR TELEPHONES. SAMUEL H. BARTLETT and HENRY E. WAITE, New York, N. Y., assignors to Charles F. Livermore, same place. Filed Jan. 9, 1882. (No model.)

Claim.—1. In a telephone-transmitter, a floor of cork or equivalent material provided with a contact-button or electrode of carbon and loosely resting in a supporting-stand, in combination with recessed blocks of carbon or equivalent material secured to the supporting-stand, and a metallic tripod provided with pendent points resting on said button and recessed blocks, substantially as described.

2. The combination, in a telephone-transmitter, of a floor loosely upheld in its stand or support and provided with a contact-button or electrode, recessed blocks or cups of carbon or its equivalent, and a series of tripods provided with pendent points or spurs and resting by gravity on said recessed blocks or cups and button, substantially as described.

253,666. LAMP-WICK. GERHARD BÖCK, Waco, Tex., assignor of one-half to George D. Streater, same place. Filed Sept. 9, 1881. (No model.)

Claim.—A lamp-wick consisting of one or more layers of mineral wool inclosed in a textile material, the whole being sewed together by a series of parallel longitudinal stitches, substantially as described.

253,667. SETTING PEARLS ON FINGER-RINGS, &c. JULIUS BRAUNS, Newark, N. J. Filed Dec. 14, 1881. (No model.)

Brief.—The cavity in the gem is larger at the bottom than at its mouth, to receive the end of the shank having the wedge, which is forced into the cavity, causing the shank to spread and fill the cavity.

Claim.—1. The combination, in jewelry, with the body *b*, of the gem having the cavity *d* therein, the hollow shank, and wedge, all arranged and operating substantially as and for the purposes set forth and shown.

2. The combination, in jewelry, of the shank carried by the body *b*, adapted to be spread, the stone having a cavity therein enlarged at its bottom, and the wedge, all arranged and operating substantially as and for the purposes herein set forth and shown.

253,668. LOCKET. WILLIAM H. BLAISDELL, Attleborough, Mass., assignor of one-half to Sturdy, Brothers & Co., same place. Filed Dec. 16, 1881. (No model.)

Brief.—A spring forces the picture-holding slides through a slot in the side of the locket-case. Spring-catches hold such slides normally retracted within the case when desired.

Claim.—1. A locket or analogous article of jewelry, consisting of a slotted case, a slide adapted to be contained therein, a spring for forcing the slide out of the case, and a spring-actuated catch adapted for use in holding the slide retracted, and also for releasing it when desired, substantially as hereinbefore specified.

2. The combination, with the case of a locket or analogous article of jewelry, of the notched picture-holding slide, adapted to work in and out through a slot in the side thereof, a spring arranged between the inner sides of the case and slide, the spring-actuated catch, beveled as described, to adapt it for being raised automatically when the slide is forced in, and for engagement therewith and disengagement therefrom, substantially as shown and described.

3. The combination, with the locket-case having one side slotted, as specified, of the notched slide, the spring for forcing out the latter, and the spring-actuated sliding bar, which projects from the case, and has a beveled catch formed on upper end, to operate as and for the purpose shown and described.

4. The combination, with the locket-case provided with a lateral slot, of a slide having ears for engagement with portions of the case when forced out, and a spring, all arranged as shown and described, to operate as specified.

5. The combination, with the locket-case having a lateral slot, a notched picture-holding slide having ears on its outer side, as shown, a spring arranged within the case, and a spring locking-catch, all as shown and described, whereby the said slide is held steady in place within the case, as specified.

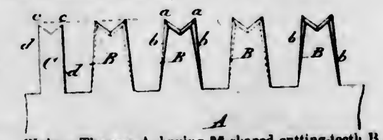
253,669. ART OF PRODUCING COLORED PHOTOGRAPHS. JEAN BAPTISTE GERMEUIL-BONNAUD, Paris, France. Filed July 7, 1881. (No specimens.) Patented in France Jan. 28, 1878, in Belgium June 30, 1879, and in Italy Sept. 30, 1879.

Claim.—1. The method of producing colored photographs, consisting in combining the coloring-matters with agents, such as albumen and sal-ammoniac, applying the colors thus prepared according to the general outlines of the picture, covering the colors with a sensitive layer and developing an image in said layer by exposure under a negative, substantially as described.

2. A pigment or coloring material mixed with albumen and sal-ammoniac, substantially as described.

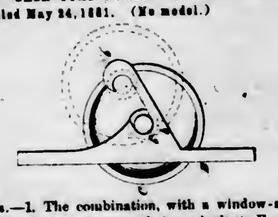
3. A coloring compound comprising vegetable color, glycerine, albumen, and sal-ammoniac, substantially as described.

4. In the art of producing colored photographs with the colors covered by a layer having the photographic image developed therein, the improvement set forth, consisting in preparing the colors with agents, such as albumen and sal-ammoniac, applying the prepared colors to paper or other material, and treating the same with a bath of alcohol and acetic acid, substantially as described.



253,670. STEAM-TRAP. GEORGE B. BOOMER, New York, N. Y. Filed Dec. 1, 1881. (No model.)

Claim.—1. The combination, in a steam-trap, of the T-shaped casing having its neck provided with lateral water-escape orifices which are diametrically opposite to each other, and also provided with the steam-pipe opening into the upper portion of said casing, the open-mouthed T-shaped float, arranged to receive the water of condensation from the steam-pipe, and constructed with a neck, A', fitted in the neck B of the casing, and provided with lateral water-escape orifices *d*, substantially as shown and described.



2. The combination, substantially as hereinbefore set forth, of the T-shaped casing having its neck provided with lateral water-escape orifices which are diametrically opposite to each other, and provided in its upper portion with a steam-pipe, the open-mouthed float, arranged to receive the water of condensation from the said steam-pipe, and constructed with a neck fitted into the neck of the casing, and provided with lateral water-escape orifices which are diametrically opposite to each other and in corresponding vertical planes to the orifices of the casing, the water-way connecting the lower portion of the neck with the head of the casing, and the float-guide, for the purpose specified.

253,671. CROSSCUT-SAW. ENOS M. BOYNTON, West Newbury, Mass. Filed Dec. 19, 1881. (No model.)

Claim.—The saw A, having M-shaped cutting-teeth B, each provided with two points, *a a*, dressed to cut in line, and two outer cutting-edges, *b b*, slightly inclined outward from the points, and the M-shaped clearing-teeth C, having points *c c* and vertical edges *d d*, said clearing-teeth being arranged alternately with two or more of said cutting-teeth, substantially as shown and described.

253,672. SASH-CORD PULLEY. THOMAS BREEN, Knowlton, Pa. Filed May 24, 1881. (No model.)

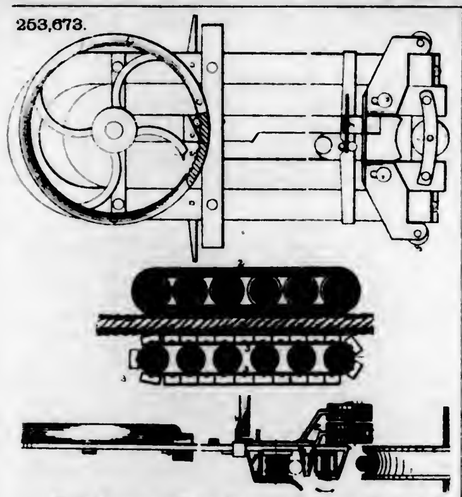
Claim.—1. The combination, with a window-sash and its frame, of the weighted straps or their equivalents E, and the pulleys C, adapted to slide out of the way of the ascending or approaching sash, substantially as and for the purpose set forth.

2. The combination, with the weighted metallic strap or band E, of the pulley C and its bracket B, having the upwardly-inclined ways or arms *b' b'*, substantially as and for the purpose specified.

253,673. GRIPE FOR PROPELLING CARS. RICHD. F. BRIDGWELL, San Francisco, Cal. Filed Nov. 10, 1881. (No model.)

Brief.—The automatic gripe has two jaws provided with rollers incased in ropes or belts, and consists of a stationary frame having one of the jaws secured thereto, and to a vertically-movable toothed frame is secured the other jaw, operated by a fly-wheel. The vertically-moving frame carries conical pulleys, which are automatically operated by inclined surfaces in the cable-way, whereby the cable is freed from the gripe when crossing another cable-line.

Claim.—1. A gripe for street-cars, having two jaws, which are provided with rollers which are incased in ropes or belts, in combination with the drawing-cable, substantially as shown.



253,673.

253,675.

253,677.

253,680. MECHANICAL MOVEMENT. PETER T. COFFIELD,

253,673.

2. In an automatic gripe for railroads, the combination of a stationary frame having one of the jaws secured thereto, a vertically-movable toothed frame having the other jaw secured to it, a fly-wheel, and a pinion, substantially as described.

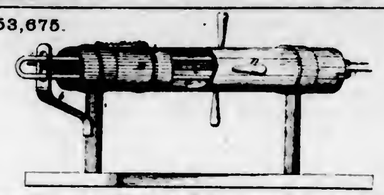
3. In a gripe for street-cars, the combination of the two frames having the jaws secured to their lower ends, a fly-wheel, pinion, and automatically-acting dog for locking the jaws in any desired relation to each other, substantially as set forth.

4. The combination of the two frames having the jaws secured to their lower ends, a vertically-movable plate or frame provided with a flange or projection for raising the plate upward, and rollers to force the cable from between the jaws, with an inclined plane to catch under the said flange or projection, substantially as specified.

5. In a gripe for railroad-cars, the combination of the two frames having the jaws secured to their lower ends, a mechanism for raising the movable frame and its jaw, a dog for locking the movable frame and jaw in place, a projection in the road-bed for tripping the dog so as to allow the lower jaw to fall, a plate provided with means for throwing out the cable from between the jaws, and an inclined plane for raising this plate upward, substantially as shown.

6. In a gripe, the combination of the stationary frame and jaw, the vertically-movable frame and jaw, provided with a friction-roller, and an inclined plane for automatically closing the lower jaw on the cable, substantially as described.

253,674. METALLIC SEAL. EDWARD J. BROOKS, East Orange, N. J., assignor to E. J. Brooks & Co., New York, N. Y. Filed Sept. 14, 1881. (No model.)



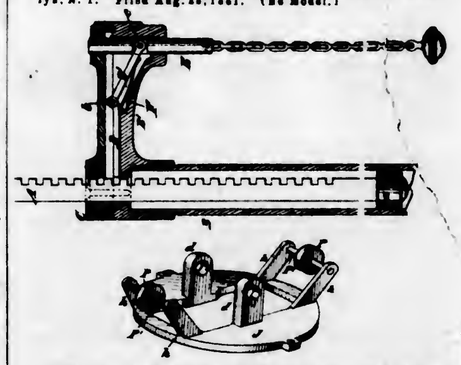
Claim.—1. In combination with a suitable shackle-wire, as herein specified, a soft-metal seal-disk cast on one end of said wire, and constructed with a threading-aperture to receive its other end, and with a recess in one of its lateral edges, into which the threaded shackle end is readily bent by a simple lateral movement, substantially as herein described.

2. The combination, in a metallic seal, of a soft-metal seal-disk constructed with recesses in its respective lateral edges, and with a threading-hole which extends into one of said recesses, and a suitable shackle-wire, as herein specified, having a straight cast-in end held in a solid portion of the seal-disk, substantially as herein described, for the purposes set forth.

253,675. MACHINE FOR BARBING FENCE-WIRE. JACOB BRUBAKER, Amos, Iowa, assignor, by mesne assignments, to the Washburn & Moen Manufacturing Company, Worcester, Mass., and Isaac L. Elwood, De Kalb, Ill. Filed Feb. 10, 1878.

Claim.—1. A fixed holder having two or more apertures for the passage of the main wires, in combination with a revolving and a reciprocating coiling-cylinder having barb-coiling lugs and

253,675.



mounted on the holder so as to be free to revolve and reciprocate without imparting its motion thereto, substantially as and for the purposes set forth.

2. The combination, with means for supporting two or more main fence-wires adapted to permit their passage and at the same time prevent them from twisting, of mechanism for catching one end of the barb inserted between the aforesaid main wires and twisting the said end spirally around both or all the main wires, substantially as described.

3. The non-rotating holder adapted to prevent twisting of the main fence-wires, the barb-winder, and the spring, combined and arranged as explained, so that the barb-winder surrounds said holder and is adapted to move endwise during the coiling operation against the pressure of the spring without imparting its endwise or rotary motion to said holder, substantially as described.

253,676. EXTENSION-CHANDELIER. JOHN T BRUNT, Brooklyn, N. Y. Filed Aug. 26, 1881. (No model.)

Claim.—1. The combination, with a stationary part and an extensible part, one comprising a rack or indented bar and the other comprising guides for the said rack, of toggle-levers, one of which forms a catch for operating in conjunction with the rack to secure the extensible part in different positions, substantially as specified.

2. The combination, with a stationary part consisting of a rack or indented bar, and an extensible part provided with guides for said rack or indented bar, of toggle-levers arranged in a lateral slideway on the extensible part, and adapted to engage with the said rack or indented bar, substantially as specified.

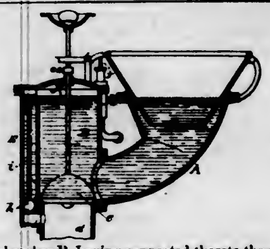
3. The combination, with the rack or indented bar A and pipe or tube B, provided with the slideway B', of the toggle-levers D D' and slider-bar E, substantially as specified.

4. The combination, with the rack or indented bar A and the pipe or tube B, provided with the slideway B', of the toggle-levers D D', slider-bar E, and spring F, substantially as specified.

5. In an extension-chandelier provided with means for counterbalancing its extensible part, the plate J provided with the bearings *d* and the bearings *h*, made in one integral piece with it, substantially as specified.

6. The combination of the plate J, drum H, bearings *d*, and shaft I, substantially as specified.

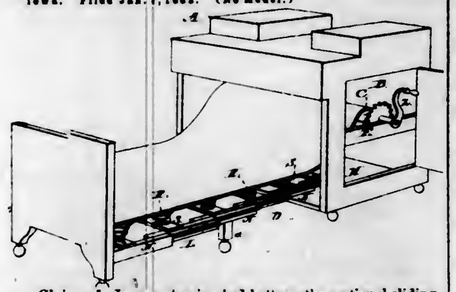
7. The combination of the plate J, drum H, bearings *d*, shaft I, and pin *e*, substantially as specified.



8. The combination of the plate J, drum H, spring L, shaft I, and pin *e*, substantially as specified.

9. The combination of the plate J, drum H, shaft I, and loop or hanger N N', substantially as specified.

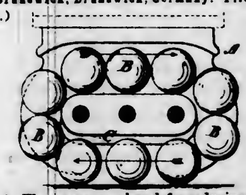
10. The combination of the plate J, drum H, shaft I, loop or hanger N N', and pin *e*, substantially as specified.



253,677. WATER-CLOSET. JOSEPH BUDDE, San Francisco, Cal. Filed Feb. 14, 1881. (Model.)

253,677.

Claim.—The chamber B, having connected thereto the curved pipe A above the upper end of the soil-pipe, said chamber having the overflow-passage E, in combination with the valve *h*, rod *i*, and float J, and the valve or plunger C, connected with mechanism, substantially as described and shown, for operating the water-supply valve, substantially as and for the purpose set forth.

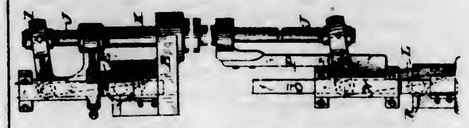


253,678. BED-BOTTOM. ALFRED S. BURNHAM, Parkersburg, Iowa. Filed Jan. 7, 1882. (No model.)

Claim.—1. In an extension bed-bottom, the sectional sliding bars N, forming the side rails, the transverse slats S, slotted at *b* and carrying the bed-springs, and the series of cross-levers *d*, pivoted at their centers to each other and at their ends to the slots of the slats, substantially as specified.

2. The combination, with the recessed case A, having the mattress-roller C and bottom H, of the foot-board K, sectional sliding side rails, L, the slotted slats S, the series of cross-levers *d*, pivoted each other and to the slats, and the mattress or mattress-cloth, substantially as specified.

253,679. ANTI-FRICTION ROLLER BEARING. HEINRICH BÜSSING, Brunswick, Brunswick, Germany. Filed Jan. 9, 1882. (No model.)



Claim.—1. The means employed for reducing the friction of the bearing-surfaces of a stationary and a moving body, which consists essentially in the combination of two such bodies, an endless track, and a series of spheres interposed between the bearing-surfaces of said bodies, said spheres being impelled by the moving body and caused to continuously travel around said track, which latter is arranged to cause the spheres to be successively brought into and moved out of contact with the bearing-surfaces of the two bodies, as described.

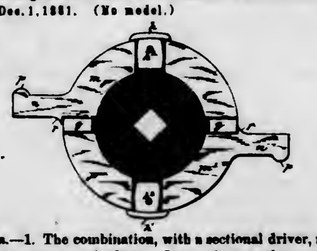
2. The casing A, composed of two or more sections, in which is formed an endless track or tracks having an opening in one portion thereof, a series of spheres, B, arranged to travel freely around said track when impelled by frictional contact with another body and projecting partly through the track to establish said frictional contact, in combination with a stationary track or road upon which said casing is moved to impel the spheres, or a moving shaft or axle that imparts motion to said spheres, all arranged for operation as described.

3. The combination, with the casing A and the spheres B, of an endless track, one section of which is provided with rails or ribs C, substantially as and for the purpose specified.

253,680. MECHANICAL MOVEMENT. PETER T. COFFIELD, Springfield, Ohio, assignor of one-half to Charles H. Paxson, same place. Filed Jan. 3, 1882. (No model.)

Claim.—1. In combination with the two cranks, the two reciprocating rods, the angular levers, and the sliding heads to which the levers are attached.

2. A mechanism for imparting a rotary motion to a crank, consisting in an angular vibrating lever mounted upon a reciprocating fulcrum.

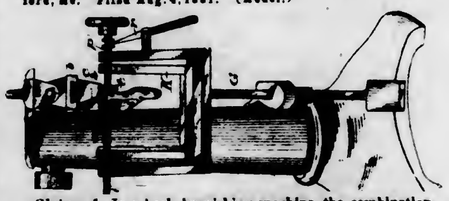


3. The combination, with the driven crank, of the angular lever, the reciprocating rod attached thereto, and the sliding fulcrum for said angular lever.

4. In combination with two cranks, two levers mounted upon the respective cranks, a connecting-rod between said levers, and positively-actuated sliding fulcrums supporting said levers, substantially as described and shown.

5. In combination with the driven crank, the angular lever connected thereto, and the sliding fulcrum for said lever, the connecting-rods J K, connected by swivel-joints to the sliding fulcrum, and angular lever connected with the driving-crank.

6. In combination with the driving-crank, the vertical guide H, reciprocating slide G, angular lever E, rods J K, guide O, slide N, lever L, and crank R.



253,681. MILLSTONE-DRIVER. AMOS CALLAHAN, Maryville, Tenn., assignor to himself and William J. Davis, same place. Filed Dec. 1, 1881. (No model.)

Claim.—1. The combination, with a sectional driver, made in two separate parts, *m m'*, plates *c d*, opposite angular arms, *h h'*, secured to said plates, of the rubber blocks *q q*, inserted in the open spaces at the ends of the separate parts of the sectional driver, substantially as described, and for the purpose set forth.

2. The combination, with the upper and lower plates, *c d*, and opposite arms, *h h'*, provided with lugs *h²* at right angles to the arms and riveted to the plates, of the sectional driver, made in two separate reversible parts, *m m'*, each semicircular at its inner end, and provided with the recess *o* and arm *n*, and the rubber blocks *q q*, inserted between the ends of the parts of the sectional driver, substantially as described, and for the purpose set forth.

253,682. HEEL-BURNISHING MACHINE. JAMES W. CARVER, Lynn, Mass., assignor to the Cachaco Heeler Company, Biddeford, Me. Filed Aug. 4, 1881. (Model.)

Claim.—1. In a heel-burnishing machine, the combination of a head, *b*, adapted to swing laterally on a rigid arm, and carrying a burnishing-tool adapted to be reciprocated, substantially as described, with a vertically-movable shoe-holder for holding the shoe in contact with the tool, such holder being capable of free lateral movement while in action, at the will of the operator, across the path of the burnishing-tool, and also of rotary movement in the line of said path.

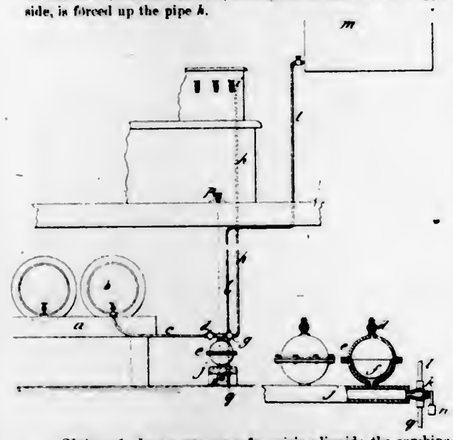
2. The combination, with the forked frame G, of the frame K,

the jointed rod *i*, and the adjusting screw-rod *p*, carrying the pressure-plate *f*.

253,685. MOTOR. JOSEPH L. DONNE, Chicago, Ill. Filed Dec. 27, 1881. (No model.)

2. The combination, with the barrels, nipples, and box, having board C on its bottom, of a breech-block, B, formed with right-

6. The shaft C, pivoted in the vertically and axially adjustable head B, and provided with the socket D, in combination with the thimble F, fitting in said socket, substantially as and for the



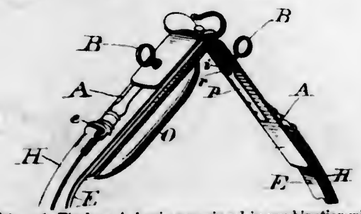
the jointed rod *i*, and the adjusting screw-rod *p*, carrying the pressure-plate *t*.

3. The combination, with the burnishing mechanism and with the forked frame G, of the frame K, having the rods *i p* fixed thereto, but adapted to slide loosely through the frame G, and the pivoted lever *r*.

4. The sole guard or plate 2, having the spring 4, in combination with the head-block, substantially as described.

253,683. APPARATUS FOR RAISING BEER, &c. PETER J. CATTERALL and EDWARD BIRCH, Manchester, County of Lancaster, England. Filed Oct. 19, 1881.[5] (No model.) Patented in England July 21, 1881.

Brief.—Beer is forced from the barrel *b* to the tap *i* by means of the water in tank *m* acting on the under side of the diaphragm in chamber *e*, whence the beer, having accumulated on the upper side, is forced up the pipe *h*.



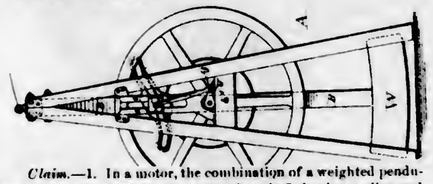
Claim.—1. In an apparatus for raising liquids, the combination, with the barrel *b*, the tap *i*, and the cistern *m*, of the chamber *e*, provided with the flexible diaphragm *f*, the tube *c*, the pipes *h l*, and the water-chest *j*, substantially as and for the purpose set forth.

2. In an apparatus for raising liquids, the combination, with the barrel *b*, the tap *i*, the cistern *m*, tube *c*, and the pipes *h l*, of the chamber *e*, provided with the flexible diaphragm *f* and the valves *d g*, and the water-chest *j*, substantially as and for the purpose set forth.

3. In an apparatus for raising liquids, the combination, with the chamber *e*, the water-chest *j*, and pipe *l*, of the three-way tap *k*, provided with the weighted lever *n*, substantially as and for the purpose set forth.

4. In an apparatus for raising liquids, the combination, with the chamber *e*, the water-chest *j*, and the pipe *l*, of the three-way tap *k*, provided with the weighted lever *n* and waste-pipe *q*, the cord *o*, and the treadle *p*, substantially as and for the purpose set forth.

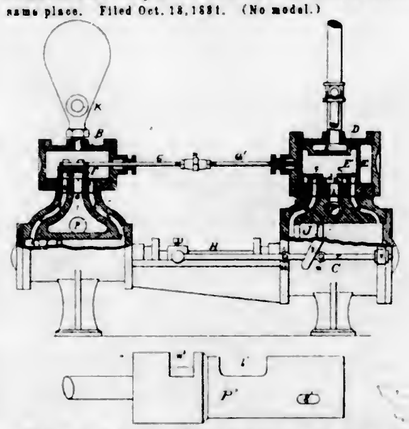
253,684. HARNESS-SADDLE LOOP. LEE DARE, North Manchester, Ind. Filed Dec. 9, 1881. (No model.)



Claim.—1. The loop A, having opening *d*, in combination with the key P, provided with hook *c*, and the terret B, substantially as and for the purpose set forth.

2. The combination of the loop A, having the opening *d*, key P, provided with a hook, *c*, and opening *n*, burr *r*, and terret B, substantially as shown and described, and for the purpose set forth.

3. The combination of the loop A, key P, terret B, and burr *r* with the shaft-bearer H, skirt E, and pad O, substantially as described and shown.

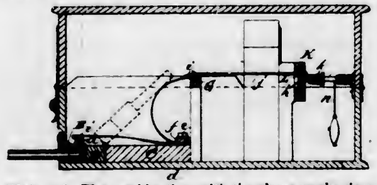


253,685. MOTOR. JOSEPH L. DONNE, Chicago, Ill. Filed Dec. 27, 1881. (No model.)

Claim.—1. In a motor, the combination of a weighted pendulum, a cam attached thereto, a rotating shaft having pulley and fly-wheel, and a cross-head, pitman, and crank connecting said cam and shaft, whereby the power is increased by the pendulum acting upon the shaft through the intermediate mechanism, substantially as described.

2. The combination of the weight W, lever B, cam C, cross-head D, pitman P', crank J, and shaft E, substantially as set forth and described.

253,686. STEAM-PUMP. EUGENE R. EATON and CYRUS TUPTS, Columbus, Ohio, assignors of one-third to Danforth H. Royce, same place. Filed Oct. 18, 1881. (No model.)

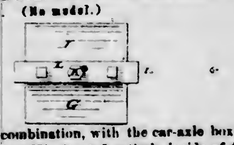


Claim.—1. In a steam-driven water-pump, the steam-valve proper, E, of piston form, having adjustable rigid connection G G' with the pump-valve, and having the central chamber, E', with the exhaust-ports *e e e*, and having the exterior circumferential and longitudinal steam-passages, *e e' e'' e'''*, substantially as described.

2. In combination with auxiliary valve P', having the auxiliary steam-cavity W, and having the central cavity, P'', with main and auxiliary exhaust-ports *b'* and *g''*, the auxiliary steam-ducts *f f''*, communicating with the extreme ends of valve-chamber D, and the auxiliary exhaust-ducts *g g''*, communicating with the said chamber at some distance from its extremities, substantially as described.

3. The combination of the steam-valve E and the auxiliary valve P', having the auxiliary steam-cavity W, and having the central cavity, P'', with main and auxiliary exhaust-ports *b'* and *g''*, as set forth.

253,687. ALARM-SIGNAL. HIRAM A. EATON, Manchester, Me. Filed Nov. 17, 1881. (No model.)

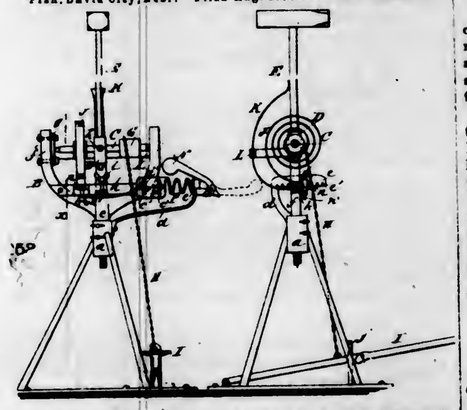


Claim.—1. The combination, with the alarm mechanism, the linked wires *g*, and the pivoted rods *j*, of the bar K, having sc[rew] *h*, and the slide L, as and for the purpose specified.

2. The combination, with the barrels, nipples, and box, having board C on its bottom, of a breech-block, B, formed with right-angled apertures and bolted to a bar hinged to said board C, as described.

3. The combination, with the springs *i*, of the linked wires *g*, the arms *j*, pivoted on cross-bar G, and the bar K, having slot *h*, whereby the wires *g* may be placed over the ends of the springs and under the arms, while the arms are placed in slot *h* to hold the springs back, as described.

253,688. CAR-AXLE BOX. JOHN H. ELWARD, Stillwater, Minn. Filed Dec. 27, 1881. (No model.)



Claim.—1. The combination, with the car-axle box and the axle of the bearing-piece H', situated entirely inside of the walls of the box, the adjusting screw or bolt K, which supports the bearing-piece, and the pins *h h*, which hold the bearing-piece in proper position, substantially as set forth.

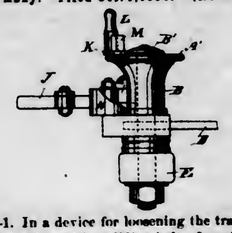
2. The combination, with the axle and the box surrounding its end, of the boss H, carried by the end piece of said box, the adjustable bearing-piece H', and the devices which prevent it from rotating, substantially as set forth.

3. The combination, with the box, the axle, the cover I, and the swinging pivoted strap L L', of the adjustable bearing-piece H' and the bolt K, passing through said strap and cover and adapted to adjust the bearing-piece H', substantially as set forth.

253,689. BLACKSMITH'S FORGING-HAMMER. MARTIN M. FISH, David City, Nebr. Filed Aug. 25, 1881. (No model.)

Claim.—1. The combination, with the adjustable bifurcated head B, provided with the cross-bar *k*, of the shaft C, journaled in the arms of the said head and provided with the handle-socket D, and the coiled spring J, having one end secured to the shaft C and its other end adjustably secured to the bar *k*, substantially as and for the purpose set forth.

2. The combination, with the adjustable bifurcated head B, provided with the cross-bar *k* and the bow L, and shaft C, provided with the socket D and handle E, of the spring K, adjustably secured to the said cross-bar and supported near its center by the said bow, substantially as and for the purpose set forth.



3. The combination, with the bifurcated head B, provided with the cross-bar *k* and bow L, and the rock-shaft C, provided with the socket D and handle E, and the means for operating it, of the coiled spring J, secured to said shaft and cross-bar, and the spring K, secured to the said cross-bar and supported at its center by the bow L, substantially as and for the purpose set forth.

4. The adjustable head B, provided with the adjustable spring-plate P, having the hinged weight N, in combination with the frame A, provided with the arm *d* and the notched plate *e*, substantially as and for the purposes set forth.

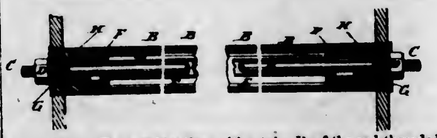
5. The perforated thimble F, adapted to be secured upon the handle of the sledge, in combination with the shaft C, formed with the socket D, the socket being provided with the set-screw *h'*, as and for the purposes set forth.

6. The shaft C, pivoted in the vertically and axially adjustable head B, and provided with the socket D, in combination with the thimble F, fitting in said socket, substantially as and for the purpose set forth.

253,690. HORSE-DETACHER. HEINRICH FLEISCHHAUER, Berlin, Germany. Filed Oct. 1, 1881. (No model.)

Claim.—1. In a device for loosening the traces of animals of draft, the combination, with a sliding bolt, of a rotating collar with a spiral edge or ridge for operating the bolt, and of a spring pressing on the bolt, substantially as herein shown and described, and for the purpose set forth.

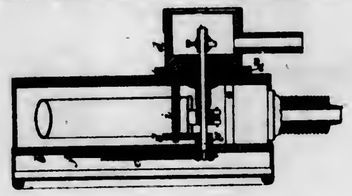
2. In a device for loosening the traces of animals of draft, the combination, with the casing B, of the sliding bolt A, the annular ridge G, the projection G', and the rotating collar H, provided with a spiral ridge or shoulder, H', substantially as herein shown and described, and for the purpose set forth.



3. In a device for loosening the traces of animals, the combination, with the casing B, of the sliding bolt A, the annular ridge G, the projection G', the spiral spring F, and the rotating collar H, provided with a spiral ridge or shoulder, H', substantially as herein shown and described, and for the purpose set forth.

4. In a device for loosening the traces of animals of draft, the combination, with the casing B, of the sliding bolt A, the annular ridge G, the projection G', the spring F, the collar H, having a spiral ridge, H', and the lever J, projecting from this collar H, substantially as herein shown and described, and for the purpose set forth.

5. The combination, with the whiffletree E, of the casings B, the sliding bolts A, the collars H, having spiral shoulders or ridges H', the levers J, the bar or rod N, and the handle N' of one of the levers J, substantially as herein shown and described, and for the purpose set forth.

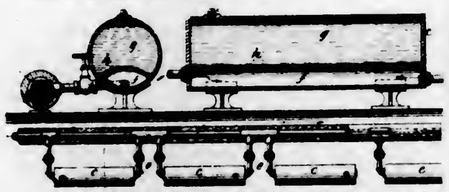


6. In a device for loosening the traces of animals of draft, the combination, with the casing B, of the pintle or bolt A, the head B', and the latch K, provided with a stud or projection, M, substantially as herein shown and described, and for the purpose set forth.

253,691. METALLIC STOPPER FOR BOILER-TUBES. JOHN W. FOWLER, Brooklyn, N.Y. Filed Oct. 21, 1881. (No model.)

Claim.—The combination, with a tube, B, of the end-threaded rod C, the nuts D D, the tubular washer E, surrounding said rod, the centrally-perforated loose blocks F G, respectively tapered and flared, and the leaden collars H, all constructed and arranged substantially as shown and described.

253,692. FLUID-PRESSURE REGULATING AND INDICATING APPARATUS FOR VULCANIZING HEATERS, &c. JOHN H. GARTRELL, Penzance, County of Cornwall, England. Filed June 7, 1881. (No model.) Patented in England Dec. 13, 1879.



2. A steam-engine comprising two cylinders, A A', two pis- | 3. The cam-faced disks s s' and suitable mechanism for con-

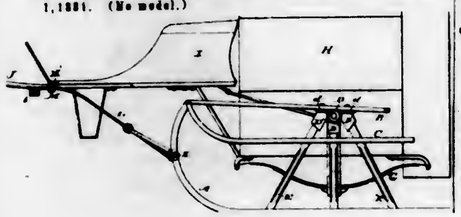
Claim.—1. The combination, in a fluid-pressure regulating and indicating apparatus, of the pointer *c*, actuated by the means, substantially as described, for denoting the steam-pressure, with the valve arranged to be closed at a predetermined time by the devices that move the said index-hand, and the pointer *j*, adjustable with the valve, whereby by adjusting the valve this index will indicate the pressure at which the valve will be closed, substantially.

2. The combination, with the pointer *c*, actuated by devices operated by steam-pressure, and including means for acting upon and closing the valve of the pointer *j*, connected with and moved by the adjustable gas-chamber casing *d*, and the valve carried by said casing, whereby the adjustment of the latter will vary the position of the valve with relation to the device which closes the same, and which is operated by the devices that control the movement of the pointer *c*, substantially as described.

253,693. STEAM-HEATER. EDWARD E. GOLD, Brooklyn, N. Y. Filed June 23, 1881. (No model.)

Claim.—1. A locally-controllable steam heating apparatus adapted for long narrow spaces, consisting of a main longitudinal steam-pipe and a series of distinct heating chambers or radiators arranged at intervals lengthwise with and parallel to the main, with lateral branch pipes connecting the same with the main, and controlling-valves in said branches, substantially as and for the purpose set forth.

2. In a heating apparatus of substantially the described kind, the combination, with a longitudinal main pipe, *a*, of the elongated heating-drums *c c*, arranged at intervals parallel with the main, lateral branches *d d*, connecting the same with the main, and valves *e e*, controlling said branches, substantially as herein shown and described.



3. A locally-controllable steam heating apparatus adapted for long narrow spaces, consisting of a longitudinal main steam-pipe covered to present a non-radiating exterior, in combination with a series of distinct heating or radiating chambers, exposed to give out their heat and arranged closely adjacent to and parallel with the main, and connected therewith by lateral branches provided with regulating-valves, substantially as and for the purpose set forth.

4. A steam heating drum or radiator constructed with two distinct cells or chambers, one placed directly over the other and separated by a partition, the upper one being charged with a sealed body of liquid, while the lower one is adapted to connect with a supply of steam admitted against the intervening partition, substantially as and for the purpose set forth.

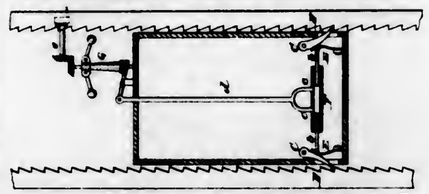
5. A steam heating drum or radiator formed of cast metal, and constructed with two distinct cells or cavities, the one being adapted to receive the steam and arranged in the base of the drum, and the other being adapted to be charged with a confined mass of liquid and placed over the steam-chamber, and the whole embodied in one integral structure, substantially as and for the purpose set forth.

6. A steam heating drum or radiator formed in one continuous casting with two distinct cavities, the one placed upon the other, and the lower one adapted to receive the steam and the upper one to be charged with a confined body of liquid, substantially as and for the purpose set forth.

253,694. SLEIGH. J. THEODORE GURNEY, Boston, Mass., assignor of one-half to Samuel Little, same place. Filed Dec. 1, 1881. (No model.)

Claim.—1. The combination of the body H, the thills J, and thill-frame, which are rigidly attached to said body, the runners connected to the body by a single pivot situated behind the centers of the runners, and devices, substantially as described, which connect the front ends of the runners together and to the thill-frame.

2. The combination of the runners, the tongue L, hinged to the runners and adapted to have the draft applied thereto, the body H, connected to the runners by a single pivot on each side, the thills J, and the thill-frame, arranged, substantially as described, to prevent the body from swinging forward when the thills are connected to the harness.

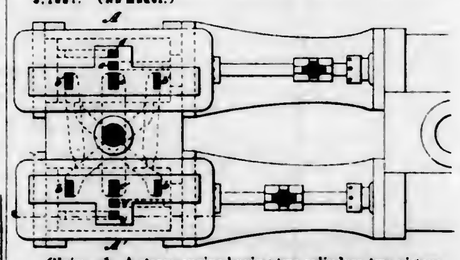


3. The combination of the body H, the thills J, connected to the body independently of the runners, the supplemental tongue L, and whiffletree *l*, connected to the shaft-frame loosely, whereby said tongue and whiffletree can slide forward and back independently of the thills, substantially as set forth.

4. The combination of the body H, the runners mounted upon pivots or trunnions, whereby they can rock independently of the body, the thills and thill-frame connected with the body independently of the runners, the draw-bar K, connected at its ends with the runners by universal joints, and the supplemental tongue L, and whiffletree *l*, supported loosely upon the thills and thill-frame, as and for the purposes set forth.

5. The herein-described metallic connecting and supporting piece for a hub-runner, consisting of the flanges *d* at the upper side, the cylindrical bearing-piece D below said flanges, and the sockets D' D', all cast in one piece of metal.

6. The combination, with the spokes or braces E E, the runner A, and the rave B, of the metallic connecting and supporting part D D' *d*, situated at the upper end of said braces or spokes E and arranged to support the rave B above the axle, and the bar D therefor, substantially as set forth.

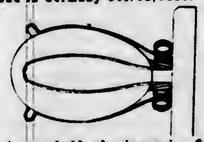


253,695. GOVERNOR ATTACHMENT FOR ELEVATORS. A. HAVNER, Eatonton, Ga. Filed Dec. 27, 1881. (No model.)

Claim.—1. The combination, with the loosely-suspended pawls C C, of the springs E, the slide-rods *d d*, attached to the upper ends of said springs, the case F, to receive the sliding rods, and the pins *c*, passing through said case and rods to hold the springs back and allow the pawls to drop out of the ratchets, as shown and described.

2. The combination, with the pins which lock the spring-holding rods to the case, of the rod *d*, extending up through the cage and connecting by a lever with the described governor mechanism, as and for the purpose specified.

253,696. STEAM-ENGINE. MILAN W. HALL, Plainfield, N. J., assignor of one-half to Albert E. Hall, same place. Filed June 3, 1881. (No model.)

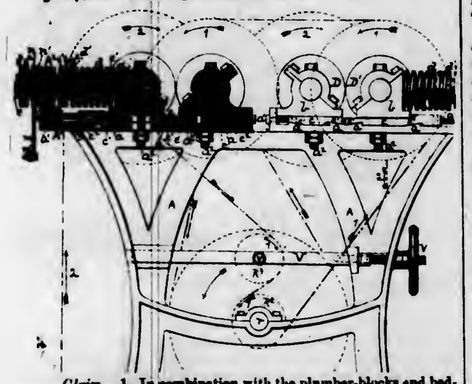


Claim.—1. A steam-engine having two cylinders, two pistons with their piston-rods, and two slide-valves, the valves having a stroke equal to that of the pistons and actuated directly thereby, and the piston in one cylinder actuating the valve which controls the admission of steam to actuate the piston of the adjacent cylinder, and which also controls the admission of steam as a cushion in front of the piston which actuates it, substantially as and for the purposes set forth.

2. A steam-engine comprising two cylinders, A A', two pistons arranged to move therein, two piston-rods attached to said pistons, two steam-chests, and two slide-valves, E E', connected directly with the piston-rods, and having a stroke equal to that of the pistons, the valve E being arranged to control ports for admitting steam to actuate the piston in cylinder A, and to control also cushion-ports *e e*, for admitting steam to cylinder A', and the valve E' being arranged to control ports for admitting steam to actuate the piston in cylinder A', and to control also cushion-ports *e e*, for admitting steam to cylinder A, all arranged to operate substantially as and for the purposes set forth.

3. A steam-engine having two cylinders, two pistons, their piston-rods, and two slide-valves, the valve which controls the admission of steam to one cylinder being actuated by the piston in the adjacent cylinder, and also arranged to control the admission of steam as a cushion in front of the piston which actuates it, substantially as and for the purposes set forth.

4. A steam-engine having two cylinders, two pistons, their piston-rods, and two slide-valves, each cylinder having the usual steam-ports opening into it, and in addition to these two cushion-ports opening into it nearer its ends than the principal steam-ports, the valve which controls the admission of steam for driving the piston of one cylinder being actuated by the piston of the adjacent cylinder, and being arranged to control the cushion-ports of the cylinder whose piston actuates it, substantially as and for the purposes set forth.



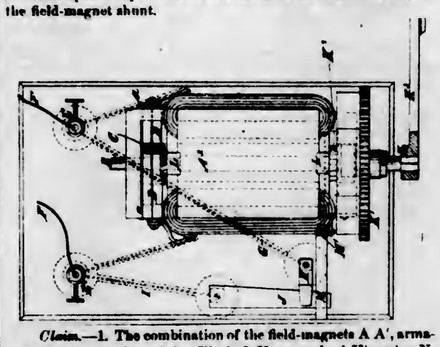
253,697. APPARATUS FOR HOLDING AND CARRYING EGGS. JOHN HALLEY and ALEXANDER BAIN, Glasgow, County of Lanark, Scotland. Filed Jan. 3, 1882. (No model.) Patented in England Aug. 31, 1880, in France Sept. 30, 1880, in Belgium Oct. 1, 1880, and in Germany Oct. 13, 1880.

Claim.—1. An egg-holder having spring-fingers, each shaped with a concave curvature adapted to the sides of an egg, and having its extreme upper end shaped with an outward flare, whereby an egg on being introduced acts like a wedge in opening the fingers, which close inward again by their spring action when the egg reaches the concave holding parts.

2. An egg-holder consisting of a plate with a number of wire fingers formed into spring-coils C at their lower parts.

253,698. ROLLER GRINDING-MILL. CYRUS T. HANNA, Allegheny, Pa. Filed Sept. 19, 1881. (No model.)

Claim.—1. In combination with the plumber-blocks and bed-plate of a roller grinding-mill, the inclines *a a* in the bed-plate at each end of the roll, and one on each side of the vertical plane of the roll-axis, and adjustable wedge-plates *c*, having each a pair of counter-inclines, *c'*, in position corresponding to position of the inclines *a*, substantially as and for the purposes set forth.



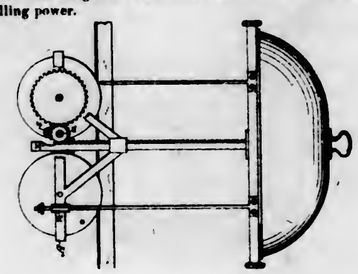
2. In combination with the movable roll of a roller grinding-mill, the stems *e*, connected to the plumber-blocks in the horizontal axial plane of the roll-axis, adjusting and jam nuts *e' e² e²* on opposite sides of the fixed bearings A⁵, sleeves *e²*, and springs *d*, substantially as and for the purposes set forth.

3. The cam-faced disks *n n'* and suitable mechanism for connecting them together in pairs, in combination with the described horizontal adjusting mechanism, substantially as set forth.

4. As a means of changing or varying the adjustments of a movable roll, a pair of cam-faced disks, *n n'*, having inclines and counter-inclines of suitable form terminating at their apexes in flat bearing-points *n²*, for imparting motion in one direction, in combination with a spring for effecting the opposite or reverse throw, substantially as set forth.

253,699. MAGNETO-ELECTRIC MACHINE. MARCUS A. BARNY, Newport, R. I. Filed Aug. 15, 1881. (No model.)

Brief.—The machine is designed for firing mines, lighting gas, or other analogous operations in which a sudden discharge of considerable intensity is desired. The circuit, when started, is through the field-magnets by a shunt from the main circuit, but upon breaking this shunt the whole current is directed through the main circuit. The machine is driven by a convolute spring, and is provided with the necessary pawls, ratchets, and detents. Pressure upon a key first starts the machine and afterward breaks the field-magnet shunt.



Claim.—1. The combination of the field-magnets A A', armature B, gear-wheel or pinion B', shaft K, gear-wheel K', spring N, ratchet-wheel K², pawl O, and a brake for controlling the wheel K', substantially as specified.

2. The combination, with a magneto-electric machine having an electro field magnet or magnets, means for driving the machine, and mechanism for storing up power in the means for driving the machine, of a brake for controlling the means for driving the machine, and a switch actuated by said brake, whereby the electric current generated in the machine may at first be caused to magnetize the field-magnets of the machine, and after that is accomplished to direct or shift the electric current upon an outside circuit, substantially as specified.

3. The combination, with a magneto-electric machine having electro field magnet or magnets, means for driving the same, and mechanism for storing up power in the means for driving the machine, of a brake for controlling the means for driving the machine, comprising a lever, M, and the binding-posts E E', connected with the wire of the field-magnets, the wires G I, and the arms H J, substantially as specified.

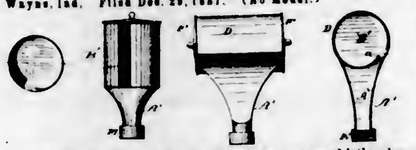
253,700. STORE-SERVICE CARRIER. HARRIS H. HAYDEN, New York, N. Y. Filed May 31, 1881. (No model.)

Brief.—The carrier is raised and lowered on its frame, being suspended by guide-rods. A vertical rack-bar on the carrier is geared to a pinion on one of the carrier-wheels by means of a pinion whose axis-bearings may travel in curved slots. The rack-bar has a recess above its upper teeth, in which the loose pinion may revolve. The weight of the carrier and its contents affords the propelling power.

Claim.—The herein-described pitcher, consisting of the base

3. The oscillating frame B, supported upon the ground-wheel

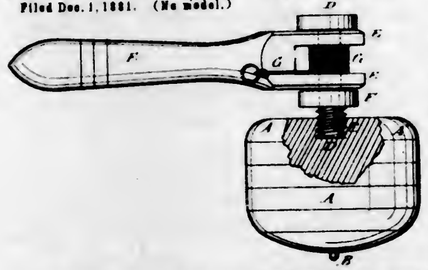
253,707. LAMP-FIXTURE, &c. WOLCOTT A. HULL, New York, N. Y., assignor of one-half to the Annapis Brass and Copper



Claim.—1. A store-service system comprising the tracks between the main desk and counters, cars adapted to travel thereon, and motor appliances carried by the cars and serving as a means of propelling the same, substantially as set forth.

2. A car for store service, consisting of a frame supported by wheels and a rack-bar geared to one of the wheels to turn the latter by its descent, substantially as set forth.

3. The combination of the frame, pinion, and rack-bar, having a recess, *r*, above its upper teeth, substantially as set forth.

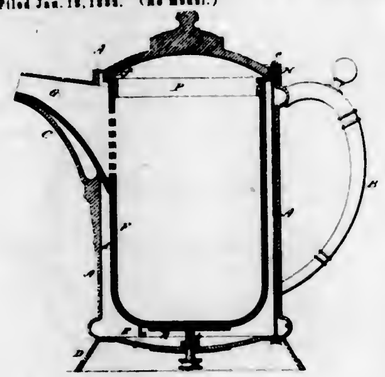


4. The combination, with the sliding rack-bar, of a pinion having a shaft extending into slots *s*, substantially as set forth.

253,701. STEAM-WHISTLE BLANK. WILBUR F. HEATH, Fort Wayne, Ind. Filed Dec. 29, 1881. (No model.)

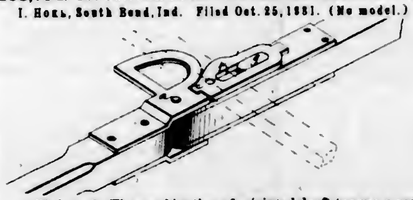
Claim.—The herein-described blank for steam-whistles, having the hollow stem A', the cylindrical part B, the ends F F, all cast in one piece, and the throat *d*, as set forth.

253,702. SPINNING-TOP. JONATHAN HILL, New York, N. Y. Filed Dec. 1, 1881. (No model.)



Claim.—1. A spinning-top constructed substantially as herein shown and described, and consisting of a slotted handle, E, a spindle, D, permanently connected with the handle and having a screw-thread upon its lower end, the top A, having screw-hole, and the cord G, substantially as herein shown and described.

2. In a spinning-top, the spindle D, permanently swiveled to the slotted handle E, and provided with a screw-thread to receive the top, substantially as herein shown and described.

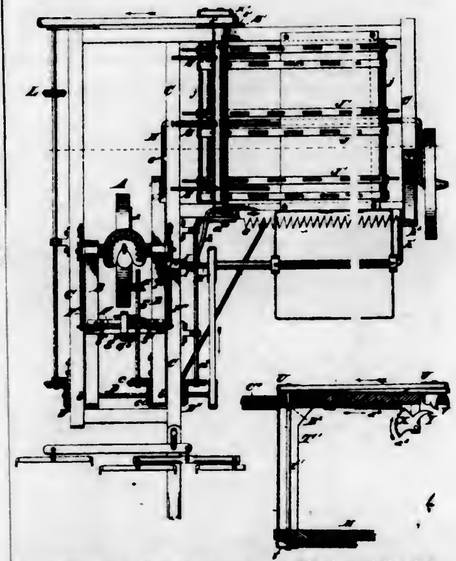


3. In a spinning-top, the combination of the slotted handle E, the spindle D, having screw-thread, and being permanently swiveled to the slotted handle, the top A, having screw-hole, and the cord G, permanently attached to the spindle, substantially as herein shown and described, whereby the top will be detached from the spindle automatically, as set forth.

253,703. PITCHER. LOUIS C. HILLER, Meriden, Conn., assignor to the Meriden Silver Plate Company, same place. Filed Jan. 18, 1881. (No model.)

Claim.—The herein-described pitcher, consisting of the base D, constructed with the bottom E, the outer shell, A, seated on the said base and provided with the handle and shell for the spout, the water-holder F, constructed with its spout G, the ring H, carrying the cover L and arranged upon the upper edge of the outer shell, constructed with a flange to set within the outer shell, rods extending from the ring at the top through the bottom below to secure the parts together, and the adjusting-screw *k* through the bottom to force the water-holder against the ring at the top, substantially as described.

253,704. TONGUE FOR AGRICULTURAL IMPLEMENTS. JOHN I. HOLL, South Bend, Ind. Filed Oct. 25, 1881. (No model.)



Claim.—1. The combination of a jointed draft-tongue, a cam, a latch, a notch to receive the locking-nose on the latch, and a double-tree attached to the latch, all constructed and arranged to operate substantially as described.

2. The combination of the two-part jointed draft-tongue, the lapped strengthening-plates, the joint-bolt *a*, the cam, the latch, and its guides, all constructed and arranged to operate substantially as described.

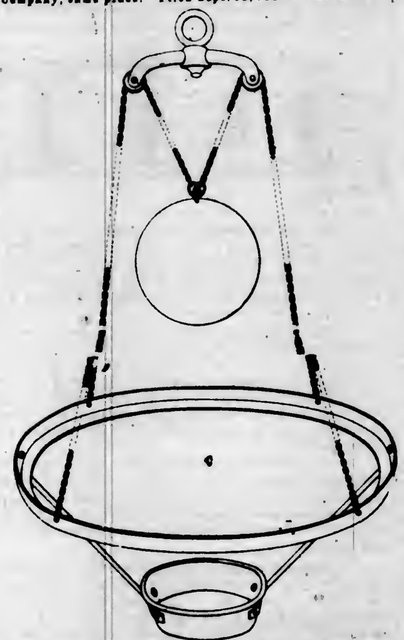
3. The combination of the two-part jointed draft-tongue, the cam, the slotted and guided latch, and the convex bearing-edge on this latch, against which the said cam acts, all constructed and arranged to operate substantially as described.

253,705. HARVESTING-MACHINE. JOHN W. HULL, Alquina, assignor of one-half to William Newkirk and William H. Wherrett, both of Connersville, Ind. Filed May 12, 1881. (Model.)

Claim.—1. A harvester-frame composed substantially of the oscillating frame B, on which the driver's seat is mounted, and supporting-frame C C, the crank-shaft E, wheels A E', and mechanism on the oscillating frame for raising and lowering the supporting-frame, substantially as herein set forth.

2. In a harvesting-machine, the oscillating frame B, supported upon the driving-wheel and attached to the main frame by axial bearings *b b*, through which the transmitting-shaft passes and imparts motion to the operating mechanism, substantially as herein set forth.

3. The oscillating frame B, supported upon the ground-wheel A and pivoted to the main frame upon a transmitting-axis, in combination with the supporting-frame C and the windlass F on the oscillating frame, for raising and lowering the frame, substantially as herein set forth.

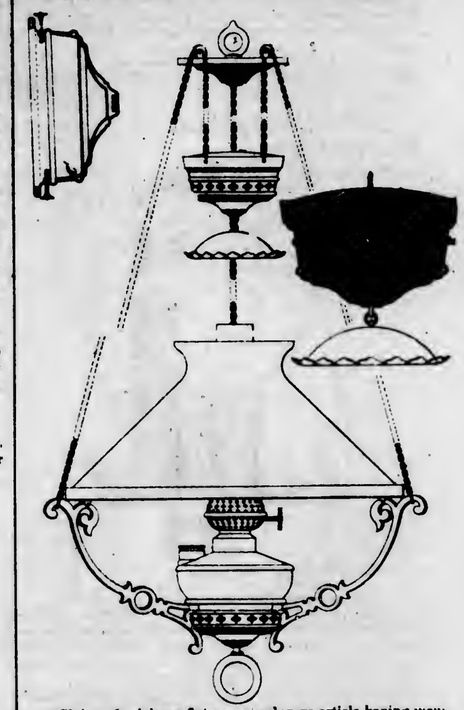


4. The combination of a crank-shaft and the main frame arranged thereon, and supporting the operating mechanism of a harvester, and capable of rising and falling in a vertical plane, with the oscillating supplemental frame pivoted to said main frame and connected with said crank-shaft, and a drive-wheel attached to the oscillating frame and imparting motion to the mechanism located on the main frame, all substantially in the manner and for the purpose described.

5. In combination with the rod S and carved apron R', the chute-rods R'' and the hinged rod *r*, catch *r'*, and spring *r''*, for checking the delivery of the grain and allowing it to be deposited intermittently in bunches, in the manner substantially as herein set forth.

6. In a harvesting-machine, a straw-binding mechanism composed substantially of the pivoted revolving arm M', grapples O O', twister V, and tucker X Y, combined to operate in the manner substantially as herein set forth.

7. In a harvesting-machine, a straw-band-tucking mechanism composed substantially of the rotary twister V, mounted on the frame T, and the band-tucker X Y, pivoted on the frame T below the twister, and intermittently operated by a rack-bar, *a'*, as set forth.



253,706. LAMP-FIXTURE. WOLCOTT A. HULL, New York, N. Y., assignor of one-half to the Ansonia Brass and Copper Company, same place. Filed Sept. 15, 1881. (No model.)

Claim.—1. The combination, with a shade-supporting ring, a holder for a lamp, rods or arms connecting them, and a hanger, of two chains having their ends fastened at about equidistant points to the said ring, and two other chains fastened to the bight or middle portion of the first-mentioned chains and extending to the hanger, substantially as specified.

2. The combination, with a shade-supporting ring, a holder for a lamp, rods or arms connecting them, a hanger, and a counterbalancing-weight, of two chains having their ends fastened at about equidistant points to the said ring, and two other chains fastened to the bight or middle portions of the first-mentioned chains, extending to the hanger and passing over pulleys arranged therein at some considerable distance apart, and then down to the counterbalancing-weight, substantially as specified.

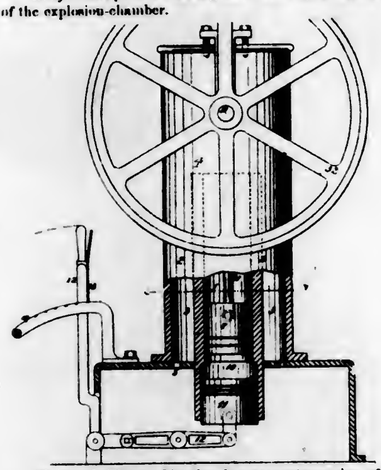
253,707. LAMP-FIXTURE, &c. WOLCOTT A. HULL, New York, N. Y., assignor of one-half to the Ansonia Brass and Copper Company, same place. Filed Sept. 15, 1881. (No model.)

Claim.—1. A lamp-fixture or analogous article having members composed severally of a body-piece of cheap, strong metal having its exterior japanned or otherwise decorated, and a thin perforated exterior shell of brass or other ornamental metal closely fitting the body-piece and preserved in form thereby, substantially as specified.

2. In a lamp-holder, the combination of a cup or socket of iron or other cheap metal having its exterior surface japanned or otherwise decorated, and a thin exterior perforated shell of brass or other bright ornamental metal closely fitting the same and preserved in form thereby, substantially as specified.

3. In a lamp-holder, the combination of an imperforate cup or socket of iron or other cheap material, and a thin exterior shell of brass or other ornamental metal closely fitting the same and preserved in form thereby, whereby I produce, with the use of a small amount of the ornamental metal, a beautiful and strong lamp-holder, and one that may constitute a drip-cup, substantially as specified.

4. In a lamp-holder, the combination of a cup of iron or other cheap metal, and a thin exterior shell of brass or other ornamental metal closely fitting the former and preserved in form thereby, save at the bottom, where a space is left and the ornamental shell turned in and threaded to form a socket for the attachment of a pull-piece, substantially as specified.



253,708. BURIAL-CASKET. HARWORTH HUTCHISSON, Burlington, Iowa. Filed June 28, 1881. (Model.)

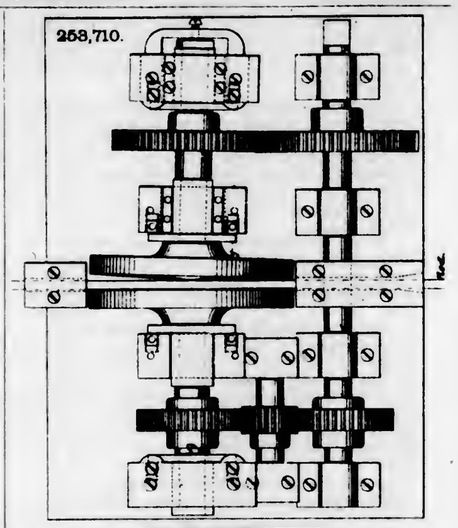
Claim.—In a burial-casket, the combination of the sides and ends, having vertical recesses or grooves, the open-work corners B, having end flanges, *b*, and lugs *c*, the padded back or panel D, and the corner-block E, having tongues *f* and screw *g* connecting it to the panel D, which is thereby held in position, substantially as set forth.

253,709. GAS-ENGINE. RICHARD HUTCHINSON, London, England. Filed Sept. 13, 1881. (No model.) Patented in England Dec. 28, 1880.

Brief.—The power of the engine is varied by changing the area of the explosion-chamber.

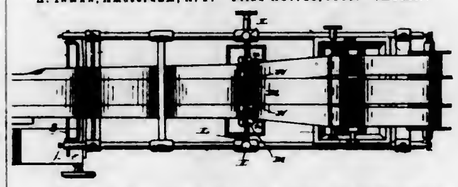
Claim.—1. The combination, in a gas-motor engine, of the piston-cylinder with the semicircular jackets arranged so that an agitation or a circulation of air will be maintained at each stroke of the working-piston, and thereby keep the cylinder cool, substantially as described.

2. The combination, in a gas-motor engine, of the piston-cylinder and piston with the plunger 11, arranged within the compressing-cylinder at one end of the piston-cylinder, and devices for operating and adjusting said plunger for the purpose of increasing or decreasing the area of the explosion portion of the cylinder, substantially as described.



3. The combination, in a gas-motor engine, of the piston with the working-cylinder provided with a port or passage, 20, the plunger-valve 17, located within the cylinder 18, and provided, substantially as described, with ports and chambers for admitting at the proper moment the mixture of gas and air into the said working-cylinder, the crank-shaft 9, the gear-wheels 15, and connections between one of these gear-wheels and the plunger-valve, substantially as shown and specified.

4. The combination, in a gas-motor engine, of the working-cylinder 1, provided with a port or passage, 20, the cylinder 18, provided with a chamber, 21, communicating with pipes for the admission of air and gas, the plunger-valve 17, provided with a port, 19, for discharging the air and gas into the port of the working-cylinder, the chamber 24, and the port 25, communicating therewith, the chamber 26, for receiving gas from a small supply-pipe and for discharging the same into the port 25 when said port and chamber are brought into communication, the air-port for feeding air into the chamber 24, the chamber 27, and connections between the piston and the plunger-valve, said members being constructed and organized for operation substantially as described.



5. The combination, in a gas-motor engine, of the working-cylinder, the cylinder 18, and the plunger-valve 17, having the necessary ports, chambers, and passages for admitting air and gas to the working-cylinder, with the exhaust-valve 36, adapted to be opened to admit of the expulsion of the exhaust-gases by the down-stroke of the piston, the tappet upon the rod of the plunger-valve, and the bell-crank levers 34 and 35, adapted to operate, substantially as described, to actuate the exhaust-valve rod, for the purpose specified.

253,710. MACHINE FOR STRAIGHTENING AND POLISHING IRON, STEEL, AND OTHER METAL RODS. JOHN ILLINGWORTH, Newark, N. J. Filed Sept. 14, 1881. (No model.)

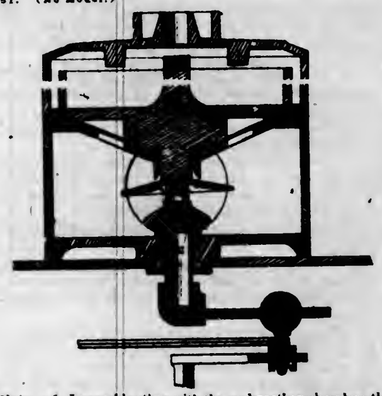
Claim.—The combination, with the plane-faced disk C, of the conical-faced disk C', arranged as and for the purpose set forth.

253,711. PAPER-BOX COVERING AND TRIMMING MACHINE. H. INMAN, Amsterdam, N. Y. Filed Nov. 28, 1881. (Model.)

Claim.—1. In a machine for covering boxes, the combination, with the bifurcated legs and the supporting-bars, of a feeding-reel bearing covering and trimming strips, the paste-tank and paste-roller, the standards with their guiding and supporting devices, and the cross-bar and guides for uniting, supporting, and guiding the covering and trimming strips, substantially as set forth.

2. In a machine for covering boxes, the supporting-frame, in combination with the paste-tank carrying a paste-roller, the standards with their guiding and supporting devices, and the cross-bar for uniting the covering and trimming, the said tank, standards, and uniting cross-bar being adapted to slide on the supporting-bars, whereby their relative distance is changed and a proper tension of the covering material maintained, substantially as shown and described.

3. In a machine for covering boxes, the combination, with the devices, substantially as described, for feeding, pasting, guiding, supporting, and uniting the covering material of a lateral adjustable carriage carrying a revolving form, and provided with mechanism for automatically rotating the same, substantially as shown and described.



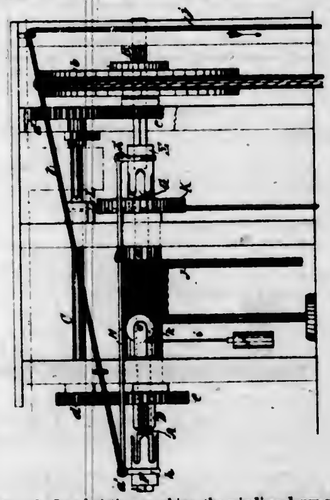
4. In a machine for covering boxes of the character herein described, adapted to manipulate a plurality of covering and trimming strips of paper, &c., the combination of the standards I I, shaft K, having link *k*, and shaft L with heads M M and fingers or guides N n, for guiding and lapping the strips, as shown and described.

253,712. MANUFACTURE OF SIRUP FROM CANE-JUICE. ALFRED H. ISAACSON, New Orleans, La. Filed Jan. 10, 1882. (No specimens.)

Claim.—1. The herein-described process of preserving sirup or molasses, consisting in heating to a degree below the boiling-point the sirup after it has been expressed from the cane, and then filling the sirup while hot into cans or other receptacles and hermetically sealing the same, for the purpose specified.

2. As a new article of manufacture, sirup from sugar-cane or molasses put up in a hermetically-sealed can or other vessel after the sirup has been heated to a degree below the boiling-point to kill the germs of fermentation, and before it has been converted into crystallized sugar, substantially as described.

253,713. OIL-DISTRIBUTING MECHANISM FOR CARBURETORS. WALTER H. JACKSON, Providence, R. I. Filed Oct. 22, 1881. (No model.)



Claim.—1. In combination with the carbureting-chamber, the valve-chest provided with an inclined conoidal or beveled seat, having ports and recesses, as described, and the valve having an inclined conoidal or beveled face and a series of radial recesses, substantially as specified.

2. In combination with the valve-casing and carburetor, the valve and valve-seat provided with recesses and ports, as described, the valve-stem and vertical rotating shaft, and suitable means for detachably connecting the two, substantially as and for the purposes specified.

3. In combination with the valve-chamber and carburetor and the valve and valve-seat provided with ports and recesses, as described, the conoidal shield or distributer secured to the valve-stem, substantially as and for the purposes set forth.

4. In combination with the vertical shaft which actuates the valve and the horizontal arm secured thereto, the central meter-shaft and its horizontal arm and the swiveled head secured thereto, through which head passes loosely the arm of the valve-actuating shaft, whereby the valve is operated without the use of ordinary gearing, substantially as specified.

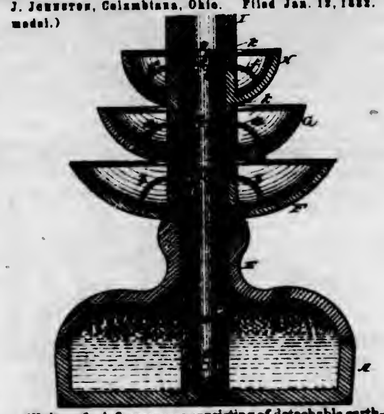
253,714. HOISTING-MACHINE. VERNON C. JARBOE, Wyandotte, Kans. Filed June 13, 1881. (No model.)

Claim.—1. In a hoisting-machine, the winding-drum and the power-wheel placed upon separate shafts, in combination with means, substantially as described, for shifting the power from direct to indirect action upon the winding-drum, and vice versa, as and for the purposes specified.

2. In a hoisting-machine, the shaft C, provided with the gear-wheels *d d'*, in combination with the shaft A, provided with the winding-drum *a* and the loose gear *e*, and the shaft B, provided with the driver *g*, pulley *b*, and the gear *c*, the said shafts being provided with clutch mechanism, whereby the winding-drum is adapted to be driven directly or indirectly from the pulley-shaft, as set forth.

3. The drum-shaft A and the pulley-shaft B, in combination with the sliding clutches E and F and the clutches D and G, the clutch D being formed upon the loose wheel *e* and the clutch G being formed upon the drum-shaft, substantially as and for the purposes set forth.

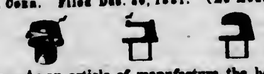
4. In hoisting-machines, the sliding clutches E and F, in combination with the rod H, arms A A', weight *f*, and operating-cord *j*, substantially as and for the purposes set forth.



5. The brake-wheel K, secured directly upon the separate drum-shaft A, in combination with the brake L, substantially as and for the purposes specified.

253,715. VASE FOR CULTIVATING STRAWBERRY AND OTHER PLANTS. JAS. J. JOHNSTON, Columbiana, Ohio. Filed Jan. 12, 1882. (No model.)

Claim.—A vase for plants, of hour-glass contour, with open ends and a water-channel, B, communicating with an angular channel, C, for conveying water down into the earth below the roots of the plants, substantially as herein described, and for the purpose set forth.



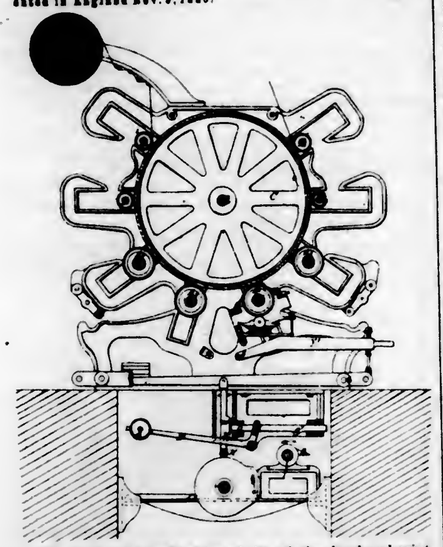
253,716. FLOWER-VASE FOR WINDOW-GARDENING. JAS. J. JOHNSTON, Columbiana, Ohio. Filed Jan. 12, 1882. (No model.)

Claim.—1. A flower-vase consisting of detachable earth-chambers of different diameters and having hollow centers with a recess at the upper end and a ledge at the lower end, said centers adapted to fit and rest on each other and upon the same pedestal, substantially as herein described, and for the purpose set forth.

2. The combination of the reservoir A, having tube B, pedestal E, and earth-chambers F, G, H, and I, the chambers H G F communicating with the tube B through the medium of siphons or wicks, substantially as herein described, and for the purpose set forth.

253,717. LACING-STUD FOR SHOES. JOSEPH L. JOYCE, New Haven, Conn. Filed Dec. 30, 1881. (No model.)

Claim.—As an article of manufacture, the herein-described shoe-stud, constructed with a rim, *d*, projecting from its head, substantially as and for the purpose described.

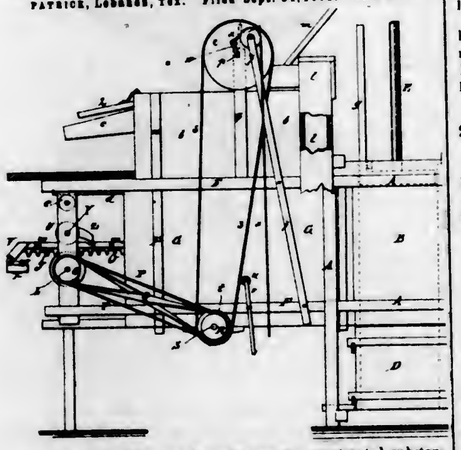


253,718. MACHINERY OR APPARATUS FOR PRINTING FABRICS. JAMES KERR and JOSEPH HAWORTH, Church, County of

and described, whereby the cotton from the gin discharge-spout is forced into the bailing-box of the press, as set forth.

253,721. MANUFACTURE OF COLORS OR DYE-STUFFS. HERMANN KOECHLIN, Lowrach, Baden, Germany. Filed Dec. 14, 1881.

11. The combination of the evaporator C, its chute C^2, the supplementary vibratory evaporator F, the inclined screen *f* therein,



253,718. MACHINERY OR APPARATUS FOR PRINTING FABRICS. JAMES KERR and JOSEPH HAWORTH, Church, County of Lancaster, England. Filed June 13, 1881. (No model.) Patented in England Nov. 9, 1880.

Claim.—1. The combination of the printing-bowl and printing-roller with levers supporting said roller and tending to keep it in contact with the bowl, cams for raising the levers to withdraw the roller, and automatic locking devices, substantially as described, for retaining the levers in a raised position.

2. The combination of the printing-bowl and printing-roller with levers supporting said roller and tending to keep it in contact with the bowl, cams for raising the levers to withdraw the roller, automatic locking devices for the lever, and rotary cams for periodically releasing the locking devices, all substantially as described.

253,719. FEEDER FOR COTTON-PRESSES. ROBERT L. KIRKPATRICK, Lebanon, Tex. Filed Sept. 24, 1881. (No model.)

Claim.—1. A feeder for cotton-presses, constructed substantially as herein shown and described, consisting of the packing-box and its follower and operating mechanism and the receiving-box and its movable top board, as set forth.

2. The combination, with the baling-box B of a cotton-press and the discharge-spout *c* of a cotton-gin, of the packing-box G, the follower H and its operating mechanism, and the receiving-box *b* and its movable top board, *j*, substantially as herein shown and described, whereby the cotton from the gin discharge-spout is forced into the bailing-box of the press, as set forth.

3. In a feeder for cotton-presses, the combination, with the packing-box G, the follower H, and the drive-shaft S, of the rack-bar J, the gear-wheel K, and the pulleys and bands M N O R P Q, substantially as herein shown and described, whereby the said follower can be moved forward and back, as set forth.

4. In a feeder for cotton-presses, the combination, with the packing-box G, the gear-wheel K, the guide-roller U, the shaft Y, and the pawl Z, of the follower H, provided with the roller I, and the rack J, provided with a notch on its upper side, substantially as and for the purpose set forth.

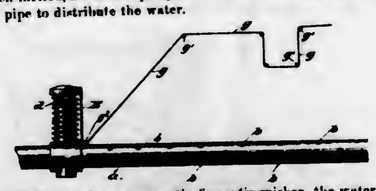
5. In a feeder for cotton-presses, the combination, with the rack-bar J, of the arms V, roller W, and track X, substantially as herein shown and described, whereby the said rack-bar will be supported when drawn outward, as set forth.

6. In a feeder for cotton-presses, the combination, with the receiving-box *b* and the movable top board, *j*, having slotted lower end, of the rack *k*, the flue *l*, and the hinged board *m*, substantially as herein shown and described, whereby the dust and air entering the receiving-box with the cotton are allowed to escape freely, as set forth.

7. In a feeder for cotton-presses, the combination, with the movable top board, *j*, and the driving-shaft S, of the connecting-bar *n*, the crank-shaft *p*, the pulleys and band *r t s*, and the springs I, substantially as herein shown and described, whereby the said top board will be operated to press down the cotton and clear the dust-flue rack, as set forth.

8. In a feeder for cotton-presses, the combination, with the belt *s*, that operates the crank-shaft *p* of the receiving-box top-board, *j*, of the pulley and lever *u v*, substantially as herein shown and described, whereby the movement of the receiving-box top board can be stopped and started, as set forth.

9. In a feeder for cotton-presses, the combination, with the crank-shaft *p*, that operates the receiving-box top board, *j*, of the crank *w*, and the cord *x*, and guide-pulley *y*, substantially as herein shown and described, whereby the said top board can be raised and held, as set forth.



10. In a feeder for cotton-presses, the combination, with the baling-box B, having open side, and the follower C, of the vertical board G, attached to the inner side of the said follower, substantially as herein shown and described, whereby cotton is prevented from entering the baling-box when the follower is forced down, as set forth.

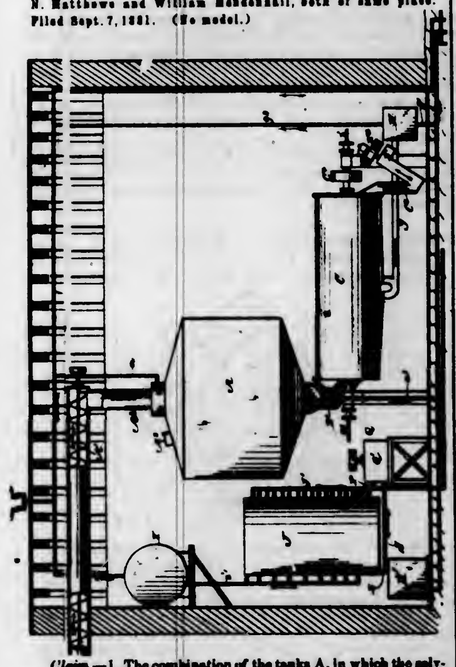
11. In a feeder for cotton-presses, the combination, with the packing-box G, having open upper side, and the follower H, of the horizontal board *d*, having its forward end attached to the upper end of the said follower, substantially as herein shown and described, whereby the cotton is prevented from entering the said packing-box when the follower is pushed forward, as set forth.

12. In a feeder for cotton-presses, the combination, with the horizontal board *d*, attached to the packing-box follower H, of the roller *v*, pivoted to the rear upper part of the packing-box frame F, substantially as herein shown and described, whereby the said board is supported, as set forth.

253,720. FIRE-EXTINGUISHER. ISAIAH KITSON, Cincinnati, Ohio. Filed Dec. 8, 1881. (No model.)

Brief.—The water-induction valve to the perforated pipe *a* is held to its seat by the fusible brace E and fusible wires *g*, which, when melted, allow the spring to raise the valve from its seat and the pipe to distribute the water.

Claim.—1. In an automatic fire-extinguisher, the water-conduit pipe *a*, provided with perforations *b*, in combination with a valve-closing fusible brace, E', and branch fusible wires *g*, substantially as described.



2. In an automatic fire-extinguisher, the fusible valve-closing truss-brace E, in combination with spring *d* and fusible wire *g*, substantially as described.

3. In an automatic fire-extinguisher, the vertical stand-pipe A, having lateral perforated branches *a*, each provided with a valve closed with a fusible brace, E', in combination with fusible wires *g* and fusible valve-closing brace E, substantially as described.

253,721. MANUFACTURE OF COLORS OR DYE-STUFFS. HORACE KOECHLIN, Lowsch, Baden, Germany. Filed Dec. 16, 1881. (No specimens.)

Claim.—The improvement in the manufacture of coloring-matters, consisting in the production of violet coloring-matters by the action of nitroso derivatives of the tertiary amines on tannin, or equivalent reaction, substantially as described.

253,722. APPARATUS FOR THE SEPARATION OR EXTRACTION OF OIL FROM VEGETABLE SUBSTANCES. HARRIS LANCASTER, Richmond, Ind., assignor of two-thirds to William N. Matthews and William Mendenhall, both of same place. Filed Sept. 7, 1881. (No model.)

Claim.—1. The combination of the tanks A, in which the solvent and vegetable substance are mixed, the reservoirs X Y, the connecting-pipes, and the herein-described evaporator C, and the condenser H, both constructed substantially as set forth.

2. The combination of the tanks A A with the conveyer B, chutes B', the evaporator C, the superheater Q, pipe *n*, and condenser H, constructed and organized substantially as described.

3. The tank A, having the inclined bottom and screen *s'*, shafts B², open-link chains B⁴, conveyer B, and chute B'.

4. The combination of the outer casing, C, of the evaporator, its hollow shaft, the inner revolving casing, *c*, and the steam-pipes disposed therein, substantially as set forth.

5. The combination of the outer casing of the evaporator C, the inner revolving casing, *c*, having the perforated or woven-wire portion *c'*, and the condenser H, substantially as set forth.

6. The evaporator C, composed of an outer case and an inner rotary case, the hollow shaft, and the radiating steam-pipes, substantially as described.

7. The combination of the evaporator C, formed in two parts with a vapor-space between them, the condenser H, the pipe connecting the condenser and vapor-space, the pipe leading to the reservoir, and a fan, G', substantially as and for the purpose set forth.

8. The combination of the evaporator C, having an inner and an outer case, with a vapor-space between them, its discharge-chute C², having a perforated bottom, and the delivery conveyer-screw E, in combination with the fan G' and the condenser H, substantially as set forth.

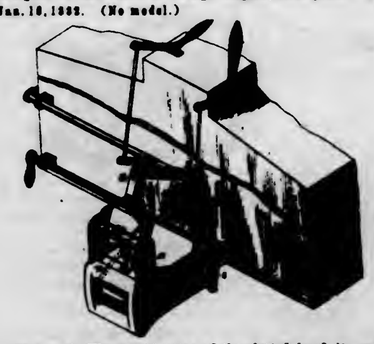
9. The combination of the tanks A, the evaporator C, the fan G', the condenser H, the reservoirs, the system of ventilating-pipes, the branch outlet-pipe, and its inlet and outlet valves, substantially as set forth.

10. The evaporator F, the cam for vibrating it, its inclined dust-screen *f*, its inlet and outlet chutes, and its draft or air outlet *f'*, substantially as set forth.

11. The combination of the evaporator C, its chute C², the supplementary vibratory evaporator F, the inclined screen *f* therein, its outlet-chute, and the draft-opening *f'*, leading to the condenser, substantially as set forth.

12. The combination of the separator-case J, the pans K, a steam-coil in each pan, the inlet-pipes *i'*, the oil-outlet pipe J² for each pan, its elbow J³, and the discharge-pipe J', substantially as set forth.

13. The evaporating or separating pan herein described, having the oil-discharge pipe connected to its bottom, so that the purest oil, or that having the least amount of solvent with it, and which is heaviest, will be first delivered from the pan.

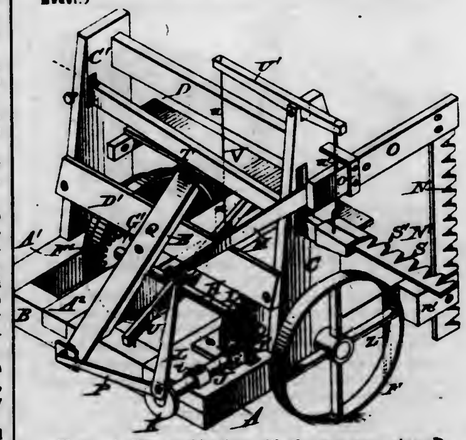


14. The separator J herein described, provided with evaporating-pans and inlet and discharge pipes, and having the glass panel, substantially as described.

15. The combination of the separator J, the outlet-pipe J', its valve, the superheater Q, the pipe P and its valve, and the condenser M, substantially as set forth.

16. The combination of the superheater, the steam-pipes and agitator therein, and the condenser M.

17. The combination, with the separator, the evaporator, and the condenser, of the ventilating-pipes *n*, the branch T, and the valves T' T², combined and arranged as specified.

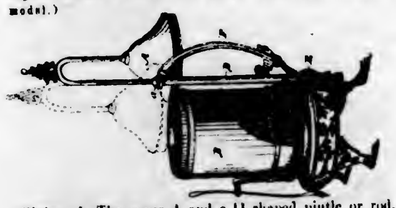


253,723. CAR-COUPLING. MICHAEL W. LAHR, Ladoga, Ind., assignor of one-third to George Rogers, same place. Filed Jan. 18, 1882. (No model.)

Claim.—1. The combination of the slotted head, its guides, rock-bar and pin and the yoke *d*, carrying the rock-bar and jointed to an arm upon a shaft, *g*, substantially as set forth.

2. The combination of the slotted draw-head, rod *e*, shaft *n*, having an arm connected to said rod, and shaft *i*, provided with a handle and connected to said shaft *n*, substantially as set forth.

253,724. COMBINED HEDGE-TRIMMER AND MOWER. JACOB V. LATTNER, Waxahachie, Tex. Filed Nov. 19, 1881. (No model.)



Claim.—1. The combination, with the rear cross-piece, B, standard C, and adjustable and detachable bar T, carrying cutter

S and cutter-bar S', of the lever U, pivoted to the rear cross-piece, the lever U', pivoted to the standard, and the rods u u', connecting the lever U' with the lever U and bar T, respectively, whereby the latter is raised, substantially as shown and described.

2. The combination, with the side pieces, A A', and vertical guard Z, of the horizontal bar T, pivoted in a recess in the side piece A', and supported by a rod connecting with the lever U on the standard C, and the horizontally-reciprocating cutter S, inclosed in the stationary cutter-bar S', and provided with suitable operating mechanism, substantially as shown and described.

3. The combination of the side pieces, A A', standards C C', transverse bar T, carrying horizontal cutter S and cutter-bar S', longitudinal bar O, supporting vertical cutter N and cutter-bar N', the crank-wheel K, the pitman P, rod P', and lever Q, connecting the horizontal cutter with said wheel, the pitman L and lever M, connecting the crank-wheel with the vertical cutter, and suitable gearing for transmitting motion from the drive-wheels to the crank-wheel, whereby the revolution of the latter will cause the vertical and horizontal cutters to reciprocate alternately, substantially as shown and described.

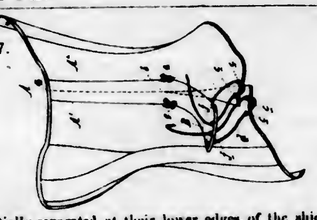
253,725. COVER FOR JARS OF PICKLE-CASTERS AND OTHER RECEPTACLES. THOMAS LEACH, Taunton, Mass., assignor to Reed & Barton, same place. Filed Jan. 9, 1882. (No model.)

Claim.—1. The cover A and a U-shaped pintle or rod, in combination with a receptacle, B, and vertical tubular guide, in which said rod is adapted to slide vertically and rotate, substantially as specified.

2. The cover A and U-shaped rod C, having a fixed roller, *a*, on its longer arm, in combination with the jar B and a tubular guide, D, in which said rod is adapted to slide and rotate, so that the cover may be raised and swung off the jar, and then be held supported, as shown and described.

3. The base of the pickle-caster, having the handle F and tubular standard D formed in one piece, and the latter rigidly attached to said base, as shown and described.

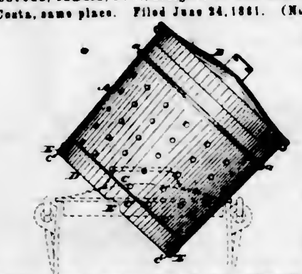
4. As a new article of manufacture, the pickle-caster having the jar-cover A and U-shaped rod C rigidly attached, and a vertical hollow standard, D, in which one arm of said rod is adapted to slide and rotate, and on which it may be supported, as shown and described.



253,726. COVER FOR PICKLE-JARS AND OTHER RECEPTACLES. THOMAS LEACH, Taunton, Mass., assignor to Reed & Barton, same place. Filed Jan. 9, 1882. (No model.)

Claim.—1. The combination, with a jar or receptacle, B, of a cover, A, a laterally-curved hinge-rod attached thereto, and having a vertical portion adapted to slide and rotate as specified, and a tubular guide for the latter, which is located above said receptacle, as and for the purpose set forth.

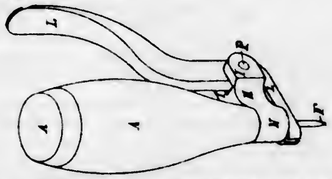
2. The combination, with the jar or receptacle B, of the cover A, the laterally-curved hinge-rod C, having a lateral pin, as specified, and a slotted tubular guide, which is located laterally from the center of the jar and above the same, as specified, whereby, in removing and replacing the cover, said rod is guided in its vertical movement and the cover is supported above the jar when swung off the same, all as shown and described.



253,727. CORSET. JOHN N. ERMEN, Jackson, Mich. Filed June 6, 1881. (No model.)

Claim.—1. In a corset, the combination, with the side pieces, A' A', partially separated at their lower edges, of the shield B, secured to the exterior of the corset and constructed to cover the junction of the pieces A' A', and the lacings *d*, adapted to draw the pieces A' A' together and the shield to the pieces A' A', substantially as described, and for the purpose specified.

2. In a corset, the combination, with the side pieces, A' A', partially separated at their lower edges, of the shield B, secured to the exterior of the corset and adapted to cover the junction of the pieces A' A', and the lacings *d*, secured to the outer edges of the shield and passing through holes e e in the side pieces and through holes *f f* in the shield, substantially as and for the purpose specified.



253,728. ATTACHMENT FOR DOMESTIC BOILERS. SILAS LUCKROAD, Camden, N. J., assignor of one-half to James S. Da Costa, same place. Filed June 24, 1881. (No model.)

Claim.—1. The perforated body A, having the bottom C, formed with a flange, C', connected to the lower rim of said body, said flange being in one piece with said bottom, and said rim having notches E, substantially as set forth.

2. The combination, with an outer close vessel or boiler, of the body A, formed with a bead, *a*, below the top thereof, and having a perforated bottom, C, a bottom rim, D, provided with notches E, and a lid, B, adapted both to said body and to the containing boiler, substantially as and for the purpose set forth.

253,729. AWL. THOMAS H. LOGAN, Lowell, Mass., assignor of one-half to Frederick Taylor, same place. Filed Dec. 10, 1881. (No model.)

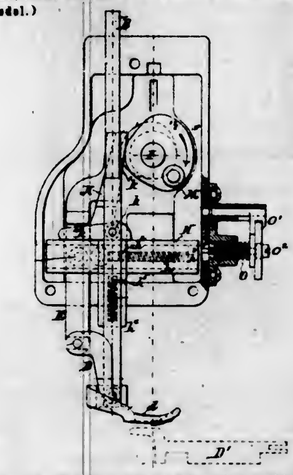
Claim.—1. The combination of the handle A and the lever L, having its fulcrum P on said handle, as and for the purpose specified.

2. The combination of the handle A and the lever L, provided with the slot S, and pivoted to said handle, as and for the purpose specified.

3. The combination of the chuck B and the nut N, provided with the arm H, as and for the purpose specified.

4. The combination of the handle A, the chuck B, the nut N, provided with the arm H, and the lever L, pivoted to said arm H, as and for the purpose specified.

253,730. PICTURE-EXHIBITOR. AUGUST LUNCKEL, Brooklyn, N. Y. Filed Oct. 26, 1881. (No model.)



Claim.—A picture-exhibitor consisting of the sheet *a*, with cut-out leg *b*, the folding card *c*, attached to sheet *a*, and the leaves

253,730.

d, flexibly connected with card *c*, whereby several ornamental designs or pictures may be shown, as described.

253,731. FEED MECHANISM FOR SEWING-MACHINES. CLAUS LUNDERS, Celle, near Hanover, Germany. Filed Oct. 18, 1880. (No model.)

Claim.—1. In a sewing-machine, the combination of a presser-foot with feed-dog D, bar E, slide H', and cross-head H, having a vertically-reciprocating motion.

2. The combination of the feed-dog bar E, its slide H', and cam with cross-head H, carrying said slide, elevating-spring L, and devices for depressing said cross-head, substantially as described.

3. The combination of the presser-bar and spring L with cross-head H, carrying the feed-dog bar, pin h^4, bell-crank lever K, and cam, all substantially as specified.

4. The combination of the presser-bar and spring L with cross-head H, slide H', feed-dog bar E, lever K, and operating-cams, all substantially as set forth.

5. The combination of the head of a sewing-machine and feed-dog bar E with cross-head H, slide H', to which said bar E is secured, and screw O in the machine-head, forming an adjustable stop for the slide, all substantially as described.

6. The combination of the feed-dog bar E and slide H', carrying said bar, with adjusting-screw O and its set-screw O^2, substantially as and for the purpose set forth.

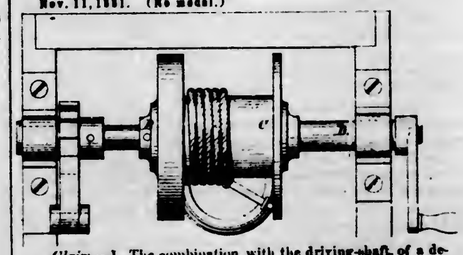
7. The combination of the feed-dog bar E and slide H' with adjusting-screw O, having a graduated plate and index-finger, O'.

8. The combination of the presser-bar and spring B' with lever K and cross-head H, carrying the feed-dog bar, whereby the said spring acts on the said presser-bar and on the feed-dog through the lever, as set forth.

253,732. GUARD FOR DOORS AND WINDOWS. JOHN L. MACDONALD, Shakopee, Minn. Filed Oct. 1, 1881. (No model.)

Brief.—Provides a frame in which is secured a wire-netting and a heavy wire guard.

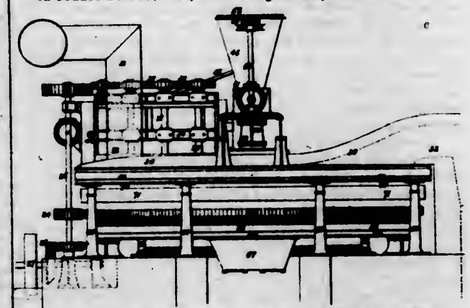
253,732.



Claim.—1. As an improved article of manufacture, a guard for doors, windows, and other openings, provided with a fine screen to exclude insects and with a heavy wire guard to exclude burglars, substantially as set forth.

2. The improved article of manufacture consisting of a frame adapted to fill and to be permanently secured within a window or like opening, and furnished with a heavy open-work guard adapted to exclude burglars without materially excluding the light and a fine screen to exclude insects, substantially as described.

3. The guard consisting of frame *a*, netting *b*, gauze *c*, and strip *d*, combined as set forth.

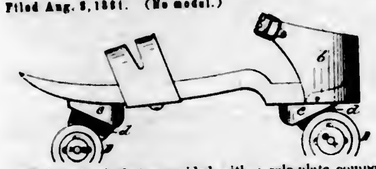


253,733. WINCH. EBENEZER R. MACOMBER, Providence, R. I., assignor of one-half to William H. Barron, same place. Filed Nov. 11, 1881. (No model.)

Claim.—1. The combination, with the driving-shaft, of a device for holding said shaft against rotation in one direction, a driving-head secured to said shaft, a barrel loose on the shaft, a crank mounted upon the shaft and having movement at times independent of the rotation of said shaft, and a sleeve surrounding the shaft and operated by the crank for pressing the barrel against the driving-head in locking frictional contact and releasing it from said locking contact, substantially as described.

2. The combination, with the driving-shaft, of a device for holding it against rotation in one direction, a driving-head fixed upon the shaft, the barrel C, loose upon the shaft, the sleeve D, having a longitudinal movement upon the shaft, a device for moving said sleeve endwise and against the barrel, and thereby moving the barrel into locking frictional contact with the driving-head, and means for turning the shaft in one direction, substantially as described.

253,734. FURNACE FOR CHEMICAL PROCESSES. JAMES MACTEAR, Glasgow, County of Lanark, Scotland. Filed Dec. 27, 1881. (No model.) Patented in England Nov. 28, 1879, in France Dec. 15, 1880, and in Belgium May 23, 1881.



Claim.—1. In combination, a rotating hearth in a reverberatory chamber, the said rotating hearth being made with a dish or rimmed compartment at the center and with a raised rim at the circumference, continuous feeding apparatus for supplying materials to the central dish, and continuous discharge apparatus near the circumferential rim, substantially as and for the purposes set forth.

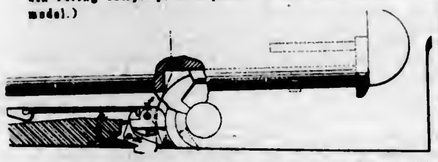
2. In combination, the feeding-screw 47, the ratchet 52, and pawl-lever 54, with screw-adjustment to vary the stroke given by

the connecting-rod 55, the hopper 46, with its rotating skeleton-frame 57 58, the pipe 48, with its delivery-outlet above the central dish, 28, of the rotating hearth, and the said rotating hearth, all arranged and operating substantially as set forth.

3. The continuous discharge apparatus consisting of the ducts 63, fitted to the outer part of the rotating hearth, and having the annular channel-cover 65 fixed to them, and also of the fixed annular channel 64 and its discharge box or boxes 67, substantially as set forth.

253,735. ROLLER-SKATE. CHARLES E. MARSHALL, Boston, Mass., assignor to himself and George N. Parker, same place. Filed Aug. 8, 1881. (No model.)

Claim.—1. A skate provided with a sole-plate composed of paper, substantially as and for the purpose set forth.



2. In a roller or parlor skate, the combination, with the usual sole-plate and axles thereof, of suitable rollers composed of paper, substantially as and for the purpose specified.

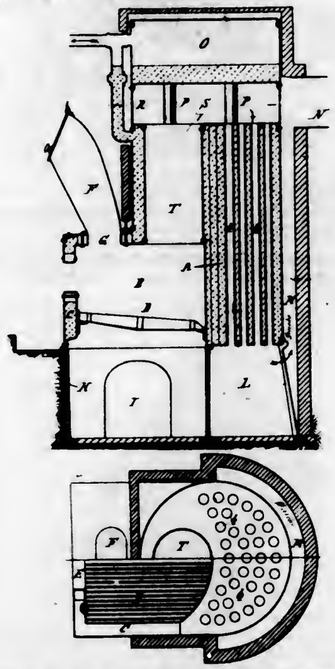
3. As an improved article of manufacture, a roller for parlor-skates, composed of paper, substantially as and for the purpose described.

4. In a roller or parlor skate, the axle B, cast with seats C inclined in opposite directions, as shown, and a central eye, *e*, in combination with the elastic cushions *d*, disposed upon each side of the eye *e*, the latter being pivoted to the box c by pin *f*, substantially as and for the purpose set forth.

5. In a roller or parlor skate, the combination, with the axle B and roller D, having the metal bushing *i*, of the round bars *k*, loosely retained around the axle and between it and the bushing by suitable disks or plates connected to the axle upon the inner and outer sides of the roller, substantially as and for the purpose specified.

253,736. BREECH-LOADING FIRE-ARM. WILLIAM MASON, Hartford, Conn., assignor to the Colts Patent Fire-Arms Manufacturing Company, same place. Filed Dec. 24, 1881. (No model.)

Claim.—1. In that class of fire-arms in which the barrel is arranged to tilt up at the breech, the combination, with the barrels and extractor-spindle, of a finger hinged at the pivot and so as to bear against the extracting-spindle as a shoulder to start the extractor, a cam hung to the fore end and so as to turn with the barrel in its opening and closing movement, and so that its rear end will come beneath the finger as the barrels approach their extreme opening movement, and a spring to turn said cam and impart to said finger a sudden rear movement during the last part of the opening movement of the barrels, substantially as described.



2. In that class of fire-arms in which the barrel is arranged to tilt up at the breech, the combination, with the barrels and extractor-spindle, of a finger hinged at the pivot and so as to bear against the extractor-spindle as a shoulder to start the extractor, a cam hung to the fore end and so as to turn with the barrel in its opening and closing movement, and so that its rear end will come beneath the finger as the barrels approach their extreme opening movement, and a spring to turn said cam and impart to said finger a sudden rear movement during the last part of the opening movement of the barrels, and a trigger to lock and release said cam, substantially as described.

253,737. POCKET-HANGER FOR HATS AND COATS. THOMAS MCDONALD, Austin, Tex. Filed July 21, 1881. (No model.)

Claim.—As a new article of manufacture, a hat-holder consisting of the two parallel plates A, connected at each end by a rivet, and the two hooks B B', pivoted on said rivets and turned in opposite directions, as shown and described.

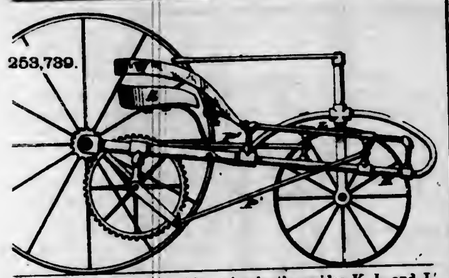
253,738. STEAM-GENERATOR. THOMAS MCGUNNIGLE, Detroit, Mich. Filed Oct. 12, 1881. (No model.)

Claim.—1. A vertical flue and tubular steam-generator provided with a low-down partially-projecting furnace, B, surrounded by a water-space, C, and provided with a feed-hopper, F, substantially as and for the purposes set forth.

2. In a vertical flue and tubular steam-generator, and in combination with the furnace and fire-tubes thereof, the base H, supporting the furnace and forming an ash-pit beneath the same, and also forming a division between the ash-pit and the lower smoke-chamber, substantially as described.

3. In a steam-generator provided with a vertical flue and vertical tubes opening into a smoke-chamber, as described, and in combination therewith, the steam-dome O, forming the top of said smoke-chamber, and the pipes P, connecting said steam-dome with the generator, as and for the purpose specified.

4. In a vertical flue and tubular boiler, the steam-dome O and ring R, forming a smoke-chamber above the tube and flues, in combination with the pipes P and pipe V, connecting said dome with the generator, as and for the purpose specified.



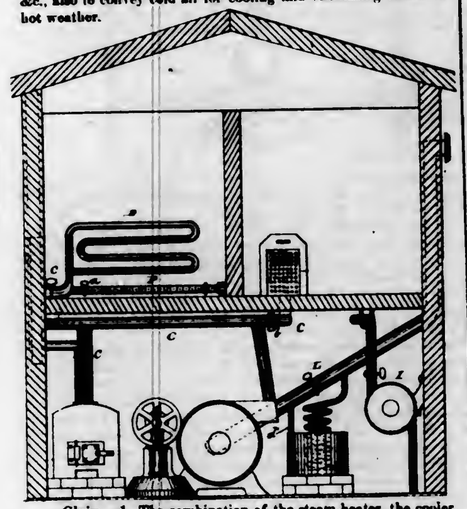
5. In a vertical flue and tubular boiler, the combination of the base H, the partially-projecting furnace B, resting on said base, the flue T, the steam-dome O, and ring R, forming a smoke-chamber, S, the pipes P V, tubes *b*, smoke-chamber L, and smoke-flue M, substantially as and for the purpose described.

6. An upright steam-generator provided with a partially-projecting furnace, an eccentric ascending flue, and a series of descending flues in rear thereof, all of which are inclosed within the water-space of the boiler-shell, substantially as described.

253,739. VELOCIPEDE. THOMAS MCGANNON, Dayton, Ohio, assignor to Anna Maria MacGregor, same place. Filed Apr. 8, 1881. (No model.)

Claim.—1. In a tricycle, the combination, with the substantially horizontal frame, of the cross-heads M, arranged to slide back and forth on the guides K L L', and provided with stirrups *r*, and the pitmen P P', connected at their forward forked ends to said stirrups and at their rear ends to cranks upon the driving-shaft, substantially as and for the purpose specified.

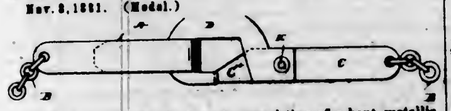
253,739.



2. In combination with a tricycle, the guides K, L, and L', along which the cross-heads slide and by which they are supported, as and for the purpose specified.

3. In a tricycle having substantially horizontally-sliding driving pedals or stirrups, the arrangement and combination, with such pedals, of the seat S and band W, whereby a firm bracing is provided for the driver, substantially as described.

253,740. COOLING AND VENTILATING HOUSES. THOMAS MCGREGOR, Philadelphia, Pa., assignor of one-half to Howard Hanes, same place. Filed Aug. 16, 1881. (No model.)

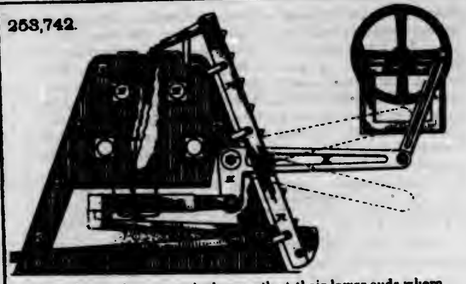


Brief.—Utilizes the steam-heating or hot-air pipes, registers, &c., also to convey cold air for cooling and ventilating rooms in hot weather.

Claim.—1. The combination of the steam-heater, the cooler, the air-inlet pipe L, the forcing-engine, pipes O N, valves *a b c*, radiator D, and the perforated pipe P, substantially as described.

2. The combination of a radiator, D, the perforated pipe P, and valves *a c*, substantially as and for the purpose described.

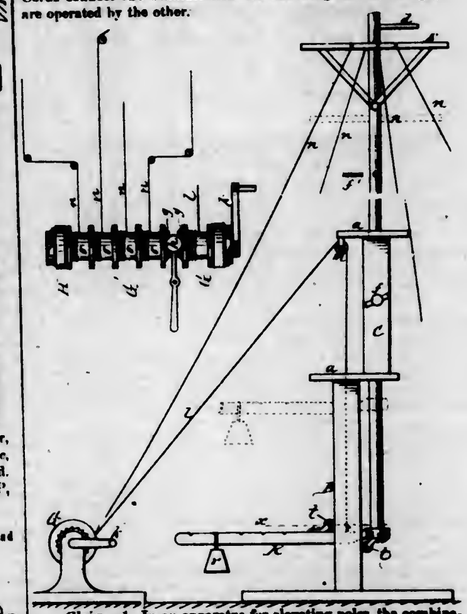
253,741. BALE-TIE. THOMAS F. MCNAIR, Dawson, Ga. Filed Nov. 8, 1881. (Model.)



Claim.—A bale-tie fastening consisting of a bent metallic strip, A, a straight strip, C, having a beveled end, C', a pivoted hook, D, adapted to hold the strip A and, in connection with the beveled end C' of the strip C, lock the parts, and the straps B, all arranged substantially as and for the purposes specified.

253,742. STONE AND ORE CRUSHER. HARRISON H. MERCH, New York, N. Y. Filed Nov. 19, 1881. (No model.)

Claim.—In an ore-crusher, the combination of the two jaws pivoted at their upper ends and having both concave and convex surfaces, the said surfaces being roughened at their tops where the



253,742.

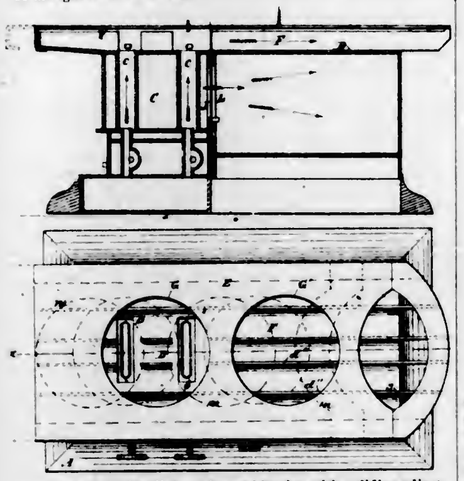
ore is broken and comparatively smooth at their lower ends where the broken ore is ground, with the frame D, the pivoted connecting-link, and the cranked lever H, which is connected at its outer end to an operating mechanism, substantially as shown.

253,743. APPARATUS FOR ELEVATING POLES FOR ELECTRIC LIGHTS, &c. JOHN D. A. MENNING, Rochester, N. Y. Filed July 8, 1881. (No model.)

Brief.—The frame consists of two guideways, the upper one being offset from the lower. An elevating device passes through the lower guide, being provided with friction-rollers and a socket for the reception of a pole at one end, and an arm notched to receive a counter-weight at the other. The purpose is to raise the pole by adding sections from below, the raised portion being projected successively upward by a double windlass, the two parts of which are connected by an engaging and disengaging gearing. Cords connect one windlass with the elevating device, and guys are operated by the other.

Claim.—1. In an apparatus for elevating poles, the combination of the two guideways B C, the elevating device K, the two sections of windlass G G', connected by an engaging and disengaging gearing, the cord or cable *l*, connecting the section G with the elevating device, and the guys *a a a a*, connecting the section G' with the pole, as shown and described, and for the purpose specified.

2. In an apparatus for elevating poles, the frame consisting of the two guideways B C, the upper guideway being offset from the lower one, so that the sections of the pole may be inserted in the upper one outside of the lower one, as herein shown and described.



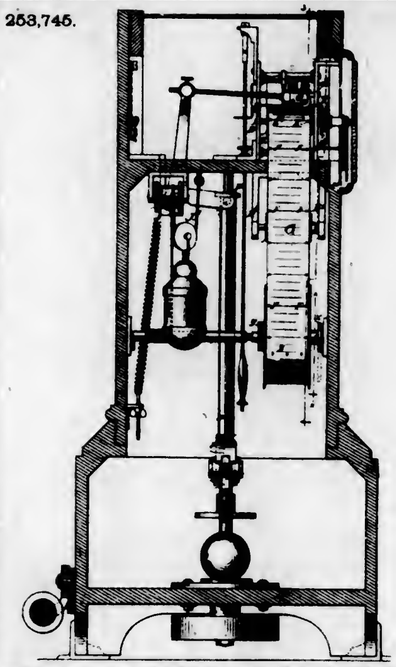
3. In an apparatus for elevating poles, the combination, with the guideway B, provided with the slot *p*, of the elevating device K, passing through the guideway, having a socket, *s*, at one end for receiving the pole, a long arm at the other end, notched to re-

ceive a counter-weight, and provided with friction-rollers *t t*, for running against the guideway, as herein shown and described.

4. In an apparatus for elevating poles, the combination, with the pole erected in sections, of the two windlass-sections G G', connected by engaging and disengaging gears, the cord or cable *l*, connecting with one windlass-section and being attached at the opposite end to the elevating device K, and the cords or cables *a a a a*, connecting with the other windlass-section and being attached at the opposite end to the pole, the several cords of one section being paid out as the cord of the other section is drawn up, as herein shown and described.

253,744. OIL-STOVE. RUFUS H. HERRILL, Englewood, Ill. Filed Nov. 16, 1881. (Model.)

Brief—Either one or two holes of the sliding top plate may be brought over the frame.



Claim.—1. An oil-stove, in combination with a sliding adjustable top plate, provided with openings to receive cooking utensils, and operating substantially as and for the purpose set forth.

2. In an oil-stove top, a movable adjustable top plate provided with openings for the reception of cooking utensils, in combination with a bottom plate, and arranged to form a flue, as shown, to operate substantially in the manner and for the purpose set forth.

3. In combination with an oil-stove provided with plates D and E, forming a flue, a warming-closet arranged to operate substantially as and for the purpose set forth.

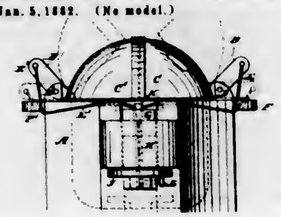
4. In an oil-stove, a tilting or removable heating-drum provided with the opening J, in combination with a fixed warming-closet having a corresponding aperture, L, and arranged and operating substantially as shown and set forth.

253,745. CONTINUOUS RECORDER. JOHN B. MOSCROP, Stratford, County of Lancaster, England. Filed Jan. 14, 1882. (No model.) Patented in England Mar. 24, 1881.

Claim.—1. The combination, in a recording apparatus, substantially as herein specified, of a time mechanism, a rotary drum geared with said mechanism and provided with peripheral stud-pins arranged in equidistant pairs, and diagram-paper having corresponding holes to receive said pins, with a receiving-reel, to which said paper passes from said drum, and means for giving said reel a constant tendency to wind up said paper, for the purpose set forth.

2. The combination, in a recording apparatus, substantially as herein specified, of a time mechanism, a rotary drum geared with said mechanism and provided with peripheral stud-pins arranged in equidistant pairs corresponding with divisions of time, and diagram-paper having corresponding holes and parallel transverse lines marking minor subdivisions of time, for the purpose set forth.

3. In a recording apparatus, a marker comprising a marking-wheel, an inking-pad in contact with said wheel, and means for limiting the rotation of said wheel to one direction, substantially as herein specified, for the purpose set forth.



4. In a recording apparatus, a marker having a marking-wheel, an inking-pad in contact with said wheel, and means for limiting the rotation of said wheel to one direction, in combination with continuous diagram-paper supported beneath said marker and propelled longitudinally thereunder, and means for reciprocating said marker transversely of said paper, said marking-wheel being arranged to rotate in the line of reciprocation, substantially as herein specified, for the purpose set forth.

5. The combination, substantially as herein specified, of a time mechanism, continuous diagram-paper propelled longitudinally by said mechanism, a marker having a marking-wheel, an inking-pad in contact with said wheel, and means for limiting the rotation of said wheel to one direction, and adapted to reciprocate transversely of said paper, and mechanism for so moving said marker, for the purpose set forth.

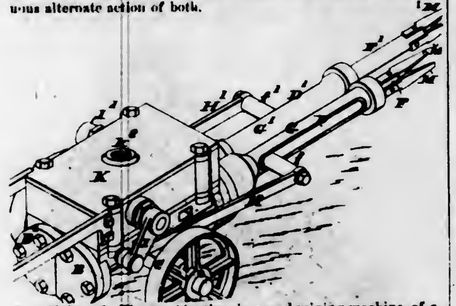
6. In an apparatus for recording the performance of a steam-engine or other motor, the combination of a time mechanism, continuous diagram-paper propelled longitudinally by said mechanism, a marker adapted to reciprocate transversely of said paper, and mechanism for so moving said marker, comprising a centrifugal governor driven by said engine or motor, and constructed with ears or cams, a gravitating slide resting upon said cams, and a spring partly counterbalancing the weight of said slide through the medium of a connecting-lever, as means for transmitting proportionated motion to said marker, substantially as hereinbefore described and illustrated.

7. In an apparatus for recording the performance of a steam-engine or other motor, the combination of a time mechanism, continuous diagram-paper propelled longitudinally by said mechanism, a marker adapted to reciprocate transversely of said paper, and mechanism for so moving said marker, comprising a centrifugal governor driven by said engine or motor, and constructed with ears or cams, and a gravitating slide resting upon said cams and partly counterbalanced, as means for transmitting a steady proportionated motion from the governor-balls to said marker, substantially as hereinbefore described and illustrated.

253,746. SPITTOON. OTTO MOSSENBOCK, Guttenburg, N. J. Filed Jan. 5, 1882. (No model.)

Claim.—1. A spittoon constructed, as herein shown and described, with swinging covers, and with foot-levers for operating these covers, whereby the covers can be swung open by depressing one of the foot-levers, as set forth.

2. The combination, with a spittoon, of swinging covers and of cords, and sliding blocks provided with foot-rests for operating the covers, substantially as herein shown and described, and for the purpose set forth.



3. The combination, with the spittoon A, of the swinging covers C C', provided with lugs or arms D D', the cords E E', the guide-brackets H H', and the vertically-sliding blocks G G', with projecting foot-rests J J', substantially as herein shown and described, and for the purpose set forth.

4. The combination, with the spittoon A, of the swinging covers C C', provided with lugs or arms D D', the cords E E', the apertured side brackets, F F', the guide-brackets H H', and the vertically-sliding blocks G G', provided at the lower ends with foot-rests J J', substantially as herein shown and described, and for the purpose set forth.

5. The combination, with the spittoon A, of the swinging covers C C', provided with lugs or arms D D', the cords E E', the guide-brackets H H', the vertically-sliding blocks G G', provided with projecting foot-rests J J', and the binding-screws L, for holding the cords E E' in the blocks G G', substantially as herein shown and described, and for the purpose set forth.

253,747. COAL-MINING MACHINE. THOMAS MURRAY, St. Louis, Mo., assignor of one-half to Andrew C. Bryden, same place. Filed Oct. 8, 1881. (No model.)

Brief.—The stroke of each drill actuates the steam-valve of the other drill, thus avoiding dead-points and producing a continuous alternate action of both.

Claim.—1. The combination, in a coal-mining machine, of a pair of engines and a pair of picking devices, each of said engines operating the valve-gear of the other engine, as and for the purpose described.

2. The combination of the engines B B', the rods F F', arms *f f'*, rods H H', cranks I I', shafts J J', cams *j j'*, chest K, bearing *k*, flange *f'*, and valves L L', substantially as described.

3. The combination, in an air-engine, of the chest K, the bearing *k*, the shaft J, and flange *f'*, substantially as described, and for the purpose set forth.

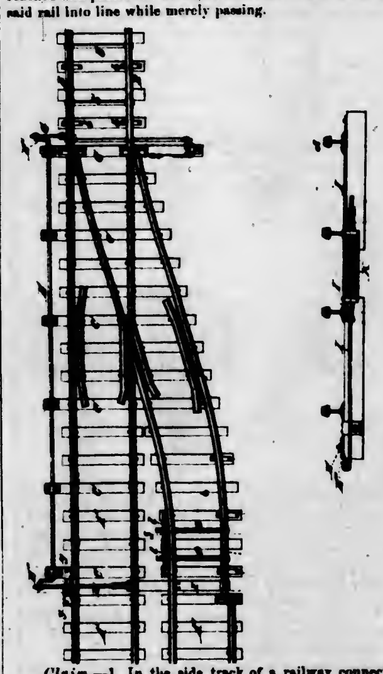
4. The combination of the engines B B', the rods F F', the guides G G', the arms *f f'*, the rods H H', the cranks I I', and the shafts J J', substantially as described.

5. The combination of the engine B, the piston E, and the disks N N', substantially as described.

6. The combination of the rod F and two or more chisels, M M', said chisels being grouped exclusively at one side of the end of the rod, substantially as described.

7. A coal-striking device having two or more chisels grouped exclusively at one side of the end of the striker-rod, for the purpose described.

253,748. FURNACE-LINING AND BRICKS THEREFOR. WILLIAM MANNING, Cincinnati, Ohio, assignor to the Queen City Malleable Iron Company, same place. Filed Dec. 29, 1881. (No specimens.)



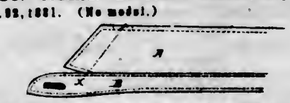
Brief.—Forty-five parts of old fire-brick; twenty-five parts of old crucibles; twenty parts of blue clay; nine parts of graphite; one part of green vitriol; one part of potash-alum.

Claim.—1. A fire-proof lining-mortar for furnace walls and arches, consisting of the rubbish of old used fire-brick, fragments of old crucibles, blue clay, graphite, green vitriol, and potash-alum compounded in the manner and proportions substantially as set forth.

2. A fire-brick consisting of the rubbish of old used fire-brick, fragments of old crucibles, blue clay, graphite, green vitriol, and potash-alum compounded in the manner and proportions substantially as described, and air-dried, as set forth.

253,749. RAILROAD-SWITCH. PATRICK HOLAN, Rockwood, Texas. Filed Aug. 1, 1881. (No model.)

Brief.—A break is maintained in one of the rails of a siding when the main switch is set to the main line, whereby shunted cars are prevented from returning and fouling with the main line. The rod operating said rail has a spring-connection, whereby, if the switch were reset to the main before the car in shunting had reached and passed the break, the wheels of the car would spring said rail into line while merely passing.

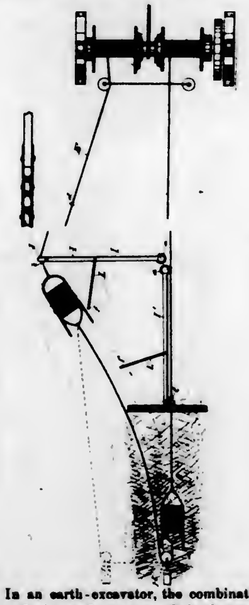


Claim.—1. In the side track of a railway connected by a switch to the main track, the short blocking switch-rail *a*, combined with the main switch, the crank-rod E, connected with and operating the latter, and a spring-connection between the blocking switch-rail and the crank-rod, said members being arranged for operation substantially as described, for the purposes set forth.

2. The combination, with a railway-switch, of the short blocking-rail *a*, crank-rod E, arranged parallel to the track-rails, and the spring connecting-rod I, all constructed and arranged substantially as and for the purpose described.

3. The combination, with the switch and main siding track-rails, the connecting-rod I, the short blocking-rail *a*, and the crank-rod E, of the switch-spring K, all arranged for operation substantially as described.

253,750. COLLAR. ROWLAND S. MORTON, Troy, N. Y. Filed Dec. 22, 1881. (No model.)



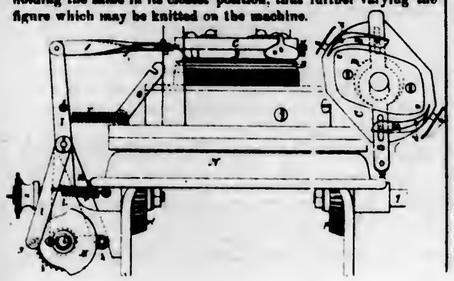
Claim.—In a collar, the combination, with its band, of a collar-body having its outward ends, at their lower or band edge, detached from the band and turned outward, so as to serve as a guard to prevent the necktie from slipping up above the neckband, substantially as herein described.

253,751. EARTH-EXCAVATOR. WILLIAM A. MOTT, Quincy, Ohio. Filed Dec. 1, 1881. (No model.)

Brief.—The scrapers are connected front and rear by ropes or cables, the former having bails passing through eyes in the end of

swinging levers and thence to winding-drums, around which they are reversely wound, knots on said ropes limiting their movement through said eyes, whereby, after each scraper has been filled, it is directed to one side of the excavation and then dumped through contact of an inclined bar on said swinging lever with the scraper-handle.

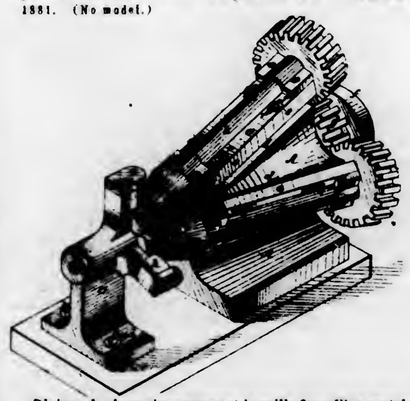
Claim.—1. In an earth-excavator, the combination, with a scraper or similar device, and a rope or chain for operating the same, of a pivoted lever adapted to turn the direction of said scraper, substantially as and for the purpose shown and described.



2. In combination with an earth-excavator, an arm, said arm being pivoted at one end at or near the line of excavation, and adapted to turn the direction of said scraper, substantially as and for the purpose shown and described.

3. In an earth-excavator, the combination of the long arm I and rope or chain E, with its knots *b d* and *c e*, substantially as and for the purpose shown and described.

4. In an earth-excavator, the combination, with the long arm I, of arm L, secured to the arm I and adapted to dump the scraper, substantially as set forth.



253,752. KNITTING-MACHINE. GEORGE E. NYE, Bristol, Pa., assignor to himself and HIRAM P. BALLOU, Needham, Mass. Filed Nov. 9, 1881. (No model.)

Brief.—The two drawing-in cams of the dial-needles are pivoted at one of their ends to the cam-supporter, and at their other ends they are attached to slides, which are operated by the mechanism set forth in the first clause. Two thread-guides are provided opposite each push-out cam, to which yarns of different colors are supplied. The improvement gives the ribbed fabric produced thereby a striped, checked, or block-work appearance. The invention embraced by the second clause is for locking one of the levers operating one of the cams to prevent it from being moved, holding the same in its closest position, thus further varying the figure which may be knitted on the machine.

Claim.—1. The removable handle for portable lifting-jacks, constructed, as herein shown and described, with ratchet-gear D, having sleeve F, provided with square hole G, and the two-armed lever B, fitted to turn freely upon said sleeve, and provided with the double pawl E, arranged to push the gear in either direction, the sleeve being secured in the gear by pin or collar, and the whole operating substantially as herein set forth.

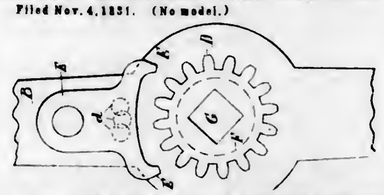
253,754. ROLLING-MILL. JONATHAN OSTRANDER, West Middlesex, Pa., assignor of two-thirds to Joseph W. Russell, same place, and Phillip M. Haas, Youngstown, Ohio. Filed June 18, 1881. (No model.)

Claim.—1. As an improvement in mills for rolling metal articles of cylindrical form, the tapering rolls *a*, arranged with their axial lines diverging from the same point, forming a tapering space between their contiguous surfaces equal to the length of the rolls and in axial line with a feeding-tube, substantially as described, for the purpose specified.

2. In a rolling-mill for metal articles of a cylindrical form, the tapering rolls *a*, arranged with their axial lines diverging from the same point, forming a tapering space between their contiguous surfaces equal to the length of the rolls and in axial line with the feeding-tube, in combination with means whereby said rolls are adjusted in the line of their axes to increase or diminish the tapering space, substantially as described, for the purpose specified.

3. The rolls of a rolling-mill for metal articles of cylindrical form, arranged with their axial lines diverging from the same point, forming a tapering space between their contiguous surfaces equal to the length of the rolls and in axial line with the feeding-tube, in combination with the roll-bearing beds *c* and the housing A, to which said beds are adapted for adjustment with the rolls, substantially as described, for the purpose specified.

4. The rolls of a rolling-mill for metal articles of cylindrical form, arranged outside of their housing bearings or supports, with their axial lines diverging from the same point, forming a tapering space between their contiguous surfaces equal to the length of the rolls, in combination with a feeding-tube arranged within said housing, substantially as described, for the purpose specified.



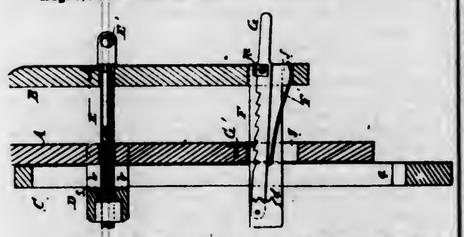
5. The rolls of a rolling-mill constructed and arranged for adjustment and operation with a feeding-tube substantially as herein described, in combination with a tri-armed adjustable standard provided with adjustable abutments for supporting the non-journaled ends of the rolls, and with a delivering and supporting tube for the finished article, substantially as described, for the purpose specified.

6. In a mill for rolling metal articles of cylindrical form, the combination, with rolls arranged for adjustment and operation substantially as described, of a permanent tube and interchangeable feeding and delivering tubes having different interior diameters adapted to suit different sizes of articles to be rolled, substantially as described.

7. The combination, in a mill for rolling metallic articles of cylindrical form, with the rolls arranged for adjustment and operation in relation to each other, and a feeding-tube arranged in central relation to said rolls, of a furnace having a heating-tube arranged in the relation to said feeding-mill tube, substantially as described, for the purpose specified.

8. A mill for rolling metal articles of cylindrical form, consisting of rolls arranged with their axial lines diverging from the same point, forming a tapering space between their contiguous surfaces and adapted for adjustment in the line of their axes, a feeding-tube carried by the roll-housings, and a delivering-tube carried by an adjustable standard having adjustable abutments for supporting the non-journaled ends of said rolls, substantially as described, for the purpose specified.

253,753. LIFTING-JACK. GEORGE A. OHL, Newark, N. J. Filed Nov. 4, 1881. (No model.)

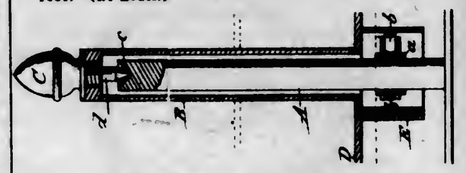


Claim.—The removable handle for portable lifting-jacks, constructed, as herein shown and described, with ratchet-gear D, having sleeve F, provided with square hole G, and the two-armed lever B, fitted to turn freely upon said sleeve, and provided with the double pawl E, arranged to push the gear in either direction, the sleeve being secured in the gear by pin or collar, and the whole operating substantially as herein set forth.

253,755. GARMENT. GEORGE W. PARKER, Detroit, Mich., assignor to F. Buhl & Co., same place. Filed July 27, 1881. (No model.)

Claim.—The coat A, provided with a fixed collar or lapel, B, in combination with the triangular flap or shield G, permanently secured to the interior of the same at one side only, and provided with means for fastening at the opposite side, said flap being constructed to entirely close the opening in the coat below the neck of the wearer and adapted to be folded under one side of the coat, whereby the flap can be used in cold weather to close the breast-opening or in mild weather be folded back entirely out of view, substantially as described.

253,756. BENCH-VISE. JESSE LISBON PARKER, Fountain City, Ind., assignor to himself and E. F. Willcuts, same place. Filed Aug. 6, 1881. (No model.)

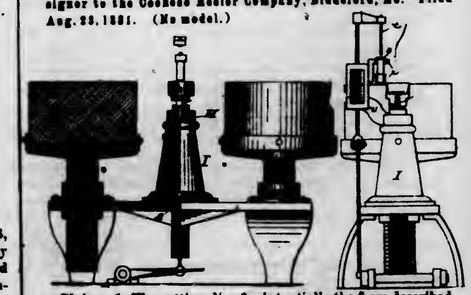


Claim.—1. An improved bench-vise constructed substantially as herein shown and described, consisting of jaw A, provided with screw E, block D, and opening *g*, of catch-plate G, and of jaw B, having opening *f*, and provided with slotted block F and pivoted ratchet-spring treadle G′, arranged as set forth.

2. In a bench-vise, the combination, with the jaws A B and the slotted bench-leg C, of the screw-block D, provided with tenons *b* and shoulders *c*, substantially as and for the purpose set forth.

3. In a bench-vise, the combination, with the jaws A B, of the slotted block F, catch-plate G′, and spring-actuated treadle G, substantially as herein shown and described, whereby the relative positions of the lower parts of said jaws are fixed, as set forth.

4. In a bench-vise, the combination, with jaw B, block F, and treadle G, provided with dog *m*, of the ratchet *n*, substantially as herein shown and described, whereby said treadle is held disengaged, as set forth.



253,757. REVOLVING SHOW-STAND. FREDERICK PEARCE, New York, and JAMES JONES, Brooklyn, N. Y. Filed Dec. 1, 1881. (No model.)

Claim.—1. The combination, with the standard A, having a bracket carrying rollers *b b*, adapted to revolve within a collar, of the tube B and disk D, having collar E, adapted to revolve around the standard, substantially as set forth.

2. In a revolving show-stand, the combination of the standard A, having rollers *b b* and oil cup or cavity *c*, the tube B, inclosing said standard, and provided with a disk, D, having a band or collar, E, adapted to revolve upon the rollers *b*, and the cap-piece C, having a threaded spindle, *d*, passing through a corresponding opening in the upper end of the revolving tube and adapted to support the same, substantially as shown and described.

253,758. HEEL-MACHINE. FRANK PEASE, Lynn, Mass., assignor to the Goodyear Hosier Company, Biddeford, Me. Filed Aug. 23, 1881. (No model.)

Claim.—1. The cutting-die of substantially the form described, adapted to receive and retain the lifts required to form a heel-blank, in combination with the nailing device consisting of an upper part, A, adapted to receive the said cutting-die and to hold the nails, and a nail-driving device, the whole operating by means of a blow upon the die to drive down both the cutter and cup, and to impale the lifts in the die, all substantially as described.

2. The combination of the sleeve sliding upon the plunger-rod, the spring-support, the nail driver or drivers, the perforated block to hold the nails, and the plate or cup A, and the nail-driver adapted to move in the holes in the nail-holding block, in combination with the vertically-adjustable post H and standard I of the table, substantially as described.

4. The combination of the table, the cutting-blocks, and their vertically-adjustable posts arranged on each side of the standard I, and in connection, as described, with the nailing devices mounted thereon, all as set forth.

5. The central standard, I, the nailing devices, as described, mounted thereon, the bracket *c*, vertical rod supported by spring and connected to treadle, and the arm and plunger-rod *f*, arranged over the slotted arm which supports the cutting-die, all as set forth.

6. The detachable plate *e*, having a flange, *d*, in combination with the plate or cup A of the described nailing device, all as set forth.

7. In combination with the cutting-die having cutting-flange and cavity, to receive the lifts of a heel-blank, the tapering brads provided with serrations at their ends, all as set forth.

253,759. SIGNAL-BOX FOR DISTRICT AND ALARM TELEGRAPHS. GEORGE H. PHELPS, Brooklyn, N. Y. Filed Dec. 13, 1881. (No model.)

Brief.—One end of the volute spring is connected with the crank and the other with the circuit-breaking wheel, the latter being free to rotate on the crank.

253,760. RAILWAY SIGNALING APPARATUS. FRANK J. PIERCE, Boston, Mass., assignor to himself and WILLIAM H. PIERCE, Cambridge, Mass. Filed Nov. 14, 1881. (No model.)

Brief.—The invention consists in the combination, with a train-signal, of a pivoted arm, a spring, and a pivoted hook, which is engaged by the arm when the signal is set, and is disengaged by the passing train, whereby the signal is released and the arm is caused to be moved by the spring, substantially as described.

253,761. SAW-SET. ALBERT PIKE, Auburn, Me. Filed Nov. 14, 1881. (No model.)

Brief.—The invention consists in the combination, with the anvil and the hammer, of a pivoted gage-plate, a spring, and a stop, whereby the gage-plate is held in position to gage the saw-tooth, and is moved out of position by the hammer, substantially as described.

253,762. RAILWAY SIGNALING APPARATUS. FRANK J. PIERCE, Boston, Mass., assignor to himself and WILLIAM H. PIERCE, Cambridge, Mass. Filed Nov. 14, 1881. (No model.)

Brief.—The invention consists in the combination, with a train-signal, of a pivoted arm, a spring, and a pivoted hook, which is engaged by the arm when the signal is set, and is disengaged by the passing train, whereby the signal is released and the arm is caused to be moved by the spring, substantially as described.

253,763. SAW-SET. ALBERT PIKE, Auburn, Me. Filed Nov. 14, 1881. (No model.)

Brief.—The invention consists in the combination, with the anvil and the hammer, of a pivoted gage-plate, a spring, and a stop, whereby the gage-plate is held in position to gage the saw-tooth, and is moved out of position by the hammer, substantially as described.

253,764. SAW-SET. ALBERT PIKE, Auburn, Me. Filed Nov. 14, 1881. (No model.)

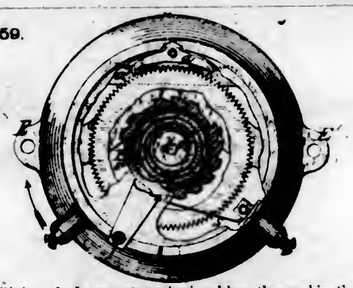
Brief.—The invention consists in the combination, with the anvil and the hammer, of a pivoted gage-plate, a spring, and a stop, whereby the gage-plate is held in position to gage the saw-tooth, and is moved out of position by the hammer, substantially as described.

253,765. SAW-SET. ALBERT PIKE, Auburn, Me. Filed Nov. 14, 1881. (No model.)

Brief.—The invention consists in the combination, with the anvil and the hammer, of a pivoted gage-plate, a spring, and a stop, whereby the gage-plate is held in position to gage the saw-tooth, and is moved out of position by the hammer, substantially as described.

253,766. SAW-SET. ALBERT PIKE, Auburn, Me. Filed Nov. 14, 1881. (No model.)

Brief.—The invention consists in the combination, with the anvil and the hammer, of a pivoted gage-plate, a spring, and a stop, whereby the gage-plate is held in position to gage the saw-tooth, and is moved out of position by the hammer, substantially as described.



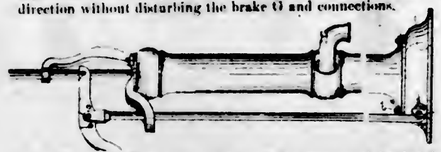
253,767. SAW-SET. ALBERT PIKE, Auburn, Me. Filed Nov. 14, 1881. (No model.)

Brief.—The invention consists in the combination, with the anvil and the hammer, of a pivoted gage-plate, a spring, and a stop, whereby the gage-plate is held in position to gage the saw-tooth, and is moved out of position by the hammer, substantially as described.

253,768. SAW-SET. ALBERT PIKE, Auburn, Me. Filed Nov. 14, 1881. (No model.)

Brief.—The invention consists in the combination, with the anvil and the hammer, of a pivoted gage-plate, a spring, and a stop, whereby the gage-plate is held in position to gage the saw-tooth, and is moved out of position by the hammer, substantially as described.

253,759.



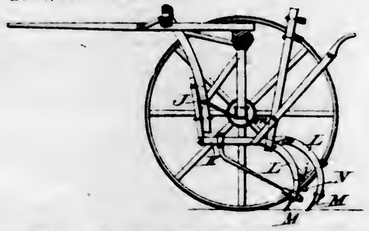
Claim.—1. In an automatic signal-box, the combination of a crank capable of continuous rotation in one direction, an automatic circuit-breaker capable of continuous rotation in the same direction as that of the crank, and a volute spring whose opposite ends are respectively connected to said crank and circuit-breaker.

2. In an automatic signal-box, the combination of a crank capable of continuous rotation in one direction, an automatic circuit-breaker capable of continuous rotation in the same direction as that of the crank, a volute spring whose opposite ends are respectively connected to the crank and circuit-breaker, and an escapement or governor for rendering the movement of the circuit-breaker uniform.

3. An automatic circuit-breaker having a stop upon its disk, and a crank operating said circuit-breaker through the medium of a spring, whereby in the rotation of the automatic circuit-breaker the crank cannot revolve in advance of said circuit-breaker to the extent of more than one revolution.

253,760. PUMP. FRANK F. PINACH, Brodhead, Wis. Filed Dec. 9, 1881. (No model.)

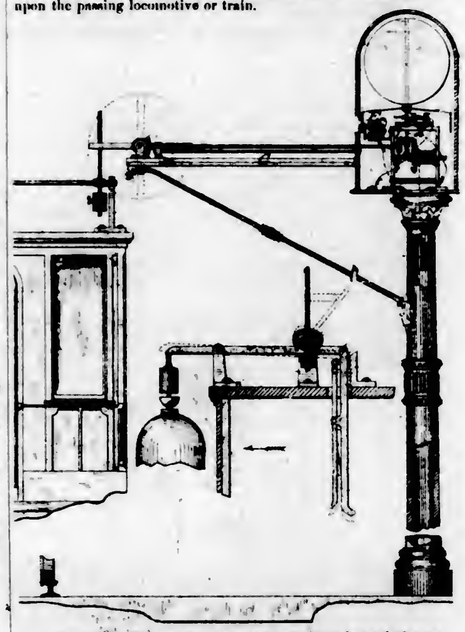
Brief.—The device is adapted to be operated by wind-power by attaching the piston-rod E to the wind-wheel and disconnecting brake G from the piston-rod. The spout may be turned in any direction without disturbing the brake G and connections.



Claim.—1. The combination, with the pump-stock having the depending annular flange at its upper end, of the base having the depending annular flange, the cap carrying the guide for the fulcrum, the hooked bolts and nuts for uniting the stock to the base and to the cap, and the handle and fulcrum, the latter hinged to the base, the whole arranged and adapted for adjustment substantially as described.

2. The cap having the upwardly and inwardly extending arm, forming a guide for the plunger, and the laterally-slotted arm for guiding and supporting laterally the fulcrum, substantially as described.

3. The combination, with the parts to be united by them, of the hooked bolts and their nuts, each bolt having a slot in its upper end, for the purpose specified.



253,761. SULKY-PLOW. THOMAS V. PLICH, Polk, Ohio. Filed Nov. 3, 1881. (No model.)

Claim.—The combination, in a sulky-cultivator, with the swiveled rods J J, of the pivoted beams K K, shovel-beams L L, pivoted thereto, and provided with handles N N and shovels M M, and the scraper R, connected with one of said beams by a curved bar, substantially as shown and described.

253,762. RAILWAY SIGNALING APPARATUS. FRANK L. POPE, Elizabeth, N. J., assignor to the Union Switch and Signal Company, Hartford, Conn. Filed Nov. 18, 1881. (No model.)

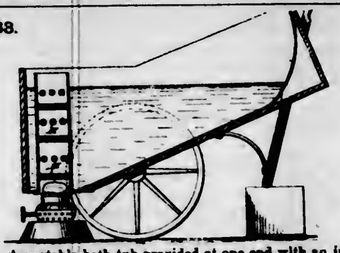
Brief.—The visual signal controls a rotating arm which lies across the path of an audible signal upon the locomotive or train, whereby, when the visual signal is at "danger," an alarm is given upon the passing locomotive or train.

Claim.—1. The combination, substantially as hereinbefore set forth, with a locomotive or car, of an audible signal, a movable lever whereby the same is actuated, a shaft capable of rotation in its bearings, an eccentric cam, and upright projecting arm mounted upon said shaft, whereby, when said arm is depressed, the audible signal is sounded by the action of said cam.

2. The combination, substantially as hereinbefore set forth, with a locomotive or car, of an audible signal, a lever for actuating the same, a double-acting cam, and projecting arm attached thereto, which arm, when deflected in either direction, acts through the cam to sound the audible signal.

3. The combination, substantially as hereinbefore set forth, with a locomotive or car, of an audible signal, mechanism for putting said signal in action automatically, controlled by a stationary signaling mechanism situated at fixed points along the track traversed by said locomotive or car, and means, substantially such as described, for locking the actuating mechanism of the audible signal after it has been automatically started until released by the attendant.

4. The combination, substantially as hereinbefore set forth, of a visual or semaphoric signal mounted upon a vertical axis and capable of two positions at right angles to each other, and a rotating arm mounted upon a horizontal axis and moving synchronously therewith, for actuating an audible signal upon a moving locomotive or car.



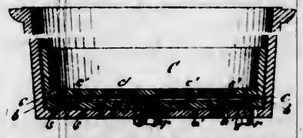
5. The combination, substantially as hereinbefore set forth, with a locomotive or car, of an audible signal, a projecting arm, whereby the same is actuated, a stationary visual signal, an arm mechanically connected with said signal, which engages with the first-named arm, and a friction-roller mounted thereon.

253,763. PORTABLE COMBINED BATH-TUB AND HEATER. WILLIAM Q. PERWITT, Lexington, Ky. Filed Dec. 1, 1881. (No model.)

Brief.—The flue has cross water-pipes, by which more heating surface is afforded.

Claim.—1. A portable bath-tub provided at one end with a hot-air flue, and pivoted upon a support, whereby the tub can be tilted, so as to throw the water to the end in which the flue is located, substantially as described.

253,763.



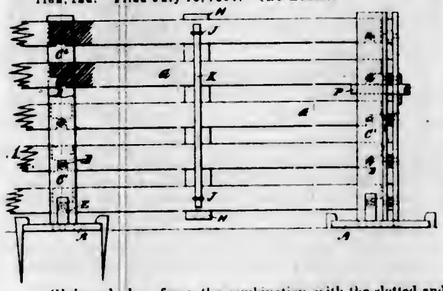
2. A portable bath-tub provided at one end with an inclined extension, and with a hot-air flue arranged within said extension, the tub being pivoted upon a support, so that it can be tilted, in order to cause the greatest depth of water to be at the point where the flue is located, substantially as described.

3. A portable bath-tub provided with an axle supported by wheels, and having at its end an inclined extension with a hot-air flue arranged therein, whereby the tub can be tilted, so as to cause the water to rise around the flue in order to expose the water to a greater area of heating-surface, and also so that the tub can be readily moved from place to place, substantially as described.

4. The combination, with the portable bath-tub provided at one end with an inclined extension, of the wheels and legs for supporting the tub, the handles, and the hot-air flue arranged in the said inclined extension, substantially as described.

253,764. KETTLE FOR MAKING DROP-SHOT. THOMAS E. RUDDY, Pittsburg, Pa., assignor to himself and JAMES McKEOFERY, same place. Filed Nov. 17, 1881. (No model.)

Claim.—1. A drop-shot kettle having two perforated bottoms, arranged face to face without any interposed device to interrupt or regulate the flow of molten lead from the perforations in one to and through the perforations in the other, substantially as set forth.



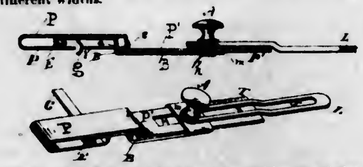
2. The combination of the kettle having a perforated bottom, a perforated vertically-movable false bottom, and means for adjusting and holding such false bottom at different heights from the kettle-bottom, substantially as set forth.

3. A drop-kettle for making drop-shot, having a perforated bottom with grooves in its inner face leading to the perforations, in combination with a false bottom having perforations therein smaller in size than the perforations in the kettle-bottom, substantially as and for the purposes set forth.

4. A drop-kettle having a perforated bottom, in combination with a perforated false bottom, B, and an inner perforated kettle or pan, C, substantially as set forth.

5. A drop-shot kettle having a perforated bottom, in combination with perforated false bottom B, having one plain face and a projection, *b*, on its other face, a perforated inner kettle or pan, C, having a projection, *c*, on its under face, and means for binding the false bottom to the kettle-bottom, substantially as set forth.

253,765. PORTABLE FENCE. OSCAR E. H. N. REICHLING, Marion, Ind. Filed July 15, 1881. (No model.)



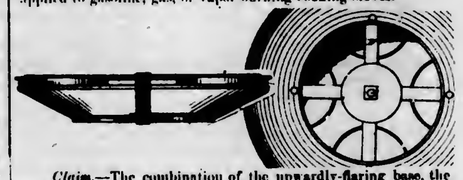
Claim.—1. In a fence, the combination, with the slotted and apertured base-board A, of the upright boards C C², the transverse pins D, and the wedge-blocks E, substantially as herein shown and described, and for the purpose set forth.

2. In a fence, the combination, with the base-board A, provided with a slot, B, and apertures F, of the upright boards C C², the transverse pins D, the wedge-blocks E, and the slats G, substantially as herein shown and described, and for the purpose set forth.

3. In a fence, the combination, with the uprights C C² and the base A, of the slats G G, the bracing-board H, with loops or staples J J at the ends, and of the rod or bar K, substantially as herein shown and described, and for the purpose set forth.

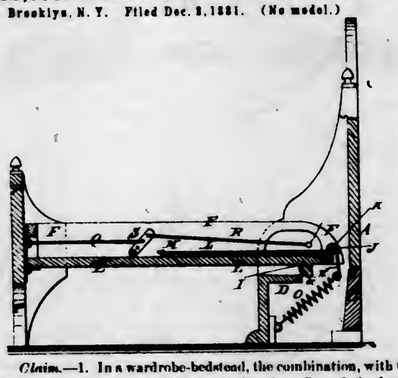
253,766. HEMMER FOR SEWING-MACHINES. CHARLES E. RICE, Owensborough, assignor of one-half to John C. Schrader, Daviess County, Ky. Filed Oct. 27, 1879.

Brief.—The hemmer is adjustable to provide for sewing hems of different widths.



Claim.—1. A hemmer for a sewing-machine, consisting essentially of the plate B, having the bent end or ear E, presser C, screw-shank *h*, and strap *m*, in combination with the plate P, having slotted extension P', provided with a graduated scale, T, and tongue *i*, having guide *g*, substantially as described.

2. A hemmer for a sewing-machine, consisting of the plate B, having bent end E, presser C, screw-shank *h*, and strap *m*, also the plate P, having slotted extension P', provided with a graduated scale, T, and tongue *i*, having guide *g*, in combination with the thumb-screw A and slotted bar L, substantially as described, and for the purposes set forth.



253,767. GAS-STOVE. CHARLOTTE RUPERT, Fort Wayne, Ind. Filed Dec. 12, 1881. (Model.)

Brief.—The invention is adapted by its open bottom to be applied to gasoline, gas, or vapor burning cooking-stoves.

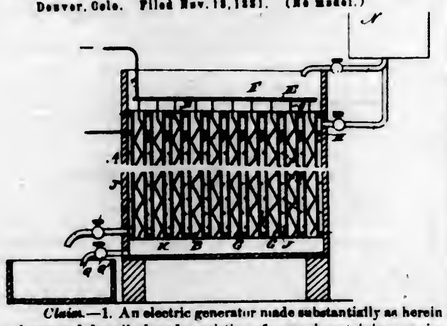
Claim.—The combination of the upwardly-flaring base, the perforated top plate thereof, the central flame-deflecting plate connected to the said base by rigid arms, the tubular post between the deflecting-plate and the top plate, and the bolt for tying the same together, substantially as and for the purposes described.

253,768. WARDROBE-BEDSTEAD. TOWNSEND SAXTON, Brooklyn, N. Y. Filed Dec. 3, 1881. (No model.)

Claim.—1. In a wardrobe-bedstead, the combination, with the side boards and bottom, E F, the spiral springs O, and the levers N, of the spiral springs K and the rod J, substantially as herein

shown and described, whereby the springs O are re-enforced, as set

Claim.—The combination, with a reflector and air-exhauster,



same, slide L', carried by said lever, the needle-bar-carrying frame

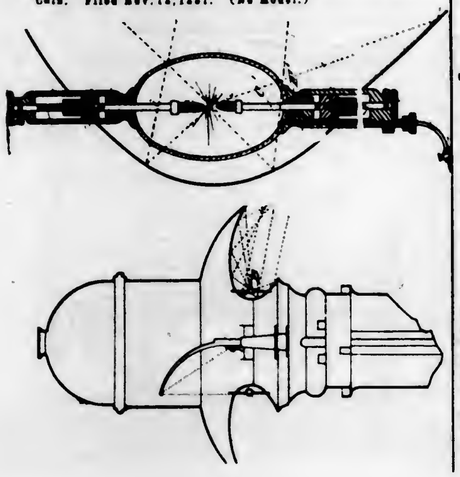
shown and described, whereby the springs O are re-enforced, as set forth.

2. In a wardrobe-bedstead, the combination, with the head-board A and the bottom E, of the rod J, the spiral spring K, provided with levers N, the spiral springs O, and the levers L, substantially as and for the purpose set forth.

3. In wardrobe-bedstead, the combination of the head-board A, the side boards, F, and the hinged foot-board P, of the lever S, pivoted to the side board, F, and the levers Q R, pivoted to the said lever and to the head and foot board, respectively, substantially as and for the purpose set forth.

258,769. GALVANIC BATTERY. ANDRÉS M. G. SORILLOT, Denver, Colo. Filed Nov. 13, 1881. (No model.)

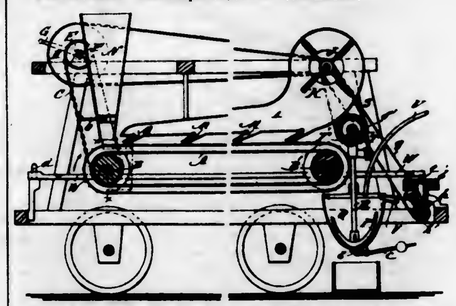
Claim.—1. An electric generator made substantially as herein shown and described, and consisting of a vessel containing a series of porous tubes for mixing two chemicals flowing down the surfaces of the same, which tubes contain and are surrounded by conducting-wires for conducting the electricity produced to collecting-plates, as set forth.



2. In an electric generator, the combination, with the cylinder A, of the porous tubes B, the internal spiral wires, G, and the external spiral wires, J, substantially as herein shown and described, and for the purpose set forth.

3. In an electric generator, the combination, with the cylinder A, having a tank, F, at the top, and a tank, K, at the bottom, of the porous tubes B and the spiral wires G and J, substantially as herein shown and described, and for the purpose set forth.

4. In an electric generator, the combination, with the cylinder A, of the porous tubes B, the spiral wires G and J, and the metal plates E and H, substantially as herein shown and described, and for the purpose set forth.

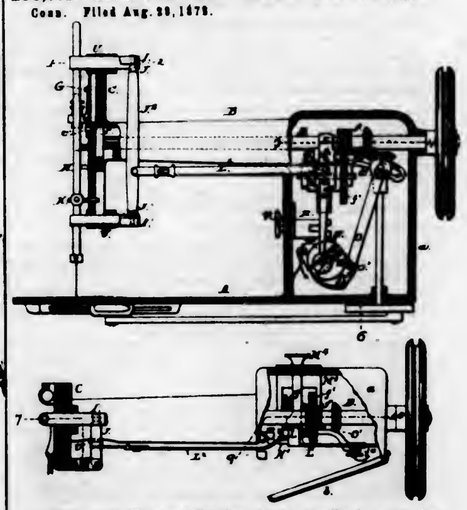


5. In an electric generator, the combination, with the cylinder A, of the porous tubes B, the spiral wires G and J, the metal plates E and H, and the tanks M and N, for containing the chemical solutions, substantially as herein shown and described, and for the purpose set forth.

258,770. ELECTRIC LAMP. ANDRÉS M. G. SORILLOT, Denver, Colo. Filed Nov. 13, 1881. (No model.)

Claim.—The combination, with a reflector and air-exhauster, substantially as described, of a ring of electric lamps having opposite adjustable carbons surrounded by a transparent vessel connected with the air-exhauster, whereby the vacuum may be maintained and the rays of light reflected, as described.

258,771. ORE-CONCENTRATOR. ANDRÉS M. G. SORILLOT, Denver, Colo. Filed Apr. 25, 1881. (No model.)



Claim.—1. In an ore-concentrator, the combination, with a superposed blower, of an endless carrier-belt, A, having a deep concavity arranged longitudinally therein in the shape of a trough, as shown and described, for the purpose specified.

2. The combination, with an ore-carrying belt, of a blower provided with a series of nozzles and arranged over said belt, as shown and described.

3. In an ore-concentrator, the combination, with the trough-shaped ore-conveying belt A, of the vibrating frame W, the pins *d e*, and the eccentric wheel X, with an inclined groove, *b'*, substantially as herein shown and described, and for the purpose set forth.

4. In an ore-concentrator, the combination, with the ore-conveying belt A, of the pulleys B B', the blower L, the hopper N the vibrating frame W, the settler Q, and the agitator P, substantially as herein shown and described, and for the purpose set forth.

258,772. SEWING-MACHINE. JEROME B. SWEAN, Bridgeport, Conn. Filed Aug. 30, 1878.

Claim.—1. The combination of the needle-bar-carrying frame, vibrating lever L, pin *e*, connecting-rod L^5 and pivot *y*, cam-cylinder M and its operating appliances, and adjusting devices, whereby movement of the connecting-pivot *y* may be thrown to a greater or less extent to either side of a vertical line drawn through the lever-fulcrum *x*, substantially as set forth.

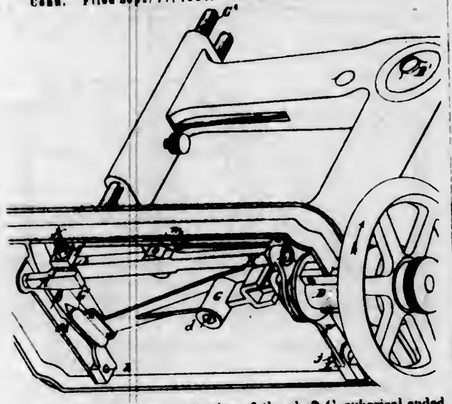
2. The combination, with the lever L and pin *e*, of the operating cam-cylinder M and devices for adjusting the latter longitudinally, as specified.

3. The combination of the lever L, devices for vibrating the

same, slide L', carried by said lever, the needle-bar-carrying frame U, connecting-rod L^2, and devices for automatically moving the slide on the lever, substantially as set forth.

4. The combination of the lever L, frame U, needle-bar H, slide L', connecting-rod N^2, crank-wheel N', its adjustable pin i', connecting-rod L^2, and appliances whereby to turn the wheel, substantially as set forth.

5. The combination of the lever L, slide L', connecting-rod N^4, crank-wheel N', and devices for turning the said crank-wheel N', constructed to automatically vary the speed with which it is turned, and appliances to automatically throw said crank-wheel in and out of operation, substantially as specified.



6. The combination of the lever L, provided with arm i^2 and operating devices, pin i^4, crank-wheel N', ratchet-wheel I^2, secured to the wheel-shaft, vibrating arm O', carrying a spring-pawl, and connecting-rod O, attached to the pin i^4, substantially as set forth.

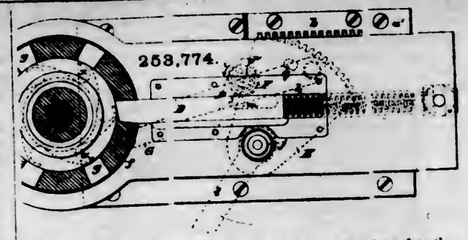
7. The lever L, provided with the graduated arm i^2, and adjustable pin i^3, connecting-rod O, and slide L', in combination with the graduated crank-wheel N', pin i', connecting-rod N^2, and devices constructed to rotate the crank-wheel from the movement of the connecting-rod O, substantially as set forth.

8. The combination of the crank-wheel N' and needle-bar-adjusting devices arranged to be operated thereby, and the ratchet-wheel I^2, arranged to turn independently of the crank-wheel, and intermediate devices for automatically connecting and disconnecting the crank and ratchet wheels, substantially as specified.

9. The combination of the crank-wheel N', having a pin, *n*, ratchet-wheel I^2, having a spring, *o*, and notched flange *m*, switch T, and devices for supporting said switch above and between the crank and ratchet wheels, substantially as and for the purpose set forth.

258,773. SEWING-MACHINE. JEROME B. SWEAN, Bridgeport, Conn. Filed Sept. 17, 1881. (No model.)

Claim.—1. The combination of the shaft C, spherical-ended crank-pin *e*, shuttle-lever G, arranged on the same horizontal plane as the shaft, having a vertical slot at the rear end, and a box adapted to receive the head of the crank-pin *e*, and sliding in the slot of the lever, substantially as set forth.



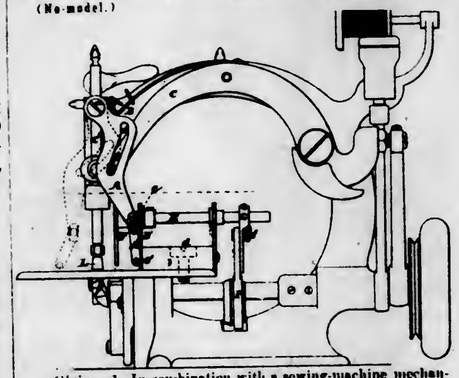
2. The combination of the driving-shaft, its spherical crank H, slotted rock-disk W, rod V, connecting the disk and crank, and needle-bar lever slotted to receive a pin, *z*, extending across the slot of the disk, substantially as specified.

3. The shaft C, carrying the cam E, crank R, disk S, and crank-pin *e*, in combination with the needle-bar-operating appliances connected with the crank R, the feed device connected with the cam E, and the shuttle-lever connected with the crank-pin *e*, substantially as set forth.

4. The combination of the feed-plate M, sliding at one end on a pin, *b*, a lever, H, connected to the opposite end of said feed-plate, an adjustable horizontal fulcrum-pin, *k*, extending through a slot in the lever, a vertically-pivoted adjustable fulcrum-block, O, slotted for the passage of the lever, and appliances for vibrating the rear end of the lever vertically and horizontally, substantially as set forth.

258,774. DEVICE FOR OPERATING TOOL-HOLDING TURRETS. JEROME B. SWEAN, Bridgeport, Conn. Filed Aug. 3, 1881. (No model.)

Claim.—1. The combination, with a slide, B, and its bed A



and turret, of the rack *b* on the bed and segment E, pivoted to the slide, and segment-lever *l*, substantially as set forth.

2. The combination, with the slide, turret, and segment E, of the arm G, adapted to engage with the ratchet-wheel *d*, substantially as set forth.

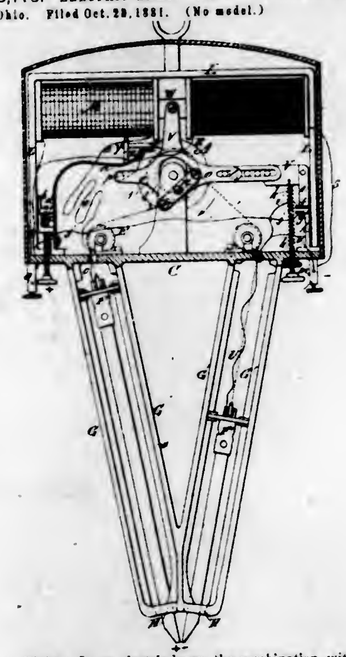
3. The combination, with the slide, segment, and turret having a ratchet-wheel, *d*, of the arm G, adapted to the teeth of said wheel and pivoted to the segment, substantially as set forth.

4. The combination, with the slide and revolving turret having notches *g*, of a spring-bolt, D, carried by the slide, a lever, F, engaging with said bolt, and a segment, E, provided with a stud, *q*, arranged to strike and turn the lever to retract the bolt as the segment is turned, substantially as described.

258,775. SEWING-MACHINE ATTACHMENT FOR MAKING FRINGE. DE LANA SHAPLIN, Boston, Mass. Filed Oct. 8, 1881. (No model.)

Claim.—1. In combination with a sewing-machine mechanism, the pendent thread-guiding lever A, the needle-bar operating lever C, connected therewith, as described, and the pendent loop-forming hook F, constructed and arranged for operation as an attachment for making fringe, as herein set forth.

2. In combination with the driving-shaft and sewing mechanism of a sewing-machine, the yarn-guiding lever A A', the rocker-shaft E, the pendent loop-forming hook F, the lever G, the eccentric-rod H, and the eccentric I, all arranged and adapted to operate substantially as and for the purposes described.

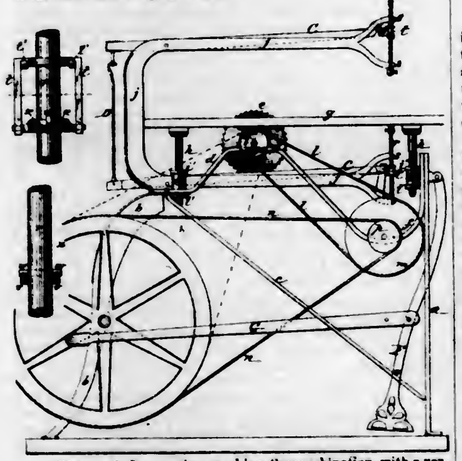


3. In a mechanism for making fringe, the combination of the yarn-guiding lever A A', made in two parts adjustably secured together, and provided with the cam-slot *a'*, the loop-forming hook, the needle-bar-operating lever C, and the roll or stud a^2, all arranged and adapted to operate substantially as described.

4. The combination, with the needle-bar-operating lever C, of the pendent thread-guiding lever A, having its lower eyed part, A', adapted for vertical and lateral adjustment in relation to its pivoted part, the pendent loop-forming hook, and a sewing mechanism, substantially as herein set forth.

5. The combination, with a sewing mechanism, of the adjustable thread-guiding lever, with the loop-forming hook F, means for increasing and diminishing the throw of said hook, and means for adjusting said hook in relation to its throw, so that its forward movement will always be to a given point in taking the thread without regard to the length of the loops, substantially as described.

6. The combination, substantially hereinbefore set forth, of a sewing mechanism, a pendent thread-guiding lever, and a pendent loop-forming hook with the presser-foot and means for operating said thread guide and looper in relation to said presser-foot, substantially as described.



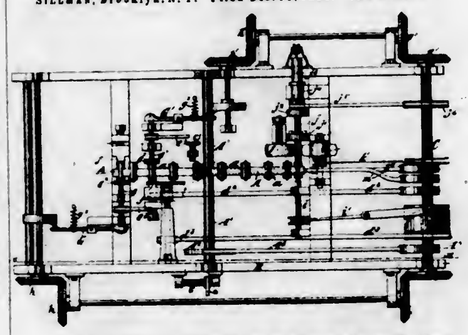
253,776. ELECTRIC LAMP. HENRY B. SHERIDAN, Cleveland, Ohio. Filed Oct. 28, 1881. (No model.)

Claim.—In an electric lamp, the combination, with the base-plate C and the carbon-holders F F', controlled by the movements of the cone-pulley A, of two or more pairs of converging guide-rods, G G G' G', connected at their lower ends by a plate, H, provided with cement-lined guide-perforations for the carbons, substantially as herein shown and described, whereby the carbons are made to approach each other on converging lines and separate on diverging lines, as set forth.

253,777. SCROLL AND CIRCULAR SAWING MACHINE. ABRAHAM SHOWALTER, Pataskala, Ohio, assignor of one-third to Wm. D. Arnold, same place. Filed Oct. 11, 1881. (No model.)

Brief.—The novelty lies in the construction of the frame and of the scroll-saw hanging device.

Claim.—1. In a sawing-machine, the combination, with a vertically-adjustable table, *g*, of a top-frame bracket having an elevated part, *d*, for carrying and supporting the circular-saw shaft, and a depressed front part, *f*, for carrying and supporting the crank-shaft *k*, for operating the scroll-saw, and the pulley *m*, for operating the circular saw, substantially as described, for the purpose specified.



2. In a combined scroll and circular sawing machine, the top-frame bracket having a front hanger part, *f*, and an arched part, *d*, and adapted to support and carry the table, the means by which the table is vertically adjusted, the circular-saw shaft, the U-frame for supporting and carrying the scroll-saw, and the means for operating both saws, substantially as described, for the purpose specified.

3. The combination, in a scroll-sawing machine, of the pivoted bars C, each having an end forked plate, *u*, with saw-carrying guide-rods *r*, each having a cross-pin, *w*, and the slotted yokes *t t'*, having the pivoted notched eyed cross-bars *v x*, substantially as described, for the purpose specified.

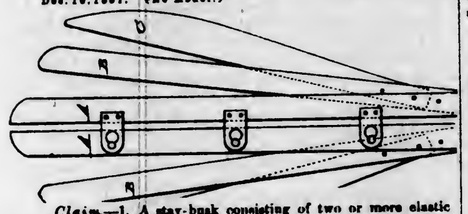
4. The combination of the fixed frame *j*, the pivoted bars C *u*, and their connecting stretcher-rod D with the saw-carrying guide-rod *r*, having the cross-pins *w*, and the slotted yokes *t t'*, having the notched eyed cross-bars *v x*, substantially as described, whereby the saw is both stretched and adjusted to operate in any direction.

5. The pivoted arms C, each having a forked end plate, *u*, and their stretcher-rod D, in combination with the saw-carrying guide-rods *r*, each having a cross-pin, *w*, the yokes *t*, each having a closed slotted end, and the notched cross-bars *v*, pivoted in the open ends of said yokes, the said forked plates hooking within the closed ends of the yokes and the said cross-bars held against said pins by said pivoted arms, substantially as described, whereby the said notched cross-bars may be released from said pins *w* to allow the saw to be set to operate in any direction without disconnecting any of the parts, for the purpose described.

253,778. MACHINE FOR MAKING SPOOLS, &c. HENRY B. SILLMAN, Brooklyn, N.Y. Filed Oct. 31, 1881. (No model.)

Claim.—1. The combination, with the wheel having holders in its periphery, and having a step-by-step rotary motion, and dogs for holding blanks in the holders, of two pivoted stops and mechanism for moving them to obtrude them in the path of said dogs to move the dogs, first to permit of the insertion of the stick in the holders and subsequently to release the blanks and to move the stops out of the way of said dogs, substantially as specified.

2. The combination, with the wheel having holders in its periphery, and having a step-by-step rotary motion imparted to it, of a longitudinally-movable shaft on one side of said wheel, a pusher-shaft on the other side of said wheel, adapted to move longitudinally and push the bobbins or other articles from the wheel and against the opposite shaft, and by its further movement to move the said shaft longitudinally, and a cutter-head, opposite to which the bobbins or other articles are carried by the two said shafts, substantially as specified.



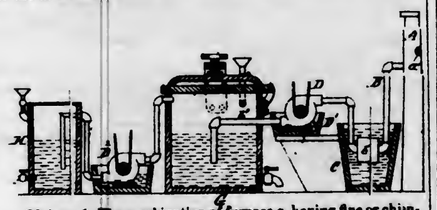
3. The combination of the wheel A, having holders in its periphery, and having a step-by-step rotary motion, the pusher-shaft *i* and shaft *j*, arranged on opposite sides of said wheel in line with each other, the fixed clutch-piece *j'* and the rotary clutch-piece *j''*, for rotating the shaft *j*, the sleeve *j''*, surrounding the shaft *j*, the spring *j'''*, and the cutter-head *k*, substantially as specified.

4. The combination of the wheel A, having holders in its periphery, and having a step-by-step rotary motion, the spindles *e e'*, arranged one in advance of the other, the stationary rests or abutments *f f'*, the pusher-shaft *i* and shaft *j*, arranged in line on opposite sides of said wheel, and both longitudinally movable, and the cutter *k*, substantially as specified.

5. The combination, with the wheel A, having holders in its periphery, and having a step-by-step rotary motion, the pusher-shaft *i*, and the longitudinally-movable shaft *j*, arranged in line with said pusher-shaft, of a cutter-head, and a round or smoothing roll, between which the bobbins are carried and rotated by said pusher-shaft and shaft, substantially as specified.

6. The combination, with the wheel A, having holders in its periphery, and having a step-by-step rotary motion, of the rollers *e*, between which the sticks are fed into said wheel, the adjustable stop *e'*, the spindles *e e'*, arranged one in advance of the other on opposite sides of said wheel, and the adjustable stationary rests or abutments *f f'*, all substantially as specified.

253,779. STAY-BUSK. HENRY SIMPSON and BENJAMIN G. SIMPSON, Sheffield, County of York, assignors to Robt. Symington, Market Harborough, County of Leicester, England. Filed Dec. 19, 1881. (No model.)

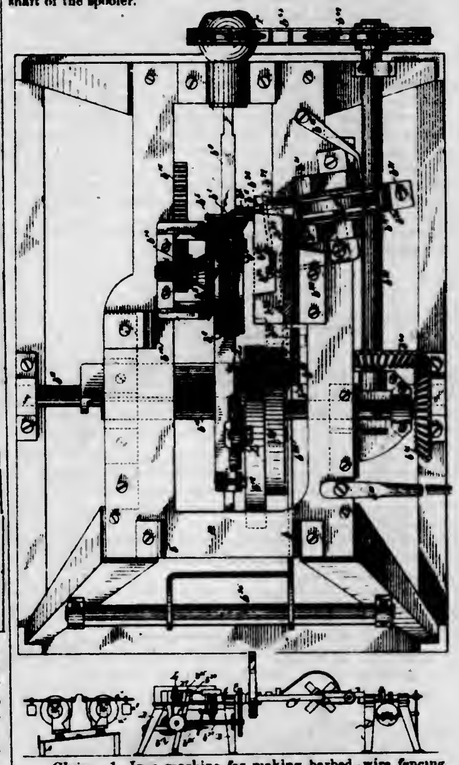


Claim.—1. A stay-busk consisting of two or more elastic blades secured together at one end, and having their opposite ends separated from each other and spread apart to form a wide or fan-like bearing, and each being arranged to yield independently of the others.

2. A stay-busk composed of the blades or fingers A, B, and C, substantially as described and shown.

253,780. APPARATUS FOR UTILIZING THE WASTE PRODUCTS OF COMBUSTION IN FURNACES. THOMAS S. SPEAKMAN, Philadelphia, Pa. Filed Jan. 16, 1881. (No model.)

Brief.—The heat of the products of combustion passes into the water of the cooling-reservoirs, raising the temperature thereof, while the condensed products are deposited in receiving-chambers for use as fertilizers.



Claim.—1. The combination of furnace *a*, having flue or chimney A, provided with damper *a'* and pipe B, the latter terminating in a condenser, *b*, immersed in water contained in a tank, C, the collecting-chambers G H, provided with removable covers, and a fan or blower, D, said parts being arranged for operation substantially as shown and described, and for the purpose set forth.

2. In an apparatus for utilizing the waste products of combustion in furnaces, the combination of the following elements, viz: a furnace provided with a flue or chimney having a damper and a pipe leading therefrom, said pipe terminating in a condenser immersed in water contained in a tank, a collecting chamber or chambers, and pipe-connection between said chambers and condenser, and a fan or blower, said parts being arranged for operation, substantially as shown and described.

253,781. MACHINE FOR MAKING BARBED-WIRE FENCING. SIDNEY M. STEVENS, Elwood, Ill., assignor, by mesne assignments, to Washburn & Moen Manufacturing Company, Worcester, Mass., and Isaac L. Ellwood, De Kalb, Ill. Filed Dec. 3, 1877.

Brief.—The barb-wire is fed through cutters and through an eye in the coiler and between the main wires. The main wires are wound on delivery-reels, passed through the coiler, and attached to the spool. The power-shaft of the barbing-machine is belted to the shaft of the twister, and both are continuously revolved. Within the hollow shaft of the continuously-revolving twister and in frictional bearing contact with its interior is mounted the shaft, from which power passes to rotate the spooler. A weighted brake is on the spooler power-shaft. When the operation begins there is a tension on the main wires by the pull of the delivery-reels against the spooler. The friction of the bearing of the spooler power-shaft and the twister-shaft is adjusted by the weighted brake to balance the tension of the delivery-reels, so that the spool is stationary. Power being applied, the twister revolves, the barb-wires are fed, and the barb-cutters are operated, and the coiling-tube simultaneously advances and rotates, bending the rear end of a cut-off barb around the main wires, while the middle part of the barb, being between the main wires, which are kept from twisting, is by the bending of the barb bound against the main wires, and being itself advanced by the advancing coiler advances the main wire as the coiling progresses. Thus the pull of the delivery-reels is transferred from the spool to the coiler, and the spool, being freed from so much tension in one direction, is revolved in the opposite direction to take up the barbed and twisted wire by the undiminished frictional power of the twister-shaft on the power-shaft of the spooler.

Claim.—1. In a machine for making barbed-wire fencing, mechanism constructed to simultaneously feed the main fence-wires and apply the barbs thereon, in combination with means for operating said mechanism, substantially as described.

2. The combination, in a machine for making barbed-wire fencing, of mechanism for feeding the barb-wire and mechanism for cutting said barb-wire to form the barbs with mechanism constructed to simultaneously feed the main fence-wires and apply the barbs thereto, substantially as described.

3. The combination of a non-rotating wire-holder having two or more apertures for the main wires with a coiling-cylinder rotating on the said holder, substantially as set forth.

4. The combination, with supports for the main fence-wires, of automatic mechanism for inserting the barbs between said wires and mechanism for catching one end of the several barbs and coiling said end around said fence-wires, substantially as described.

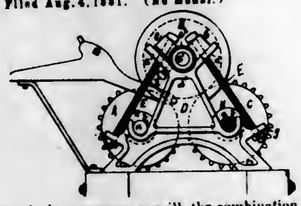
5. The combination, with supports for the main fence-wires, of automatic mechanism for inserting barbs between the said main wires, and mechanism for catching one end of the several barbs and coiling said end around both said main wires, and mechanism for twisting the latter between the barbs, substantially as shown and set forth.

253,787.

Claim.—1. The combination of the knob-shank having the slots *x* and *y* with the slotted sleeve A, provided with lugs C and

6. A coiling-wheel provided with a pierced projection for receiving the barb, substantially as described.

7. The combination, with the hollow shaft b^3, of the slotted keys b^7, substantially as described.



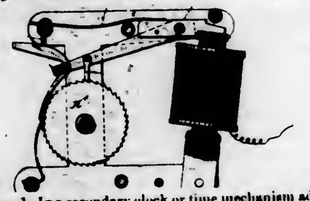
8. The combination, with the rotating and reciprocating coiling mechanism, of the gearing b^{13} upon the frame and the intervening devices, whereby the reciprocating motion of the coiling mechanism is made to rotate the same, substantially as set forth.

9. The inclined track-stand, in combination with the reel-carriage and its rollers, substantially as specified.

10. The combination, with the feed-wheel b^{10}, of the friction-brake, consisting of the arm pivoted upon the axis of the wheel and having an inclined surface opposed to the periphery of the wheel, and the small roller interposed between such inclined surface and the periphery, substantially as described.

11. The combination of a delivery apparatus comprising a carriage supporting the wires to be barbed and mounted on inclined ways, a spooling apparatus comprising a spool journaled in bearings, a continuously-revolving power-shaft, means for conveying power from said shaft to said spool through a friction-connection, and means for regulating or adjusting the power conveyed to said spool, and a barbing apparatus comprising main wire-feeding and barb-applying mechanism and means for operating said mechanism substantially as described, whereby the main fence-wires are constantly stretched by the balanced tension in opposite directions of the said delivery and spooling apparatus, and the barbed wires are rapidly wound upon said spool as the main wires are advanced and the barbs applied thereto, substantially as set forth.

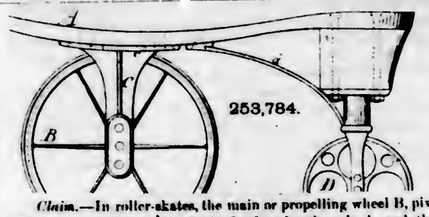
253,782. SUGAR-CANE MILL. JOEL STUBBS, Minneapolis, Minn. Filed Aug. 4, 1881. (No model.)



Claim.—1. In a sugar-cane mill, the combination of a main or pressure roll, a feed-roll, and a discharge-roll, the discharge-roll being adapted to rotate at a higher rate of speed than the feed-roll, whereby the cane is rapidly discharged and clogging prevented, substantially as set forth.

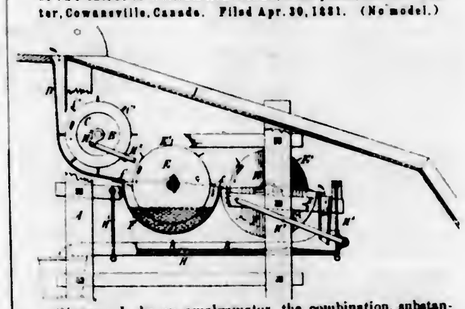
2. The combination of the rollers A B C, frame D, having the forked bearings d, angular boxes c^1, and set-screws k^1 k^2, substantially as set forth.

3. The combination of the rollers A B C, frame D, having the forked bearings d, angular boxes c^1, and rods E, substantially as set forth.



253,783. SECONDARY ELECTRIC CLOCK. D. PRUD SWEET, Hastings, Mich. Filed July 23, 1881. (No model.)

Claim.—1. In a secondary clock or time mechanism adapted to be operated by an intermittent electric current established through the medium of a prime motor, the combination, with an electro-magnet, of a vibrating lever carrying an armature and a bent pawl, the latter being pivoted to the rear end of the lever, and a pin adapted to bear upon the upper end of said pawl and press the same into contact with the ratcheted minute-hand wheel, substantially as and for the purposes specified.

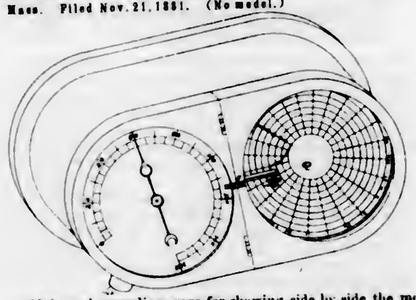


2. In combination with the lever carrying the armature, the electro-magnet, and the ratcheted minute-hand wheel, the detent secured to the said lever and adapted to engage the ratchets of the said wheel to hold the same when the circuit is open, substantially as and for the purposes specified.

253,784. ROLLER-SKATE. HENRY YAPPEL, Cleveland, Ohio. Filed Dec. 12, 1881. (No model.)

Claim.—In roller-skates, the main or propelling wheel B, pivoted in bracket C and adjustably fixed under the sole A, and the rear wheel or caster, D, fixed in post and brace d to the bottom of heel a, all constructed to operate substantially as specified.

253,785. APPARATUS FOR SEPARATING AND AMALGAMATING GOLD. CHARLES TAYLOR, Montreal, Quebec, assignor of two-thirds to William H. Burland, same place, and A. F. Foster, Cowansville, Canada. Filed Apr. 30, 1881. (No model.)

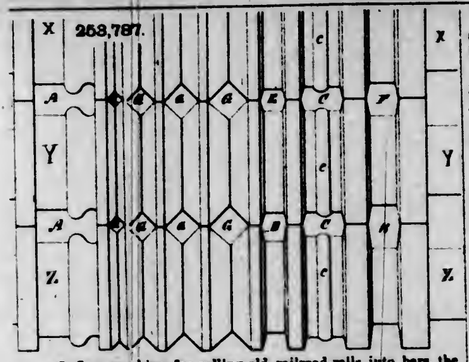


Claim.—1. In an amalgamator, the combination, substantially as before set forth, of the rotating drums and the lipped pans pivoted to the shafts of said drums.

2. In an amalgamator, the combination, substantially as before set forth, of the drums, the lipped pans pivoted to the shafts of said drums, and the shaking-table beneath the pans.

3. In combination with a water-wheel, C, the drums E E, revolving in pans F F, and shaking-table H, substantially as and for the purposes described.

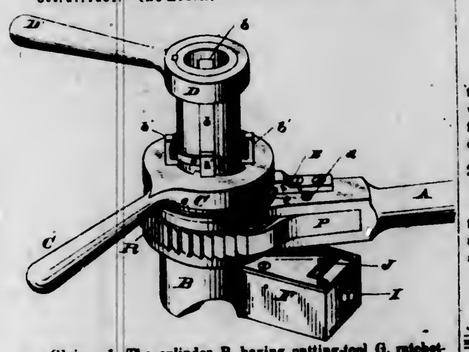
4. In combination with the revolving drums E E and pans F F, the grating I, shaking-table H, and means for shaking said table, as and for the purpose described.



253,786. RECORDING-GAGE. EARL AMBI THISSELL, Lowell, Mass. Filed Nov. 21, 1881. (No model.)

Claim.—A recording-gage for showing side by side the momentary indications of pressure and a continuous record of the same on a pair of circular dials, comprising a paper dial removable from a rotary carrier for receiving the record of each day, a marker having a jointed rod connected with the shaft of the index-hand, a notched stationary dial in front of the marker-rod, behind said index-hand, and a hinged and slotted front plate, substantially as herein specified, for the purpose set forth.

253,787. MACHINERY FOR ROLLING RECTANGULAR BARS FROM OLD RAILS. JOHN J. THOMAS, Zanesville, Ohio. Filed Nov. 18, 1881. (No model.)

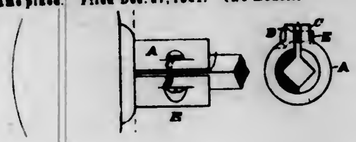


Claim.—1. In a machine for rolling old railroad-rails into bars, the rolls X Y Z, constructed, substantially as shown and described, with ridges and grooves adapted to form the several passes A, B, F, D, E, and G, as set forth.

2. In a machine for rolling old railroad-rails into bars, the rolls X, Y, and Z, provided with the passes A, having the shape of a pear-head rail having a thick base, the hexagonal passes B, F, D, and E, and the flat hexagonal passes C and the ridges c, forming concave recesses in the flat sides of the billet passing through the passes C, substantially as herein shown and described, and for the purpose set forth.

3. In a machine for rolling old railroad-rails, the rolls X Y Z, provided with passes or grooves A, in the shape of a pear-head rail with a thickened or upset base, substantially as herein shown and described, and for the purpose set forth.

253,788. STAY-BOLT CUTTER. NICHOLAS THOMAS, Chicago, Ill., assignor of one-half to Allen Barker, same place. Filed Oct. 27, 1881. (No model.)



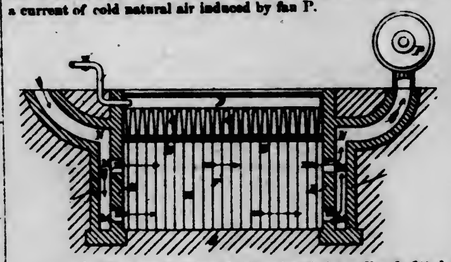
Claim.—1. The cylinder B, having cutting-tool G, ratchet-wheel R, and pawls f, and handle A, having pawl P and piece E, in combination with a sleeve, S, having jaws b and spring a, and a cam-piece, C, having a ratchet, O, substantially as described and shown.

2. The combination, with the rotating cylinder B, having box F and handle A, provided with projection h, of the feed-screw I, nut H, carrying cutter G, ratchet J, and washers i g, substantially as and for the purpose described.

3. In a stay-bolt cutter, a sleeve provided with jaws operated by a cam, whereby said sleeve may be secured directly to the bolt to be cut off, in combination with a device for carrying the cutting-tool which rotates upon said sleeve, substantially as described.

4. A sleeve, S, having collar D and handle D', and provided with jaws b b, and a cam-piece, C, having a handle, C', in combination with a cutter, G, substantially as and for the purpose described.

253,789. KNOB ATTACHMENT. HENRY E. TOWNE, Stamford, Conn., assignor to the Yale Lock Manufacturing Company, same place. Filed Dec. 27, 1881. (No model.)



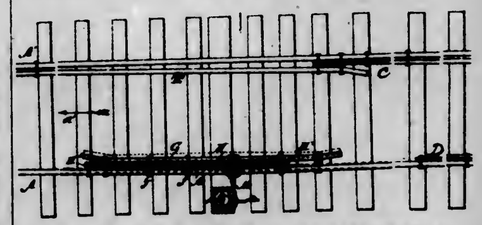
Claim.—1. The combination of the knob-shank having the slots x and y with the slotted sleeve A, provided with lugs C and D, in which works the screw E, substantially as herein set forth.

2. The combination of the knob-shank having the slots x and y and groove F with the slotted sleeve A, provided with lugs C and D, in which works the screw E, substantially as herein set forth.

253,790. ICE-HOUSE. ARTHUR VON KRAUSE and MATHIAS KRUSE, Blauvelt ville, N. Y. Filed Nov. 4, 1881. (No model.)

Brief.—Water enters house through pipe H, passes down funnels C and down on vertical wires F, where it is frozen into ice by a current of cold natural air induced by fan P.

Claim.—The tapering funnels C, having their small ends fitted into apertures of a water-tank bottom, D, in combination with pendent wires F, supported at their upper ends in said funnels and extending down into a freezing-chamber, as shown and described.

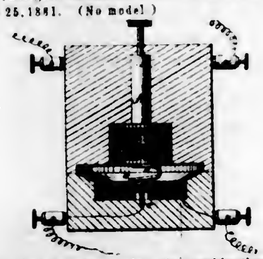


253,791. FASTENING DEVICE. RICHD. H. WARLOW, Atlanta, Ga. Filed Nov. 14, 1881. (Model.)

Claim.—In combination, the part A, having cruciform slot a, the part B, having upturned slotted end, and the part C, provided with strap d, adapted to slide freely in the said slotted end, and to fit the slot a, the whole constructed and operating substantially as described.

253,792. RAILROAD-SWITCH. JOHN H. WAIT, East Minneapolis, Minn. Filed Sept. 12, 1881. (No model.)

Brief.—A safety-switch for main line wherein an unbroken flexible main-line rail having secured thereto an auxiliary rail and a guard-rail is employed as the movable part, combined with a fixed point and main-line rail on the opposite side of the track.

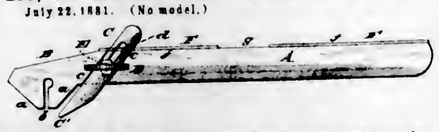


Claim.—1. A railroad-switch constructed, substantially as herein shown and described, with a laterally-movable main rail, with which a guard-rail and a middle rail are united, so as to move with this laterally-movable main rail, as set forth.

2. The combination, with the laterally-movable rail A of a railroad-switch, of the guard-rail G and the middle rail, H, firmly united with the rail A, substantially as herein shown and described, and for the purpose set forth.

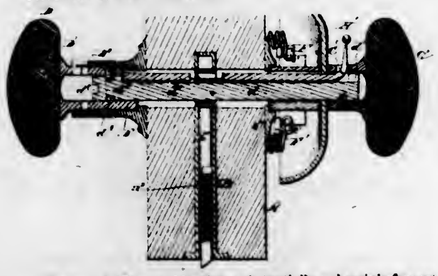
3. The combination, with the laterally-movable rail A of a railroad-switch, of the guard-rail G, the middle rail, H, both attached firmly to the rail A, the rail A', the guard-rail E, and the tongues C and D, substantially as herein shown and described, and for the purpose set forth.

4. The combination, with the laterally-movable rail A of a railroad-switch, of the guard-rail G, the middle rail, H, the guard-rail E, the fixed rail A', the tongues C and D, the connecting-rod M, the vertical crank-rod L, and devices for operating this rod L, substantially as herein shown and described, and for the purpose set forth.



253,793. TELEPHONE-RELAY. HENRY E. WAITE, Bridgeport, Conn., assignor to Charles F. Livermore, New York, N. Y. Filed June 25, 1881. (No model.)

Claim.—1. In a telephone-relay, the combination of a magnet provided with a recurved spring-extension of one of its poles, a coil surrounding said magnet and arranged within one line or circuit, and a microphone arranged within another and independent line or circuit, the recurved arm of the magnet resting in contact with one of the electrodes of the microphone, substantially as described.



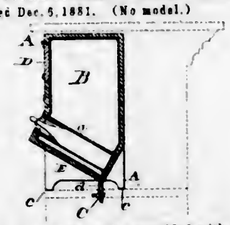
2. In a telephone-relay, the magnet surrounded by the coil of one line or circuit, and provided with the recurved arm resting upon and in combination with the microphone of another and independent line, said magnet, coil, and microphone being inclosed in a box or case, preventing their displacement.

253,794. SAW-SET. NELSON J. WEBB, Denver, Mich. Filed July 22, 1881. (No model.)

Claim.—The described saw-setting tool or implement, consisting of a handle, A, having head B, beveled at *a a* and slotted at *b*, laterally-projecting top plate, F *f*, discontinued to form the opening *g*, slotted gage-plate C C', sliding in the grooved way or recess *c*, parallel to the contiguous bevel *a* of the head, and thumb-screw D, provided with the washer E, all constructed and combined to operate as shown and specified, for the purpose set forth.

253,795. ALARM-LOCK. JAMES E. WELLS, Auburn, N. Y. Filed June 8, 1881. (Model.)

Claim.—1. The combination, substantially as hereinbefore set forth, of the spindle *d*, provided with a longitudinal groove, *d'*, and a circumferential groove, *d*², the knob D, constructed with one or more longitudinal grooves, D², a retaining-screw put through the shank of the knob D and projecting into the circumferential groove *d*², with the key-rod *d*, having a cut-away portion, H², and inserted in the groove *d'* in spindle *d*, with its end having the cut-away portion resting in the hub of the knob D and its opposite end carried through the lock and projected at the other knob, substantially as set forth.



2. The combination, with the hub *c*, having a series of longitudinal grooves, *c'*, formed in its central opening, and provided on its periphery with means for drawing back the latch of the lock, and the spindle *d*, fitting in the opening in the hub *c* and having a longitudinal groove, *d'*, extending from its seat in the hub to the inner end of the key-rod H, placed within the groove *d'* and passed through the hub *c*, and constructed with a cut-away portion, H², arranged within the hub and having its outer end projected at the knob C, substantially as set forth.

3. The combination, substantially as hereinbefore set forth, of the spindle *d*, constructed with a cross-slot, *d'*, in its end, a circumferential groove, *d*², formed around it near the end, with the knob D slipped into the end of the spindle, and provided with a key-hole, D', and a set-screw put through the hub of the knob and projecting into the circumferential groove in the end of the spindle, substantially as set forth.

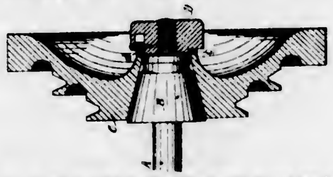
4. The combination, substantially as hereinbefore set forth, of the casing B, the latch-bolt *a*, having the parallel arms *a' a*², provided with hooks *a'*, the spring *a*², the gravitating dogs *b b'*, having hooks on both ends, and the sleeve *c*, for receiving the spindle *d*, and provided with the projecting hooks *c'*, substantially as set forth.

5. The combination, substantially as hereinbefore set forth, of the spindle *d*, provided with a spline, *d'*, the key-rod H, the reversible cam F, provided with a longitudinal groove and locked to the spindle *d* by the key-rod H, and the hammers F, supported on spring-rods *e*, bent into elbows *e'* and made fast to the door or plate *e*², substantially as set forth.

253,796. BOTTLE-COOLER. PAUL M. WENTHER, Sioux City, Iowa. Filed Dec. 5, 1881. (No model.)

Claim.—1. In a bottle-cooler provided with cooling-tubes *a*, a door, D, opening into the space B above said tubes, substantially as shown and described, and for the purpose set forth.

2. In a bottle-cooling device, the metallic cooling-tubes *a*, placed at an angle to the main part of said cooler, substantially as shown and described.



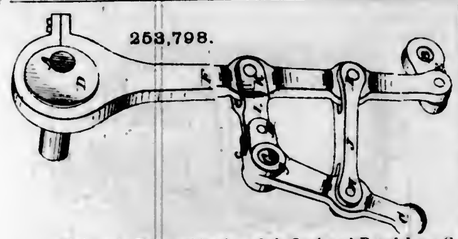
3. In a bottle-cooler provided with cooling-tubes *a*, a door, D, opening into the space B above said tubes, in combination with a discharge-pipe, *d*, leading from the space below said tubes, and provided with a stop-cock, C, substantially as shown and described.

4. In a bottle-cooler, the case A A and end pieces, E E, in combination with the cooling-tubes *a* and labels *b*, substantially as described and shown.

5. In a bottle-cooling device, the case A A, provided with the cooling-tubes *a*, doors D, discharge-pipe *d*, and stop-cock C, in combination with the end pieces, E E, having feet *c c*, substantially as shown and described.

6. The combination of the case A A, cooling-tubes *a*, labels *b*, doors D, discharge-pipe *d*, stop-cock C, and end pieces, E, having feet *c c*, substantially as and for the purpose set forth.

253,797. GOOSE PULLEY. ELBERT D. WHYBURN, Atlanta, Ga. Filed Sept. 7, 1881. (No model.)



Claim.—1. The combination of the pulley C and nut D, one having a pawl and the other ratchet-teeth, with the shaft A, whereby the nut serves the double purpose of securing the wheel on the shaft and forming one part of the clutch, substantially as described.

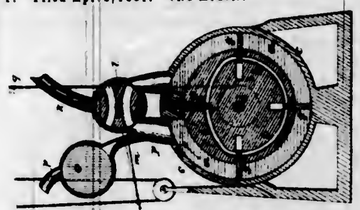
2. The combination, with the revolving shaft A, provided with the cone B, of the pulley C, having an aperture loosely fitting said cone, and the nut D, for securing the pulley on the cone B, substantially as described.

3. The combination of the pulley C and the nut D, one having a pawl and the other ratchet-teeth, with the shaft A, having a cone, B, fitting in an aperture in the pulley, substantially as described.

253,798. MECHANICAL MOVEMENT. RUEL W. WHITNEY, New York, N. Y., assignor of one-half to Peter S. Baylor, Jersey City, N. J. Filed Jan. 11, 1881. (No model.)

253,798.

Claim.—1. The combination of shafts A and B and lever C and means, substantially as shown and described, for rotating shaft B and vibrating lever C by the rotation of shaft A, as and for the purpose set forth.

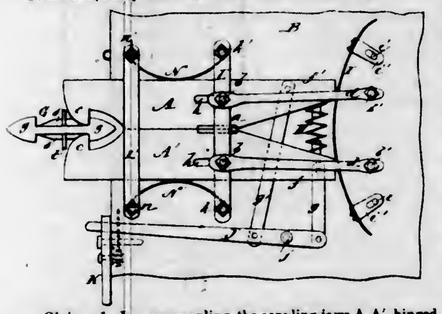


2. The combination of a power-driven shaft, an eccentrically-connected rod attached concentrically to a second shaft and pivotally connected at two points to a pivoted lever, substantially as shown and described.

3. The combination of a power-driven shaft, an eccentrically-connected rod, and a pivoted lever connected at two points pivotally to said rod, substantially as shown and described.

4. The combination of shaft A, eccentric D, lever F, links L and J, and pivoted lever C, substantially as shown and described.

5. The combination of shaft A, lever F, shaft B, lever C, and connecting-links L and K, substantially as shown and described.



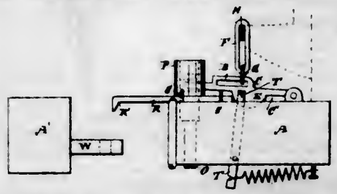
253,799. HYDRAULIC ELEVATOR. CHARLES T. WIDSTRAND, Minneapolis, Minn., assignor to Mary B. Thayer, New York, N. Y. Filed Apr. 5, 1881. (No model.)

Claim.—1. The combination, with an elevator, of a suitable hydraulic rotary engine, pressure-wheel, or pump having an inlet-pipe leading to one side of the pistons and an outlet-pipe leading from the opposite side thereof, a reservoir communicating with the outlet-pipe, and an induction-valve located between said pipes, and which is adapted to connect them with each other, substantially as shown and described, whereby the cylinder may be kept full of water and the descent of the cab regulated by the free or retarded circulation of the water through the port of the said induction-valve, as set forth.

2. The combination, with an elevator, of a hydraulic rotary engine, pressure-wheel, or pump having valve *l*, provided with arm *m* and rope *n*, inlet-pipe *k*, having check-valve *s*, escape-pipe *p*, and reservoir *o*, and hoisting-rope *q*, substantially as shown and described.

253,800. CAR-COUPLING. LA VERA T. WILLIAMS and EDWIN D. KNIGHT, Pooryville, Ind. Filed Oct. 11, 1881. (No model.)

Claim.—1. In a car-coupling, the coupling-jaws A A', hinged together by the hinge *a* a little beyond the center of their length, and provided with hooks *c*, having their adjacent faces serrated or cut away to form a series of openings or passages, *e*, substantially as and for the purpose set forth.



2. In a car-coupling, the combination, with the hinged coupling-jaws A A', provided with hook *c* and openings *e*, of the link G, provided with the heads *g*, the fins *s*, and the cross-bar *t*, substantially as and for the purpose set forth.

3. In a car-coupling, the combination, with the car-body B and hinged jaws A A', provided with the slots *h*, of the cross-bars L L', and the connecting-rods *d*, and the bolts *b b'*, *k k'*, and *n n'*, substantially as and for the purpose set forth.

4. In a car-coupling, the combination, with the car-body B and the coupling-jaws A A', of the spring I, the slotted ears *i'*, and the rods *i*, substantially as and for the purpose set forth.

5. In a car-coupling, the combination, with the hinged coupling-jaws A A' and the bolts *k k'* and *n n'*, of the coiled spring H, between their rear ends, and the flat side springs, N N', substantially as and for the purpose set forth.

253,801. CAR-COUPLING. MICHAEL WIRTER, Sr., Union City, Ind. Filed Dec. 29, 1881. (Model.)

Claim.—1. In a car-coupling, the combination, with the draw-head, of a lever pivoted on the top of the draw-head and provided with a cam-projection, of the coupling-pin adapted to be acted upon by the front end of this lever, and of a projecting sliding rod on the top of the draw-head, adapted to raise the cam-lever, thereby raising the coupling-pin, substantially as herein shown and described.

2. In a car-coupling, the combination, with the draw-head A, of the coupling-pin O, the lever C, pivoted on the top of the draw-head and provided with a cam-projection, E, and of the projecting sliding rod R, substantially as herein shown and described, and for the purpose set forth.

3. In a car-coupling, the combination, with the draw-head A, of the coupling-pin O, the pivoted cam-lever C, projecting sliding rod R, the lever T, and the spring V, substantially as herein shown and described, and for the purpose set forth.

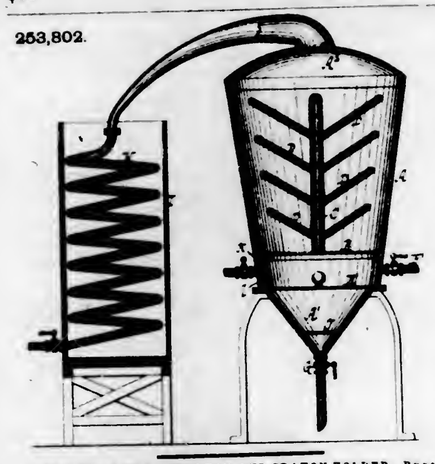
4. In a car-coupling, the combination, with the draw-head A, provided with a vertical guide-collar, P, of the coupling-pin O, the pivoted cam-lever C, and the projecting sliding rod R, substantially as herein shown and described, and for the purpose set forth.

5. In a car-coupling, the combination, with the draw-head A, of the coupling-pin O, the pivoted cam-lever C, the link F, and the sliding bar H, passing through this link and provided with a beveled projection, J, substantially as herein shown and described, and for the purpose set forth.

6. In a car-coupling, the combination, with the draw-head A, of the coupling-pin O, the pivoted cam-lever C, the link F, the sliding bar H, provided with a beveled projection, J, and the lever L, pivoted to the end of the car and to the bar H, substantially as herein shown and described, and for the purpose set forth.

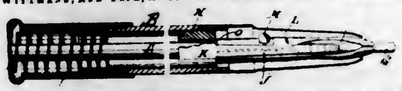
7. In a car-coupling, the combination, with the draw-head A, of the coupling-pin O, the pivoted cam-lever C, the link F, the sliding bar H, provided with a beveled projection, J, the projecting sliding rod R, the pivoted arm T, and the spring V, substantially as herein shown and described, and for the purpose set forth.

253,802. APPARATUS FOR MAKING EXTRACTS FROM VEGETABLE SUBSTANCES. MORRIS WISE, New York, N. Y., assignor to the West India Manufacturing Company, same place. Filed July 9, 1881. (No model.)



Claim.—1. The combination, with a distilling-tank, of a foraminous false bottom provided with an attached foraminous vertical stem having lateral foraminous branches, substantially as described, whereby the steam admitted beneath the false bottom will enter the tank through the false bottom and through the stem and its branches, as and for the purpose set forth.

2. The combination, substantially as hereinbefore set forth, with the distilling-tank A, of the primary foraminous false bottom B, the secondary false bottom E, and the central upwardly-projecting hollow foraminous stem of the primary bottom having laterally-projecting foraminous branches.



2. The combination, with the wheels *a*, endless chains B, and [illegible]

11. The combination of the plow A, wheel O, brace *o'*, and

253,802.

253,803. AUTOMATIC LEAD AND CRAYON HOLDER. RUDOLF WITTMANN, New York, N. Y. Filed Nov. 11, 1881. (No model.)

Claim.—1. In a lead or crayon holder, the combination, with the sheath, of a longitudinally-movable lead or crayon receiving tube provided with longitudinal slots and with a cam-plate, and of spring-strips provided with lugs, substantially as herein set forth.

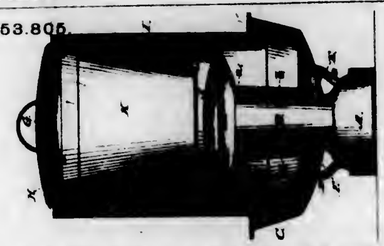
2. In a lead or crayon holder, the combination, with the sheath, of a longitudinally-movable lead or crayon receiving tube provided with longitudinal slots and with a cam-plate, of spring-strips provided with lugs, of a cap at the rear end of the sheath, and of a spring for pressing this cap from the rear end of the sheath, substantially as herein set forth.

3. In a lead or crayon holder, the combination, with the sheath B, of the longitudinally-slotted lead or crayon receiving tube A, provided with a transverse cam-plate, M, the spring-strips J, provided with lugs L, the shoulder or projection O, and the collar N, the tube A being longitudinally movable in the sheath B, substantially as herein set forth.

253,804. STOCK-CAR. HORACE S. WOLFE, Kalamazoo, Mich., assignor of two-thirds to Frank W. Corsell and Chester Kellogg, both of same place. Filed Sept. 27, 1881. (No model.)

Claim.—1. In a stock-car provided with sectional water and feed troughs, the troughs secured to a bar having the end grooves, in combination with a car having the semicircular projections and rods, between which the ends of the trough-bar are movably located, all substantially as set forth.

2. In a stock-car, the grain-chambers occupying the limited space set forth, provided with the obliquely-angled beams, serving to brace the structure and guide the grain to the mouth of the feed-spouts, substantially as specified and shown.

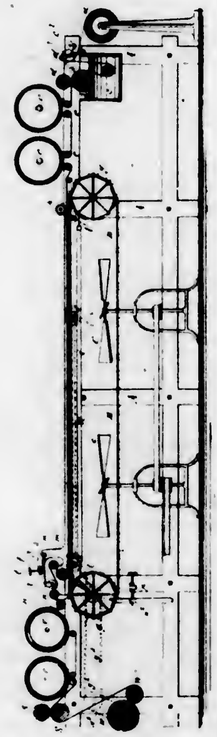


3. In a stock-car, the double rafters in the roof, constituting inclosures for the water-pipes, substantially as described.

253,805. COOKING-BOILER. JAMES A. WOOD, Rochester, N. Y. Filed Dec. 30, 1881. (No model.)

Claim.—1. In a cooking-boiler, the combination of the removable base, the double-walled flue having the tubes or pipes connecting the interior of the flue B with the water-pan C, the receptacle D', the perforated diaphragm, the cover, and condenser, substantially as specified.

2. In a cooking-boiler, the combination of a steam generator and flue, the receptacle D', the closed cup or vessel K, the lid F, having the projection G, and the condenser L, substantially as specified.



253,805.

3. In a cooking-boiler, the combination, with the cold-water pan, of the double-walled flue B, having the pipes E E and the perforations *a* in its outer wall, substantially as and for the purposes specified.

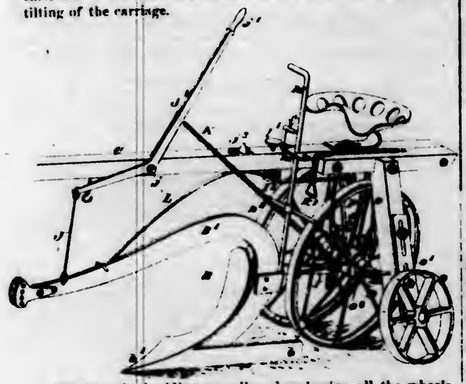
253,806. CLOTH TENTERING, DRYING, AND CALENDERING MACHINE. ALVIN WOODMAN, Lewiston, Me., assignor to himself and Cyrus I. Barker, same place. Filed Mar. 14, 1881. (No model.)

Brief.—The cloth upon entering the machine passes through a diagonally-fluted and adjustable tension device. The parallel tracks and the ends next thereto of the diverging tracks are adjusted in width at one movement. Rollers adjustable horizontally at either end serve to bring the plaid or stripe of the cloth into position at right angles with the sides of the cloth. A series of short rollers held in arms, each adjustable vertically, is used to straighten the line of the plaid if curved, any of said rollers being made to bear on or left free from the cloth, as may be necessary. Both sets of rollers serve to deliver the cloth to the calendering-roll with its figure correct.

Claim.—1. The combination, with roll *a*, of the spreader, consisting essentially of bars *b'*, diagonally fluted in opposite directions from the middle, and pivoted end pieces, *b'*, provided with a ratchet-wheel, *c'*, and pawl *d'*, substantially as and for the purposes described.

2. The combination, with the wheels *g*, endless chains B, and tracks *h*, of the screw-shafts *l*, nuts *l'*, shaft *l*^{3} and its gearings, and mechanism for driving the wheels *g*, substantially as shown and described.

3. The combination, with the cylinders *s* and rollers *r*, of the rollers *s n'*, winding-drum *w*, and the pulleys *g*^{5} *g*^{6} and belts *g*^{7} *g*^{7}, substantially as shown and described.



4. The combination of rollers *r* and mechanism for their vertical adjustment with rollers *m' n'*, substantially as and for the purposes specified.

5. The combination, with the guide-rollers *n' n*, the rollers *r*, and fixed guide-rollers *m m'*, of mechanism for adjusting the rollers *n n'* horizontally and rollers *r* vertically, as and for the purposes set forth.

6. The combination of arms *r'*, spring *u'*, adjusting-screws *t'*, rollers *r*, guide-rollers *n n'* and *m' m*, substantially as and for the purposes specified.

253,807. SULKY-PLOW. JAMES K. WORTHINGTON, Kirkwood, Mo. Filed June 7, 1881. (Model.)

Brief.—Two wheels on an axle so short as to allow both to run behind the plow in the furrow. A push-bar extends rearward from the plow to a loop at the axle and bent-lever connections from it lift the heel of the plow. From the main lifting-lever a chain passes around the grooved hub and over pulleys to the driver's foot. By tightening the chain the turning of the wheel assists in raising the plow. A spring operates to hold down the point of the plow. A handle with foot-rests to guide or tilt the plow. A wheel carried on the land side and a fender on the furrow side limit the tilting of the carriage.

Claim.—1. A riding or sulky plow having all the wheels which support the sulky when upright in the rear of the plow, and arranged to travel in the furrow being turned.

2. The combination, in a sulky-plow having a seat, of the plow B and sulky-wheels D D', used in supporting the sulky in an upright position, and constituting the entire support when in that position, all of said wheels being arranged to travel in the furrow being turned.

3. The combination of the axle E, the wheels D D', the grooved collar G', the chain K, the beam C, bearings *k k*, lever J', link J, beam B', and plow B, substantially as described.

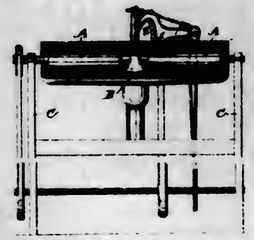
4. The combination, in a plow, of the chain K and the pulley G', said chain at its forward end being connected directly or indirectly with the plow B, and to enable it, when tightened upon the pulley G', to draw and lift the plow B.

5. The combination, in a sulky-plow, of the axle E, the bearing G', the chain K, the bearings *k k*, and the beam C, substantially as described.

6. The combination, in a sulky-plow, of the axle E, bearing G', chain K, beam C, lever J', link J, and plow-beam B', substantially as described.

7. The combination, in a plowing device, of the beam C, the plow B, the beam B', the spring L, the handle M, and the spring L', substantially as described.

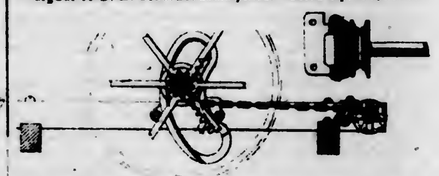
8. The combination, in a plowing device, of the plow B, handle M, beam C, and spring L', substantially as described.



9. In a sulky-plow, the combination of the plow B, the carriage-beam C, the arm I, the link I', the lever I^3 in the form of a spring, and the bearing *f'*, substantially as described.

10. A sulky-plow having the side wheel, O, and the fender P, neither said wheel nor fender touching the ground saving when the sulky is tilted, substantially as described.

11. The combination of the plow A, wheel O, brace *o*^{2}, and step *o*^{3}, substantially as described.



12. The combination of the axle E, loop H, arm I, and plow B, serving to guide said arm as the plow is lifted at the heel, and also allowing the plow to be canted by means of the handle M, substantially as described.

253,808. SOLE-BUFFING MACHINE. BARNES C. YOUNG, Boston, Mass. Filed July 25, 1881. (No model.)

Claim.—The herein-described organized buffing-machine, consisting of the frame-work C, the horizontal buffing-rolls A A, the buffing-pad B, mounted on the vertical shaft D, and arranged between the rolls A A and in close proximity to them, as shown, and the single driving-shaft, from which both rolls and the pad receive motion through the connecting-belts, substantially as set forth.

253,809. HARVESTER. CALVIN YOUNG, Auburn, N. Y., assignor to D. M. Osborne, same place. Filed Apr. 11, 1876.

Claim.—1. The button-shaped formations at each end of the axle, formed to act independently of the pinions thereon for preventing endwise movement, in combination with the open guideway in the rack-standards, in which guideways said button-shaped formations have a vertical movement.

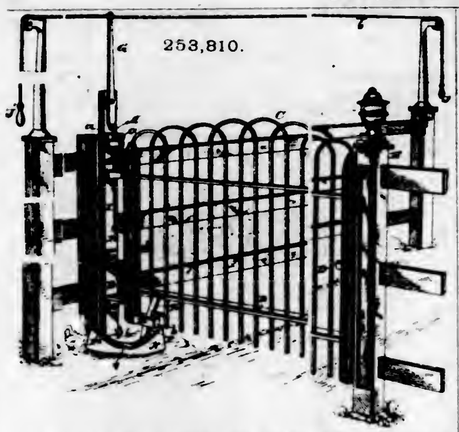
2. The supporting-plates attached to the frame of the machine at either end of the axle, each provided with a rack for the pinion on the axle and an open guideway for the end of said axle formed by flanges in front and rear thereof, in combination with the axle having disks or button-shaped formations at its ends.

3. The supporting plates or standards for the main axle, each formed with a rack for the pinion, an open guideway, raised flanges at the sides of said guideway, meeting each other at the top and open at the bottom, and a channel outside of said flanges for the reception of a disk or button upon the end of the axle.

4. The combination, with the supporting plates or standards, formed, as described, with racks, open guideways, raised flanges, and underlying channels, and the axle and its pinions, and the disks or buttons on the ends of said axle.

5. The combination, with the supporting plates or standards having the racks, open guideways, raised flanges, and underlying channels, as described, of the main drive-wheel axle, with its pinions, disks, or buttons, and chain-wheel or sheave for actuating the same, substantially as described.

253,810. SWINGING GATE. JACOB W. SHUMAKER, Hagerstown, Md. Filed Dec. 17, 1881. (No model.)



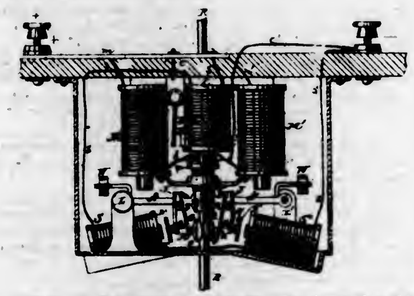
Claim.—1. The combination, with a swinging gate adapted to be moved vertically, of a swinging arm adapted to rest over an inclined trackway when the said gate has been moved upward.

2. The combination, with the gate-post having a lever pivoted thereto, which latter is connected to suitable operating-handles, of a gate secured to the said post and connected to the said lever by suitable chain, by which the gate is moved upward, and provided with a swinging arm having a roller thereon, which latter is adapted to rest over inclined trackways when the gate is moved upward, substantially as set forth.

3. The combination, with a vertically-movable gate having an arm pivoted thereto, the latter being provided at its lower end with a roller, of a track or guideway provided with two single inclined

Claim.—The thimble-race herein described, consisting of the

253,810.



tracks and a double inclined track, on which the said roller is adapted to move, substantially as set forth.

4. The combination, with a vertically-movable gate having an arm pivoted thereto, the latter being provided at its lower end with a roller, a guide for holding the said arm in position, and suitable levers and chains for operating the said gate, of a track or guideway provided with a single inclined track on which the said roller moves while the gate is being opened by the lever, before referred to, a single inclined track on which the roller moves while the gate is being closed by the levers before referred to, and a double inclined track on which the roller moves when the gate is being either opened or closed by simply pushing thereon.

5. The combination, with the gate-post A, staples B, lever G, chain I, ropes J, and levers J', of the gate provided with the swinging arm K, the latter having the roller K' secured to its lower end, and the track or guideway N, the above parts being constructed and adapted to operate substantially as set forth.

6. The combination, with the gate-post A, staples B, lever G, rope or chain I, ropes J, levers J', and pulleys *a a*, of the gate having the swinging arm K pivoted thereto, the latter being provided at its lower end with the roller K', the guide M, and the track or guideway N, all of the above parts being constructed and adapted to operate substantially as set forth.

253,811. ELECTRIC LAMP. ALBERT L. AREY, Cleveland, Ohio. Filed Aug. 31, 1881. (No model.)

Claim.—1. An electro-magnet in the main circuit of an electric lamp, provided with the vibrating armatures, with their heads and geared segments, and the double lifting-clamp mechanism attached to said armatures, and consisting of one set of clamps arranged in respect to the upper carbon in the line described, and actuated by said armatures to separate the carbon points, in combination with the electro-magnets of high resistance in the shunt-circuit and its armatures T T', whereby the said clamping mechanism is released when an increased resistance of the main circuit diverts the current into the shunt-circuit.

2. The electro-magnet of low resistance in the main circuit, wound only of such strength that with less than the normal current it just lifts the vibrating armatures A A', in combination with said vibrating armatures, whereby, after the voltaic arc is increased in length, the said magnet continues to hold the said armatures up, substantially as described.

3. The combination of the electro-magnets M M', of low resistance in the main circuit, the vibratory armatures A A', actuated by said magnets, the double lifting-clamp mechanism attached to said vibrating armatures, and the upper carbon point, whereby the upper carbon point is separated from and fed to the lower point, and whereby, after the voltaic arc is increased in length, the said vibrating armatures and lifting mechanism are held by the said magnets in the same position to feed the upper carbon point to the lower one that they occupy after the points are separated, substantially as described.

4. The combination of the vibrating armatures, the counter-balance-weights, the adjusting-nut, the clamps O O, and their connecting mechanism, substantially as described.

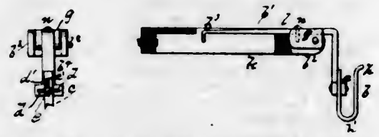
5. The double lifting mechanism connected with the vibrating arms, and consisting of the segmental gears G, the heads H, the plates J, the springs K, the clamps O, armatures T, rods e, and nuts N, in combination with the bearings L and counter-weights *s*, substantially as described.

6. The combination of the magnets M M', vibrating armatures A, and armatures T with their connecting mechanism and the helices S, substantially as described.

7. The combination of the magnets M M' in the main circuit, the vibrating armatures A A', having the geared segments G G', the armatures T T', and their connecting mechanism, substantially as described.

8. In a lower-carbon holder, the plates provided with holes, and an annular space between the plates to inclose a disk or disks, in combination with such disks, to provide for the displacement and lateral adjustment of the carbon point, substantially as described.

9. The combination of the adjustable lower-carbon holder, the disk or disks for carrying one or more carbon points, and the plates which inclose and clamp the said disk or disks, substantially as described.



253,812. TELEPHONE-RECEIVER. SAMUEL H. BARTLETT and HENRY E. WAITE, Bridgeport, Conn., assignors to Charles F. Livermore, New York, N. Y. Filed Aug. 31, 1881. (No model.)

Claim.—In a telephone-receiver, the combination, with the bar-magnet, coil, and a diaphragm of non-magnetic material, of a spring-armature rigidly secured at one end and bearing at its other end against the diaphragm, said armature being disconnected from the magnet, but in inductive proximity thereto.

253,813. WEFT-FORK FOR LOOMS. JOHN C. BURKE, Great Falls, assignor of one-half to Eben N. Higley, Somersworth, N. H. Filed May 14, 1881. (No model.)

Brief.—The body portion of the fork is clamped by means of a screw to the block pivoted between the arms at the end of the carrier-strap. The bent front end of the body is slotted transversely, and the head, secured to it by a bolt, is slotted vertically, whereby both vertical and horizontal adjustment of the head and its tines can be effected.

Claim.—1. The weft-fork-body portion having the transverse slot *d*, in combination with the head *c*, having the upwardly-bent tines and the longitudinal slot *d'*, and the connecting-bolt *e*, substantially as specified.

2. The pivoted seat-block *g*, recessed at *s*, in combination with the body *l*, the carrier-strap *b'*, screw *n*, slotted front *b'*, slotted head *c*, and connecting-bolt *e*, substantially as specified.

253,814. MANUFACTURE OF PAPER. DANIEL R. BURNS, Dayton, Ohio, assignor of one-half to Francis J. McCormick, same place. Filed Jan. 9, 1882. (Model.)

Claim.—1. The herein-described process of manufacturing paper, which consists in first cooking the stock, then reducing it to pulp, and finally in bleaching it in a separate vessel, substantially as described.

253,814.

2. The process of manufacturing straw board and paper, which consists in first cooking the stock and then reducing it to pulp, whereby the fiber is separated, but not destroyed, and all the albumen and gluten of the straw preserved, in the manner substantially as set forth.

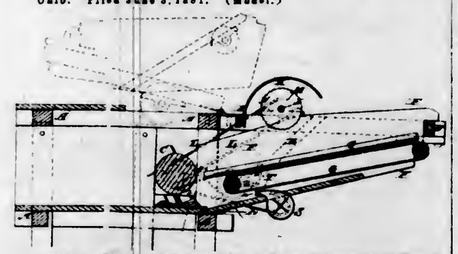
3. The process of manufacturing paper, which consists in first cooking the stock, then reducing it to pulp, and finally subjecting it to a bleaching process, which consists in eliminating chlorine gas from chloride of lime by heat and passing the same through the material to be bleached in a separate vessel, substantially as set forth.

4. The process of cooking, disintegrating, and bleaching paper-stock, whereby all the gluten and albumen are retained and the bleaching is effected without the introduction into the stock of any of the solid particles of chloride of lime, caustic alkali, or the like, substantially as herein described.

5. A cooking-vessel having a central upright perforated steam-pipe provided with a deflecting-cap, substantially as herein shown and described.

6. A grinding-disk having a concave face, substantially as set forth.

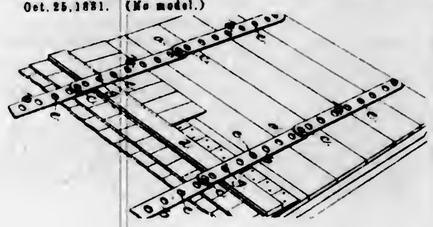
7. A grinding-disk having a concave face and central feed-orifice, substantially as set forth.



8. The shaft A, having the washer B, stationary plate C, and adjusting-screw E, substantially as set forth.

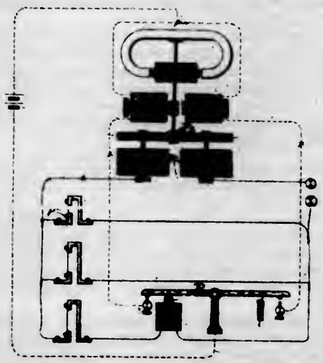
9. The process of treating the stock and fiber with carbonate of soda and tannic acid, substantially as described, and set forth.

10. The process of treating the stock and fiber with carbonate of soda, substantially as described and set forth.



11. The herein-described tub P, containing the chloride of lime, provided with steam-pipe R, and tub Q, containing the stock to be treated, provided with gas-pipe S, substantially as described and set forth.

253,815. BAND-CUTTING AND FEEDING ATTACHMENT FOR THRASHERS. SAMUEL CALDWELL and JORDAN BURGESS, Greenfield, assignors of one-third to Luther Bradley, Ross County, Ohio. Filed June 3, 1881. (Model.)



Claim.—The combination, with the hinged frame D E F and feed-apron G, of the fan-blower S, having its discharge-spout made of the same width with the feed-apron, substantially as shown and described, and for the purpose set forth.

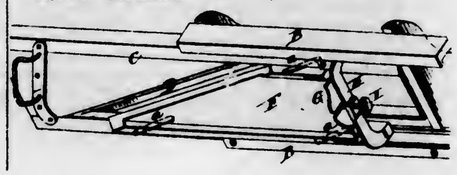
253,816. SHINGLING-GAGE. GEORGE B. CLARK, Springville, N. Y., assignor of one-half to F. G. Eaton, same place. Filed Oct. 25, 1881. (No model.)

Claim.—The shingle-gage herein described, consisting of the strips *a a*, formed of the perforated sections *b*, pivoted together at *c*, and the adjustable rule or straight-edge *d*, provided with pins or studs *g*, substantially as specified.

253,817. ELECTRIC LIGHTING APPARATUS. MOSES G. FARMER, Newport, R. I., assignor to the United States Electric Lighting Company, New York, N. Y. Filed Mar. 7, 1881. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, of a rheostat, mechanism for increasing or decreasing the resistance of said rheostat, an electro-magnet included in the same electric circuit with the rheostat, or in a branch thereof, and a lever for controlling the action of said mechanism, which is normally balanced between the attractive force of said electro-magnet and a constant antagonistic force, and contact-stops for limiting the motion of and determining the action of said lever.

2. The combination, substantially as hereinbefore set forth, of a generator of electricity, an electric circuit uniting the poles of said generator, one or more electric lamps included in said circuit, an electro-magnet included in said circuit, a lever acted upon in opposite directions by said electro-magnet and by an antagonistic force, electrical contact-stops limiting the motions of said lever, reversible mechanism actuated by electricity and controlled by said lever, and having its motion in one direction or the other determined by the respective preponderance of the opposing forces acting upon said lever, and mechanism for increasing and decreasing the current traversing said circuit, which mechanism is controlled by the reversible mechanism.



253,818. APPARATUS FOR SHAPING HAT-BRIMS. LUCIUS H. HOYT, Danbury, Conn. Filed Jan. 6, 1882. (No model.)

Claim.—1. The within-described device for shaping fronts and backs of hat-brims, having two blocks or shaping-surfaces, A B, with means E, for conveniently adjusting their distances apart, as herein specified.

2. The combination of the bed C, having guiding means *c*, with the fixed support C, movable support D, dowels *b b*, and false blocks A B, adapted to serve relatively to each other and to hats of different sizes, substantially as herein specified.

253,819. MEAT-SLICER. ANTHONY ISER and ALBERT ISER, Lancaster, Pa., assignors to I. L. Landis, same place. Filed June 17, 1880. Renewed Feb. 7, 1881. Again renewed Nov. 12, 1881. (No model.)

Claim.—In a slicing-machine, the combination of the knife-

253,823. AXLE-BOX GAGE. JOHN A. MYERS, Monroe City,

253,825. FOLDING SETTEE. CORNELIUS H. DUMARSEY, Brooklyn, N. Y. Filed Jan. 15, 1881. (Model.)

shunt or subsidiary circuit passing through the helices wound around said armatures, substantially as described, and for the pur-

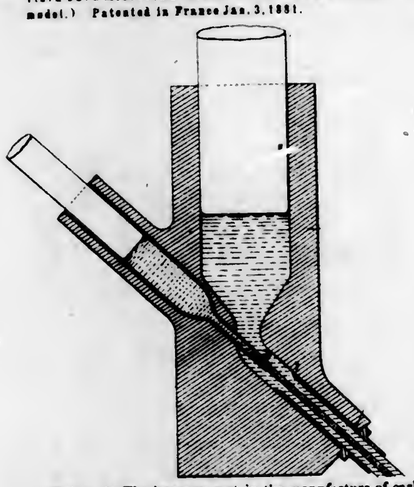
Claim.—In a slicing-machine, the combination of the knife-slide C, the bar H, fixed thereto, the board F, the links *a*, connecting the board to the said slide, the horizontally-slotted plate G, fixed to said board, and the set-screw I, screw-tapped through the bar H and swiveling in the slot of plate G, substantially as described.

253,820. PROCESS OF TREATING BUTTER. GEORGE W. KENDALL and ROBERT E. ROBERTS, New Orleans, La., assignors to the Golden Butter Company, same place. Filed Nov. 17, 1881. (No specimens.)

Claim.—The process herein described for the treatment of butter, which consists in first melting the butter and mixing therewith a vegetable oil, then filtering the mixture through bone-black, next adding the coloring-matter and a quantity of fresh sweet butter for the purpose of flavoring the mass, which is finally congealed by being brought in contact with ice, and is then ready for use, substantially as herein described.

253,821. MANUFACTURE OF OIL-CAKE. JOHN MCDOUGALL, London, England. Filed Aug. 4, 1879. Patented in England Dec. 20, 1878.

Claim.—1. The method of treating cotton-seed by cracking or partially grinding the seed between millstones—such as commonly employed for grinding wheat—set far enough apart to crack or mash the seed without liberating the oil, so that the fiber on the seed is balled by the action of the stones, substantially as described.

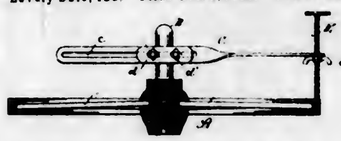


2. The method of treating cotton-seed in manufacture of oil-cake by cracking or partial grinding between millstones, crushing and grinding under edge-runners, and pressing, substantially as described.

3. The method of utiliaing cotton-seed husks by grinding the same apart from the kernels and introducing the ground husks into oil-cake, substantially as described.

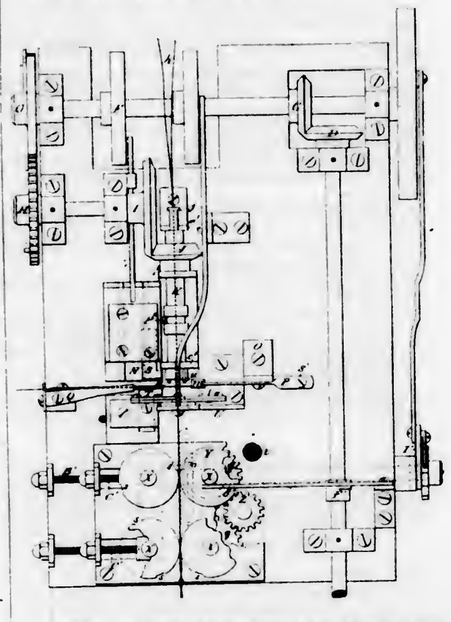
4. The process of making oil-cake, consisting in treating cotton-seed by cracking or partial grinding between millstones, crushing and grinding under edge-runners, and pressing, in separating the husks after the cracking operation, and grinding them apart from the kernels, and in introducing the ground husks into the oil-cake in admixture with said kernels, substantially as described.

5. The new product described, being oil-cake containing ground cotton-seed husks.



253,822. CANDLE FOR ELECTRIC LIGHTING. JEAN BAPTISTE JAVA MIGNON, Paris, France. Filed Sept. 17, 1881. (No model.) Patented in France Jan. 3, 1881.

Claim.—1. The improvement in the manufacture of carbons or electrodes for electric lights, consisting in pressing out from plastic material a double carbon, both core and outer coating at one operation, substantially as described.



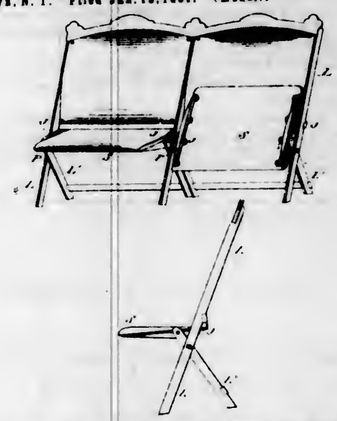
2. The apparatus described for making double carbons at one operation, comprising the inner and outer molds, with their rams and contracted tubes or orifices, the tube or orifice of the outer mold being concentric with but lower than the orifice of the inner mold, and being contracted below said orifice of the inner mold, substantially as described.

253,823. AXLE-BOX GAGE. JOHN A. MYERS, Monroe City, Lovely Dale, Ind. Filed Dec. 9, 1881. (No model.)

Claim.—The combination of the spindle B, gage C, nuts *d'*, and washer *d* with the index-rod E, operating in a threaded hole in the outer end of the gage-arm, and provided with a lock-nut, *e*, and with the wheel A, substantially as shown and described.

253,824. FENCE-WIRE-BARBING MACHINE. HENRY W. PUTNAM, Bennington, Vt. Filed Dec. 23, 1878.

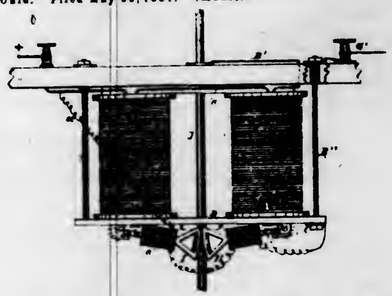
Claim.—1. The non-rotating tubular guide *j* for the two longitudinal fence-wires, adapted to prevent them from twisting around, and at the same time allowing them to be drawn through such tubular guide, in combination with a barb-winder surrounding such tubular guide and receiving a rotary movement, substantially as set forth.



2. The non-rotating tubular guide for the two longitudinal fence-wires and the barb-winder surrounding such tubular guide, in combination with mechanism for revolving the barb-winder and mechanism for moving the barb-winder and guide endwise, substantially as set forth.

3. The combination, in a fence-wire-barbing machine, of mechanism for introducing the barb-wire between two longitudinal wires, mechanism for twisting the barb-wire around the longitudinal wires, mechanism for feeding along the wires, and mechanism for twisting the longitudinal wires together, substantially as set forth.

4. A non-rotating guide and holder for the main fence-wires, adapted to permit their passage along it, and at the same time to prevent them from twisting around each other at their guided portions, in combination with a barb-winder surrounding such guide, and with means for imparting a rotary movement to the winder, substantially as described and shown.



5. The combination, in a fence-wire-barbing machine, of mechanism for feeding longitudinal wires through the machine, mechanism for introducing the barb between the longitudinal wires, and mechanism for twisting it around both said longitudinal wires, substantially as described.

253,825. FOLDING SETTEE. CORNELIUS B. DEMAREST, Brooklyn, N. Y. Filed Jan. 15, 1881. (Model.)

Claim.—In folding settees, the folding legs L and L', connected by the straps J J, in combination with the seat S, pivoted back of its center to the legs L' only and at their upper ends, whereby the frame of the settee may be folded and the front side of the seat S is made movable upward and the rear end is made movable downward independently of the folding frame, and like an opera-seat, in the manner and for the purpose set forth.

253,826. ELECTRIC LIGHT. ALBERT L. ADEE, Cleveland, Ohio. Filed May 23, 1881. (Model.)

Claim.—1. In lampstructures for electric lights, a pair of armatures pivoted respectively below the helices A B, and having the free ends of the armatures terminating in a segment provided with a peripheral groove, a section of which from *y* to *z* is an arc of a circle having its center at the pivotal point of the armatures, and the section of the groove from *z* to *x* a straight line, or nearly so, at right angles to the radius *z* to *l* of the segment of the armature, and the section of the groove from *y* to *x* formed or shaped so as to allow the rod J to pass freely through the grooves of the segment when the said segments are approximated to each other and the rod between *x* and *y*, substantially as and for the purpose set forth.

2. In combination with the rod J, carrying the upper carbon point of an electric lamp and an electro-magnet, a pair of armatures surrounded with coils in a derived circuit, as described, below the helices of said magnets, the opposite or free end of the armatures terminating in a segment, with or without a peripheral groove adapted to clamp said rod between them for regulating and controlling the carbon point, substantially as set forth.

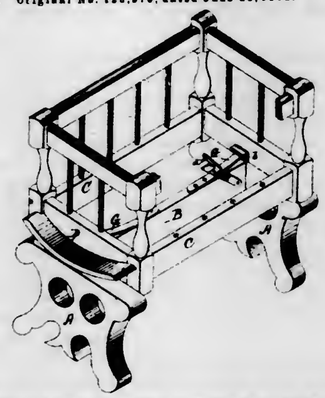
3. The helices A and B of an electro-magnet, and rod J, carrying the carbon point, in combination with the vibrating armatures having free segmental ends, provided respectively with a peripheral groove adapted to and arranged in relation to said rod so as to clamp the same, and the said armatures having thereon respectively shunt-magnets operated by a portion of a divided main circuit, substantially as described, and for the purposes set forth.

4. In electric lamps, the combination of the electro-magnets A B, the rod J, and the vibrating segmental armatures with a shunt or subsidiary circuit passing through the helices wound around said armatures, substantially as described, and for the purpose set forth.

5. In an electric lamp, the combination, with the rod J, carrying the carbon terminal point, of a pair of armatures forming vibrating electro-magnets pivoted to the apparatus below the magnets A B, as described, and operated by one portion of the main circuit and the said electro-magnets A B, substantially as herein set forth.

6. In electric lamps, a pair of vibrating armatures having helices arranged thereon connected with the shunt-circuit, and a rod for carrying the electrode in the main circuit and between the segmental terminals of the armatures and in connection with the magnets A B, the latter being in the main circuit with the carbons and the said helices in a derived circuit, substantially as described, and for the purpose set forth.

253,827. PREPARATION OF PHOTOGRAPHIC PAPER FOR MAKING GELATINE-BROMIDE OF SILVER PRINTS. JEAN J. D. HUTINET and PIERRE E. LAMY, Paris, France. Filed Apr. 27, 1881. (No specimens.) Patented in France Apr. 5, 1881.



Claim.—1. The method of preparing photographic paper with gelatine-bromide of silver or analogous sensitive compound for positive printing, which consists in applying, in connection with said compound, a varnish for imparting brilliancy, and thus rendering brilliant the sensitive pellicle itself, so that varnishing after the printing operation is rendered unnecessary, substantially as described.

2. Photographic paper prepared for positive printing with a sensitive pellicle of gelatine-bromide of silver or analogous compound, combined with a varnish for imparting brilliancy, substantially as described.

3. Photographic paper prepared for positive printing with a sensitive pellicle of gelatine-bromide of silver or analogous compound, combined with a varnish for imparting brilliancy, and calendered, substantially as described.

REISSUES.

10,036. CRADLE. WILLIAM H. EARHART, Parkersburg, W. Va., assignor to John R. Ebert; said Ebert assignor to Charles Streit and Henry Schmit, Cincinnati, Ohio. Filed Sept. 1, 1881. Original No. 188,375, dated June 26, 1872.

Claim.—1. The combination, substantially as specified, of the stand and the rocking frame with the metal keepers G, arranged at right angles to the rockers, one end of said keepers being attached to the rocking frame and the opposite end attached to the stand, for the purpose set forth.

2. The stand A A B and rocking frame, in combination with metal strips or keepers G G, said keepers having their inner ends attached to the bar B and their outer ends slotted and attached to the ends of said rocking frame at right angles to the rockers, substantially as and for the purpose set forth.

3. The combination, substantially as specified, of the stand, the rocking frame resting thereon, and the metal keepers connecting the said stand and rocking frame with the stirrups J J, to limit the motion of the cradle and prevent its rocking too far.

4. The combination of the stand A B, rocking frame, metal strips or keepers G G, stirrups J J, and projection b, all constructed and arranged substantially as and for the purpose herein set forth.

10,087. PROCESS OF COATING REAL AND IMITATION PRECIOUS STONES. FRANCIS ED. MEYER, New York, N. Y. Filed Jan. 20, 1882. Original No. 236,603, dated Jan. 11, 1881.

Brief.—Improvement on Letters Patent Nos. 223,237, and 229,328, and 233,364.

Claim.—1. The process herein described of applying a reflective coating, B, to the rear face or collet of a real or imitation precious stone or gem, composition of glass or paste, A, by first coating the said stone A entirely with the reflective material B and then removing by any suitable means the reflective coating from the front face or crown of the said stone or gem.

2. The process of protecting the outside of the reflective coating on the collet side of the stone by means of an electroplating or a metallic shield, substantially as described

3. The electroplated covering or cap for the reflective substance, applied to and combined with the reflective cap B, substantially as described.

4. The application by electricity of a solid metallic coating or cap on the back or collet of a real or imitation precious stone, paste, or gem on the outside of a reflective substance, B, which has been previously placed on the said collet side of the stone.

THE ELIOTYPE PRINTING CO. BOSTON

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

DECISIONS OF THE U. S. COURTS.

U. S. Circuit Court—Northern District of New York.

WRIGHT, JR., *v.* RANDEL *et al.*

Decided August 4, 1881.

1. EQUITY.
Between equal equities the law will prevail.

2. LETTERS PATENT—ASSIGNEES—SUPERIOR TITLE.
Bona fide purchasers, for value, without notice, under an instrument of assignment which was duly recorded, whereby interests are assigned in an unpatented invention, and wherein the Commissioner is requested to issue the patent to such assignees, as was duly done, can convey a good title to such patent as against prior assignees of a prior patent which was issued to the same inventor, to whom such inventor at the same time assigned interests in new inventions which he had made, of which the invention above referred to was one, the prior instrument of assignment having been executed and recorded first, and the invention the nature of which was definitely referred to in such prior instrument having been made before any of such assignments.

3. REVISED STATUTES, SECTION 4898, CONSTRUED—RECORDS.
Section 4898 of the Revised Statutes does not provide for the recording of assignments, grants, and conveyances of interests in patents not yet issued.

4. REVISED STATUTES, SECTION 4895, CONSTRUED—CONSTRUCTIVE NOTICE—RECORDS.
Section 4895 of the Revised Statutes makes no provision for the recording of an assignment of an unpatented invention on which the patent is not to be issued to the assignee; therefore its record is not constructive notice of its contents to one who subsequently deals with a party to it in respect to its subject-matter.

Mr. N. Davenport for the plaintiff.
Mr. Enck Cowen for the defendants.

BLATCHFORD, *C. J.*:

On the 17th of August, 1875, Letters Patent No. 166,810 were issued to the defendant, William Randel, for an improvement in button-hole attachments for sewing-machines. Randel, by an assignment made September 19, 1876, and recorded September 22, 1876, assigned to Oscar Smith and Benjamin H. Downer each an undivided one-third interest in said patent—

Together with an undivided one-third each of any improvements or new inventions that I have or may produce in button-hole attachments or button-hole machines, and agree to assign interests, as stated above, and make application for letters patent for such improvements on machines; * * * and it is a subject of agreement by myself and the said assignees this date that we will neither of us sell, assign, or set over to other parties any portion of our interest in said patent, reissues, or new patents in said button-hole attachments or machines that we now have or may have, unless by the written consent of each party now owning the same.

By an assignment made January 31, 1877, and recorded February 9, 1877, and which recited that Randel had assigned to Smith and Downer an undivided one-third interest to each in said patent, "and to any improvements or new invention in button-hole attachments or button-hole sewing-machines that the said Randel might make or produce," Randel and Smith assigned to Downer "all our right, title, and interest in and to said inventions, as secured to us by said letters patent and assignment."

By an assignment made February 5, 1877, and recorded February 9, 1877, and which recited the contents of said two assignments, Downer assigned to one House "one undivided half of all my right, title, and interest in and to said inventions as secured to me by said letters patent and assignment, and to any improvements or new inventions in button-hole attachments or button-hole sewing-machines that the said Randel might make or produce."

By an assignment made February 19, 1877, and recorded February 22, 1877, and which recited the contents of said three assignments, Downer and House assigned to the Randel Button-Hole Machine Company "all our right, title, and interest in and to said invention, as secured to us by the said letters patent and assignments."

By an assignment made March 7, 1878, and recorded May 31, 1878, and which recited the contents of said prior assignments, and that Lysander Wright, Jr., (the plaintiff in this suit,) "is desirous of obtaining an undivided interest in and to certain improvements and inventions in button-hole attachments made by said William Randel previous to the 19th day of September, 1876, and for which a United States patent was issued bearing date the 2d day of January, 1877, and numbered 192,008," the said company assigned to said Wright all its right, title, interest, and claim in and to said invention, as set forth in said Letters Patent No. 192,008, and which bear date January 2, 1877, as set forth in abovementioned assignments.

On the 2d of January, 1877, Randel filed in the Patent Office an application for a patent for an "improvement in button-hole attachments for sewing-machines."

On the 28th of March, 1877, Randel and the defendants, John W. Cipperly, John C. Cole, and Theodore E. Haslehurst, executed an agreement, whereby Randel agreed to assign to the other three (one-third each) a one-half "interest in his invention of an attachment to a sewing-machine for making button-holes, and all benefits and advantages to be derived therefrom, excepting his interest in a patent issued by the United States and already assigned to B. H. Downer and Oscar Smith," and in consideration thereof the other three agreed "to be to the expense of procuring patents in such countries as may be mutually agreed upon."

By an assignment dated May 22, 1877, which recited that Randel had invented an invention in button-hole attachments for sewing-machines, an application for a patent for which was filed on or about January 15, 1877,

same instrument of an undivided one-third interest to

Randel assigned to the said Cipperly, Cole, and Haslehurst each an undivided sixth part of all his right, title, and interest in and to the said invention, as set forth in the specification filed with the application, and requested the Commissioner of Patents to issue the patent jointly to him and the said Cipperly, Cole, and Haslehurst. The patent was issued to the four June 12, 1877.

By an assignment dated June 28, 1877, Randel, with the consent of the other three, assigned to Joseph W. Smart all his right, title, and interest in and to said inventions, as secured by said Patent No. 192,008.

On the 28th of June, 1877, the said Oscar Smith executed an instrument, which recited the contents of the said assignment of September 19, 1876, and assigned to said Cipperly, Cole, and Haslehurst all his right, title, and interest of whatever nature remaining or reserved to him in said instrument.

On the 7th of July, 1877, the Randel Button-Hole Machine Company served on Cipperly, Cole, and Haslehurst a written notice, which recited the said assignments of September 19, 1876, and January 31, 1877, and that the Randel Button-Hole Machine Company, by assignments executed by said Downer and said House, had become the sole owner of said Patent No. 192,008 and of all the inventions transferred by the said assignments, and that Randel had no right which he could assign in said patent to said Cipperly, Cole, and Haslehurst, and required them to assign to said company all their interest in said Patent No. 192,008 and all the interest they had acquired since September 19, 1876, by any and all assignments from said Randel for any patents issued to Randel, or to him and them, as his assignees, for any button-hole attachments for sewing-machines or for any improvements in such attachments.

In December, 1877, Cipperly, Cole, Haslehurst, and Smart, and one Huntington formed a corporation, under the laws of New York, called "The Empire Button-Hole Machine Company, (Limited,)" which is one of the defendants in this suit.

By an assignment dated January 4, 1878, which recited the said assignment by Randel to Smart, the said Cipperly, Cole, Haslehurst, and Smart assigned to the said Empire Button-Hole Machine Company, (Limited,) all their right, title, and interest in and to said inventions, as secured to them by said Patent No. 192,008 and said assignment.

The bill in this case sets forth that the inventions afterward patented by Patent No. 192,008 were invented and reduced to practice by Randel on or about August 16, 1876, or prior thereto, and that the said assignments by Randel to Smith and Downer and by Randel and Smith to Downer were made and recorded; but it does not state when they were recorded, nor does it base any cause of action on any notice claimed to have been given by the recording. Its cause of action is based on actual knowledge by the codefendants with Randel of the contents of the said prior assignments by him and on want of the consideration for the assignments from Randel under which the codefendants with him claim.

The bill avers that the expenses of the application for Patent No. 192,008 were paid by Smith and Downer; that prior to May 22, 1877, Cipperly, Cole, and Haslehurst, each of them, knew of the contents of said assignments of September 19, 1876, and January 31, 1877; that the assignment to them was made without any valuable consideration, and for the purpose of defrauding the prior assignees of Randel of their interest in said invention and the patent which might issue for the same; that said patent was issued without the consent or knowledge of the Randel Button-Hole Machine Company and in violation of their rights; that the assignment of June 28, 1877, was without the consent or knowledge of said company; that Smart knew of the contents of said assignments of September 19, 1876, and January 31, 1877; that the assignment to Smart was made without any valuable consideration and for the purpose of defrauding said company; that the Empire Company knew of the said assignments of September 19, 1876, and January 31, 1877; that Cole was the president and Cipperly, Haslehurst, and Smart were directors of it; that Randel was and is interested in and connected with it; that all said parties, both officers and directors of said company, knew of the said prior actions and doings of Randel; that said assignment to the Empire Company was for the purpose of defrauding the Randel Company and without any valuable consideration; that after said Patent No. 192,008 was issued the Randel Company requested Randel to assign to it the said patent, but he refused, and the same request was made of his assignees, and they refused, and that the plaintiff after he acquired his title requested said Randel and his said assignees to assign said patent to the plaintiff, but he refused.

The prayer of the bill is that the title to said Patent No. 192,008 may be decreed to belong to the plaintiff; that the defendants assign it to the plaintiff, and that Randel assign it to the plaintiff in accordance with the terms of said assignments of September 19, 1876, and January 31, 1877.

The answer admits that the invention of Randel, patented in No. 192,008, was made and perfected on August 16, 1876, or prior thereto. It denies that Cipperly, Cole, and Haslehurst, or either of them, at and prior to the date of the assignment of said invention to them, had any knowledge of said assignments and the contents thereof, made September 19, 1876, and January 31, 1877. It avers that the assignment to them was for a full and valuable consideration paid by them, and that the assignment to Smart was for a full and valuable consideration paid by him to Randel. It denies that at the time of said assignment to Smart he had any knowledge of said prior assignments and the contents thereof, and it denies that at the time of said assignment to the Empire Company it had, through its officers, any knowledge of the prior acts and doings of Randel in relation to said previous assignments made by him. It admits that previous to the date of said assignment to the Empire Company Cipperly, Cole, and Haslehurst had heard that some claim was made by Downer or his assignees to the invention secured by said patent, and understood it to be by virtue of an assignment by said Randel of future inventions. It avers that the Empire Company paid its assignees a full and valuable consideration for their assignment. It is proved that Cipperly, Cole, Haslehurst, and Smart paid a valuable consideration for what was assigned to them. No attempt is made to show actual notice to any one but Haslehurst of the prior agreement by Randel in respect to the sale of improvements.

The answer admits that the invention of Randel patented June 12, 1877, was made and perfected "on the

16th of August, 1876, or prior thereto, as is alleged in the said complaint." The allegation of the bill is that the improvements covered by the patent afterward issued June 12, 1877, were "invented and reduced to practice" on or about August 16, 1876, or prior thereto. The assignment of September 19, 1876, besides conveying to Smith and Downer each an undivided one-third interest in Patent No. 166,810, conveyed to them "an undivided one-third each of any improvements or new inventions that I have or may produce in button-hole attachments or button-hole machines, and agree to assign interests, as stated above, and make application for letters patent for such improvements or machines, the same to be held and enjoyed" by the said Smith and Downer. Then the assignment, which is signed by Randel alone, goes on to say:

> And it is a subject of agreement by myself and the said assignees this date that we will neither of us sell, assign, or set over to other parties any portion of our interest in said patent, reissues, or new patents in said button-hole attachments or machines that we now have or may have, unless by the written consent of each party now owning the same.

Although this assignment does not refer specifically to any particular improvements which Randel had already made and had not patented, yet the use of the words "that I have or may produce" shows that the existence of improvements which he had made and not yet patented was before the minds of himself and Smith and Downer when this assignment was made, on the 19th of September, 1876.

Randel testifies that the first machine, embracing the invention described in Patent No. 192,008, was made in August, 1876. Randel agreed in said assignment to apply for patents "for such improvements or machines," and also agreed not to assign to other parties any portion of his interest in "new patents in said button-hole attachments or machines" that he might have without the written consent of Smith and Downer. The "new patents" referred to are patents for such improvements. They were to be held by Smith and Downer, each an undivided third thereof. This assignment was recorded in the Patent Office September 22, 1876.

It is very clear that the legal title of Patent No. 192,008 is in the Empire Company. The patent was properly issued to Randel jointly with Cipperly, Cole, and Haslehurst under the assignment of May 22, 1877, which contained a request to that effect by Randel. The statute (section 4895, Rev. Stats.) provides that "patents may be granted and issued or reissued to the assignee of the inventor or discoverer, but the assignment must first be entered of record in the Patent Office." Under the decision in *Gaylor* v. *Wilder* (10 How., 477) the legal title to the patent would, under said assignment of May 22, 1877, have been in Randel and the other three jointly, even if the patent had afterward been issued to Randel alone. The question arises, then, whether Downer acquired an equitable title as against Randel to the improvements which Randel had so made and perfected prior to August 16, 1876. The assignment of September 19, 1876, was broad enough in its terms to carry to Smith and Downer each an undivided third of "any improvements or new inventions" which Randel had made prior to that time "in button-hole attachments or button-hole machines." He had admittedly before that time made the inventions embraced in the subsequent Patent No. 192,008. The agreement in the instrument "to assign instruments, as stated above," must be read in connection with the prior absolute assignment in the same instrument of an undivided one-third interest to each of any past unpatented inventions in button-hole attachments or button-hole machines, and is an agreement to assign by further papers anything needed either to complete the equitable title conveyed or to perfect legal titles to the patents when they should be issued. The further agreement in the instrument excluding all parties from assigning to any one any interest in any patent to be applied for thereafter and obtained thereafter for any improvements which Randel had already made in button-hole attachments or button-hole machines is consistent with the conveyance of such equitable title. The instrument provided that Randel should apply for the new patents for the past improvements, but it did not while assigning the improvements provide that the new patents should be issued to Randel and the assignees jointly. Out of this all the trouble has arisen.

The assignment of January 31, 1877, by Randel and Smith to Downer recites Patent No. 166,810, and recites the assignment of September 19, 1876, as having conveyed to Smith and Downer an undivided one-third interest to each in that patent and in "any improvement or new invention in button-hole attachments or button-hole sewing-machines that the said Randel might make or produce." It does not add "had produced," which would have been a correct recital, but it refers to the paper by date, and as having been recorded in the Patent Office in a specified book and page of transfers of patents. It then recites that Downer "is desirous of obtaining the exclusive right and all the right, title, and interest in and to the letters patent and to the rights transferred by the said assignments." The defendants contend that "the letters patent" mean only Letters Patent No. 166,810, and that there were no rights transferred to Randel by the assignment of September 19, 1876. The instrument of January 31, 1877, then goes on to say that Randel and Smith assign to Downer "all our right, title, and interest in and to said inventions, as secured to us by said letters patent and assignment." The defendants contend that by that paper Randel did not assign to Downer the one-third interest in the as yet unpatented improvements which he had not assigned by the paper of September 19, 1876, inasmuch as there were no rights transferred to Randel by that paper and there was nothing secured to Randel by that paper, and that therefore by that paper Randel assigned nothing but his one-third remaining interest in Patent No. 166,810. But the paper has a wider scope. It refers to the prior instrument by its date and place of record, and identifies it as conveying something more than an interest in Patent No. 166,810. The expression in regard to Downer is that he desires to obtain "the exclusive right and all the right, title, and interest"—that is, the whole title, exclusive of every one else—in and to the letters patent and rights transferred by the prior paper. It does not say "the said letters patent," confining it to No. 166,810, but it says "the letters patent and rights transferred by the prior paper." Now, in substance, two-thirds of any new patent for any improvements already made were transferred by the prior paper. Those were the rights that were transferred by the prior paper.

The second paper was framed to transfer to Downer "the exclusive right and all the right, title, and interest" in such new patent, as well as in the old patent,

of all which he before had but an undivided one-third. So in the granting part, when the paper conveys "all the right, title, and interest of Randel and Smith in and to said inventions as secured to us by said letters patent and assignment," it means all their interest "in said inventions"—that is, the inventions "transferred by" or the subject of transfer in the prior assignment. The words "as secured to us by said letters patent" mean "as secured to us by the letters patent transferred to us by the prior assignment," which includes the new patent. The paper is unskillfully drawn, but is capable of such construction, and it is in the interest of fair dealing that it should be so construed in a court of equity in favor of those who are prior in time and have acted in good faith.

Downer, being thus the equitable owner of the inventions which Randel had so made and had not patented, conveyed to House the undivided half of all the rights which he had so received, and Downer and House conveyed to the Randel Button-Hole Machine Company all of the rights which either of them had so received which they possessed. That company thus became the owner of the improvements embraced in Patent No. 192,008, and the owner of the equitable title to that patent as against Randel before the codefendants with Randel acquired any interest in said improvements. The omission of a request by Randel to the Patent Office to issue the patent to Smith and Downer jointly with himself, or to Downer alone, enabled Randel to make a second transfer of the invention and to secure the issuing of the patent as it was issued. The Randel Company had no legal title to the patent when it was issued, and the most it could do was to claim and assert an equitable title. (*Gaylor* v. *Wilder*, 10 How., 477; *Clum* v. *Brewer*, 2 Curtis, 506.) That title was prior in time to the legal title obtained by the codefendants with Randel. Can it be asserted as superior in right by reason of any notice, constructive or actual, with which the codefendants with Randel are chargeable?

The assignments of September 19, 1876, and January 31, 1877, were not instruments the recording of which was provided for by section 4898 of the Revised Statutes, which is confined to assignments, grants, and conveyances of interests in patents after they are issued. Fees are prescribed by section 4934 for recording "every assignment, agreement, power of attorney, or other paper;" but it does not follow from this that the record of every paper which may happen to be recorded is to be taken as constructive notice of its contents to every person subsequently dealing with a party to it in respect to its subject-matter. The record of an instrument is not constructive notice to a subsequent purchaser, unless the statute requires the instrument to be recorded. No assignment of an unpatented invention is required by section 4895 to be recorded, unless it is an assignment on which a patent is to be issued to the assignee; and in such case the invention must be so identified in the assignment—by a reference to a specification, or an application, or otherwise—that there can be no mistake as to what particular invention is intended.

The two assignments in question so far as they relate to unpatented inventions of Randel already made do not fall within section 4895 in either of the above particulars, and it must be held that the record of them was not constructive notice to the subsequent purchasers of the prior assignment by Randel of said unpatented inventions.

As to actual notice, the burden is on the plaintiff to establish it. There is not sufficient proof to show that Haslehurst had notice before he became a *bona fide* purchaser for a valuable consideration. The contract was made March 28, 1877, expressing, as a consideration, that Cipperly and the two others were to pay the expense of procuring patents. They paid three hundred and fifty dollars toward procuring foreign patents April 18, 1877, and afterward paid more for that purpose. The full assignment was made May 22, 1877. The assignment by Smith to Cipperly and the two others was made June 28, 1877, after the patent was issued. The assignment of Randel to Cipperly and the two others was to them individually and not as copartners. Haslehurst acted for himself and the other two for themselves. Downer's testimony as to what passed between him and Haslehurst does not make out notice, and Downer is contradicted directly as to what he said by Haslehurst. Phelps's testimony as to what Randel said to Haslehurst is contradicted by Randel, and it is wholly improbable that Randel, who was trying to effect a sale to Haslehurst of an invention which he had before sold to another, would inform Haslehurst of such prior sale. Haslehurst was informed by Randel before purchasing that the patent papers had been drawn by Mr. Lowe, and he applied to Mr. Lowe and was informed by him that he had drawn an assignment of the patent that had been issued, but had drawn no assignment of the pending patent, and that Randel was the owner, so far as he knew. All this tended to show that the invention had not been assigned. There is nothing to show any notice to Cipperly, Cole, or Smart. The title of the Empire Company is sustained by the title of the prior *bona fide* purchasers for a valuable consideration without notice, although that company was formed after the notice of July 7, 1877, had been served on three of the persons who afterward became directors of it.

The bill is dismissed, with costs.

33

U. S. Circuit Court—Southern District of New York.

MACAULAY *v.* THE WHITE SEWING MACHINE COMPANY *et al.*

Decided December 14, 1881.

1. WANT OF JURISDICTION CURED BY APPEARANCE.

A party becomes amenable to the jurisdiction of the court by appearing in the suit.

2. VIOLATION OF INJUNCTION.

It was a violation of the injunction granted against defendant in this case to sell machines at Cleveland, whether or not they were sent within the territorial jurisdiction of the court.

Mr. F. H. Betts for the plaintiff.

Mr. S. A. Duncan and *Mr. S. J. Gordon* for the defendants.

BLATCHFORD, *J.*:

The injunction was served on Mr. Baylor and on the company. Although it was not served on Mr. White personally, he knew of its service. He, as president of the company, directed the doing of what the company did in violating the injunction. He did not intend to have the injunction violated, but it was violated by the company by selling machines at Cleveland and sending them from there to purchasers, whether they were sent by it within the territorial jurisdiction of this court or not. The company made itself amenable to the jurisdiction of this court by appearing in this suit. The advice that it was no violation of the injunction for the company to sell machines at Cleveland so long as such machines were not sent by it within the territorial jurisdiction of this court was erroneous advice. Moreover, some of the machines so sold were sent by the company to places within this district, although Mr. White thought that this district comprised only the city of New York. Mr. White acted for the company. I do not think he ought to be punished personally, but the company must pay a fine of two hundred and fifty dollars, which will go to the plaintiff toward his expenses and counsel fees about this motion. The profit and damages from the infringement involved in the violation will remain to be accounted for in the suit. Mr. Baylor did not violate the injunction.

DESIGNS.

12,772.—AQUARIUM AND STAND FOR SAME.—*Charles F. Klepper*, Covington, Ky. Application filed January 14, 1882. Term of patent 7 years.

12,773.—CORSET.—*Paul T. Hertzog*, Newark, N. J., assignor to *Henry S. Strauss* and *Solomon Heilner*, both of New York, N. Y., and *Samuel Strauss*, North Brookfield, Mass. Application filed January 9, 1882. Term of patent 14 years.

12,774 and 12,775.—WATCH-CASE.—*Eugene F. Margot*, Boston, Mass. Applications filed January 12, 1882. Term of patents 7 years.

12,776 to 12,782, inclusive.—CARPET.—*Thomas Onslow*, Philadelphia, Pa., assignor to the *Horner Brothers*, same place. Applications filed January 11, 1882. Term of patents 3½ years.

12,783.—CARPET.—*George W. Pugh*, Philadelphia, Pa., assignor to the *Horner Brothers*, same place. Application filed January 11, 1882. Term of patent 3½ years.

12,784.—CARPET.—*Stephen Smith*, Philadelphia, Pa., assignor to the *Horner Brothers*, same place. Application filed January 11, 1882. Term of patent 3½ years.

12,785.—CARPET.—*Thomas J. Stearns*, Boston, Mass., assignor to *The Roxbury Carpet Company*, same place. Application filed December 17, 1881. Term of patent 3½ years.

12,786.—CARPET.—*Thomas J. Stearns*, Boston, Mass., assignor to *The Roxbury Carpet Company*, same place. Application filed January 13, 1882. Term of patent 3½ years.

12,787.—PENCIL-STAMP.—*Arthur H. Rogers*, Springfield, Mass. Application filed January 10, 1882. Term of patent 3½ years.

12,788.—CURTAIN-BAND.—*Bernhard Dreyfus*, New York, N. Y. Application filed January 24, 1882. Term of patent 14 years.

12,789.—PAPER-CAP OR TOY PISTOL.—*Henry S. Lockwood*, South Norwalk, Conn. Application filed January 24, 1882. Term of patent 7 years.

12,790.—FINGER-RING.—*William P. Sinnock*, Newark, N. J., assignor to himself and *Horace D. Sherrill*, New York, N. Y. Application filed January 18, 1882. Term of patent 7 years.

12,791.—CASTER-BOTTLE.—*John McC. Watson*, Pittsburg, Pa. Application filed January 18, 1882. Term of patent 3½ years.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 8,191 and upward are registered under the act of March 3, 1881.]

9,103.—BLACK-LEAD PENCILS.—*The Eagle Pencil Company*, New York, N. Y. Application filed January 20, 1882.
"Word-symbol 'CHROMO.'"

9,104.—LEAD-PENCILS.—*The Eagle Pencil Company*, New York, N. Y. Application filed January 20, 1882.
"The word-symbol 'OFFICE.'"

9,105.—GINGER-ALE.—*Henry Sugden Evans*, Montreal, Quebec, Canada, and Rouse's Point, N. Y. Application filed January 17, 1882.
"The monogram 'S. G. A.,' the autograph 'H. SUGDEN'S,' and the triangles on which they are placed."

9,106.—CLARET-WINE.—*Eschenauer & Co.*, Bordeaux, France. Application filed December 27, 1881.
"A fac-simile of the autograph of 'ESCHENAUER & CO.'"

9,107.—COTTON, LINEN, OR OTHER FABRICS.—*E. Milne French*, Brooklyn, N. Y. Application filed May 11, 1881.
"A mesh of a fish-net which incloses the device of a shield ermine charged with a chevron sable, the crest a dolphin, and the motto 'MALO MORI QUAM FŒDARI.'"

9,108.—LINIMENTS.—*Gish & Garner*, Hopkinsville, Ky. Application filed January 18, 1882.
"The arbitrarily-selected words 'WILD GOOSE.'"

9,109.—CERTAIN MEDICAL PREPARATIONS.—*Lewis M. Green*, Woodbury, N. J. Application filed January 10, 1882.
"The fanciful words 'AUGUST FLOWER.'"

9,110.—CERTAIN MEDICAL PREPARATIONS.—*Lewis M. Green*, Woodbury, N. J. Application filed January 10, 1882.
"The word 'GERMAN.'"

9,111.—COOKING-RANGES.—*James & Kirtland*, New York, N. Y. Application filed January 26, 1882.
"The word 'BEEBE.'"

9,112.—COMPOSITION OR WASH FOR DRESSING HAIR.—*Mary E. Johnson*, Newburyport, Mass. Application filed January 23, 1882.
"The word-symbol 'CALMANTINE.'"

9,113.—CIGARS, CHEROOTS, AND CIGARETTES.—*Kinney Tobacco Company*, New York, N. Y. Application filed January 7, 1882.
"A Turkish cap A placed in the center of a semicircular space, B. The space B surrounded by radial groups C of lines arranged alternately closer together and farther apart to represent pencils of light. The outer edge of the pencils of light C may be rectangular."

9,114.—HUMAN-HAIR GOODS.—*Jean R. Krause*, New York, N. Y. Application filed January 16, 1882.
"The arbitrarily-selected word 'MASCOTTE.'"

9,115.—ORNAMENTAL JEWELRY-CHAINS.—*S. & B. Lederer*, Providence, R. I. Application filed December 22, 1881.
"The arbitrarily-selected letter-symbol 'X L N T.'"

9,116.—LIQUID DRESSING.—*Morse & Gilman*, Chicago, Ill. Application filed December 27, 1881.
"The word 'JEWEL.'"

9,117.—CHAMPAGNE-WINE.—*Louise H. L. R. Olry*, Rheims, France. Application filed January 25, 1882.
"The letter and word 'L. ROEDERER.'"

9,118.—CHAMPAGNE-WINE.—*Louise H. L. R. Olry*, Rheims, France. Application filed January 25, 1882.
"The name 'L. ROEDERER' and a symbol of a star and point."

9,119.—CHAMPAGNE-WINE.—*Louise H. L. R. Olry*, Rheims, France. Application filed January 25, 1882.
"The title or designation 'N. H. SCHREIDER.'"

9,120.—CHAMPAGNE-WINE.—*Louise H. L. R. Olry*, Rheims, France. Application filed January 25, 1882.
"The word-symbol 'CABINET' and the name or title 'L. ROEDERER,' arranged within the ornamental frame-like border *b* upon a ruled ground, *a*."

9,121.—CHAMPAGNE-WINE.—*Louise H. L. R. Olry*, Rheims, France. Application filed January 25, 1882.
"The word 'SCHREIDER,' in connection with the figure of an anchor."

9,122.—CHAMPAGNE-WINE.—*Louise H. L. R. Olry*, Rheims, France. Application filed January 25, 1882.
"The title or designation 'LOUIS ROEDERER.'"

9,123.—CHAMPAGNE-WINE.—*Louise H. L. R. Olry*, Rheims, France. Application filed January 25, 1882.
"The letters word and 'N. H. SCHREIDER' and an anchor, arranged in connection with a border, *a*, placed upon the figure of an ermine robe, *b*.

9,124.—TOCOLOGICAL MEDICINE.—*Nicanor B. Peraza*, Brooklyn, N. Y. Application filed January 23, 1882.
"The picture of Dr. N. Bolet."

9,125.—TOBACCO-PIPES.—*Rejall & Becker*, New York, N. Y. Application filed January 24, 1882.
"The letters 'G. P. D.'"

9,126.—WATCHES.—*Adolphe Schwob*, New York, N. Y. Application filed January 16, 1882.
"The arbitrarily-selected word 'CONGRESS.'"

9,127.—WATCHES.—*Adolphe Schwob*, New York, N. Y. Application filed January 16, 1882.
"The arbitrarily-selected word 'UNIVERSAL.'"

9,128.—BATE FOR TANNERS' USE.—*Walton C. Tiffany*, New York, N. Y. Application filed January 16, 1882.
"The representation of a stretched skin or hide."

9,129.—CERTAIN MEDICINAL PREPARATIONS.—*Susanna Titcomb*, Baltimore, Md. Application filed January 12, 1882.
"The pictorial representation of two females, one an invalid reclining on a bed, with one hand supporting her head, and looking at the other female as she holds a bottle in her left hand and in her right hand a bunch of herbs."

9,130.—SOAP.—*Jas. B. Williams & Co.*, Glastonbury, Conn. Application filed January 3, 1882.
"The word 'POCKET.'"

9,131.—SOAP.—*Jas. B. Williams & Co.*, Glastonbury, Conn. Application filed January 3, 1882.
"The word 'CLIPPER.'"

9,132.—SOAP.—*Jas. B. Williams & Co.*, Glastonbury, Conn. Application filed January 3, 1882.
"The word 'YANKEE.'"

9,133.—SOAP.—*Jas. B. Williams & Co.*, Glastonbury, Conn. Application filed January 3, 1882.
"The word 'FAVORITE.'"

9,134.—LAUNDRY-STARCH.—*American Starch Company*, Columbus, Ind. Application filed November 12, 1881.
"The word 'SPRAY.'"

9,135.—HOPS AND MALT BITTERS.—*George Pickering Glazier*, Chelsea, Mich. Application filed January 18, 1882.
"A sheaf of barley."

9,136.—CERTAIN MEDICAL PREPARATION.—*George G. Green*, Woodbury, N. J. Application filed January 10, 1882.
"The fanciful word 'CONQUEROR.'"

9,137.—BUILDERS', AGRICULTURAL, AND GENERAL HARDWARE.—*Theophilus Hessenbruch*, Philadelphia, Pa. Application filed May 24, 1881.
"The figure of a bear."

9,138.—WHISKY.—*Iler & Co.*, Omaha, Nebr. Application filed January 20, 1882.
"The word 'WINCHESTER.'"

9,139.—CANNED FRUITS AND VEGETABLES, EXCEPT CANNED CORN.—*Augustus W. Kriete*, Baltimore, Md. Application filed December 19, 1881.
"The word 'EAGLE.'"

9,140.—LEAD-PENCILS.—*The Eagle Pencil Company*, New York, N. Y. Application filed January 20, 1882.
"The word-symbol 'ACADEMIC.'"

LABELS.

2,614.—Title: "GRIGG'S GLYCERINE SALVE."—*Griggs & Company*, Ottawa, Ill. Application filed January 5, 1882.

2,615.—Title: "DR. BIGELOW'S POSITIVE CURE."—*Griggs & Company*, Ottawa, Ill. Application filed January 5, 1882.

2,616.—Title: "KNIGHT'S CURE." (A MEDICINE.)—*David M. Holbrook*, Watertown, N. Y. Application filed January 14, 1882.

2,617.—Title: "STARCH."—*John C. Hubinger, Joseph E. Hubinger*, and *Nicholas W. Hubinger*, New Haven, Conn. Application filed October 29, 1882.

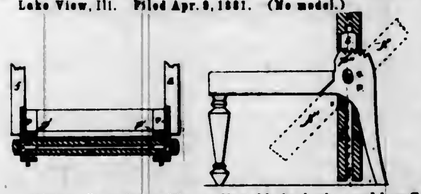
2,618.—Title: "HEATH'S ENGLISH SALVE."—*John A. Heath*, Colebrook, N. H. Application filed January 14, 1882.

2,619.—Title: "HORSE TONIC, THE GREAT BLOOD PURIFIER AND A SURE CURE FOR EPIZOOTIC, COUGHS, COLDS, HEAVES, &c."—*A. E. Mosher*, Cattarangus, N. Y. Application filed January 11, 1882.

2,620.—Title: "ORCUTT'S SURE RHEUMATIC CURE."—*William N. Orcutt*, Woonsocket, R. I. Application filed December 12, 1881.

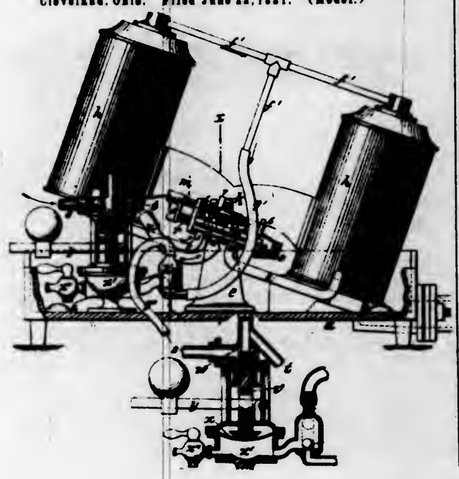
2,621.—Title: "DR. N. BOLET'S TOCOLOGICAL PILLS."—*Nicanor B. Peraza*, Brooklyn, N. Y. Application filed January 23, 1882.

PATENTS



GRANTED FEB. 21, 1882.

258,828. GATE-HANGER. WILLIAM G. ALEXANDER, Ocheloosa, Iowa. Filed Dec. 26, 1881. (No model.)



Claim.—In a gate-hanger, the angle-plate C, having pivoted thereto the bolt *e*, with lug *f*, in combination with the disk D, formed with slot *i* and shoulder *d*, the roller E, and disk F, formed with lugs *m*, substantially as and for the purpose set forth.

258,829. PHOTOGRAPHER'S CHAIR. JONAS A. ANDERSON, Lake View, Ill. Filed Apr. 9, 1881. (No model.)

Claim.—In a chair with an adjustable back, the pawl-bars S, provided with a toothed shoulder, in combination with the legs P P, provided with a ratchet, *p''*, and the back A, provided with the clamping flaps or skirts A' A', substantially as described, and for the purposes set forth.

263,830. HYDRAULIC AIR-COMPRESSOR. WILLIAM A. BABCOCK, South Coventry, Conn., assignor to Bishop & Babcock, Cleveland, Ohio. Filed June 22, 1881. (Model.)

Claim.—1. The combination, with a rocking pump substantially such as described, of a slide-valve governing the flow to each pump-cylinder alternately, mounted or fixed on the rocking beam at or near the axis thereof, with a fixed fork or projection extending from the support or base of the pump and engaging the sliding portion of the valve, so as to shift the same at each rock of the beam, substantially as herein shown and described.

2. The combination, with a rocking pump such as described, of a valve controlling the flow to each cylinder alternately, fixed on the rocking beam at or near the axis thereof, with a fixed projection engaging the operating part of the valve, so as to move and shift the same at each rock of the beam, with rigid pipes extending from the opposite ports of the valve directly to the corresponding pump-cylinders on the ends of the beam, substantially as and for the purpose set forth.

3. The combination, with a sliding valve-plunger, *r*, substantially such as herein described, having an inclosing-cylinder, *l l*, from which the ports proceed, formed in sections abutting one against the other, with a fixed sustaining-frame, *n*, formed to inclose or embrace said sections, with a fixed head at one end, against which the one end of the sections abut, and a fixed head at the opposite end, through which a clamping device extends, bears upon the opposite end of the sections, and binds the whole together firmly in said frame.

4. The combination, with the sliding valve-plunger *r*, substantially such as described, of the inclosing sectional cylinder *l l*, rigid sustaining-frame *n*, and hollow screw *o*, clamping said sectional cylinder in said frame and inclosing the protruding end of the valve-plunger, substantially as herein shown and described.

5. The combination, with the sliding valve-plunger *r*, of the parallel operating-rod *m*, coupled thereto, with the rigid sustaining-frame *n*, holding the inclosing-cylinder of said valve, and formed with the lateral guide-wings 6 6, through which said operating-rod slides, substantially as herein shown and described.

6. The combination, with a hydraulic air-compressor, of an automatic water-regulator constructed with an adjustably-loaded throttle-valve, arranged to directly throttle the flow of water to the pump, in combination with a diaphragm actuated by the direct pressure of the air compressed to close said throttle, substantially as herein shown and described.

7. The combination, with a hydraulic air-compressor, of an automatic water-throttle constructed with an adjustably-weighted throttle-valve forced to its seat by the pressure of the compressed air, and having its seat arranged lateral to the flow of water, whereby its movements are independent of the water-pressure, substantially as herein set forth.

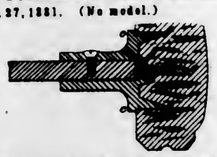
8. The combination, with an automatic pump substantially such as described, of an automatic water throttle-valve formed with the valve-plunger *r*, having one end acting as the throttle-valve and the opposite end resting loosely or disconnectedly upon a diaphragm against which the back-pressure is exerted, substantially as and for the purpose set forth.

9. In an automatic hydraulic air-pump, the combination, with a supply of water under pressure and an air vessel or vessels into which said water is admitted to compress and displace the air therefrom, of a pipe leading from said air-vessels to a beer-barrel or other receptacle into which the air is discharged, with an accumulating-trap or drip-chamber arranged on said pipe between the said air-vessel and the said receptacle, whereby any water overflowing from the air-vessel through the air-pipe may be accumulated and removed without being forced into the receptacle, substantially as herein set forth.

10. The combination, with an automatic pump such as set forth, of an automatic water-throttle having its diaphragm-chamber *x'* connected with the air-discharge pipes from the pump-cylinders, and arranged to form an accumulating drip-chamber on

said pipes to receive overflowing water which may enter the same, with a cock, *a''*, on said diaphragm-chamber, to allow said drip or overflow to escape, substantially as herein set forth.

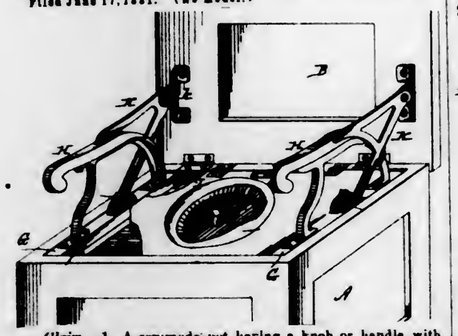
11. The combination, with an automatic hydraulic air-pump substantially such as set forth, of an accumulating drip or trap chamber located on the air-discharge pipe between the pump-cylinders and the beer-barrel or receptacle into which the air is discharged, with a detached float inclosed thereby and adapted on the overflow of water into said chamber to rise against and close the outlet-orifice of said chamber, whereby one part forms both a float and valve and acts to confine or "trap" said overflow until removed from the chamber, substantially as herein shown and described.



12. In a hydraulic air-pump substantially such as set forth, the guards or flanges *g'*, arising from the sink or tray into which the cylinders discharge, and adjacent to and at one side of the discharge-ports of the cylinders, whereby splash is prevented, substantially as herein shown and described.

13. The combination, with the pump-cylinder of an automatic hydraulic air-pump substantially such as set forth, of air and water vent valves operatively connected through the same actuating device, with a play or interval between the two valves, whereby both valves are opened by one action, but the air-vent in advance of the water-vent, substantially as and for the purpose set forth.

14. The combination, with the pump cylinder or chamber of a hydraulic air-pump, of an air-vent valve mounted on the top of a tube opening from the base of a cylinder and rising therein, with a wire or rod operating said valve through said tube from the base of the cylinder, substantially as herein shown and described.



15. The combination, with the pump cylinder or chamber of a hydraulic air-pump, of a water-vent valve opening in the base of said cylinder, with a tube, *r'*, fixed to and rising from said valve into the top of the cylinder and open throughout, together with an air-vent valve, *t'*, mounted on the top of said tube, and an operating device arranged to lift both valves successively, substantially as herein shown and described.

253,831. DOOR-KNOB. JOSEPH BARDSLEY, Newark, N. J. Filed Sept. 27, 1881. (No model.)

Claim.—The attachment for wooden knobs herein described, consisting of a spindle-socket formed with a collar having wedge-pins and an interior central shoulder, in combination with a wooden knob, a central fastening-screw, and a lock-spindle, substantially as described.

253,832. COMMODE. JOSEPH BENSON, Philadelphia, Pa. Filed June 17, 1881. (No model.)

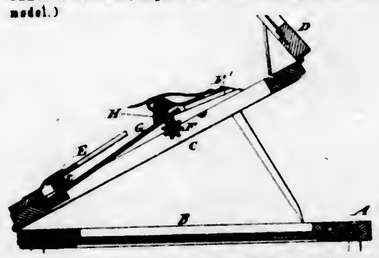
Claim.—1. A commode-pot having a knob or handle, with elastic plug or buffer, substantially as shown and described.

2. The combination, of a pot having a lid with elastic seat or joint and an elastic plug or buffer with a commode having a top constructed and arranged to press upon said buffer and hold said lid tight on the pot, substantially as shown and described.

3. The combination, with commode-body A, having pivoted bars G, affording supports for arms H, of the hinged lid B and braces K K, connecting said lid and bars G, substantially as shown and described.

4. The combination, with the commode-body A, of bars G G, hinged or pivoted at one end and affording supports for the arms H, substantially as shown and described.

5. In combination with the hinged or pivoted arm-supporting bars G G, the slide I, substantially as shown and set forth.

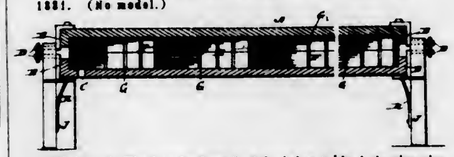


6. The combination of body A, top B, hinged arm-supporting bars G G, and pivoted braces K K, substantially as shown and described.

253,833. MANUFACTURE OF FEATHER PILLOWS, BOLSTERS, &c. HERMAN BENSEN, Milwaukee, Wis. Filed Dec. 16, 1881. (No model.)

Claim.—In the manufacture of pillows, bolsters, cushions, and similar articles, the filling composed of chicken, turkey, or other inferior feathers chopped fine, substantially as and for the purpose set forth.

253,834. APPARATUS FOR RETOUCHING NEGATIVES. THEOS N. BENSON, Elgin, Iowa. Filed Aug. 11, 1881. (No model.)



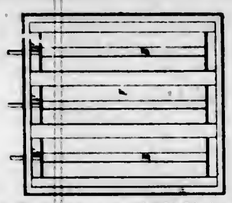
Claim.—1. The combination, with the negative-easel of a negative-retouching machine, of the ribbed corrugated roll or mechanism bearing directly on the negative-plate, and adapted to impart to the said plate a vibratory motion, substantially as set forth.

2. In a negative-retouching machine, the hand-rest E, having the elastic holding-bar *e*, substantially as set forth.

3. In a negative-retouching machine, the combination, with the negative-easel C, of the ribbed, fluted, or corrugated roll F, hand-rest E, having the elastic bar *e*, and elastic bar H, substantially as and for the purpose set forth.

4. In a machine for retouching negatives, the combination, with the negative-easel C and the roll F, of the pivoted or hinged bearing-plates F', covering two or more bearing-sockets in the easel, substantially as and for the purpose set forth.

253,835. CHEESE-DRAINING TABLE AND MOLD. JAMES W BLAIR and ERASTUS H. WILDER, Brooklyn, Wis. Filed Dec. 26 1881. (No model.)

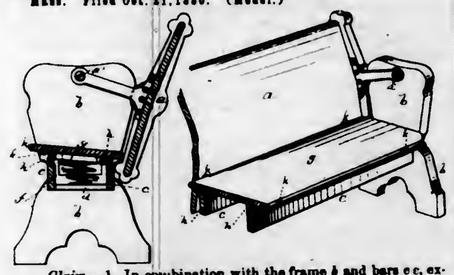


Claim.—1. The herein-described draining-table A, having rim or flange B, openings C, and half-round pivots D, in combination with a suitable frame or support, substantially as and for the purpose set forth.

2. The herein-described mold, consisting of a pair of frames, E, having longitudinal partitions F, the sides of which and of the frames are provided with vertical grooves G, and a loose bottom, I, said bottom and frames being connected by dowels H, substantially as and for the purpose set forth.

3. The combination of the supports J, having springs K, with a pair of draining-tables A A, having half-round pivots D, and the molds E, held between said tables, substantially as and for the purpose set forth.

253,836. REFRIGERATOR. CHARLES BOSS, Bathurst, New Brunswick, Canada. Filed Jan. 21, 1881. (No model.) Patented in Canada Apr. 11, 1877.

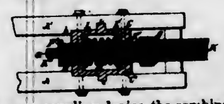


253,836.

Claim.—1. In a refrigerator, the double ice-receptacle *a*, surrounding two sides and the top and bottom of the chamber E, in combination with the single ice-receptacles B, and shelves *a' a''*, all arranged substantially as described, whereby chambers of three different degrees of coldness are obtained, as and for the purpose specified.

2. In a refrigerator, the chamber E and the ice-receiver *a*, in combination with a hopper, F, having a contracted lower end, whereby an even thickness of ice or freezing-mixture is maintained entirely around the chamber E, substantially as described.

253,837. REVERSIBLE SEAT. ELISHA B. BRIDGMAN, Boston, Mass. Filed Oct. 21, 1880. (Model.)



Claim.—1. In combination with the frame *b* and bars *c c*, extending from one end to the other of the settee, the back *a* and seat *g*, provided with the longitudinal ribs *h h*, extending the length of the seat and placed nearer together than said bars, as shown, each rib acting alternately as a seat-support and back stop as the seat is reversed, substantially as and for the purpose set forth.

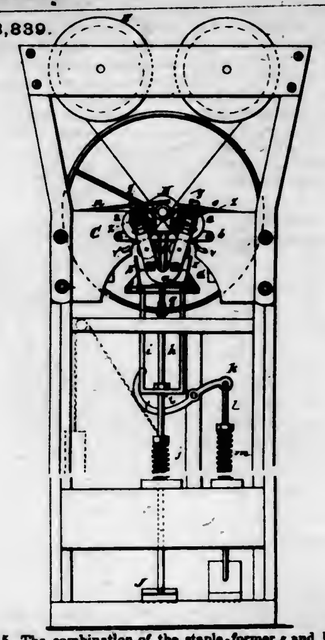
2. In combination with the frame *b*, provided with the relatively large openings *b'* and bars *c c*, the seat *g*, provided with the ribs *h h*, blocks *f*, and tenons *f'*, substantially as and for the purpose described.

3. In combination with the bars *c c*, cross-bars *d d*, and springs *e e*, the seat *g*, provided with the ribs *h h*, and blocks *f*, provided with the tenons *f'*, and the frame or end pieces, *b*, provided with the large openings *b' b'*, arranged and constructed substantially as and for the purposes specified.

253,838. CAR-COUPLING. GEORGE BUTLER, Cincinnati Ohio. Filed Aug. 12, 1881. (No model.)

Claim.—In a car-coupling device, the combination of the case M and the sleeve F, provided with flange or collar J, and the draft-rod G and key K', and an appropriate draw-head, substantially as and for the purposes specified.

253,839. MACHINERY FOR FORMING AND FASTENING BOXES AND DISHES. LAUREN CARPENTER, St. Joseph, Mich. Filed Nov. 1, 1881. (No model.)



Claim.—1. In a machine for forming and fastening boxes, dishes, &c., the combination of the feed-wheels *c d* with the ratchet *c'*, arms *e*, rods *f*, and rod or shaft, substantially as specified.

2. The combination, with the dish-former, of the supporting-rods *i*, and suitable mechanism, such as described, for holding the said former in its elevated position, substantially as set forth.

3. The staple-former *s*, having the notches or openings *s'* and the depression *t*, in combination with the hammer or plate *q*, having the projections *r* and *t'*, substantially as and for the purpose set forth.

4. The driving hammer or plate *q*, in combination with the forming-hammer *q'* and staple-former *s*, substantially as specified.

253,839.

5. The combination of the staple-former *s* and hammers or plates *q u* with the rods *n o* and disks or eccentrics N N', substantially as described.

6. The combination of the rods *h i* and dish-former G with the spring *j* and treadle J, substantially as set forth.

7. The combination of the feed-wheels *c d* with the staple-former *s* and hammer or plate *q*, all constructed and operating substantially as specified.

8. The combination of the feed-wheels *c d*, having an intermittent movement, with the staple-former *s* and cutting-hammer *q*, substantially as described.

9. The combination and arrangement of the feeding devices *c d*, staple-former *s*, hammers *q u*, and casings or boxes *p* with the dish-former G, having the grooved clinch-plates *w*, all constructed and operating substantially as specified.

10. The folding and forming springs *a' a''* and *b' b''*, in combination with the dish-former G, so arranged as to fold the blank on the former as it is pressed upward to receive the staples, substantially as described.

253,840. WATER-PROOF PAPER. WILLIAM B. CARPENTER, Newark, N. J., assignor to himself and the Celluloid Novelty Company, New York, N. Y. Filed May 24, 1881. (No specimens.)

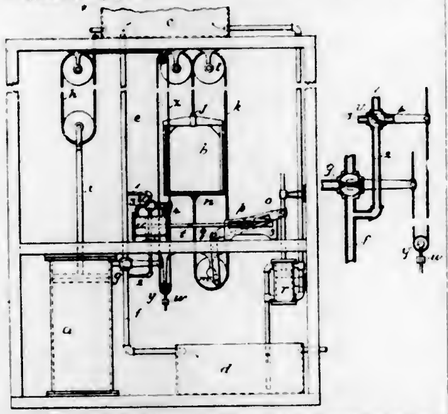
Claim.—1. A paper made from a combination of paper-pulp and a plastic water-proof material—such as celluloid, lignoid, or similar plastic water-proof material—substantially as specified.

2. The process of making a compound paper-pulp by mixing or grinding in water the water-proof material and the ordinary paper-pulp, substantially as and for the purpose set forth.

3. The process of putting the paper, when made from the compound pulp, as described, through the bath and afterward through the heated rollers, substantially as and for the purpose named.

253,841. CIGAR AND CIGARETTE WRAPPER. WILLIAM B. CARPENTER, Newark, N. J. Filed Apr. 9, 1881. (No specimens.)

Claim.—1. An improved paper for the wrappers of cigarettes and cigars, composed of asbestus and vegetable fiber properly pulped and formed into sheets.



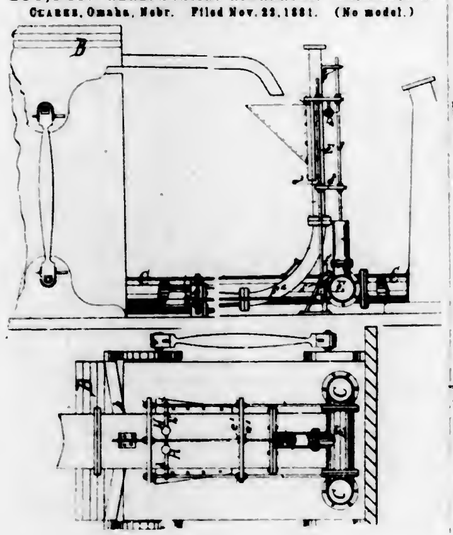
2. An improved paper for the wrappers of cigarettes and cigars, composed of asbestus and tobacco fiber combined.

3. An improved paper for the wrappers of cigars and cigarettes, composed of tobacco, asbestus, and saltpeter, the latter to excite combustion and give piquancy of sensation.

4. An improved paper for the wrappers of cigars and cigarettes, composed of tobacco, asbestus, and a coloring of charcoal, substantially as specified.

263,842. HYDRAULIC ELEVATOR. CLARENCE A. CHANDLER, East Bridgewater, Mass. Filed Sept. 15, 1881. (No model.)

Brief.—When in motion the car operates a pump, which forces water into the tank *c*. The length of the stroke of the pump-piston depends on the location of the fulcrum *p* in the slotted lever *o*. This in turn is actuated by the piston in cylinder *u*, to which water is admitted by valve *r* on either side of the piston. This valve, and also valve *g*, which admits water to cylinder *s*, are operated by the conductor by means of the cord *x*, and are held in place by the weighted pulley *y w*.



Claim.—1. In a hydraulic elevator, the combination of a cylinder, *u*, its piston, and the movable fulcrum *p* with the guides *z z*, oscillating lever *o*, and the piston and pump *r*, all operating substantially as described, and for the purpose specified.

2. The combination, in a hydraulic elevator, of a hand-rope, *x*, the weighted pulley *y w*, and the valve *e* with the cylinder *u*, with its injection and ejection pipes 1, 2, 3, and 4, connected and operating substantially as shown, and for the purpose set forth.

3. In a hydraulic elevator, the combination of the piston *i*, cylinder *s*, and the valve device *g* with the hand-rope *x* and weighted pulley *y w*, all arranged substantially in the manner shown, and for the purpose specified.

4. In a hydraulic elevator, the combination of the hand-rope *x* and the weighted pulley *y w* with the valve devices *v* and *g*, whereby both valves are controlled by a single hand-rope, substantially as described, and for the purpose specified.

263,843. AMALGAMATING APPARATUS. ALEXANDER D. CHARES, Omaha, Nebr. Filed Nov. 23, 1881. (No model.)

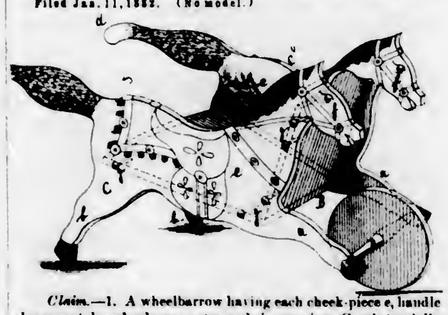
Claim.—1. In combination with blast-conducting devices to which and the hopper by which the sand is fed, a wind-gate in the former and a valve in the latter, and devices for actuating the said gate and valve simultaneously or substantially simultaneously substantially as specified.

2. The combination, with the hopper-valve, of governing mechanism and conduits for conducting the actuating-blast to said mechanism, substantially as specified.

3. The combination, with the wind-gate, of governing mechanism, conduits for conducting the blast to said mechanism, and the devices for conveying motion from the said mechanism to the gate, substantially as specified.

263,844. HEEL FOR BOOTS AND SHOES. HENRY E. CLINTON, Augusta, Ga. Filed Dec. 21, 1881. (No model.)

Claim.—The combination, with a boot or shoe having a plate, G, arranged upon the inside of the outer sole and provided with perforation *f* and prongs H, of the heel having a plate, A, secured to its upper side, said plate being provided with a boss, C, countersunk in the heel, and having a threaded opening, D, to receive a fastening-screw, S, and openings E E, to admit the prongs H, substantially as set forth.

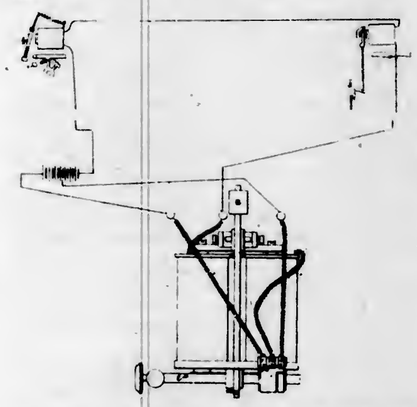


263,845. PLUMBER'S TRAP. PATRICK CONNOLLY, Brooklyn, N. Y., assignor, by mesne assignments, to Julia Connolly, same place. Filed Nov. 14, 1881. (No model.)

Brief.—The spherical casing is made of transparent material with thickened threaded extensions at the points, through which the pipes enter to engage with threaded couplings, as shown in the drawings.

Claim.—The spheroidal casing D, formed in one piece of transparent material, provided with the threaded nozzles or re-enforces D', in combination with the pipe B, having a screw-thread, B', and the pipe E, having a screw-thread, E', and with the couplings M, adapted to serve as herein specified.

263,846. TOY WHEELBARROW. JESSE A. CHANDALL, Brooklyn, N. Y., assignor to Ives, Blakeslee & Co., Bridgeport, Conn. Filed Jan. 11, 1882. (No model.)



Claim.—1. A wheelbarrow having each cheek-piece *e*, handle *d*, rear rest, *b*, and axle-support *a* made in one piece, C, substantially as described.

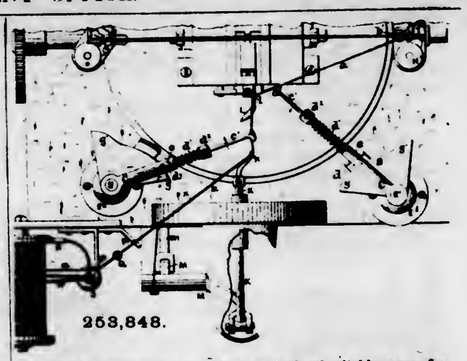
2. A wheelbarrow having each cheek-piece, handle, rear rest, axle-support, and front projection, *f*, made in one piece, C, substantially as described.

3. As a new article of manufacture, a wheelbarrow having its sides constructed in form of animals, substantially as and for the purpose herein shown and described.

263,847. NON-INTERFERING FIRE-ALARM SYSTEM. MOSES G. CRANE, Newton, Mass. Filed Oct. 10, 1881. (No model.)

Brief.—The armature-levers are all held up at the signal-boxes by a normally-strong current. When a signal is turned in a repeater or switch mechanism throws part of the battery out of circuit, leaving sufficient battery in circuit to transmit signals, but not enough to hold up said armatures, which carry spring-blocks resting normally between the locking and tripping levers of the boxes

Claim.—1. That improvement in the method of operating a fire-alarm-telegraph system for the purpose of producing non-interference of signals which consists in employing a current of less strength while a signal is being sounded than is normally used on the lines while no signals are passing over them, and in producing the said signals by opening and closing the said circuit while the reduced current is flowing, substantially as and for the purpose described.

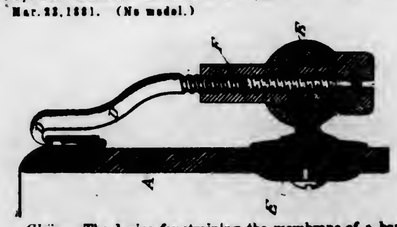


2. In a fire-alarm-telegraph system, a circuit-terminal or contact-spring and a battery or electric generator for producing a current of a certain strength, having one pole connected therewith, and a circuit-terminal or contact-spring properly connected with the said generator to receive a current of diminished strength therefrom, and a circuit-terminal and a fire-alarm-telegraph circuit connected therewith extending to the other pole of the said generator, and including signal-boxes with controlling-magnets, to operate as described, combined with a rheotrope-shaft operated by a repeater, and the rheotrope thereon co-operating with the said circuit-terminals, in the manner and for the purpose set forth.

263,848. MACHINE FOR MAKING WEAVERS' HARNESS. JOHN H. CROWELL, Providence, R. I., assignor to the Kendrick Loom Harness Company, same place. Filed May 20, 1881. (No model.)

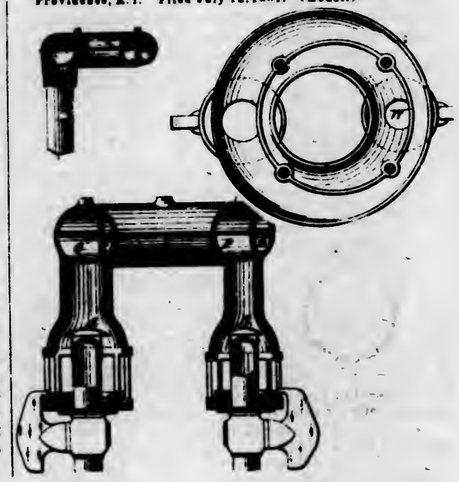
Brief.—A single twine secured at its end to one of the back bands is laid by vibrating hooked arms into continuous folds, being returned upon itself and knitted to the back-bands at the ends of each fold. To provide for proper engagement by the vibrators the twine is laid by a reciprocating guide-rod into the notch of an intermediately-situated plate, and is engaged between such notch and guide by the hooks of the vibrators, which, in order to properly engage the twine and deliver it to the latch-needles at the back-bands, are made extensible and contractible. Each vibrator is in two parts, connected by a contractile spring, and the projection or retraction of the movable hooked member is controlled by a stationary cam-surface. The eyes of the heddles are formed between metal clasps, which secure two adjacent lengths of twine together.

Claim.—1. The combination, substantially as before set forth, of the extensible and contractible vibrators, suitable means, as described, for reciprocating the same, and the fixed cams for varying the lengths of said vibrators.



2. The combination, substantially as before set forth, of a stand for supporting a twine-bobbin, devices, as described, for leading the twine to one of the back-bands of the harness, suitable means for supporting said back-bands, two oppositely-moving vibrators arranged to engage the twine and return it upon itself to form two strands of the heddles, and simultaneously, or nearly so, to carry said strands to the back-bands, mechanism for fastening the heddles to the back-bands, and suitable means, as described, for actuating the operative devices.

263,848.



3. The combination, as before set forth, of suitable means for supporting the back-bands of the harness, a device having a notch, *i*, for holding a portion of the length of twine that is to enter into the formation of the next ensuing heddle, a movable guide-eye, *k*, the hooked vibrators, adapted to engage with the length of twine between such notched device and the guide-eye, and carry the twine returned upon itself to the back-bands, mechanism for fastening the twine to the back-bands, and suitable means, as described, for actuating the operative devices.

263,849. BANJO. EDWIN J. CURLEY, Ravenswood, Ill. Filed Mar. 23, 1881. (No model.)

Claim.—The device for straining the membrane of a banjo, tambourine, drum, or other similar instrument, operating wholly upon the outside of the instrument, and consisting of the firmly-fixed stud E, the screw-hook D, and the long socketed or long sleeved nut F, which protects the screw-thread on the hook D, and has two bearings—that upon and along the shank of said hook and that upon and through the fixed stud—constructed and arranged substantially as described, and adapted for attachment to the banjo or other similar instrument, as set forth.

263,850. GAS HEATING APPARATUS. SAMUEL DARLING, Providence, R. I. Filed July 12, 1881. (Model.)

Claim.—1. A gas-burner having two narrow continuous combustion-apertures, one larger than the other, the larger one being in the outer and the smaller one in the inner contour of the burner, substantially as described.

2. A double gas-burner in one piece, having in combination two combustion-apertures, one larger than the other, the larger one in the outer and the smaller one in its inner contour, a partition within the burner dividing it into two gas-chambers, and a supply-pipe and gas-cock for each chamber, substantially as described.

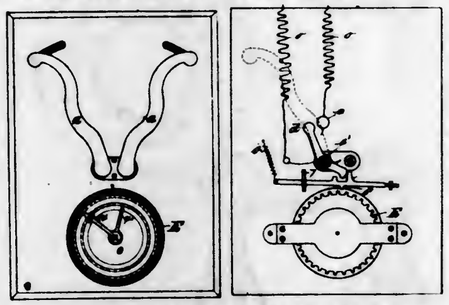
253,851. DOOR-SPRING. WILLIAM C. DE LONG and ANSON A. SCHOONER, Warren, Ill. Filed July 8, 1881. (Model.)

Claim.—In a spring-hinge, the combination, with a spring consisting of a single piece of wire bent to form a central section having arms projecting from each end and coiled in spiral form, of a central core or tube provided with flanged ends and a longitudinal slot, substantially as set forth.

253,852. BASIN AND SINK TRAP. CHARLES H. DENISON, New York, N. Y. Filed June 3, 1881. (No model.)

Claim.—1. In a basin or sink trap, the supplemental reservoir C in the second arm, in combination with the ball-valve bulb B in the first arm of the trap, by which a double action is secured to valve *a*, substantially as described.

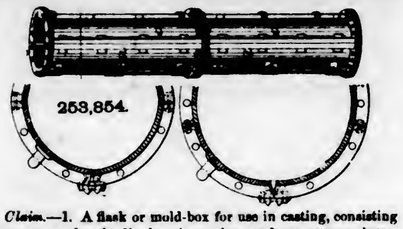
2. In a basin or sink trap, the bulb D, with valve *c* in the waste-pipe below the trap, in combination with ball-valve bulb B, substantially as described.



3. In a basin or sink trap, the air chamber or bulb D, in combination with ball-valve bulb B, substantially as described.

4. In a basin or sink trap, the air-chamber D, in combination with reservoir C and ball-valve bulb B, substantially as described.

5. In a basin or sink trap, the bulb D, with valve *c*, in combination with reservoir C, and bulb B, with its valve *a*, substantially as described.



253,853. CALL-REGISTER FOR TELEPHONES. WILLIAM J. DENYER and WILLARD W. SAWYER, Springfield, Mass. Filed May 16, 1881. (No model.)

Brief.—The movement of the switch-lever in putting the instrument into circuit actuates a registering device.

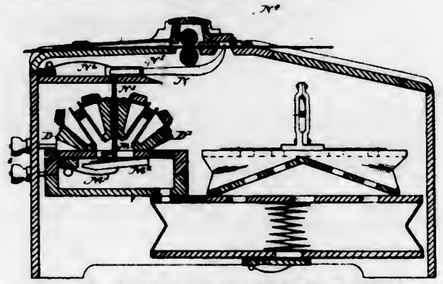
Claim.—In a telephonic or other electric signaling apparatus, the combination, with the switch-lever *a*, having the arm *d* secured thereto, and with the registering apparatus E, of the notched bar *i*, having the tooth *f* thereon and spring *i*', substantially as set forth.

253,854. FLASK FOR CASTING. JACOB K. DIMMICK, Newport, Ky., assignor to the Cincinnati and Newport Iron and Pipe Company, same place. Filed May 24, 1881. (No model.)

Claim.—1. A flask or mold-box for use in casting, consisting of two or more longitudinal main sections and one or more intermediate removable sections, substantially as described.

2. A flask for casting, adapted to be separated to open for discharging the casting, and to be separated at points other than at said opening lines to receive an enlarging section.

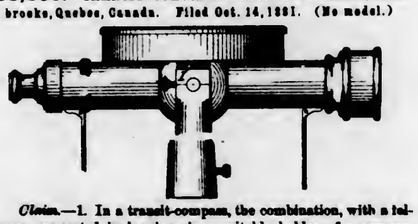
3. A flask for casting, composed of two or more sections, each having a curvature forming an arc of a circle of a diameter greater than the smallest diameter of the flask, whereby it is adapted to receive enlarging sections.



4. In a flask provided with removable sections, a series of longitudinal sections having a curvature differing from the true circumference of the flask, substantially as described, whereby the minimum deviation from a true circle is secured under variations in the number of sections employed.

5. A flask for casting, composed of detachable longitudinal and transverse main sections and supplementary longitudinal enlarging sections, whereby both its diameter and its length may be varied at will.

6. In combination with the swinging sections of a flask for molds, one or more centering-spindles affording support in the pivotal axis upon which they swing.



7. In combination with a flask for molds, a hinge composed of vertical and horizontal bolts, substantially as described.

253,855. MECHANICAL ORGANETTE. PATRICK J. DUGGAN, Boston, Mass. Filed Aug. 22, 1881. (No model.)

Claim.—In a mechanical musical instrument, the combination of the segment reed-board D D' D² D³ and the valves M⁵ with the set of push-pins N⁵, levers N, and music-paper, all arranged and operating together substantially as described, and for the purpose set forth.

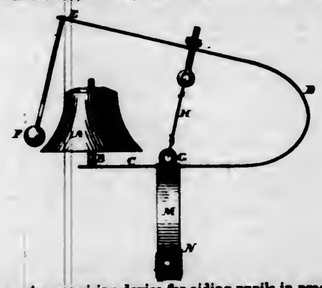
253,856. TRANSIT-COMPASS. ARTHUR W. ELKINS, Sherbrooke, Quebec, Canada. Filed Oct. 14, 1881. (No model.)

Claim.—1. In a transit-compass, the combination, with a telescope supported in bearings in a suitable holder, of a compass located above, attached to and having a fixed relation with said telescope, substantially as and for the purpose set forth.

2. The combination, with a telescope supported in a suitable holder, of a compass located above, attached to, and having a fixed relation with said telescope, and provided with two or more levers, substantially as and for the purpose set forth.

3. In a surveying-instrument, a compass having the levels arranged thereon for the purpose set forth, in combination with and attached to a telescope, substantially as described.

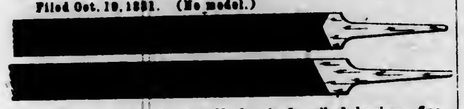
4. The combination, with the telescope provided with a compass and the trunnions, as shown, of the bifurcated holder having the socket *b*, substantially as shown and described.



5. The combination, with a telescope provided with a compass and the trunnions, of a bifurcated holder adapted to support the telescope, as and for the purpose set forth.

6. The combination, with a telescope provided with a compass and the trunnions, of the bifurcated holder having the set-screw, substantially as and for the purpose set forth.

7. The combination, with the telescope provided with a compass and the trunnions, of the swinging bifurcated holder and the hinged sights, said sights secured to the under surface of said telescope, substantially as and for the purpose set forth.



8. The combination, with a telescope provided with a compass having the levels as shown, of a pair of sights secured to the under surface of said telescope, substantially as and for the purpose set forth.

253,857. LEGATO MONITOR FOR PIANO-FORTE PLAYERS. STEPHEN A. EMERY, Newton, Mass. Filed Nov. 25, 1881. (No model.)

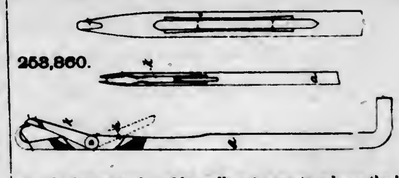
Claim.—An exercising device for aiding pupils in practicing on key-board musical instruments, which consists of the adjustable spring C D E, hammer F, and bell A, mounted upon the wrist-let M, or its equivalent, all constructed and arranged substantially in the manner described, and for the purpose set forth.

253,858. FILE. CRAWFORD H. FAIRBANKS, Pawtucket, R. I. Filed Oct. 10, 1881. (No model.)

Claim.—The safe-edge file herein described, having a fine over cut and a coarse upper cut, as and for the purposes specified.

253,859. PULLEY-BLOCK. GEORGE A. FOOS, Cleveland, Ohio. Filed Aug. 23, 1881. (No model.)

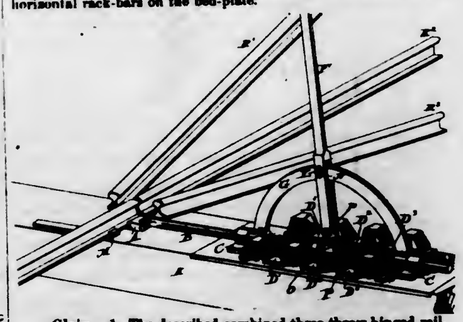
Brief.—About the axle of the block are placed free anti-friction rollers, leaving a vacant space about equal to the diameter of one roller. The rollers are laterally retained in position by loose washers.



Claim.—In pulley-blocks, a series of free anti-friction rollers, placed around the axle of the pulley, having a vacant space nearly or equal to the diameter of one of the rollers, in combination with loose end washers, and the bosses of the cheek-pieces, substantially as and for the purpose described.

253,860. KNITTING-MACHINE NEEDLE. FREDERICK E. GILFORD, Manchester, N. H., assignor to William Corey, same place. Filed Sept. 5, 1881. (No model.)

Brief.—The latch-receiving slit is enlarged from the latch-pivot toward the hook and butt of the needle, and shoulders are formed in said slit upon which the latch may rest when thrown over on the body of the needle. The improvement obviates the liability of the latch catching or sticking in the slit, and enables the said latch to be made stronger by gradually increasing the same in thickness from its pivoted end to the sides of the "spoon."

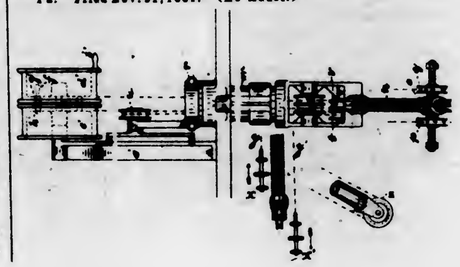


Claim.—1. As an improved article of manufacture, a latched knitting-machine needle composed of a latch and a body part having the inner portion of its walls cut away to enlarge the latch-receiving slit from near the pivot of the latch toward the end of the slit in the direction of the butt of the needle, whereby the liability of the latch to catch in the said slit is obviated, substantially as described.

2. As an improved article of manufacture, a knitting-machine needle composed of the latch *b*, shaped, as shown and described, to strengthen it and enable the loop on the body of the needle to be cast over the latch without sudden strain, and a body part having a slit widened from the pivot of the latch toward the butt of the needle, and having shoulders upon which the latch may rest when thrown over on the body of the needle to uncover the hook of the needle, substantially as described.

253,861. RAILWAY SWITCH-STAND. JOHN H. GREENWOOD and WILLIAM H. COWELL, Logan, Ohio. Filed Jan. 3, 1882. (No model.)

Brief.—The switch-lever is fulcrumed to a hinged arc or quadrant, whereby both can lie horizontally out of the way when not being operated, the lever being secured in either of its positions by horizontal rack-bars on the bed-plate.



Claim.—1. The described combined three-throw hinged railway switch-stand, the quadrant and lever of which are hinged to the base, so that after use in an upright position they can be dropped upon the ground on either side of the tie on which they are supported, so as to be out of the way of passing trains or persons, all substantially as specified.

2. The combination of the plate H, hinges C, hollow pintles C' C', hinged quadrant G, lever F, swivel O, strap E, racks D, and rod B, in the manner and for the purposes set forth.

3. In a railway switch-stand, the combination of the switching-lever with a hinged quadrant capable of being folded down upon the ground on either side, so that the lever and arc will be out of the way, as described.

4. In a railway switch-stand, the locking device consisting of the combination of the rod B, sleeve P, strap E, and racks D', in the manner and for the purpose stated.

253,862. FLUE-CLEANER. JOHN H. HARTMAN, Philadelphia, Pa. Filed Nov. 21, 1881. (No model.)

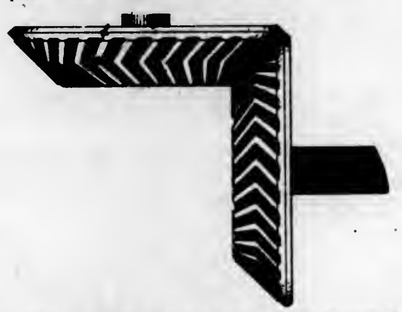
Claim.—1. In combination with a regenerative stove, a flue-cleaner, with an arm, sleeve, and scraper swinging under the dome

253,865.

253,867. MOTOR. ALBERT IEKE, Lancaster, Pa., assignor of one-half to Anthony Ieke, same place. Filed Aug. 30, 1881. (No model.)

ceptacles, each entrance being adapted to be closed by the appropriate cover after the receptacle has entered.

2. In combination with an oscillating tube and a pair of re-



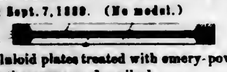
Claim.—1. In combination with a regenerative stove, a flue-cleaner, with an arm, sleeve, and scraper swinging under the dome of the stove.

2. In combination with a regenerative stove, a flue-cleaner having an arm swinging under the dome of the stove, with the chains *r* and sheaves *t v s u* to change the position of the sleeve on the arm.

3. In combination with the flue-cleaner of a regenerative stove, the double drum *c' d'*, made in two pieces, the pin *f'*, the chains *y y'*, and scrapers *x x'*.

4. In combination with the flue-cleaner of a regenerative stove, the arm *n*, swinging under the dome, the hollow shaft *m*, the bearing *o'*, the drums *c' d'*, the sleeve *o*, the chains *r y y'*, the sheaves *t v s u*, the sheaves *a' b' p q*, and scrapers *x x'*

253,863. SPIRAL BEVEL-GEAR. URI HASKIN, Pittsburg, Pa., assignor of one-half to the Atlas Works, (Limited,) same place. Filed Nov. 25, 1881. (No model.)



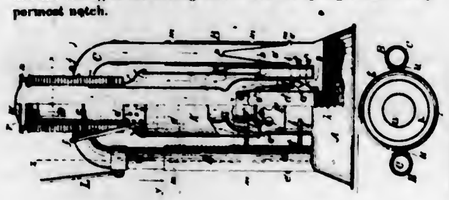
Claim.—1. In bevel or like gearing wherein the plane of the teeth intersects that of the shaft or axis, a series of interlocking teeth arranged on intersecting or double spiral lines, substantially as and for the purpose specified.

2. A beveled-gear wheel having shroudings extending around it at the ends of the teeth, substantially as and for the purpose described.

3. A beveled-gear wheel having a shrouding extending around it at the lower end of the teeth and at a plane above the base of the teeth, substantially as and for the purpose described.

253,864. SLATE. CHARLES H. HAYS and JAMES H. HAYS, Newark, N. J. Filed Sept. 7, 1880. (No model.)

Claim.—1. Celluloid plates treated with emery-powder or like material, as and for the purposes described.



2. Slates of celluloid treated with emery-powder, as set forth and described.

3. Slates composed one side of celluloid and one of celluloid treated with emery-powder, as set forth and described.

4. Slates composed wholly of celluloid treated with emery-powder, or partly of celluloid and partly of celluloid treated with emery-powder, and re-enforced with a lining, as set forth and described.

253,865. HAND-LANTERN. LEONARD HOEKLE, Rochester, N. Y. Filed Dec. 27, 1881. (No model.)

Brief.—The air-supply tubes consist of tubes attached to the reservoir and vertically-sliding tubes within the same, to which the air-deflecting device is secured. The sliding tubes are provided with springs engaging with notches in the stationary tube. At the upper end the stationary tubes are cut away at one side to permit the tilting of the sliding tubes when the spring enters the uppermost notch.

253,865.

Claim.—1. A thimble, D, provided with strips *a* and flange *e*, and side tubes, C C, with means to hold said tubes and thimble rigidly together, and leaving a clear air-space between the ends of the tubes and said strips *a* and flange *e*, for the purpose of insulating said latter parts from the tubes, so that heat may not be communicated to the tubes, substantially as shown and described.

2. The reservoir or base A of a hand-lantern, provided with tubes B B, in which are fitted respectively smaller tubes, C C, and made to slide freely therein, which latter tubes support upper parts of the lantern, said tubes C C being vertically adjustable within the tubes B B, as and for the purposes set forth.

3. The reservoir or base A of a lantern, provided with tubes B B, and tubes C C, arranged to slide within said tubes B B, respectively, and means to hold said tubes C C in positions of vertical adjustment within the tubes B B, substantially as shown, and for the purpose set forth.

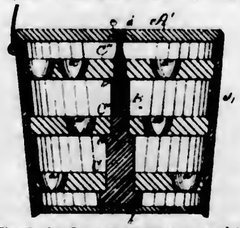
4. In combination, the fringed or perforated band *b* of the burner-cone F, the thimble D, provided with the perforated globe cap or holder *d*, globe K, and chimney G, substantially as shown and described.

5. The combination, with the conical ring *c'*, fringed band *b*, and inverted conical ring *c²*, of an ordinary Argand burner for lamps, a close band, *l*, forming a curtain to cover the said ring *c²*, and plate *h*, substantially as shown.

6. The combination, in lanterns, of an Argand burner, F, provided with a close band, *l*, and reservoir A, provided with an internal air-passage, *s*, and socket *k*, to receive said burner, substantially as shown.

7. The reservoir or base A of a lantern, provided with tubes B B, and tubes C C, arranged to slide within said tubes B B, the tubes C C being provided with locking devices *p m*, by means of which said tubes C C are held in any desired position of vertical adjustment within the tubes B B.

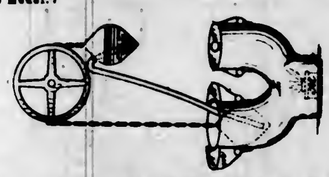
8. The chimney G of a lantern, in combination with vertically-adjustable tubes C C, and thimble D, provided with a cap or part, *d*, for shedding rain away from said chimney, substantially as shown, and for the purpose set forth.



9. In combination with air-supply tubes B B of lanterns, a reservoir, A, provided with an air-passage, *s*, within the oil-chamber leading to the burner, substantially as shown and described.

10. In combination with the burner and chimney of a lantern, a reservoir, A, containing an internal air-passage, *s*, and extensible air-supply tubes B B and C C, substantially as shown.

11. An oil-reservoir, A, for a lantern, in which the socket *k*, for receiving the burner, is depressed below the surface of the upper plate of said reservoir.



12. Tubes B B of a lantern, provided with holes *m* and indentations *o'*, in combination with tubes C C, provided with locking devices *p*, substantially as shown, and for the purpose set forth.

253,866. EGG-PAIL. ANDREW L. HILL and GEORGE S. SIMPSON, Decatur, Ill. Filed Oct. 7, 1881. (No model.)

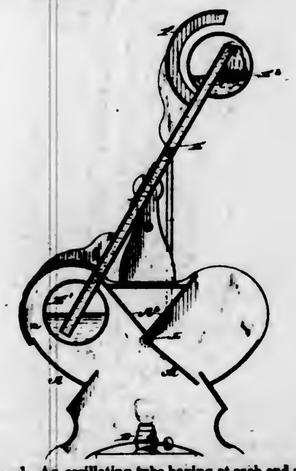
Claim.—The device for conveying eggs, consisting of a series of disks, C C' C'', of relatively different areas, made with beveled edges, and having different numbers of holes *a a' a''* bored therein to receive eggs, and central holes, *c c' c''*, of different diameter in each disk, in combination with the standard B, constructed with a broad base, *b*, a series of shoulders, and a knob, *d*, whereby the series of disks may be lifted together, and a pail, A, having a cover, A', of larger diameter than the bottom of the pail, substantially as and for the purposes described.

253,867. MOTOR. ALBERT ICKE, Lancaster, Pa., assignor of one-half to Anthony Icke, same place. Filed Aug. 30, 1881. (No model.)

Claim.—1. In a motor, the combination of a flexible connecting-tube with two air-tight exhausted receptacles provided with easily-vaporizable liquid in sufficient quantities to partly fill said receptacles and tube, and a caloric device or devices acting on said receptacles alternately for the purpose of vaporizing a part of said liquid and causing the remainder to shift in vacuo from receptacle to receptacle, substantially as set forth.

2. In a motor, the combination of a flexible connecting-tube with two air-tight exhausted receptacles provided with steam, to which said tube is attached, and with easily-vaporizable liquid in sufficient quantities to partly fill said receptacles and tube, and a caloric device or devices acting on said receptacles alternately for the purpose of vaporizing a part of said liquid and causing the remainder to shift in vacuo from receptacle to receptacle, substantially as set forth.

3. In a motor, the combination of a flexible connecting-tube with two air-tight exhausted receptacles provided with easily-vaporizable liquid in sufficient quantities to partly fill said receptacles and tube, one or more supporting-chains and wheels, and a caloric device or devices acting on said receptacles alternately, for the purpose of vaporizing a part of said liquid and causing the remainder to shift in vacuo from receptacle to receptacle, substantially as set forth.



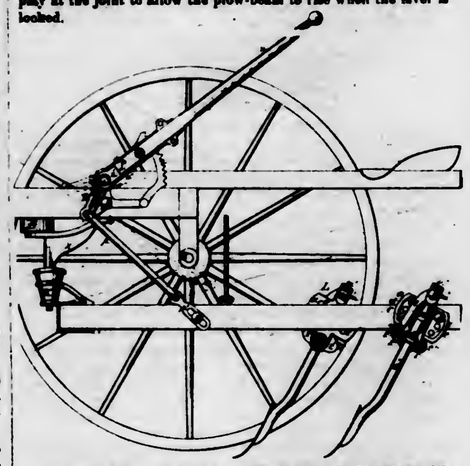
4. The combination of a pair of pointed bulbs with a flexible connecting-tube, a suspending-chain and pulley, and a heating device.

5. A heating-chamber provided with a sliding sectional top, in combination with a bulb adapted to automatically open said top in its descent, substantially as set forth.

6. A bifurcated heating-chamber having each of its divisions covered by an automatically-closing top, in combination with a pair of pointed bulbs, an intermediate support, and a flexible connecting-tube, all operating substantially as set forth.

7. In combination with a pair of bulbs or receptacles and a flexible connecting-tube, a heating device arranged to act alternately and directly on each of said bulbs as it descends, keeping up thereby an oscillating movement of said motor.

253,868. MOTOR. ANTHONY ICKE and ALBERT ICKE, Lancaster, Pa. Filed Nov. 4, 1881. (No model.)



Claim.—1. An oscillating tube having at each end a receptacle for volatile liquids and a cover, in combination with a caloric chamber provided with an entrance for the admission of said receptacles, each entrance being adapted to be closed by the appropriate cover after the receptacle has entered.

2. In combination with an oscillating tube and a pair of receptacles for volatile liquid, attached to the ends of said tube, a caloric chamber divided into two parts or passages, and a gate or valve within said chamber connected to said tube in such manner that the oscillation of said tube cuts off the hot air from one of said parts or passages and directs it into the other.

3. In combination with tube E and terminal receptacles E' E², the casing A, the gudgeons or pivot-shaft for said tube, rock-shaft L, gate M, and the cranks and pitman or connecting-rod, whereby the oscillation of said tube is enabled to automatically control the vibration of said gate, substantially as set forth.

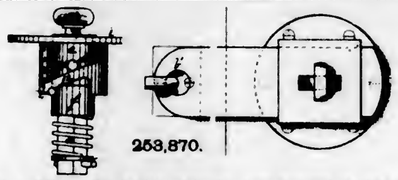
253,869. CULTIVATOR. JAS. H. JOHNS, Rockford, Ill. Filed Oct. 4, 1881. (No model.)

Brief.—A standard frictionally held by means of an eyebolt and a pointed rotating support entering the notch of a friction-lever made to yield to a heavy strain. The whole is arranged to be reversible on a bed-plate. A two-part lever having limited play at the joint to allow the plow-beam to rise when the lever is locked.

Claim.—1. In a cultivator slip-tooth, the combination, with the bed-plate, of a lever-support for the shovel-standard pivotally supported in a bearing of the bed-plate, a slotted lever for holding the support, and a screw-eyebolt adapted to receive the shovel-standard and connect the standard-lever and bed-plate, substantially as set forth.

2. The combination, with the bed-plate and the standard-support, the latter being pivoted to the bed-plate, of a friction-lever pivoted on the bed-plate, and having a gear-tooth connection with the standard-support, substantially as set forth.

3. The combination, with the bed-plate and with the lever-standard support having a pivotal connection therewith, of a friction-lever having a screw-clamping bolt, pivotal connection with the bed-plate, and a gear-tooth connection with the lever-support, substantially as and for the purpose hereinbefore set forth.



4. The combination, substantially as herein described, of the bed-plate capable of use on either side of the drag-bar, a lever-standard support and standard, having a screw-eyebolt pivotal connection with the bed-plate, and a friction-lever having pivotal clamping-bolt connection with the bed-plate and a gear-tooth-like connection with the pivoted lever-support, substantially as and for the purpose hereinbefore set forth.

5. The combination, with the bed-plate and the standard-support, of the pivoted friction-lever, having a gear-tooth-like connection with the said support, and provided with an enlarged end adapted to engage with the bed-plate, substantially as set forth.

6. In a cultivator, the combination, with the main frame, a ratchet-segment mounted thereon, and a drag-bar, of a two-part raising and holding lever, having a handle portion and a pendent portion capable of a slight upward movement independent of the handle portion, and a link connected to the lever and to the drag-bar, substantially as set forth.

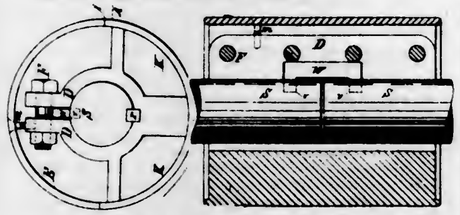
253,870. SEAL-LOCK. LAWRENCE H. JUNKIN, Pittsburg, Pa. Filed Nov. 17, 1881. (Model.)

Claim.—1. The combination, in a seal-lock, of a rotating bar-

rel, a sliding collar having projecting pins mounted on the stem of the barrel so as to turn with it, a spring mounted on the stem between the collar and a stop or pin at the lower end of the stem, and inclines and notches upon which the pins of the collar play, substantially as and for the purpose described.

2. The combination of the headed barrel having both an axial and longitudinal movement with a recessed hasp and a slotted frangible seal of metal or glass.

253,871. SEWING-MACHINE SHUTTLE. WILLIAM H. KNELLER, Norwalk, Ohio, assignor to himself and J. W. Foster, same place. Filed Mar. 9, 1881. (Model.)



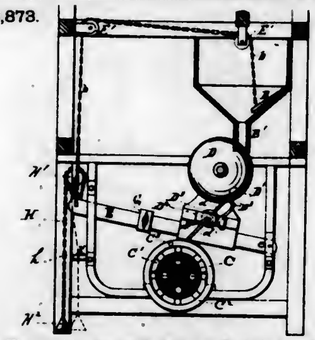
Claim.—1. The combination, with a shuttle provided with an open slot at its upper edge and an elongated slot communicating with said open slot, of a tension-plate the forward end of which is located in rear of said open slot, said tension-plate being constructed and arranged to cover the elongated slot, substantially as set forth.

2. The combination, with a shuttle provided with an open slot at its upper edge and an elongated slot communicating with the open slot, of a tension-plate arranged to cover the elongated slot and secured to the heel of the shuttle by a tension-adjusting screw, the forward end of said tension-plate being located in rear of the open slot, substantially as set forth.

3. The combination, with a shuttle provided with the open slot *a*, elongated slots *c c*, and communicating passage *d*, of the tension-plate C, adjustably secured to the heel of the shuttle, said tension-plate being arranged to cover the slots *c c* and allow the thread to be readily inserted in the open slot *a*, substantially as set forth.

253,872. SHAFT-COUPLING. CHARLES C. KLEIN, Philadelphia, Pa. Filed Jan. 3, 1881. (Model.)

Claim.—1. A shaft-coupling provided on one side of a plane dividing it longitudinally with the rim K and on the opposite side of the plane with the wings D D and tangential bolts F, substantially as and for the purpose specified.

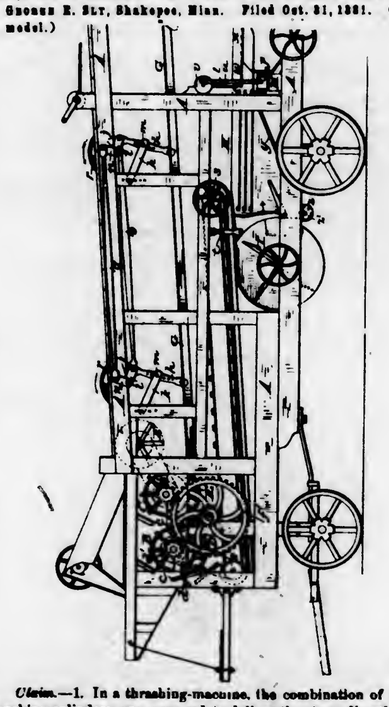


2. In combination with a shaft-coupling having the rim K wings D D, and tangential bolts F, the cap E and screw *m*, substantially as and for the purpose specified.

3. In combination with a shaft-coupling having wings D D the bolt F and differential nuts G *g*, substantially as and for the purpose set forth.

253,873. ALARM FOR MILLSTONES. WILLIAM LAUGOFF, Detroit, Mich. Filed Sept. 20, 1880. (Model.)

Claim.—1. In a grinding-mill, the combination, with a hopper and a valve or flexible wing located thereon, of a signal mechanism provided with a bell and a bell-hammer having a spring-arm provided with a projecting tripping tail or end, a pivoted lever carrying said signal mechanism, a rotary wheel arranged below said arm or adjacent thereto and having a projection arranged to strike the projecting end of the bell-hammer, an adjustable counterpoise arranged upon said lever, and a flexible connection between the free end of said lever and the valve or wing in the hopper, substantially as described.



253,873.

2. The combination, with the lever E, chain *b*, and the signal mechanism carried by said lever, of the valve or wing B, chain H, having ring *h*, pin *h'*, and weight H³, substantially as described, and for the purpose set forth.

3. The combination, with the hopper and the valve or wing thereon, of the chain *b*, the pulleys E' E', over which said chain passes, the pivoted lever E, having its free end attached to the lower end of said chain *b*, the signal mechanism mounted on said lever and having a bell and a spring bell-hammer provided with the projecting end *d*³, the rotary wheel provided with the pin C', the chain H, connected to the free end of the lever, the pulley H', the ring *h*, inserted in said chain H, the weight H³, and the stationary pin *h'*, all arranged and operating substantially as described, and for the purpose set forth.

253,874. THRASHING-MACHINE. JOHN L. MACDONALD and GEORGE E. SLY, Shakopee, Minn. Filed Oct. 31, 1881. (No model.)

Claim.—1. In a thrashing-machine, the combination of two thrashing-cylinders, one arranged to deliver the straw directly to the other, concaves located beneath the respective cylinders, and an intermediate slatted section, substantially as described.

2. In combination with the cylinders B C, concaves D E, the dust-board *g*, located between them and serving to direct the dust downward, and the slatted section between the respective concaves, substantially as shown and described.

3. In a thrashing-machine, the combination of the two thrashing-cylinders B C, arranged, as described, to act conjointly upon the grain, and independently-adjustable concaves D E, for the respective cylinders, substantially as shown and described.

4. In combination with the cylinders B C, the independently-adjustable concaves D E and the wind-boards *f* and *g*, all combined and operating as set forth.

5. In a thrashing-machine, the combination of revolving cranks or eccentrics, a straw-carrier, sustaining and operating arms or levers connected at one end to the carrier and at the opposite end to said revolving cranks or eccentrics, said arms having a shifting fulcrum at a point between the two points of attachment, and the parts being combined and operating substantially as described.

6. In combination with the straw-carrier, sustaining-arms jointed thereto, revolving cranks carrying said arms, and pivoted arms jointed at one end to the sustaining-arms at a point between the ends of the latter and pivoted at the opposite end.

7. In combination with a straw carrier or platform and cranks *i*, arms *k*, provided with perforations, connected at their opposite ends with the cranks *i* and the straw-carrier, respectively, and the arms *k*, jointed to the arms A, and pivoted to the framing of the machine.

8. The combination, in a thrasher, of a straw carrier or platform, G, sustaining and operating arms A, swinging arms *k*, jointed to arms A, shafts *j*, provided with cranks *i* and *n*, and the pitmen *o* and *q*, all arranged and operating as set forth.

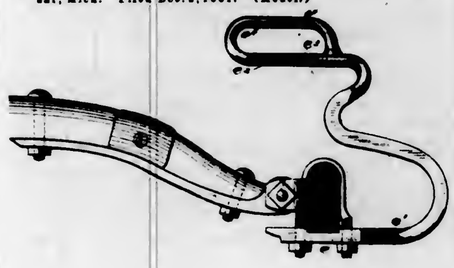
9. In combination with the arms A, connected with cranks at one end, the arms *k*, adapted and arranged to be adjusted substantially as shown and described.

10. In combination with a screening-shoe, a revolving crank or eccentric, a lever connected at one end with said revolving crank or eccentric and at the opposite end with the shoe, and arranged to oscillate and move endwise upon its fulcrum, whereby an elliptical motion in a vertical plane is produced.

11. In combination with the shaking-shoe of a thrashing-machine, the slotted levers *u*, crank-wheels *v*, and studs or pins *l*, located between the crank-wheels and the shoe, as and for the purpose set forth.

12. In combination with the straw-carrier G, the arms A and *k*, cranks *i* and *n*, and pitmen *o* and *q*, the weighted wheels *r*, applied to the crank-shafts, as and for the purpose set forth.

13. A shaking-shoe provided in rear of the tailings-trough with a corrugated or ribbed extension, closed on its lower side to prevent the return of matters to the screens or tailings-trough.



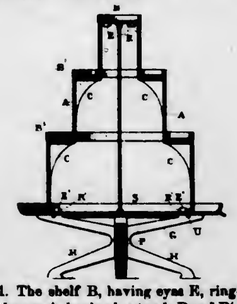
14. In a thrashing-machine, the combination of a tailings-trough, an upright pivoted prop or support at one end thereof, and an elbow-lever connected with the opposite end and with a rotating crank, substantially as shown.

15. The herein-described thrashing and separating machine, consisting of the cylinders B C and concaves D E, beater F, straw-carrier G, sustaining and operating arms A, cranks *i*, carrier-belt, screening-shoe H, and fan I, all combined and operating as set forth.

16. In a thrashing-machine, the combination, with a vertically-moving straw-carrier and screening devices, of a crank or eccentric, and one or more slotted arms connected at one end with the crank or eccentric and at the other with the screening devices, and arranged to move about a fixed stud extending through its slot.

17. In combination with a screening device, a crank or eccentric, and a slotted lever connected positively at one end with said crank or eccentric and at the other end with the screening device, a pin or stud extending through the slot and adapted to be adjusted therein and to be secured rigidly in its adjusted position, substantially as set forth, whereby an elliptical movement of varying scope may be imparted to the end of the lever connected with the screening devices.

253,875. TONGUE-SUPPORT. WELLINGTON B. MCFAIL, Vassar, Mich. Filed Dec. 9, 1881. (Model.)



Claim.—The herein-described spring thill or tongue support, constructed in one piece, and comprising the U-shaped rod *c'*, gradually flattened so as to be capable of a lateral spring movement, and continued upwardly to form two oblique guides, *c² c²*, above which is formed a loop, *c'*, serving as a handle, all arranged and operating substantially as and for the purpose herein shown and specified.

253,876. RING-STAPLE FOR SUSPENDING PAPERS, &c. GEORGE W. MCGILL, New York, N. Y. Filed Dec. 15, 1881. (No model.) Patented in England Feb. 25, 1879, in Germany Mar. 15, 1879, in France Sept. 13, 1879, in Belgium Jan. 28, 1880, and in Austria-Hungary May 5, 1880.

Claim.—The improved ring-staple for holding and suspending papers, &c., consisting of the suspending-ring, the penetrating-legs, and the intermediate twisted shank, all from a single piece of wire, as set forth and shown.

253,877. FLOWER-STAND. BASIL H. MESSLER, Canton, Ill. Filed May 9, 1881. (No model.)

Claim.—1. The shelf B, having eyes E, ring-shaped shelves B' and B², and braces A, having bent ends R and R', in combination with the eyes E', the pan S, having stop-cock F and circular rod U, the standard G, having notched arms, the legs H, and pin P, substantially as and for the purpose set forth.

2. The combination of the shelf B, having eyes E, ring-shaped shelf B', braces A, strengthened by the V-shaped pieces C and having bent ends R and R', and the pan S, having eyes E', substantially as and for the purpose specified.

3. The combination of the pan S, having cock F, the circular rod U, fastened to the under side of said pan S, the standard G, legs H, and pin P, substantially as and for the purpose specified.

4. The pan S and circular rod U, fastened to the under side of said pan, in combination with the standard G, having notches at the upper ends of its arms, substantially as and for the purpose set forth.

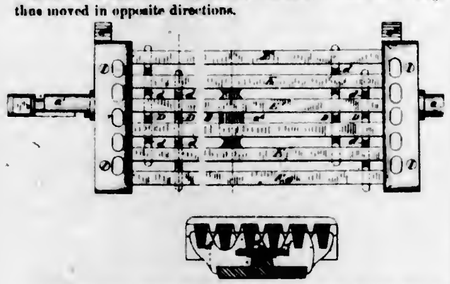
253,878. ROLLER FOR GRADUAL-REDUCTION FLOUR-MILLS. WILLIAM M. MILLS, Dayton, Ohio. Filed Apr. 26, 1881. (No model.)

Claim.—1. A grinding-roll having peripheral corrugations the sides of each of which are of different lengths and together form an obtuse angle, substantially as described.

2. A grinding-roll having peripheral corrugations arranged spirally, the sides of each corrugation being of different lengths and together form an obtuse angle, substantially as described.

3. A pair of co-operating grinding-rolls having peripheral corrugations the sides of each of which are of different lengths and together form an obtuse angle, substantially as described, for the purpose specified.

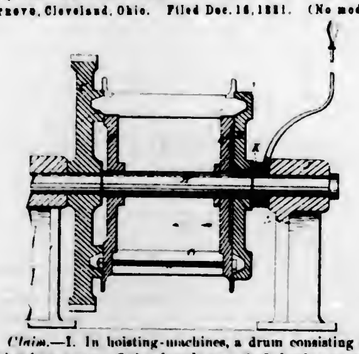
253,879. CHURN. ALONZO W. NIBOT and MARTIN RHOADES, Rockford, Ill., assignors to Henry H. Palmer and George E. King, same place. Filed Oct. 7, 1881. (No model.)



Claim.—1. The combination, with an annular ring-head, of anti-friction rollers supported to revolve on bearings above the surface of the annular ring-head, substantially as and for the purpose hereinbefore set forth.

2. The combination, with an annular ring-head provided with anti-friction rollers mounted to revolve on bearings above the surface of the annular ring, of a removable lid provided with radially-moving bolts to engage the anti-friction rollers, substantially as and for the purpose hereinbefore set forth.

3. The combination, with an annular ring-head provided with anti-friction rollers mounted to revolve on bearings above the surface of the annular ring, of a removable lid provided with radially-moving bolts operated by a spirally-grooved rotary cam, substantially as and for the purpose hereinbefore set forth.

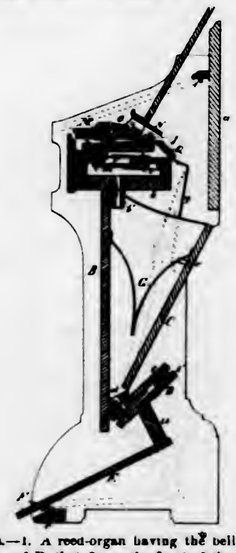


253,880. GRATE. JOHN F. MONTGOMERY, Taunton, Mass., assignor of one-half to Henry M. Ryder, same place. Filed Nov. 14, 1881. (Model.)

Brief.—The bar E' being reciprocated, motion is imparted to the alternate bars which are mounted on the standards, on which it rests, and through the connecting-lever B a reverse motion is imparted to the bar which is next to it, and this communicates motion to the bars which rest on its standard, all the bars being thus moved in opposite directions.

Claim.—The improved grate herein described, having one set of bars moving in one direction mounted on one pair of vibrating standards, the other set of bars mounted on a second pair of vibrating standards, a bar of one set being connected to the bar of the other set by a lever, so that by reciprocating one set the other set will reciprocate in the opposite direction, substantially as and for the purposes set forth.

253,881. DRUM FOR HOISTING-MACHINES. FRANK MUNGAVROVE, Cleveland, Ohio. Filed Dec. 16, 1881. (No model.)



Claim.—1. In hoisting-machines, a drum consisting of the two heads or centers, fitting loosely on a shaft, having secured between and through the heads longitudinally a series of wooden lags or battens to form the exterior of the drum, the ends of these lags or battens projecting beyond the outer faces of the heads, and being beveled to fit the grooves in the friction-wheels, constructed substantially as and for the purpose described.

2. The combination of a hoisting-drum having wooden lags or battens with their ends projecting beyond the centers with the friction-wheel and disk, having beveled annular grooves to correspond with the ends of the lags or battens, substantially as and for the purpose described.

3. The combination of the spur-gear wheel having a beveled friction-groove, the drum constructed with wooden lags or battens projecting into the groove, the disk having a groove to correspond with the beveled ends of the wooden lags or battens, and the clutch consisting of the two sections with beveled ratchets, substantially as and for the purpose described.

4. The clutch consisting of the two sections K and L, having corresponding beveled ratchets, and the wings to prevent the turning of the stationary section, substantially as and for the purpose described.

253,882. REED-ORGAN. AUGUSTUS NOWELL, Chicago, Ill. Filed Aug. 14, 1881. (No model.)

Claim.—1. A reed-organ having the bellows-reservoir composed of board B, that forms the front of the organ-case, strip *d* back board, C, and spring G, all constructed and arranged substantially as set forth.

2. In a reed-organ, the perforated strip *d* of the bellows-reservoir, and the board *t* of the feeders D, secured thereto, in combination with the pedals E and E', each rigidly connected with a feeder-board, *t'*, by block, *u*, all constructed and arranged substantially in the manner described and shown.

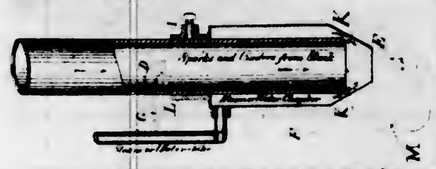
3. The combination of the feeders D D', pedals E E', block *u*, base-strip *e*, and wire F, substantially as and for the purpose set forth.

4. The swell-cap Q, pivotally connected to the rear edge of the reed-board H, and having pending arm *q*, in combination with the back board, C, having pin *r*, substantially as and for the purpose described.

5. In a reed-organ, the key-board J, having grooved strip *j*, in combination with the keys M, having tapering rear ends that enter said groove and form a pivotal connection therewith, all substantially as described and shown.

6. In a reed-organ, the combination of the key-board J, reed-board H, bridge-board N, constructed and arranged to conceal the rear ends of the keys and also to form a supporting-shelf for the sheet-music, the swell-cap Q, pivotally connected to said reed-board and having arm *q*, and the back board, C, having pin *r*, substantially as and for the purpose set forth.

7. In a reed-organ, the combination, with the bridge-board N, of the cover or lid I', pivoted above said bridge-board, as described, so that when opened it forms the music-desk, substantially as set forth.



8. The reed-board H, formed of a single piece of wood grooved from the top and slotted in the rear, so as to form reed-cells that are open on top, with side grooves in the bottom for holding the reed, with the front end of the reed-frame close upon the projecting base-strip formed to said board, substantially as set forth.

9. In a reed-organ, the combination of the reed-board H, key-board J, and swell-cap Q, pivotally connected to the rear edge of said reed-board, substantially as and for the purpose described.

10. In a reed-organ, the key-board J and reed-board H, with pivoted swell-cap Q, having arm *q*, in combination with the back board, C, of the bellows-reservoir, having pin *r*, the same being constructed to operate substantially as set forth.

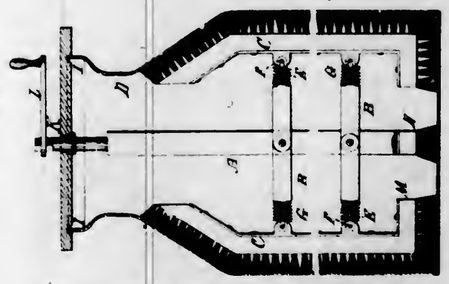
11. The case for a reed-organ, composed of standards A, back *a*, front B, forming one side of the bellows-reservoir, throat-board *b*, and base-strip *e*, all connected by wood-screws, and constructed in the manner substantially as shown and specified.

253,883. SPARK-ARRESTER. GEORGE B. NICHOLS, Galveston, Tex. Filed Nov. 7, 1881. (No model.)

Claim.—1. In a locomotive-engine, a pipe or pipes for conveying sparks from the smoke-stack, in combination with a diaphragm or cone placed in the stack and a steam or water chamber placed around the discharge of said pipe or pipes.

2. In locomotive-engines, a pipe or pipes for conveying the sparks and cinders from a stack, in combination with water or steam chambers and steam or water jets, substantially as and for the purposes described.

3. The downwardly-discharging steam or water chambers F F, surrounding the delivery-pipes D D, in combination with means, substantially as described, for supplying steam or water thereto, substantially as and for the purpose described.



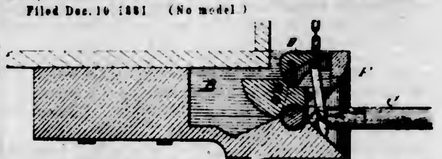
4. The steam or water chambers F F, having conical lower ends, in combination with spark-delivery pipes, substantially as and for the purpose described.

5. The chambers F F, having the opening at their lower ends smaller in area than the openings of the delivery-pipes D D, substantially as and for the purposes described.

6. The combination of the chambers F F and the set-screws for regulating the annular space K, substantially as and for the purpose described.

7. The steam or water jets M and I, in combination with spark-delivery pipes and chamber F, substantially as and for the purpose described.

253,884. BRUSH FOR CLEANING MILK-CANS. JOHN K. ODELL, Beckertown, N. J. Filed July 18, 1881. (No model.)



Claim.—1. The central shaft, A, having pivoted to it two or more sets of arms, carrying brushes, moved outwardly by pressing down said shaft, and adapted by adjustable mechanism to fit cans of different diameters, substantially as and for the purpose specified.

2. The combination of the shaft A, arms B, and brushes C, the said arms having the slots E and carrying the springs G, substantially as and for the purpose set forth.

3. In combination with the shaft A, carrying the arms and brushes, substantially as described and shown, the sections M and N, substantially as and for the purpose specified.

253,885. CAR-COUPLING. GEORGE T. OSBORNE, Atlanta, Ga. Filed Dec. 10, 1881. (No model.)

Claim.—1. In a car-coupling, the combination, with the draw-head thereof, of the pivoted jaw D and pivoted hook E, said jaw having pivoted thereto a suitable dog, F, substantially as and for the purpose set forth.

2. In a car-coupling, the combination, with the pivoted hook E, constructed as described, of the pivoted jaw D, carrying pivoted dog F, with shoulders *d*, substantially as and for the purpose specified.

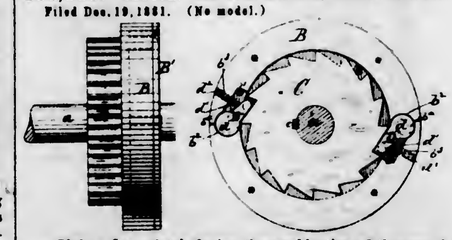
3. In a car-coupler, the combination, with the pivoted jaw D and hook E, of the chains *f*, or other suitable connection, and the upright rod G, secured thereto, substantially as and for the purpose set forth.

253,886. SPRING-WASHER. EWALD OTTE, Indianapolis, Ind. Filed Jan. 3, 1882. (No model.)

Claim.—1. A washer for bolts, &c., in which several wings or their described equivalents are bent away from the plane of the body of the washer, upon all sides of the same, whereby a substantially equal spring force is caused to be exerted against all portions of the nut simultaneously, substantially as set forth.

2. The combination, with a bolt and its nut, of the spring-washer D, having the wings *d'*, *d*² bent alternately in each direction away from the plane of the body of the washer, substantially as set forth.

253,887. POCKET-KNIFE. JAMES M. PALMER, Cambridge, Mass. Filed Oct. 25, 1880. (No model.)



Claim.—In a finger-nail knife-blade, the combination of a shank, a cutting-blade end, and the longitudinally-arranged file ribs or teeth on the surface of the intermediate portion, substantially as described.

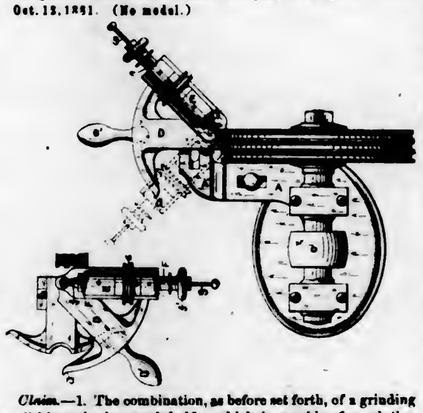
253,888. PROCESS OF REFINING AMALGAM OF GOLD AND SILVER CONTAINING BASE METALS. EUGENE M. KIOTZ, New York, N. Y. Filed Sept. 28, 1881. (No specimens.)

Claim.—The process of refining amalgam, which consists in subjecting the amalgam under agitation to the action of chlorine gas, whereby the base metals in said amalgam are transferred into insoluble chlorides, and then separating such chlorides from the amalgam, substantially as and for the purpose set forth.

253,889. CLUTCH. ISAIAH L. ROBERTS, Jacksonville, Fla. Filed Dec. 19, 1881. (No model.)

Claim.—In a clutch device, the combination of the gear A and housing B, loose on the shaft *a*, said housing being recessed at *b* to receive the ratchet-wheel C, keyed to said shaft, and having the dogs D, formed with cylindrical heels *d*, working in recesses *b*², together with recesses *b'*, springs *d'*, and the plate B', all constructed and arranged to operate substantially as and for the purpose specified.

253,890. MACHINE FOR GRINDING OR POLISHING THE HEADS OF SCREWS. CHARLES D. ROGERS, Providence, R. I., assignor to the American Screw Company, same place. Filed



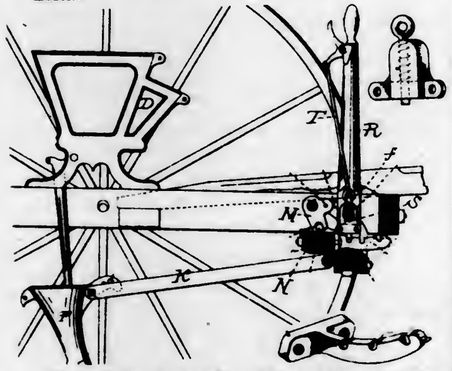
3. In a grain-drill, the combination of two parallel shifting-bars arranged in different horizontal planes, whereby one of the bars has in its shifting movement a compound motion, as described, and for the purpose set forth.

253,895. PLAYING-CARD AND DOMINO COMBINED. BENJAMIN A. SHELDON, New York, N. Y. Filed Dec. 6, 1881. (No model.)

disorganization, and soft flexible elastic sleeves interposed between the said collars and the central stick, substantially as and for the purpose specified.

2. In an umbrella, the collar around the central stick, to which

253,890. MACHINE FOR GRINDING OR POLISHING THE HEADS OF SCREWS. CHARLES D. ROGERS, Providence, R. I., assignor to the American Screw Company, same place. Filed Oct. 13, 1881. (No model.)



Claim.—1. The combination, as before set forth, of a grinding or polishing wheel, a work-holder which is capable of revolution and longitudinal movement in its bearings, a frame in which said holder is mounted, a sliding block to which said frame is pivoted, and a platform adjustable laterally and longitudinally with relation to the wheel upon which said sliding block is mounted, substantially as and for the purposes specified.

2. The combination, as before set forth, of a grinding or polishing wheel, a work-holder which is capable of revolution and longitudinal movement in its bearings, a frame in which said holder is journaled, a bed, D, upon which said frame is mounted, a sliding block to which said frame and bed are pivoted, a platform for supporting the parts, and suitable means, as described, for temporarily locking the bed to the platform, substantially as set forth.

3. The combination, as before set forth, of a grinding or polishing wheel, a spindle which is capable of revolution and longitudinal movement in its bearings, suitable jaws attached to said spindle for holding the work, a frame in which said spindle is journaled, a bed, D, upon which said frame is mounted, a sliding block to which said frame and bed are pivoted, a spring the pressure of which causes the said parts to move toward the grinding-wheel, and a stop to limit the extent of their forward movement.

253,891. GRAIN-DRILL. GEORGE W. RUDD, JOHN R. RUDD, and SQUIRE S. RUDD, Liberty, Ind. Filed Sept. 9, 1881. (No model.)

Claim.—1. In a grain-drill, a shifting-bar having attached thereto directly an operating-lever arranged at the front end of the frame and means for actuating a spring-bolt, in combination with a parallel transverse shifting-bar provided with a rack to receive the spring-bolt of the lever, substantially as described.

2. In a grain-drill, the combination of two parallel shifting-bars, one of which is provided with a curved bar having a plurality of notches, and the other provided with a hand-lever and an automatic spring-bolt for engaging with the notches of the curved bar to secure a lock, substantially as described.

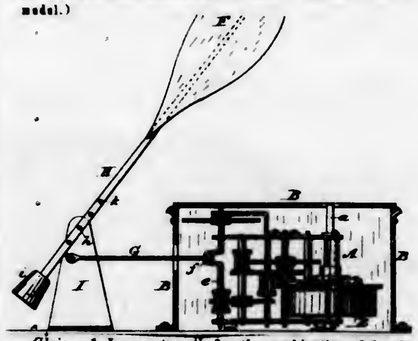
3. In a grain-drill, the combination of two parallel shifting-bars arranged in different horizontal planes, whereby one of the bars has in its shifting movement a compound motion, as described, and for the purpose set forth.

4. In a grain-drill, the rear shifting-bar provided with the notched curved arm and the front shifting-bar provided with the hand-lever and side casing containing a spring-bolt, with means for withdrawing the bolt from its engagement, substantially in the manner as described.

5. In a grain-drill, the combination, with the operating-lever R, of the bell-crank lever M, connecting-rod T, and spring-bolt *f*, inclosed in a casing, substantially as described.

253,892. CIGARETTE. WOLF SALOMON, New York, N. Y., assignor to S. Jacoby & Co., same place. Filed Jan. 5, 1882. (No model.)

Claim.—The cigarette having the butt-end of its wrapper formed into a hollow cone, C, containing the air-space *a*, and the closed point of said cone covered with the igniting substance *b*, substantially as herein shown and described.

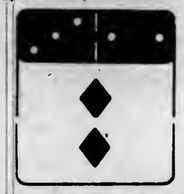


253,893. EXPLODER FOR BLASTING-CARTRIDGES. JOHN C. SCHRADER, Warwick, R. I. Filed Aug. 11, 1881. (No model.)

Claim.—1. The combination, substantially as hereinbefore described, of the tubular blasting tube or bar, the cartridge connected therewith, and a fulminate-exploder connected with the blasting-tube, located within the cartridge and beyond the end of said tube, as and for the purposes specified.

2. The combination, substantially as hereinbefore described, of the tubular blasting tube or bar, the cartridge connected therewith, and a fulminate-exploder connected with the inner end of said tube within the cartridge and communicating with said tube for firing purposes by way of a passage or channel of lesser diameter than that of the blasting-bar, as and for the purposes specified.

253,894. AUTOMATIC FAN. ALBERT A. SELDEN and WILLIAM G. DUCKETT, Baltimore, Md. Filed Sept. 30, 1881. (No model.)

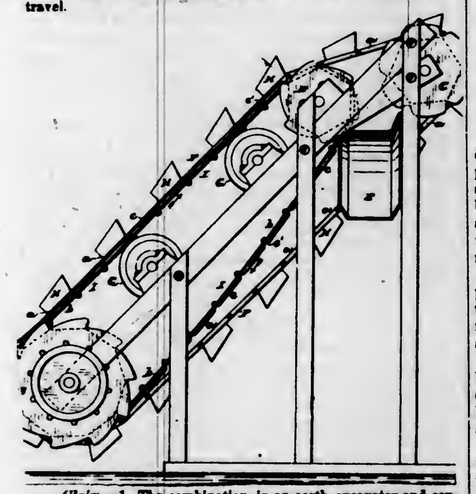


Claim.—1. In an automatic fan, the combination of the clock mechanism having a motive-power-imparting shaft, *e*, provided with a crank, *f*, with a connecting-rod, G, bracket I, and a counterbalanced fan, F, substantially as shown and specified.

2. In an automatic fan, the clock mechanism A, having the motive-power-imparting shaft *e*, provided with a crank, *f*, in combination with the casing B, connecting-rod G, bracket I, and a counterbalanced fan, F, all arranged substantially as shown and described.

3. The automatic fan herein described, consisting of the clock mechanism A, having the motive-power-imparting shaft *e*, provided with a crank, *f*, to which the connecting-rod G is attached and connects with the pivoted fan F, having transverse adjustable shaft *h* and counterbalance-weight *i*, journaled in bracket I, and the case B, all constructed and arranged for operation substantially as shown and hereinbefore set forth.

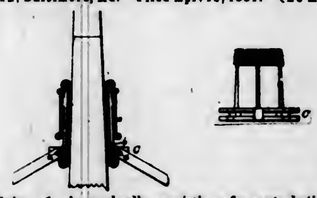
253,895. PLAYING-CARD AND DOMINO COMBINED. BENJAMIN A. SHELDON, New York, N. Y. Filed Dec. 6, 1881. (No model.)



Claim.—1. As a new article of manufacture, a combined playing-card and domino, substantially as shown and described.

2. A playing-card of rectangular shape provided with the representation of a domino at one end, as shown and described.

253,896. EARTH EXCAVATOR AND CONVEYER. CHARLES A. SMITH and FRED. D. SMITH, New Carlisle, Ind.; said Fred. D. Smith assignor to Charles A. Smith. Filed Jan. 3, 1882. (No model.)



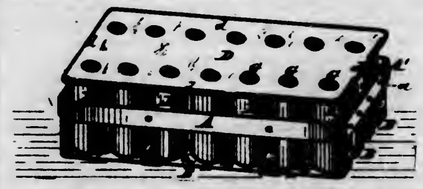
Brief.—Bottomless buckets are temporarily closed in their under side by an independent endless apron or belt underneath and traveling with said buckets during a part only of their upward travel.

Claim.—1. The combination, in an earth excavator and conveyer, of an endless chain, F, carrying bottomless scoops, shovels, or buckets H H, and an independent apron or belt, I, supported against or directly underneath and traveling with the said buckets during only a part of their upward travel, substantially as and for the purposes specified.

2. The combination, in an earth excavator and conveyer, of an endless chain consisting of centrally-open links carrying bottomless buckets H H, the independent endless apron or belt I, made shorter than the chain F, the chute E, and the wheels B, C, and D, the wheels B and C carrying the chain F and the wheels B and D carrying the belt I, all arranged substantially as shown and described with relation to each other, for the purposes set forth.

253,897. COMBINED CANE AND UMBRELLA. GILBERT T. SMITH, Baltimore, Md. Filed Apr. 18, 1881. (No model.)

Claim.—1. An umbrella consisting of a central stick, a complete covered frame connected to the said stick by means of diametrically-compressible collars, which admit of its removal without disorganization, and soft flexible elastic sleeves interposed between the said collars and the central stick, substantially as and for the purpose specified.



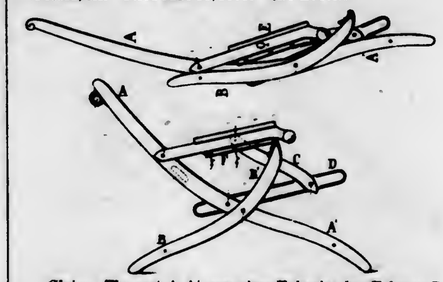
2. In an umbrella, the collar around the central stick, to which the ribs are hinged, provided with a diametrically-compressible extension and an inclosed soft elastic sleeve, and means for effecting the closing of the said extension around or about the said sleeve, substantially as and for the purpose specified.

3. In an umbrella, the collar to which the rib-braces are hinged, provided with a diametrically-compressible extension having a soft elastic sleeve or lining, and means for effecting the closing of the said extension around or about the said sleeve, and the clamping of the central stick, substantially as and for the purpose specified.

4. The collars C and E, or either of them, having an internal soft elastic sleeve, substantially as and for the purpose specified.

253,898. TRAY FOR HOLDING FRUIT-CANS. JOB TAYLOR, East Hamburg, N. Y. Filed Nov. 9, 1881. (No model.)

Brief.—The plate D is heavy and prevents the cans from floating before becoming filled with syrup.



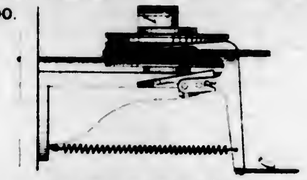
Claim.—1. As a new and improved article of manufacture, a dipping-tray for fruit-cans, consisting of a metallic basket composed of two U-shaped bands, A A', two (or more) longitudinal U-shaped slats, B, secured with their ends between the parallel members *a a'* of said bands A A', and the U-shaped transverse slats C, and a plate, D, having cone-shaped perforated protuberances G, the whole being constructed and combined substantially in the manner as and for the object stated.

2. The combination, with the tray A, of the cans E and the plate D, said plate being provided with a series of perforated protuberances, G, corresponding in position with the position of the filling-apertures *e* in said cans E, substantially as and for the use and purpose stated.

3. A tray for holding fruit-cans, consisting of two U-shaped bands, A A', placed together as specified, the longitudinal U-shaped slats B, secured with their ends between the parallel members *a a'* of said bands A A', and the U-shaped transverse slats C, substantially as and for the object stated.

4. The combination, with the plate D, having a series of apertures, of the cone-shaped baskets G, having the flange *g*, as specified, said cone-shaped baskets being permanently affixed to said plate, substantially in the manner as and for the purpose indicated.

253,899. FOLDING RECLINING-CHAIR. ARTEMAS H. UPHAM, Peoria, Ill. Filed June 13, 1881. (No model.)



Claim.—The part A A', arm-piece E, having bar F, brace C, and side bar, D, in combination with the leg B, prolonged to B', and having adjusting attachments H J, substantially as and for the purpose specified.

253,900. BELT-SHIPPER. WILLIAM H. UPHAM and CHARLES W. SCOTILL, Cohoes, N. Y. Filed Dec. 24, 1881. (No model.)

Claim.—1. The combination of a drive-pulley, an idle-pulley, a shipper for transferring a belt from one pulley to the other, and a shoe connected to the shipper and operated thereby so as to be

253,900.

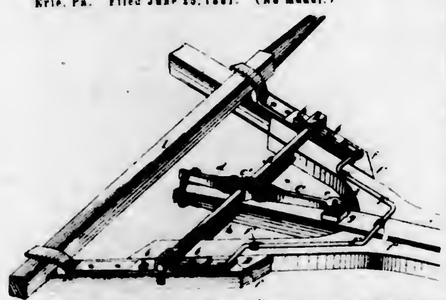
thrown against the drive-pulley when the belt is shipped from that to the idle-pulley and away therefrom when the belt is shipped back, substantially as set forth.

2. The combination, with a drive-pulley and idle-pulley, of a shipper adapted to ship a belt from one pulley to the other, and an adjustable shoe connected with and operated by the shipper so as to be thrown against the drive-pulley and away therefrom as the belt is shipped from off and onto said pulley, substantially as set forth.

3. The combination of a drive-pulley and idle-pulley, a shipper for shipping a belt from one of said pulleys to the other, a shoe connected with and operated by the shipper, means for moving the shipper and shoe in one direction, and a spring for moving them in the opposite direction, substantially as set forth.

4. The combination of a drive-pulley provided with a sleeve and fitted over a shaft so as to turn thereon, an idle-pulley fitted to the sleeve of the drive-pulley so as to turn thereon, a shipper for transferring a belt from one of said pulleys to the other, and a shoe connected with the shipper and operated by it, substantially as set forth.

5. The combination of a pulley provided with a perforated sleeve and mounted on a hollow perforated shaft, a pulley mounted on the sleeve of the first pulley, and a collar and cup for respectively holding the pulleys on the shaft and for feeding a lubricant thereto through the said shaft, substantially as set forth.

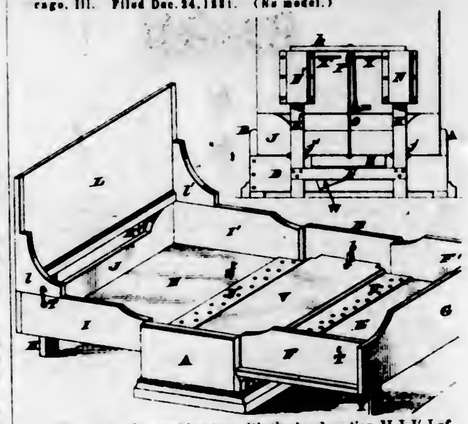


253,901. BUTTON-FASTENER. JACOB WEIDEMANN, New York, N. Y. Filed Mar. 3, 1881. (No model.)

Claim.—1. A button provided with a fastening device consisting of one or more hinged levers bearing one or more curved teeth, the levers being operated from the upper side of the button, and the teeth passing through holes in the button and adapted to pierce into and through the fabric to which the button is secured and secure the button thereto, substantially as described.

2. The combination, in a button-fastening device, of one or more hinged levers bearing one or more curved teeth passing through holes in the button and one or more curved stationary teeth, the whole being adapted to secure the button to the fabric, substantially as described.

253,902. WAGON-TONGUE SUPPORT. JEROME W. WETMORE, Erie, Pa. Filed June 25, 1881. (No model.)



Claim.—1. The square torsion-spring bar, when both of its ends are held by bearings bolted to the bounds under the axial bolt, in combination with the movable central iron arm, C, substantially as described.

2. The torsion-spring bar attached to the bounds under the axial bolt, in combination with the arms C and *c'* substantially as described

3. The counter torsion-spring F, substantially as shown, for the purpose specified.

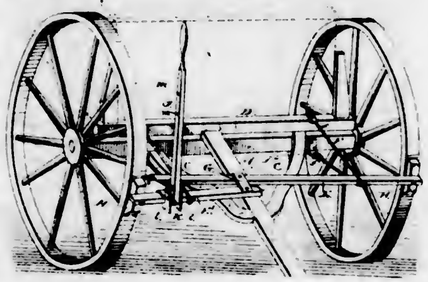
4. The combination of the straight torsion spring wagon-tongue support, held by bearings at its ends with the key-boxes for adjusting the lifting strain, substantially as described.

253,903. FOLDING CABINET-BED. SAMUEL H. WITMER, Chicago, Ill. Filed Dec. 24, 1881. (No model.)

Claim.—1. In combination with the head-section H I I' J of a folding or cabinet bedstead, the frame K K' *k k'*, hinged thereto at *j j'*, and carrying a shiftable extension, L, the latter being counterbalanced by a concealed weight, R, suspended from a rope, O, passing over a pulley, P, of said frame, and then secured to said extension L, substantially as herein described.

2. A folding or cabinet bedstead consisting of the supporting-base A B C D, to which is coupled, at *e e'* and *d d'*, respectively, the foot-section E P F' G, having swinging legs Y Y', and the head-section H I I' J, having hinged to it at *j j'* the frame K K' *k k'*, carrying a shiftable extension, L, the latter being counterbalanced by a weight, R, suspended from a rope, O, passing over a pulley, P, of said frame, and then secured to said extension L, substantially as herein described

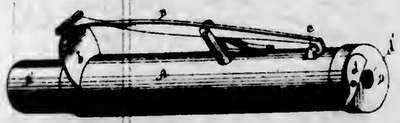
253,904. SNAP-HOOK. FRANK C. WRIGHT, New York, N. Y. Filed July 27, 1881. (No model.)



Claim.—As an article of manufacture, a snap-hook consisting of the plates A and B, pivoted together as described, plate A having one end turned over upon itself to form the wide-ended hook with the thinned and inwardly-curved edge *a'*, and having at the opposite end the wide transverse slot *b*, and plate B being actuated by spring *f*, and having the thumb-piece *e* and the upwardly-turned thin end *d*, adapted to conform to and rest upon the edge *a'* of hook *a*, all constructed and arranged to operate as specified, whereby the device is particularly adapted for use in a suspender in connection with the ring of a suspender-end, as described.

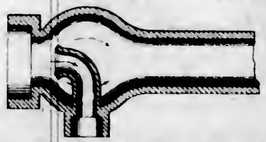
253,905. ORNAMENTING METALS. HORACE WRIGHT, Pittsburg Pa. Filed Dec. 6, 1881. (Specimens.)

Claim.—As a new article of manufacture, tops for sirup-jugs, pitchers, salt and pepper receptacles, &c., of soft metal, ornamented in colors, in contrast with the polished surface of the metal produced by turning or trimming off a portion of the metal.



253,906. WAGON-BRAKE. ROBERT E. SALLUS, Denison, Tex. Filed Apr. 4, 1881. (No model.)

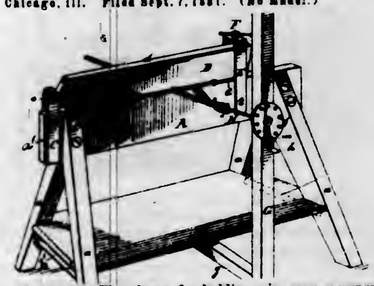
Claim.—1. The brake-beams E E', pivoted in the clamp G, in combination with the bent rods F, when constructed to operate substantially as and for the purpose set forth.



2. The brake-beams E E', pivoted to the clamp G, in combination with the bent rods F, castings I, brake-blocks H, and lever J, constructed substantially as and for the purpose described.

253,907. ANIMAL-TRAP. ALEXANDER ANDRÉ, Bakersfield, Cal. Filed May 11, 1880. (No model.)

Claim.—An animal-trap consisting of the tube A, slotted to receive the door, and open-end tube-section A', extending beyond the door, in combination with the spring-lever B, operating directly the door *b*, arranged to move at right angles to the line of tube A, the trigger *c*, and removable end D, provided with opening *d'* and shutter *d*, all constructed, arranged, and operated as set forth.

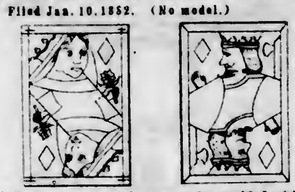


253,908. MAIN FOR CONVEYING FLUIDS. JAMES BRADY, Brooklyn, N. Y. Filed Jan. 4, 1881. (No model.)

Claim.—1. A water or fluid main constructed or provided with a branch pipe or nipple opening from the side of the main and extending into the bore thereof, with an orifice of less area than the main, and opening therein opposite the direction of the flow through the main, and in the center thereof, or thereabout, whereby the main current is at all times free to flow around the branch, while the orifice of the branch, when opened, intercepts a column equal to its area, substantially as herein set forth.

2. A fluid-main constructed with a branch pipe opening from the side of the main and extending into the bore thereof, and opening therein in a direction to face the current, with a lateral swell, bend, or enlargement in the main at or around the location of the inwardly-turned orifice of the branch, whereby the full area of the main is maintained constant along its length, or nearly so, while the orifice of the branch always opens in the middle of the current, or nearly so, and facing the same, substantially as and for the purpose herein set forth.

253,909. WIRE-ROPE-SPLICING BENCH. HENRY CHARRON, Chicago, Ill. Filed Sept. 7, 1881. (No model.)

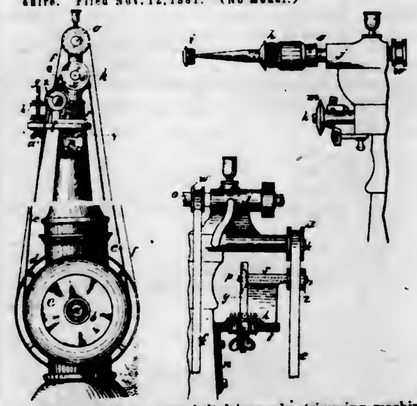


Claim.—1. The clamp for holding wire rope, composed of beam A, having stirrup C, yoke E, and screw F, and of bar D, in combination with the crank-hook H, for opening the strands of the rope, as and for the purpose of making eye-splices in the manner set forth.

2. A splicing-bench composed of beam A, with legs *a*, hinged beam D, and yoke E, with screw F, in combination with crank-hook H, all substantially as and for the purpose set forth.

3. A splicing-bench composed of beam A, with legs *a*, hinged clamp-bar D, and yoke E, with clamp-screw F, in combination with post G, having perforated plate *j*, pin *m*, and crank-hook H, all constructed and arranged substantially as and for the purpose set forth

253,910. PLAYING-CARDS. SOLOMON L. COHEN, New York, N. Y. Filed Jan. 10, 1882. (No model.)



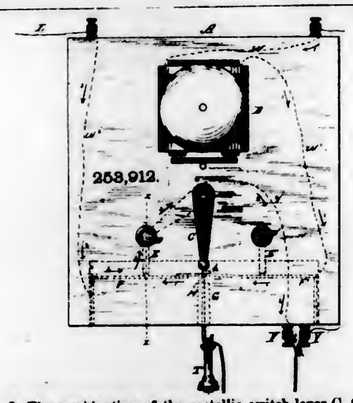
Claim.—1. A pack of playing-cards provided with indicative emblems independent of the face illustrations, the court-cards of which have additional emblems diverse to those on the rest of the pack, adapted to distinctly designate the several court-cards from the other cards when displayed, substantially as described.

2. A pack of playing-cards, the court-cards of which have lines parallel to their side edges and carried out close to said side edges, substantially as described.

3. In a pack of playing-cards, each class of court-cards provided with a designating-emblem distinct from each other, and distinct from the emblems on the cards of other character in the pack, substantially as described.

253,911. COMBINED SOLE-EDGE TRIMMER AND TRIMMING-TOOL GRINDER. SAMUEL N. CORTHELL, Quincy, Mass., assignor to the Corthell Manufacturing Company, of New Hampshire. Filed Nov. 12, 1881. (No model.)

Claim.—1. In a rotary belt-driven edge-trimming machine, a rotary cutter-grinder arranged to be brought into contact with, to be separated from, and to be actuated by, the cutter-driving belt, when so brought into contact therewith, by means substantially as specified.

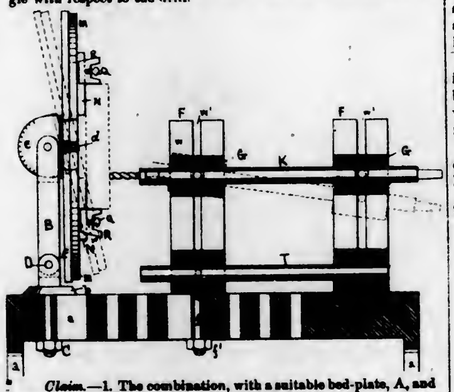


2. The combination of the adjustable standard *g*, the standard *a*, carrying the arbor *p*, with its pulley *x* and disk *i*, and adjustable relatively to the driving-belt, substantially as specified.

253,912. TELEPHONE-STATION APPARATUS. GEORGE W. COY, Milford, Conn., assignor, by mesne assignments, to the United States Telephone Manufacturing Company, New York, N. Y. Filed June 25, 1881. (No model.)

Brief.—A secrecy-switch and a telephone-switch are so combined with the circuit-wires that the telephone-switch may be left to connect the telephone with the line in either direction without interfering with the circuit through the secrecy-switch. The latter is controlled by the weight of the telephone.

Claim.—1. In a telephone-station apparatus, the combination, with the main line and a telephone branch ground-line, of a secrecy-switch and a separate telephone branch switch, the latter being capable of closing and breaking the main-line circuit independently of the former, but both co-operating to ground the main circuit through the telephone branch line, substantially as described.

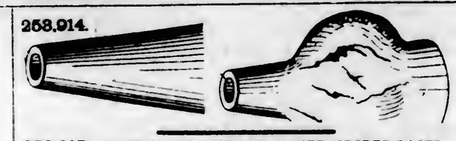


2. The secrecy-switch consisting of a pivoted metallic switch-lever and two metallic contacts, in combination with a wire leading from said lever to a telephone branch circuit, and a separate switch arranged to break the main-line circuit and connect the two parts thereof with the contact-plates of the secrecy-switch, substantially as described.

3. The combination of the metallic switch-lever C, the contact-plates D and D', the springs F and F', telephone-supporting rod H, suitable projections from the said contact-plates into the paths of said springs, and the conducting-wires, substantially as described.

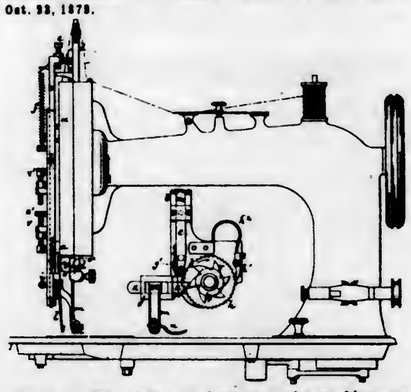
253,913. BORING-MACHINE. ELIJAH D. DAVIS, Brooklyn, N.Y. Filed Dec. 15, 1881. (No model.)

Brief.—The drill-arbor is capable of longitudinal and vertical adjustment. The article to be bored is supported by a plate pivoted to a rotary standard, and is thus capable of assuming any angle with respect to the drill.



Claim.—1. The combination, with a suitable bed-plate, A, and with an arbor, K, adapted to receive and carry a drilling-tool and to traverse longitudinally and rotate freely in adjustable bearings over said bed-plate, of a table, C, for holding the work to be drilled, supported upon a standard, B, upon the bed-plate, and adjusted to tip upon and to turn with said standard to any desired angle in front of the drill, substantially in the manner and for the purpose herein set forth.

2. The combination, with an arbor or drill-shaft, K, and with a drill-table, C, adapted to tip and to turn to any angle with the drill, of a plate, M, pivoted centrally to said table to rotate thereon, and fitted with retaining or clamping devices for holding the work thereon, substantially in the manner and for the purpose herein set forth.

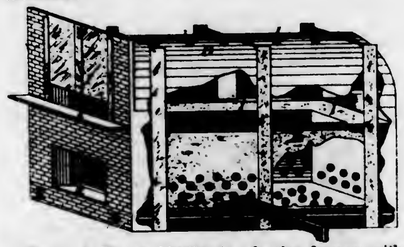


3. The combination, with the drill-table C and drill-arbor K, of the pivoted strips N N and the sliding clamps R R, traversing upon said strips, adapted for holding the work in position for the drill, substantially in the manner and for the purpose herein set forth.

253,914. TESTER FOR EXPLOSIVES. GILBERT S. DEAN, San Francisco, Cal. Filed June 24, 1881. (No model.)

Claim.—The method herein described for testing the blasting force of explosives, consisting in inclosing them in conical lead or other vessels having a predetermined resistance to a fracturing strain, tamping the charge, and exploding it, whereby the altered shape and condition of the vessel indicates and registers the force of the explosive charge, substantially as set forth.

253,915. MACHINE FOR PURLING MANUFACTURED LACES, &c. OCTAVE L. DESCHAMPS, Paris, France. Filed Apr. 8, 1881. (Model.) Patented in France Oct. 16, 1879, and in England Oct. 23, 1879.



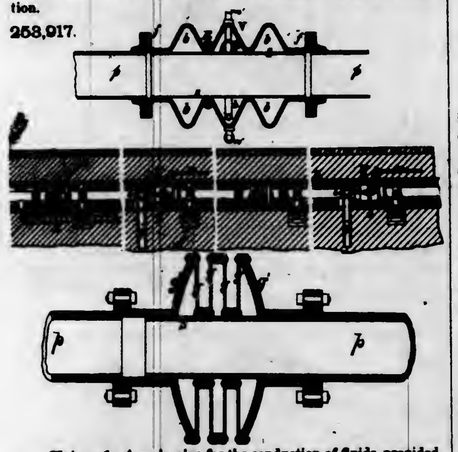
Claim.—1. The purling-attachment to sewing-machines, consisting of the combination of the slide *c*, pawl *g*, ratchet-wheel *h*, and star-wheel *r*, with the slide *k*, purling-needle *n*, and oscillating lever *l*, substantially as herein described.

2. The combination of the pivoted lever *l*, which is suspended in front of the needle and has the projection o^3, with the needle-bar *d*, having projection *p*, and with the spring o^3, all arranged to vibrate the lever at right angles to the direction in which the fabric is fed, substantially as herein shown and described.

3. The slide *c*, having projection *c'*, in combination with screws *e* and *v*, and with the needle-bar *d*, for operation substantially as herein shown and described.

253,916. REHEATING-FURNACE. JAMES F. DUFFY, South Chicago, assignor of one-half to Augustus D. Lamb and Francis W. Newland, both of Chicago, Ill. Filed June 13, 1881. (No model.)

Claim.—1. The combination in reheating-furnaces, with a perforated fire-box, having a perforated plate arranged below and between said fire-box and the tuyeres to obtain an even distribution of heat, of a surrounding ledge to receive the articles to be heated.



2. A heating-furnace consisting of the perforated fire-box, the furnace-walls, an air-chamber surrounding said fire-box, and air-inlets entering said chamber, as and for the purpose set forth.

3. A reheating-furnace consisting of the perforated fire-box the air-chamber surrounding said box, the air-inlets of a perforated plate arranged below and between said fire-box and the tuyeres, and said tuyeres, substantially as and for the purpose set forth.

253,917. APPARATUS FOR SUPPLYING CITIES WITH STEAM, &c. CHARLES E. HENRY, Brooklyn, N.Y. Filed Mar. 8, 1880. (No model.)

Brief.—The invention relates to expansion-joints for street-mains designed for steam-distributing systems, and it has for its object to dispense with slip-joints and large stuffing-boxes. The variations in the length of the main due to changes of temperature are compensated for by constructing portions of the pipe of such shape as to utilize the flexibility and elasticity of the metals, &c. The claims define the precise points comprised in the invention.

253,917.

Claim.—1. A main pipe for the conduction of fluids, provided with a series of flexible or elastic sections or variators to permit expansion and contraction, and a series of outlets to permit the distribution and delivery of the fluid.

2. In combination with a main pipe, *p*, the variators V and branch pipes *m* and *n*, substantially as and for the purposes specified.

3. In combination with a steam street-main and an exterior protecting-gallery for the same, the skeleton segments or chocks *l*, substantially as and for the purposes specified.

4. A main pipe for conveying fluids, made continuous without slip-joints or stuffing-boxes, and provided with means, substantially as described, for permitting expansion and contraction, and for supplying fluid at intervals, in combination with and adapted to the distinguishing locating features of a public highway or street.

5. In combination with the elastic variators, arranged at intervals in a steam main pipe, anchorages and attachments from the same to the main pipe at or near the outlets, substantially as described.

6. A curved outlet-pipe, *m'*, combined with the bottom of a lobe of an elastic variator, substantially as and for the purpose specified.

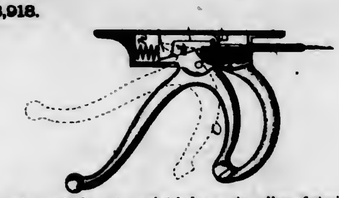
7. An outlet, *n'*, combined with the enlarged chamber of an elastic variator.

8. An annular flexible diaphragm, *l*, combined with the two sections of a pipe, substantially as and for the purpose specified.

9. The combination of the diaphragm *l*, sleeve *o*, head *n*, and chamber *q* with the pipes *p* and *p'*.

10. In combination with a main for conveying heated fluids, drains *d d*, arranged at the lower corners or angles of the trench in which each street-main is laid and below the level of the soil or other supports under each main, substantially as and for the purpose specified.

11. A continuous metallic main pipe constructed without slip-joints or stuffing-boxes, but provided with elastic sections or variators at intervals to permit expansion and contraction, and outlets to service-pipes and laterals at intervals, in combination with apparatus for the supply of steam or other fluid adapted to furnish heat and power.



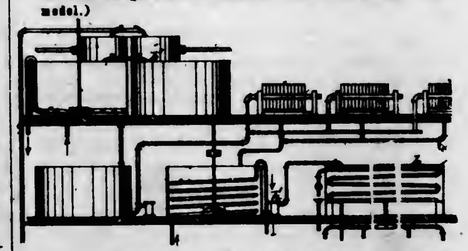
12. In combination with a main pipe for conveying heated fluids and a lateral connected therewith, one or more variators in the lateral to make the same flexible and permit free expansion of the main without injuring the lateral.

13. The separate lengths of pipe, rigid disks or flanges, and elastic disks, in combination with each other and with the smooth pipe extended through the space within the disks.

253,918. WARDROBE-HOOK. WILLIAM G. PECTER, Chicago, Ill., assignor of one-half to Leverett E. Pitts, same place. Filed Dec. 16, 1881. (No model.)

Claim.—1. In a wardrobe-hook, the combination, with the pivoted jaw or loop, of one or more locking-wedges continuously bearing against said jaw at a point below or in a line of strain outside of their pivot, substantially as described.

253,918.

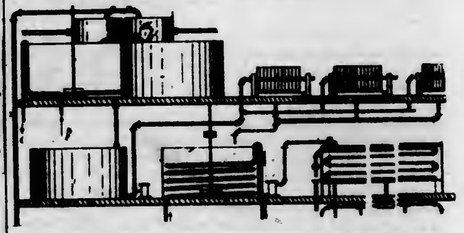


2. The combination, with a wardrobe-hook, of a pivoted jaw and one or more locking-wedges having a curved edge engaging with said jaw, substantially as described.

3. The combination, with the swinging jaw of the locking wedge or wedges having the curved projection, of an expansion-spring automatically operating said wedge or wedges, substantially as described.

4. The swinging jaw having the beveled extension, in combination with the locking-wedge having the curved projection, substantially as described.

253,919. PROCESS OF MANUFACTURING CORN-SIRUP. ADOLPH GIESECKE and HARRY HAMLIN, Buffalo, N.Y.; said Giesecke assignor to said Hamlin. Filed Jan. 5, 1882. (No model.)



Claim.—1. The process, substantially as before set forth, of manufacturing the compound of glucose and cane-sirup, consisting of the mixture of the two sirups and the subjection of the mixture to heat and agitation.

2. The process, substantially as before set forth, of manufacturing the compound of glucose and cane-sirup, consisting of the mixture of the two sirups, the subjection of the mixture to heat and agitation, and the subsequent filtration of the mixture.

3. The process, substantially as before set forth, of manufacturing the compound of glucose and cane-sirup of the required color, consisting of the mixture of the two sirups, the subjection of the mixture to heat and agitation, the subsequent filtration of the mixture, and the adjustment of the color subsequent to filtration.

4. The process, substantially as before set forth, of manufacturing the compound of glucose and cane-sirup in a condition ready for barreling it, consisting of the mixture of the two sirups, the subjection of the mixture to heat and agitation, the subsequent filtration of the mixture, and the rapid cooling of the filtered product.

253,920. COMPOSITE CORN-SIRUP. ADOLPH GIESECKE and HARRY HAMLIN, Buffalo, N.Y.; said Giesecke assignor to said Hamlin. Filed Jan. 5, 1882. (No model.)

Claim.—As a new article of manufacture, the composite corn-sirup hereinbefore set forth.

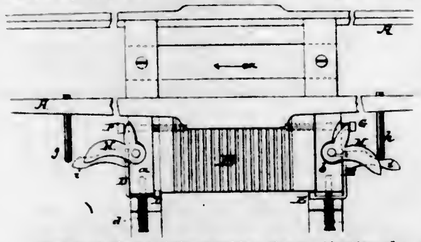
253,921. CHAIR. JOSEPH GREEN, Whitewater, Wis., assignor

253,924.

253,925.

253,928.

253,921. CHAIR. JOSEPH GREEN, Whitewater, Wis., assignor to James Oscar Green, same place. Filed Oct. 15, 1881. (No model.)



Claim.—1. In seats having back and bottom formed of spiral-wire fabric, the device herein described for attaching said fabric to the frame, consisting in the combination of grooved bars G and E, rod F, as interposed between said bars within the circular recess formed by said grooves, fabric D, having the ends of the respective wires forming said fabric wound around said rod upon both its upper and lower surfaces, and retaining screws or rivets *a a*, all substantially as set forth.

2. The improved chair herein described, consisting in the combination of sides M M, formed of two separate pieces, I and J, said sides being curved to form the front legs and side frames to the seat and back cross-pieces O, rear legs, P, and spiral-wire fabric H, said fabric being secured around a retaining-rod within a groove between said pieces, all substantially as and for the purpose specified.

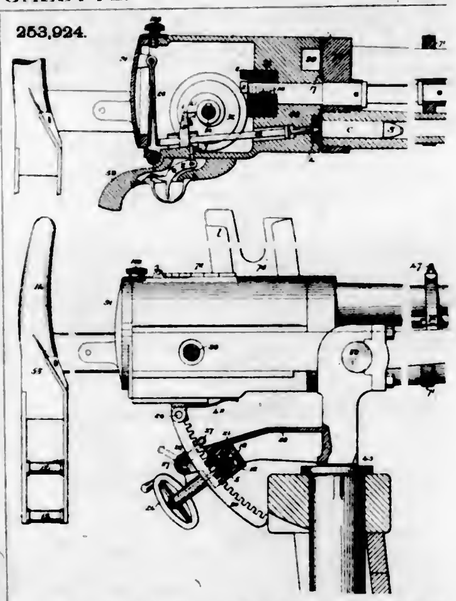
253,922. KNITTING-MACHINE. HUGO GÜNTHER, Chemnitz, Saxony, Germany, assignor of one-half to Matthäe Herfurth, same place. Filed Nov. 30, 1880. (No model.)

Brief.—The devices specified in the claims operate to adjust the needle-plate horizontally and hold it in its adjusted position.

Claim.—1. In a knitting-machine, the combination of a reciprocating carriage, A, having projecting pins *g* and *h*, with the needle-plate B, devices for moving the same, and with two locking-catches, all arranged so that the needle-plate will always be locked by one of the catches, as set forth, and in position to be moved by one of the projecting pins of the carriage, substantially as specified.

2. The combination of the carriage A, having pins *g* and *h*, with needle-plate B, having pins F and G, and with the levers H and spring-catches D and E, all arranged to operate substantially as described.

253,923. ART OF MANUFACTURING STARCH. HARRY HAMLIN, Buffalo, N. Y. Filed Jan. 5, 1882. (No specimens.)



Claim.—1. The process, substantially as before set forth, of separating starch from starch-water, consisting of the separation of a portion of the starch directly from the starch-water by subsidence, the treatment of the residuary starch matter with caustic alkali, and the separation of the remaining portion of starch by subsidence.

2. The process of subjecting starch matter to the action of alkali, consisting in conducting the settlings from several settling-tanks into one mixing-tank, in which the alkali is applied, and in which the collected settlings may be simultaneously reduced to the desired consistency.

253,924. MACHINE-GUN. BENJAMIN B. HOTCHKISS, New York, N. Y. Filed Mar. 3, 1881. (Model.) Patented in France July 9, 1878, in Germany Oct. 26, 1879, and in England Nov. 15, 1879.

Brief.—A trigger serves to stop the loading mechanism at a point just short of firing position. A pull of the trigger completes the movement and fires the gun, or the trigger may be thrown out of connection and the gun operated entirely by the crank. The elevating-gear may serve as an auxiliary to the shoulder-piece in training the gun or may be thrown out of gear and the gun manipulated entirely by means of the shoulder-piece.

253,924.

Claim.—1. A shoulder-piece for attachment to guns, to aid in training the same, consisting of an upper arm having a shoulder and breast bearing and a lower arm provided with one or more handles, substantially as described.

2. The combination, with a cannon or similar gun provided with a shoulder-piece for training it, of a segment-rack attached to the rear part of the gun, and a worm, and means for rotating it, the latter being carried by an arm fixed on a support which participates in the horizontal movement of the gun, but is not affected by its vertical movement, all substantially as described.

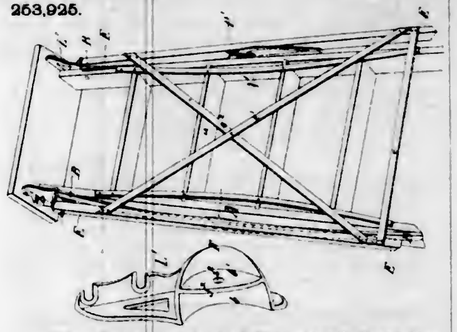
3. The combination, with a cannon or similar gun, its carriage, and shoulder-piece, of a segment-rack, as 20, a worm-wheel, as 21, worm-wheel 6, and a worm, 18, carried by an operating-shaft, 19, extending rearward under the breech, substantially as described.

4. The combination, with a cannon or similar gun and its carriage, of an elevating and depressing mechanism consisting of a segment-rack depending from the breech, a worm or similar driving wheel co-operating with said rack, and means, substantially as described, for engaging and disengaging said rack and driving-wheel.

5. The combination, with a cannon or similar gun and its carriage, of a swinging segment-rack, a driving-wheel, as 21, means for rotating the same, and a cam, as 29, operating to hold said rack and wheel engaged, or to admit of their disengagement, substantially as described.

6. The combination, with the operating mechanism in a machine-gun, of an independent trigger, arranged, substantially as described, to arrest the movement of the operating mechanism and control the firing action.

7. The combination, with a cannon mounted upon trunnions, of a shoulder-piece and a mechanical elevating mechanism constructed to be thrown into and out of operation, all substantially as described.



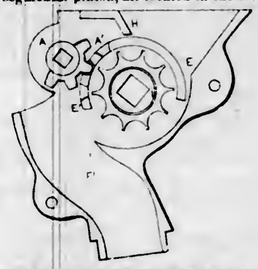
8. The combination, with a revolving cannon or other system of machine-gun, of a trigger arranged and operating substantially as shown and described, whereby the discharging movement of the firing-pin is controlled, independently of the cocking action thereof, through the ordinary movements of the gun mechanism.

9. The trigger operating to arrest and liberate the firing-pin, in combination with the projection 1 on the firing-pin, arm 9, and the stop 11 on the face of the worm-stock, whereby the continuance of the revolution of the shaft 33 is prevented when the gun is cocked, substantially as described.

253,925. STEP-LADDER. GEO. KIRK, Frederick, Md. Filed Nov. 2, 1881. (No model.)

Brief.—The bracket is partitioned so that one socket receives the end of the swinging brace and the other the end of the fixed brace.

253,925.



Claim.—1. A bracket for stop-ladders, cast entire in one piece, with bearing-plates *f* and *f'* and a cap or shoulder bearing, F, provided with a partition-plate, *f*^{3}, substantially as and for the purpose described.

2. Swinging braces E and braces B, in combination with brackets L L', provided with separate sockets, *b b'*, to receive the upper ends of said braces, substantially as and for the purpose described.

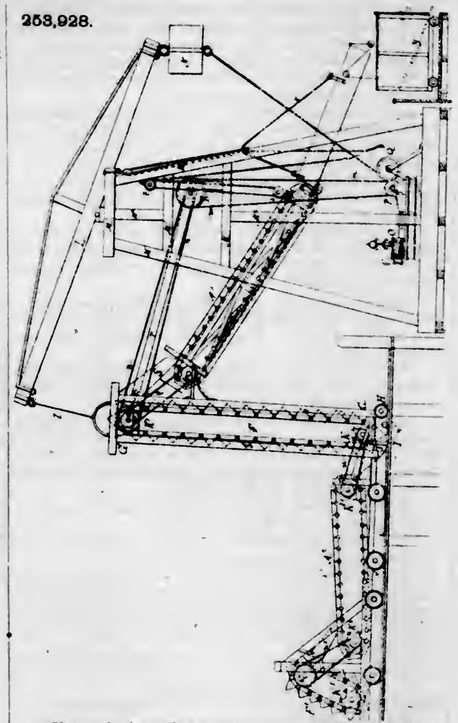
253,926. SEED-CUP FOR GRAIN-DRILLS. JACOB KING, Indianapolis, Ind. Filed July 8, 1881. (Model.)

Brief.—Cylindrical cut-off for graduating the flow of seed, operated by segmental pinion, all located in the seed-cup.

Claim.—1. In a seed-cup for grain-drills, the segmental pinion A', constructed and arranged to gear into the teeth E' of the cylindrical slide E E', substantially as and for the purpose set forth.

2. In a seed-cup for grain-drills, the combination and arrangement of the segmental pinion A', the teeth E', and the cylindrical slide E E', substantially as and for the purpose set forth.

253,927. TENSION-BRACE. AARON LAWSON, Gilroy, Cal. Filed Sept. 8, 1881. (No model.)



Claim.—1. A tension-brace consisting of a wire or other flexible rod bent or twisted at its center to form the double loop B or equivalent locking-loop, and having its ends *a a* formed into or provided with screws, one of which is a right-hand and the other a left-hand screw, substantially as and for the purpose herein described.

2. A tension-brace consisting of a wire or other flexible rod having its ends *a a* in line, and provided with right and left hand screws, and its center so bent that the ends may be allowed considerable end play for the purpose of inserting them, said center being so crossed that when drawn up its sides will lock, so that the whole will form a rigid rod, substantially as and for the purpose herein described.

253,928. DEVICE FOR HANDLING COAL, ORES, &c. ALFRED LAWTON, Elizabeth, N. J. Filed Jan. 12, 1881. (No model.)

253,928.

Claim.—1. An endless conveyer composed of a series of pans hinged together (by links and rods) in such manner that their sides and ends overlap each other, and that they can be readily disconnected for the purpose of lengthening or shortening the conveyer, substantially as set forth.

2. The combination of an endless conveyer provided with a series of pans hinged by rods and link-eyes, substantially as described, and revolving spiders, the conveyer being driven by the arms of the spiders engaging with the link-eyes, substantially as and for the purpose set forth.

3. The combination, in an endless conveyer provided with a series of hinged pans and driven by revolving spiders, of a series of wheels attached to rods beneath the pans, and an adjustable lower track, substantially as and for the purpose set forth.

4. An upper track provided with angle-iron as guides for the wheels of an endless conveyer, substantially as and for the purpose set forth.

5. An endless conveyer constructed and arranged to be shortened or lengthened at pleasure, substantially as set forth, in combination with a suitable supporting-frame constructed and arranged to be adjusted so as to conform to the varying lengths of the conveyer, substantially as set forth.

6. The combination of an endless conveyer constructed to be lengthened and shortened at pleasure, substantially as set forth, and an endless elevator, the conveyer being located to deliver material to or remove it from the elevator, substantially as described.

7. The combination of an endless elevator and an endless conveyer, each provided with a separate series of buckets or pans, the construction and arrangement being such that the conveyer is driven by power taken from a spider-shaft or equivalent revolving device of the elevator and transmitted to the conveyer, substantially as and for the purpose set forth.

8. In combination with a boat or barge, and suspended from a frame permanently secured thereto, an endless elevator and endless conveyer, each provided with a separate series of hinged buckets or pans, the conveyer being driven by power transmitted to it from the elevator, substantially as and for the purpose set forth.

9. A vertically-adjustable endless elevator mounted upon a turn-table, in combination with an endless conveyer, substantially as and for the purpose set forth.

10. A laterally-adjustable endless elevator provided with wheels upon its foot, substantially as and for the purpose set forth.

11. In combination with an endless elevator and endless conveyer, a chute having its receiving end located below the top of the elevator and its delivering end over the receiving end of the conveyer, so that the contents of the inverted buckets of the elevator is received upon and transferred by the chute to the pans of the conveyer, substantially as described.

12. In combination with an endless elevator and endless conveyer, an adjustable chute, S', connected with the delivery end of the conveyer and suspended from the frame of the barge or boat, substantially as and for the purpose described.

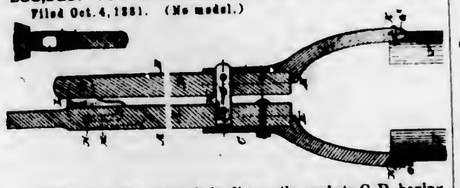
13. An endless conveyer, in combination with scales for weighing, located at the delivery end of the conveyer, substantially as set forth.

14. The combination of a shoveler and endless conveyer to deliver the material to a main elevator, and a main elevator laterally adjustable in the direction of the shoveler, substantially as and for the purpose set forth.

15. The combination of a shoveler, an endless conveyer located between the shoveler and main elevator, a main elevator and a conveyer to remove the material from the main elevator, substantially as set forth.

16. The combination of the receiver J with an endless conveyer and the foot of an endless elevator, substantially as and for the purpose set forth.

17. In combination with a wheeled platform, a vertically-adjustable elevator and a vertically-adjustable conveyer, each provided with an endless series of buckets or pans, and so arranged that the conveyer is driven by power transmitted from the elevator, substantially as and for the purpose set forth.

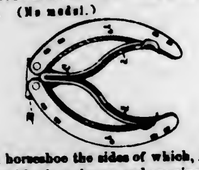


18. The combination of the sword-plates 15 with the conveyer-frame for adjusting the chute 15', as set forth.

19. A chute, 16, provided with a hinged door, 18, for varying the delivery length of the chute, as set forth.

20. The combination of main and cross conveyers, each provided with a separate series of hinged pans, the arrangement and connection being such that the cross-conveyers are driven by power transmitted from the main conveyer, substantially as and for the purpose described.

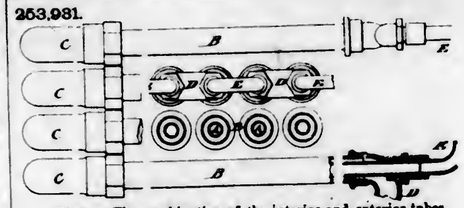
21. The combination of the wheels 30, 29, 27, and 28, as described and shown.



253,929. POST-HOLE DIGGER. JOHN LEA, Mansfield, Ohio. Filed Oct. 4, 1881. (No model.)

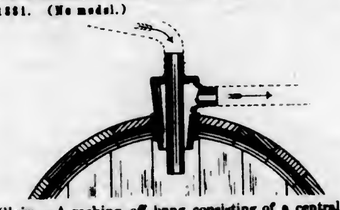
Claim.—1. In a post-hole digger, the sockets C D, having shoulders E E, and provided respectively with a laterally-projecting arm, G, and a slot, H, in combination with the handle A and lever B, arranged and operating as herein described, for the purpose set forth.

2. In a post-hole digger, the combination of the handle A, secured to socket C, having laterally-projecting arm G, the handle B, pivoted to said arm, and the cam-lever L, pivoted to handle B, and having an angular slot, M, working upon a stud, N, of handle A, substantially as and for the purpose set forth.



253,930. HORSESHOE. WM. LARUE, Oroville, Cal. Filed Sept. 8, 1881. (No model.)

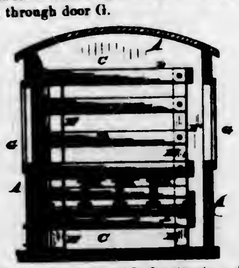
Claim.—A horseshoe the sides of which, A A, have the nail-holes at the toe and heel, as shown, and are pivoted at their forward ends to a toe-plate, B, in combination with the spring C, the base of which rests upon the toe-plate, and its diverging arms a a press against the inner rear edges of the sides A A, substantially as and for the purpose herein described.



253,931. APPARATUS FOR SUPERHEATING STEAM. RICHARD LEHMANN, Dresden, Saxony, Germany. Filed Nov. 14, 1881. (No model.) Patented in Germany Sept. 4, 1880, in Austria Oct. 8, 1880, and in Hungary Oct. 6, 1880.

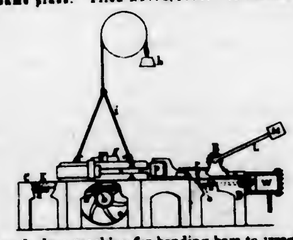
253,931.

Claim.—The combination of the interior and exterior tubes, A and B, closed end portions, C, attached to tubes B and extending into the furnace, couplings D, connecting the tubes B, and couplings E, connecting the tubes A, the latter being arranged outside of the furnace, substantially as specified.



253,932. RACKING-BUNG. JOHN S. LIPPS, deceased, (Algernon S. Sullivan, Administrator,) New York, N. Y. Filed June 3, 1881. (No model.)

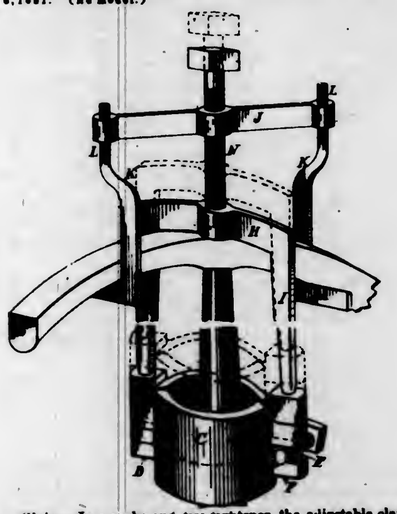
Claim.—A racking-off bung consisting of a central supply-tube connected with a rubber tube and surrounded by a conically-tapering exterior tube, which latter is connected to the central tube below its upper end, and closed at the top, but open at the bottom, and of a lateral discharge-tube connected to the exterior tube, substantially as described.



253,933. REFRIGERATOR-CAR. HIRAM MCCRAY, Kendallville, Ind., assignor to himself, Elmer McCray, same place, and John Reynolds, Union City, Ind. Filed Dec. 1, 1881. (No model.)

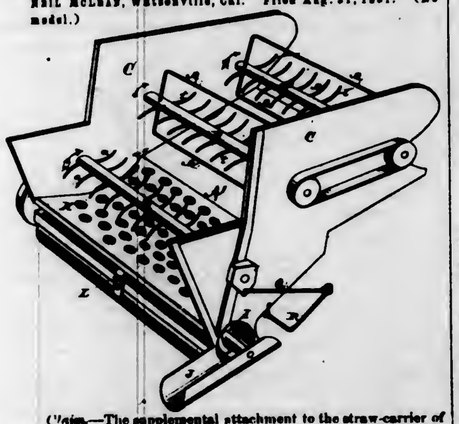
Brief.—Sets ice-bunker in the end of car and fills from outside as required through door G.

Claim.—The combination, with the structure A, having partitions B, with spaces or air-passages C at the top and bottom, and doors G, of the ice-boxes D, arranged as herein described, and having open ends F, substantially as set forth.



253,934. BENDING-MACHINE. JOHN MCDOWELL, Chicago, Ill., assignor to the Union Foundry and Pullman Car Wheel Works, same place. Filed Nov. 4, 1881. (No model.)

Claim.—1. In a machine for bending bars to irregular form, a table having an opening in its top, a revolving bed loosely seated in said opening, with pattern-dies of irregular form attached to said bed and rotating therewith, substantially as shown, in combination with an anti-friction roller which, by a yielding pressure against the bar, shall shape it to the form of the pattern, substantially as and for the purpose set forth.

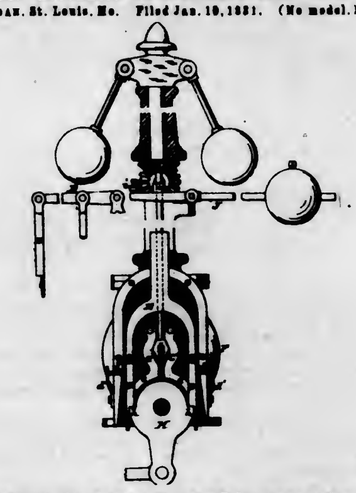


2. In a bending-machine, the dies A B, constructed in parts, the part A constructed with an offset or smaller sectional part, c, whereby a recess or groove is formed, the sectional part c forming the bottom of the recess or groove, as shown, and with post f and key g, substantially as and for the purpose set forth.

253,935. TIRE-TIGHTENER. JOHN T. MCELHANEY, Atlanta, Ga., assignor to William R. Christian, Milan, Tenn. Filed Oct. 6, 1881. (No model.)

Claim.—In a spoke and tire tightener, the adjustable clamp C C', in the upper side of which are loosely socketed the legs I I, projecting downward from the frame H over the felly, in combination with the threaded bolt N, passing centrally through a cross-bar, J, and socketed in the cross-frame H, and carrying at each end a screw-threaded arm, K, having at the lower end a hook, M, to be placed under the felly, substantially as and for the purpose herein set forth.

253,936. GRAIN-SAVING ATTACHMENT FOR SEPARATORS. NEIL MCLEAN, Watsonville, Cal. Filed Aug. 31, 1881. (No model.)

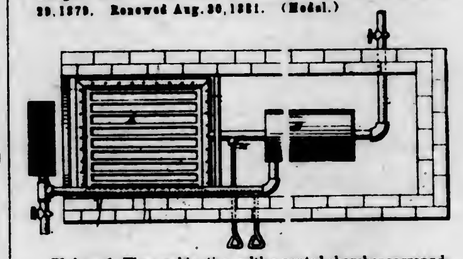


Claim.—The supplemental attachment to the straw-carrier of a grain-separator, consisting of the spout formed by side boards, C C, having the inclined floor A', and revolving shafts B B', provided with fingers *t t*, and reels A A, the screw-conveyer I, spout J, perforated screen K, and revolving shaft M, provided with fingers *a a*, all constructed, arranged, and operated as set forth.

253,937. BATH FOR TREATING METALS. JOHN MESSENGER, Etna, Pa. Filed Dec. 22, 1881. (No specimens.)

Claim.—A bath for treating cast-iron or malleable cast-iron, composed of Jamestown weed, apples, turnips, and water, substantially in the proportions and for the purposes specified.

253,938. AUTOMATIC CUT-OFF-VALVE GEAR. JOHN W. MENDAM, St. Louis, Mo. Filed Jan. 10, 1881. (No model.)



Claim.—1. In an automatic cut-off for steam-engines, the governor-stem a, provided with a wedge-block, B, in combination with the adjusting-links C and adjustable links D, connected to the valve or valves of an engine and operated by a rock-arm, H, substantially as described, and for the purpose set forth.

2. The combination of the plug-valve *f*', constructed and arranged, as shown, with the governor-valve F, having seats *f f*', all as herein described, and for the purpose set forth.

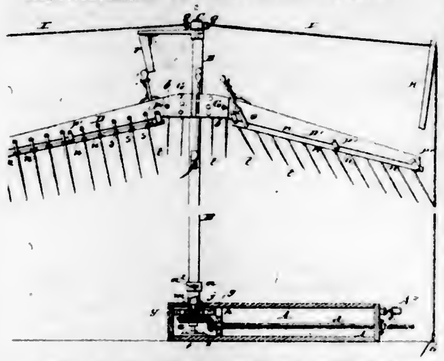
3. The bracket I, pivoted to the governor-frame and provided with a bearing-bar, *i*, in combination with the counterbalance rod and weight, as described, and for the purpose set forth.

253,939. FURNACE. NATHAN L. NEWCOMB, Cleveland, Ohio, assignor to himself and John Pollock, same place. Filed Aug. 29, 1879. Renewed Aug. 30, 1881. (Model.)

Claim.—1. The combination, with a vented chamber surrounding the fire-space, a rear heater, and a pipe connecting said chamber and heater, of a forward heater communicating with the exit-flue, and a pipe connecting said rear and forward heaters, substantially as set forth.

2. The combination, with a vented chamber surrounding the fire-space, a rear heater, and a pipe provided with a valve which controls communication between said heater and chamber, of a forward heater connecting with the exit-flue, and a pipe provided with a valve which controls communication between said two heaters, substantially as set forth.

3. The combination, with a vented chamber surrounding the fire-space, a rear heater, and a pipe having a valve which controls communication between said heater and chamber, of a forward heater connecting with the exit-flue, a pipe having a valve which controls communication between the two said heaters, and a pipe provided with a valve which controls communication of said forward heater direct with the open air, substantially as set forth.



253,940. STACKER FOR HAY AND STRAW. NATHAN NEW-

circuit, of the movable contact-plates *b'* and *b''*, connected with the main-line wires, contact-strip *b''*, connected with the short circuit

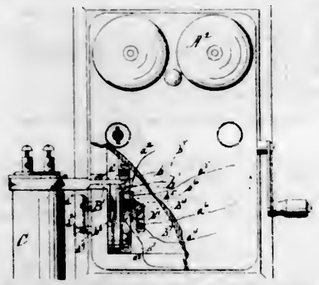
253,945.

253,948.

253,940. STACKER FOR HAY AND STRAW. NATHAN NEWSOM, Columbus, Ind. Filed Aug. 29, 1881. (No model.)

Claim.—1. In a stacking-machine, the combination, with a gear-box provided with suitable gear, of a stacking-shaft actuated by said gear, substantially as and for the purpose set forth.

2. In a stacking-machine, the combination of the stacking-shaft, a rake-head vertically adjustable on the shaft and having four openings equidistant from each other, and rake-arms adjustably secured to the rake-head, substantially as and for the purpose set forth.



3. In a stacking-machine, the combination of a shaft, B, a rake-head, the rake-arms adjustably secured to said head and provided with teeth, and an adjustable bar provided with teeth-guides, substantially as and for the purpose set forth.

4. In a stacking-machine, the combination, with actuating mechanism for operating the vertical stacking-shaft B, of the inclined or wedge-shaped box A, inclosing said mechanism, and provided with a hook, A^1, for withdrawing the box from under the stack when completed, substantially as set forth.

5. In a stacking-machine, the combination, with the stacking-shaft B and socket *m*, of the shaft *j*, toe-rest *f*, and bevel-gear *k c*, substantially as set forth.

253,941. AUTOMATIC SWITCH FOR TELEPHONES. JOHN B. ODELL, Chicago, Ill. Filed Aug. 8, 1881. (No model.)

Brief.—The telephone-support consists of a pair of yoke-shaped jaws, one of which is pivoted and provided with an arm which controls spring-contacts whereby the circuit is closed through the bell when the telephone is in the support and through the telephone and microphone when the telephone is taken from its support. A switch which serves to connect the line on either side of the station through the telephone to ground is automatically operated to cut the ground-line by the restoration of the telephone to its support.

Claim.—1. The combination, with the spring switch-bar provided with two insulated contact-plates, of two movable contact-plates and contact-strip b^{11}, arranged and adapted, substantially as described, so that when said switch-bar is moved to make connection between said insulated and said movable contact-plates the connection between said movable contact-plates will be broken and connection made between one of said movable contact-plates and contact-strip b^{11}, substantially as specified.

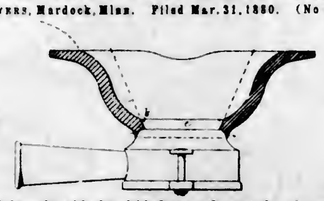
2. The combination, with spring switch-bar provided with insulated contact-plates b^1 and b^2, connected with the local telephonic circuit, of the movable contact-plates b^3 and b^4, connected with the main-line wires, contact-strip b^{11}, connected with the short circuit for shunting the ringer, and a pair of pivoted yoke-shaped jaws for holding the telephone, one of said jaws being provided with an arm for operating the switch-bar, substantially as specified.

3. The means of cutting out either of the line-wires for the purpose of holding secret communication over the other line-wire, consisting in the combination of pivoted contact-maker *d*, spring-strips b^9 b^{10}, connected with the line-wires, crank d^6, and stops d^7 d^8, connected with the ground, whereby, when either of said spring-strips b^9 or b^{10} are in connection with the telephone, the other line-wire may be grounded by turning said crank to the right or left until it comes in contact with the stop d^7 or d^8, and whereby, when the telephone is not in such connection, the contact between said crank and the stop d^7 or d^8 is automatically broken and both lines put in communication with the ringer, substantially as set forth.

253,942. POCKET COAT-HOOK. ROBERT ODDERDORN, New York, N. Y. Filed Dec. 31, 1881. (No model.)

Claim.—The combination, with a main outer slotted hook, of an inner hook or bolt pivoted thereto to close and fold completely therein and be guarded thereby, substantially in the manner and for the purpose herein set forth.

253,943. HOD-ELEVATOR. JESSE POWERS, Chicago, Ill., assignor to John H. Edelmeyer and William C. Morgan, both of New York, N. Y. Filed Jan. 11, 1882. (No model.)

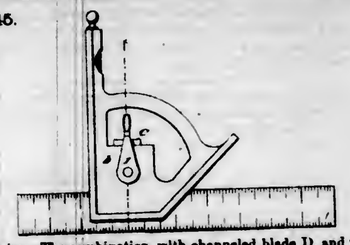


Claim.—1. In a hod-elevator apparatus, the combination, with links of the chain A, of the brackets B, arranged in pairs upon the links, and carrying the hooks *b'*, whereby a hod provided with the studs *c* projecting from the sides of the hod-bowl will engage said hooks, as and for the purpose specified.

2. In a hod-elevator apparatus, the hod C, having the laterally-projecting studs *c* upon the exterior of the sides of the hod-bowl, whereby the hod may be hung upon brackets B on the elevating-chain, as and for the purpose specified.

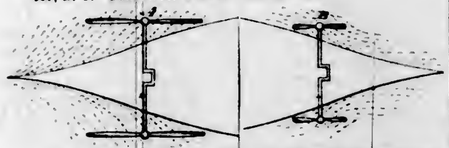
3. In a hod-elevator apparatus, the hod C, in combination with the saddle D, composed of the seat *d*, and the upwardly and outwardly extending arms d', carrying the studs *c*, whereby the hod may be hung upon brackets B on the elevating-chain, as and for the purpose specified.

253,944. FIRE-POT FOR BLACKSMITHS' FORGES. JOHN POWERS, Mardock, Minn. Filed Mar. 31, 1880. (No model.)



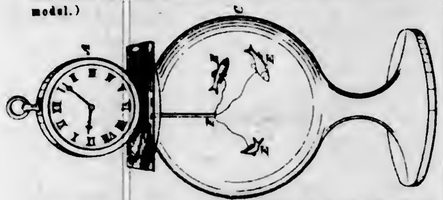
Claim.—In a blacksmith's forge, a fire-pot therefor made separate from the tuyere, and constructed with a central opening, *c*, having a wall, *b*, directing the blast, as described, a concave wall, *d*, to the pot, diverging from the top of the wall of central opening, *c*, and a recess, *e*, about and below the opening *c*, so as to adapt the pot to be snugly fitted to the tuyere, all substantially as and for the purpose set forth.

253,945. CLAMP FOR TRY-SQUARE BLADES. FRANCIS H. RICHARDS, Springfield, Mass., assignor to Elwin R. Hyde and Clarence L. Hyde, same place. Filed June 23, 1881. (No model.)



253,945.

Claim.—The combination, with channeled blade D, and with a stock provided with a recess to receive the blade, and with a socket, V, having the incline *d'* to seat the clamp-jaw and direct its movement by means of said incline, of jaw C, adapted to bear simultaneously upon the blade and incline, and combined with the screw H and lever I, or similar draw mechanism to cause it to follow upon the incline to clamp the blade to the stock upon two of its surfaces, substantially as shown and described.

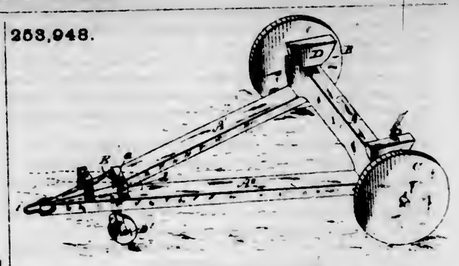


253,946. PROPULSION OF SHIPS. JOHN B. ROOT, Port Chester, N. Y. Filed Dec. 6, 1881. (No model.)

Claim.—1. In a vessel, a screw or other equivalent device arranged to move the water transversely to the line of movement of the vessel, in combination with an inclined propelling-surface of the hull for receiving the increase or decrease of pressure produced by the transverse movement of the water, such surface being inclined to or at an angle with the fore-and-aft line or line of movement of the vessel, whereby the vessel will be propelled in one direction by throwing the water transversely against such inclined surface, and will be propelled in the opposite direction by drawing the water away from such inclined surface, substantially as described.

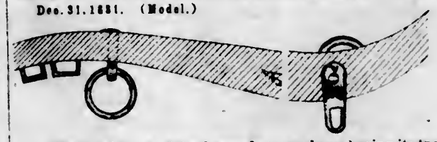
2. In a screw-propeller, a screw or screws working upon a shaft or axis placed at substantially right angles to the line of movement of the vessel and constructed to move the water transversely to such line of movement, in combination with an inclined propelling-surface of the hull for receiving the increase or decrease of pressure produced by the transverse movement of the water, such surface being inclined to or at an angle with the fore-and-aft line or the line of movement of the vessel, whereby the vessel will be propelled in one direction by throwing the water transversely against such inclined surface and in the opposite direction by drawing the water away from such inclined surface, substantially as described.

253,947. ORNAMENTAL ATTACHMENT FOR CLOCKS. AARON C. SANFORD, Winsted, assignor to Frank S. Grant, Augusta, and Frank Sackett, Winsted, Conn. Filed July 21, 1881. (No model.)



Claim.—1. The combination, with a clock, A, of the globe C, containing suspended imitation fish E, substantially as described.

2. The combination of the clock A, the globe C, the fish E, and the suspending device F, connected with the clock mechanism, substantially as described.



253,948. TRUCK. TOLLIE J. SCARFF, New Carlisle, Ohio. Filed Dec. 12, 1881. (No model.)

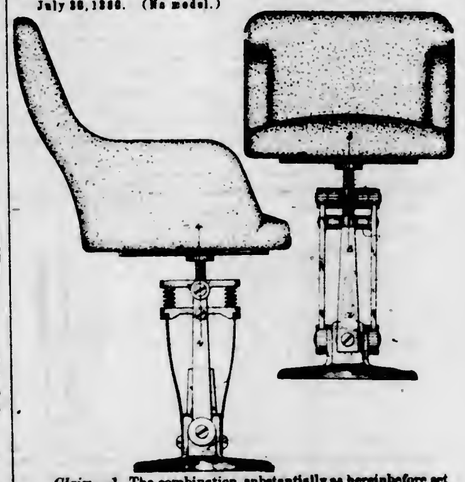
Claim.—The truck herein described, consisting of beams A A' A^2, wheels B C, bolsters D D, guide-wheel D', and staples *b c*, substantially as and for the purpose set forth.

253,948.

253,949. HAME. BENJAMIN S. SEAMAN, Corning, N. Y. Filed Dec. 31, 1881. (Model.)

Claim.—As an article of manufacture, a hame having its tug-loop secured thereto by the breast-ring eyebolt, which is passed through the hame, the diagonally-apertured branch b', and the apertured branch b^2 of said loop, and headed or riveted against said branch b^2, whereby the loop is firmly drawn and held against the hame in the finished article, substantially as shown and described.

253,950. MECHANISM FOR ROLLING FINGER-RINGS. CHAS. R. SMITH, Providence, R. I. Filed Oct. 29, 1881. (No model.)



Claim.—1. The combination, with the adjustable arbor a' and roll C, of the interchangeable spools *a*, substantially as shown and described.

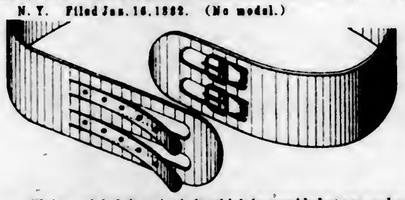
2. The combination of the holder B, having the collared arbor a', adjustably connected thereto, with the spool *a* and roll C, substantially as shown and described.

3. In a machine for embossing, engraving, and finishing rings, a metallic spool loosely fitted to a rigidly-supported arbor and adapted to guide the rings when in contact with the figured roll, substantially as shown and described.

253,951. CAR-SEAT. ELI T. STARR, Philadelphia, Pa. Filed July 28, 1880. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, of a base, a rocking or yielding support connected with said base, a chair body or seat carried by said rocking support, and an

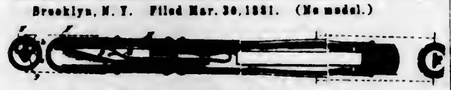
Claim.—1. The combination of a polarized receiver, an induc-



7. The combination, with an electric lamp, of two divided in-

independent rocking connection between said rocking support and said chair body or seat.

2. The combination, substantially as hereinbefore set forth, of a base, a rocking or yielding support connected with said base, a chair body or seat carried by said rocking support, and a rocking and turning connection between said support and said chair body or seat.



3. The combination, substantially as hereinbefore set forth, of a base, a rocking or yielding support connected with said base, the chair body or seat carried by said rocking support, and the rocking, turning, and elevating and lowering connection between said support and said chair body or seat.

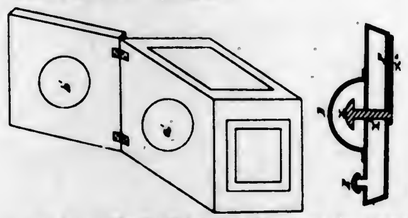
253,952. WAIST-BELT. FRIEDMAN STERNBERGER, New York, N. Y. Filed Jan. 16, 1882. (No model.)

Claim.—A lady's waist-belt which is provided at one end with tongues cut from the body of the belt and at the other end with tongues cut similarly from the body of the belt, the last tongues being folded back and adapted to carry the buckles, substantially as and for the purpose set forth.

253,953. FOUNTAIN PEN-HOLDER. WILLIAM W. STEWART, Brooklyn, N. Y. Filed Mar. 30, 1881. (No model.)

Claim.—1. A holder with its interior made of vulcanite or other material, and provided, substantially as described, with capillary and glazed surfaces, whereby the capillary surfaces will cooperate with the gravity of the fluid, and the glazed surface will facilitate the movement of the entering bubbles of air.

2. A holder portions of the interior surface whereof are made dissimilar—viz., roughened and glazed—and so arranged that capillary attraction of the one and the non-capillary action of the other will be graduated with relation to each other for the purpose of regulating the flow.

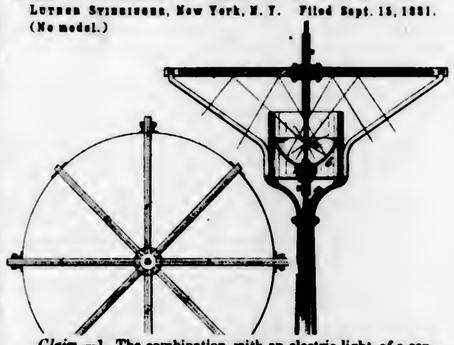


3. A permeable strand or cord arranged to be moved by the pen as a pipe to draw off the ink from the reservoir, combined with said pen and a trough or bath under the same.

4. A fountain pen-holder provided with an ink tube or gutter, *g*, and a pen, F, combined with a permeable elastic strand, *b*, at its end, secured to the point of the ink-gutter *g*, and maintained in contact with the pen by a pin, *e*, substantially as set forth.

5. In combination with a fountain-holder provided with interior smooth or glazed surfaces, a permeable fibrous covering for a part of said glazed surface, substantially as set forth.

6. A permeable strand or cord to act as a pipe to draw off the ink from the reservoir, combined with an elastic part in contact with the pen, whereby the motion of the pen will impart motion to said strand, as set forth.



253,954. COMMODE. HENRY P. STICHTER, Pottsville, Pa. Filed Mar. 1, 1881. (No model.)

Claim.—1. In the disinfecting lid or cover for commodes herein described and constructed as shown, the combination of the receptacle fog holding a disinfecting-powder, having a partly perforated bottom at F, the perforations being covered by a sliding cover, X', which is operated by means of a stem, X', and knob X, the handle D, and screw-cap E, all substantially as set forth.

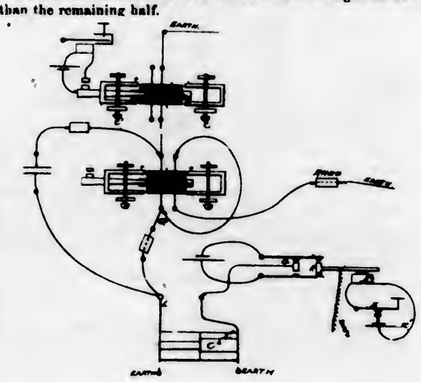
2. In the commode herein shown and described, the disinfecting lid or cover, in combination with the commode-case having a cover provided with the opening *b'*, adapted to receive the disinfecting-lid when not in use.

253,955. LANTERN FOR ELECTRIC AND OTHER LIGHTS. LUTHER STIRLINGS, New York, N. Y. Filed Sept. 15, 1881. (No model.)

Claim.—1. The combination, with an electric light, of a septum formed of an opaque substance and a closed reflector extending across above the light, substantially as set forth.

2. The combination, with an electric light, of a septum formed of an opaque substance having a reflecting-surface next the light, a closed reflector extending across above the light, and formed of slabs of porcelain or earthenware having a white enameled surface and a metallic supporting-frame, substantially as set forth.

3. The reflector formed of the grooved radial bars connected together at the center and the triangular slabs of porcelain introduced into the grooves and secured in place, as set forth.

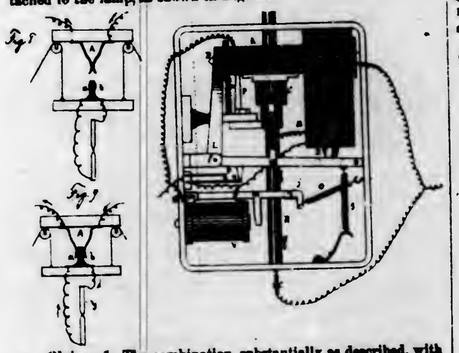


253,956. KNOB ATTACHMENT. WARREN H. TAYLOR, Stamford, Conn., assignor to the Yale Lock Manufacturing Company, same place. Filed Oct. 11, 1881. (No model.)

Claim.—The combination, with a spindle, screw-threaded shank, and screw-threaded sleeve, of a washer fitting upon and turning with the spindle and extending between the end of the sleeve and shank and the surface of the rose or thimble, substantially as and for the purpose specified.

253,957. TELEGRAPHIC APPARATUS. BENJAMIN THOMPSON and CHARLES SELDEN, Toledo, Ohio. Filed Nov. 21, 1879.

Brief.—Induced currents of alternate polarity are sent to line, which act upon delicately-balanced relays. A peculiar form of induction-coil in which one half of the core is of larger diameter than the remaining half.



Claim.—1. The combination of a polarized receiver, an induction-coil whose secondary is connected to line, and suitable means, substantially as described, for reversing the direction of the primary current of said induction-coil without interrupting the continuity of the current, as and for the purpose set forth.

2. The combination, substantially as described, of an induction-coil whose secondary is connected to line, a primary coil in circuit with a local battery, and a continuity-preserving pole-changing key whose contact-points are in said local-battery circuit.

3. The combination of a swinging straight-bar electro-magnet and two permanent horseshoe-magnets arranged each to embrace with its poles one pole of said electro-magnet, the poles of said magnets being arranged to act as stops to the poles of the electro-magnet, and adjusting devices for adjusting the poles of the permanent and electro magnets with relation to one another.

253,958. ELECTRIC LAMP. ELIHU THOMSON, New Britain, Conn., assignor to the American Electric Company, same place. Filed Apr. 9, 1881. (No model.)

Brief.—Three electro-magnets control the carbons. One in the main or arc circuit and a second in a derived or shunt of high resistance about the lamp act upon the opposite ends of a common armature-lever to establish the arc and operate the clutch mechanism, respectively, while the third is normally shunted out of circuit by spring-contacts, which may be broken when too great a current passes through the shunt-magnet around the lamp. This third magnet is connected with devices for feeding or forcing the upper carbon forward positively when the clutch mechanism accidentally holds it. A peculiar form of electro-magnet (see Fig. 3) cuts out mechanism connected with the lamp-sustaining devices. (See Figs. 8 and 9.) A contrivance for polishing the carbon attached to the lamp, as shown in Fig. 10.

Claim.—1. The combination, substantially as described, with the regulating mechanism of an electric lamp, of an electro-magnet provided with a polar projection, conoidal or tapered in form, and an armature less in thickness than the extent of the tapered portion of said projection, substantially as and for the purpose set forth.

2. The combination, substantially as described, with the regulating mechanism of an electric lamp, of an electro-magnet provided with a conoidal or tapered projection, and a perforated armature encircling said projection and less in thickness than the extent of the tapered portion thereof, so that it may move in a field of force, where its motion results from the difference of attraction toward the body of the core, and toward the polar projection extending beyond said armature, as and for the purpose set forth.

3. The combination, with the regulating mechanism of an electric lamp, of an electro-magnet having a paraboloidal pole, and a perforated armature encircling said pole and adapted to move between the extremity of the polar projection and the body of the core, substantially as and for the purpose set forth.

4. The combination, with the regulating mechanism of an electric lamp, of an electro-magnet having a tapered pole and an armature provided with an opening whose inner edges are rounded, as shown and described.

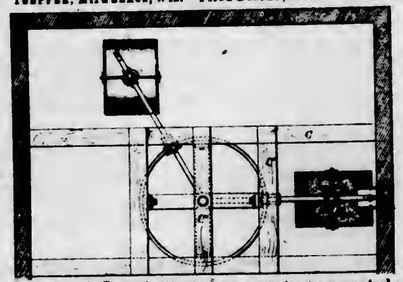
5. In an electric-light regulator, a safety device consisting of an electro-magnet, V, armature W, pivoted in a slot, impact surface *j*, adapted to engage with the carbon-carrier, and spring *e*, substantially as described.

6. In an electric-light regulator, a safety device consisting of an electro-magnet and a pivoted and sliding armature carrying an engaging-piece to strike and impel the carbon-carrier, substantially as described.

7. The combination, with an electric lamp, of two divided insulated plates, constituting the poles of the regulator and attached to the frame of the lamp, two circuit-closing springs, as described, in permanent connection with the general circuit and fixed to the frame or support from which the lamp is hung, and means for lowering and raising the lamp into position, all combined as described, so that when the lamp is raised the springs are separated by the insulated plates, thus putting the lamp into circuit, while, when the lamp is lowered for renewal of the carbons, the springs come together and preserve the general circuit.

8. The combination, substantially as described, of the conducting carbon carrier or rod R, the arc C, lined with polishing and abrasive material, and spring F, for holding said arc normally out of contact with the rod.

253,959. SOLAR CAMERA. BENJAMIN TITCOMB, Baltimore, Md. Filed Sept. 19, 1881. (Model.)



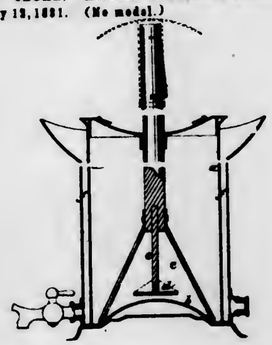
Claim.—1. In a solar camera, the adjusting-bars Q Q', for the purpose of suspending the same, constructed and arranged substantially as set forth.

2. The suspended easel V and adjustable brace Y, in combination with the skeleton-camera N N and adjustable plate A, substantially as and for the purpose set forth.

3. The shaft G and journal-boxes H H, in combination with the arms F F, toothed wheel E, mirror-brace I, adjustable arm J, joint K, and screw-rod L, arranged substantially as and for the purpose herein set forth.

4. The negative-holder S, springs T T, and latch U, in combination with the adjustable screw-rod R, arranged substantially as set forth.

253,960. GRAIN-DISTRIBUTER FOR MALT-KILNS. WRIGHT THOMPSON, Milwaukee, Wis. Filed Dec. 29, 1881. (No model.)

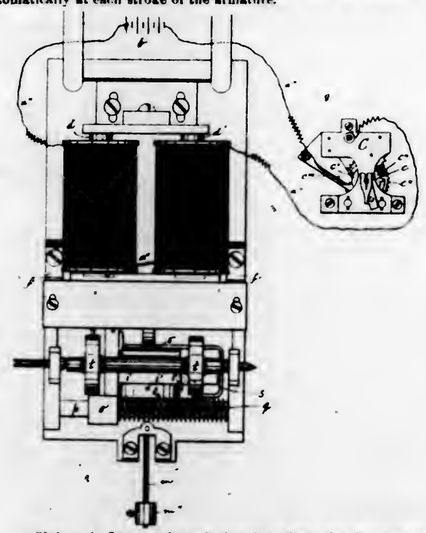


Claim.—1. In grain-distributers, arms having a central pivotal support, in combination with buckets suspended from sheaved brackets traveling thereon.

2. The combination, with pivoted arms, of supporting-brackets having sheaves that travel on a circular way.

3. The combination of circular way, a central supporting-rod, arms having brackets *g*, and brackets supported on said arms from sheaved brackets, as set forth.

253,961. CHURN. MICAGER C. WALLACE, Saulsbury, Tenn. Filed July 13, 1881. (No model.)

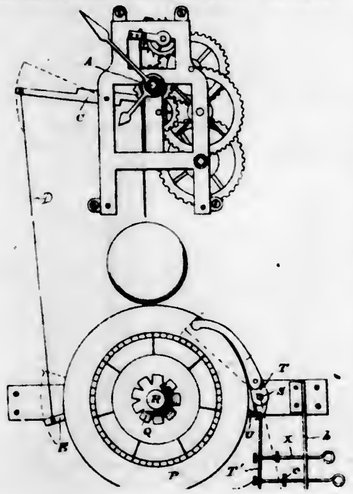


Claim.—A churn-dash consisting of the perforated conical dash-c provided with the oblique ribs *d* upon its outer surface, the

Claim.—In a watchman's time-detecter, the combination, with a clock-movement, having arbor A provided with screw B, of the

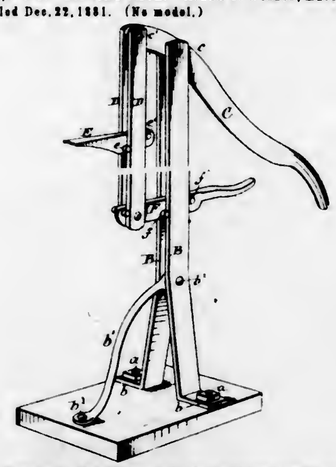
Claim.—A churn-dash consisting of the perforated conical dash *c*, provided with the oblique ribs *c'* upon its outer surface, the inner flat dash, *d*, and a spring-catch at its handle end adapted to engage with the tubular holder of an attachable strainer, *i*, as shown and described.

253,962. WATCHMAN'S ELECTRIC REGISTER. GEORGE G. WHITE, Boston, Mass. Filed Aug. 24, 1881. (No model.)



Brief.—The spring-power to operate the stylus is wound automatically at each stroke of the armature.

Claim.—1. In a watchman's electric register, the electro-magnet *a a' d d'* and movable armature *e*, and mechanism connecting it to the spring-driver *k*, by means of which the latter is wound up automatically by the attractive power of the electro-magnet, as described.

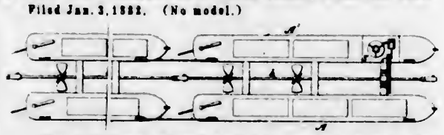


2. In a watchman's electric register, the combination of the movable armature *e*, armature-lever *e'*, winding-up lever *g*, ratchet-wheel *h*, pawls *g' g''*, spring-driver *k*, escapement *l l' l'' m m' m''*, locking and let-off lever *n n'*, projections *i' i''* on spring-case *i*, projections *l' l''* on escapement-wheel *l*, the depressing-lever *s s''*, laterally-movable stylus-bar *o*, its tooth *o'*, and spring *q*, as and for the purpose set forth.

253,963. WATCHMAN'S TIME-DETECTER. HERMAN J. WESSEL, San Francisco, Cal. Filed Sept. 30, 1881. (No model.)

Claim.—In a watchman's time-detecter, the combination, with a clock-movement having arbor A, provided with cams B, of the levers C and E, connected by rod D, ratchet G, having pinion H, pawls K L, adapted to engage with said ratchet, spur-wheel I, meshing with said pinion, and provided with bearing O, rotating disk P, clamped to bearing O, and registering-lever T, provided with suitable mechanism for holding a pencil in contact with the rotating disk, substantially as shown and described.

253,964. LIFTING-JACK. HIRAM J. WILSON, Mason, Mich. Filed Dec. 22, 1881. (No model.)



Claim.—1. In a lifting-jack, the combination of a slotted upright, a slotted link, an operating-lever, and a supporting-bar and a catch-bar, each of the latter provided with pins adapted to bind upon the front and back edges of their respective coacting members, substantially as shown and described.

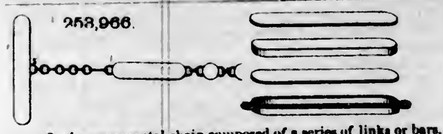
2. The combination of the parallel upright straps B B, bound laterally at *b'* against the brace *b'* between them, the handle C, pivotally secured therein at *c*, and pivotally secured between two links, D D, the supporting-bar E, provided with the pins *e e'*, and means, substantially as shown and described, for securing said links in desired positions, substantially as and for the purpose set forth.

3. In a lifting-jack, the combination of links D D, supporting-bar E, provided with pins *e e'*, and catch-bar F, provided with pins *f f'*, substantially as shown and described.

253,965. CANAL-BOAT. JACOB BAKER, Greenville, Ohio. Filed Jan. 3, 1882. (No model.)

Claim.—1. The combination of the connected sections A A' and the shaft *h*, extended to the ends of the boat and provided with couplings for connecting the same to the shafts of other boats, substantially as specified.

2. The combination of a series of boats, each having a longitudinal propeller-shaft coupled detachably to the shafts of the contiguous boats in the same line, and a driving-engine arranged upon one of the boats and propelling all the shafts, substantially as specified.

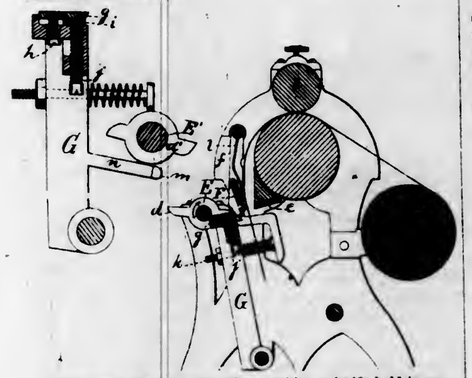


253,966. ORNAMENTAL CHAIN. ROBERT BARKER, East Attleborough, Mass. Filed Nov. 25, 1881. (No model.)

Brief.—The central blank is of cheap metal. A band of gold covers the sides of the blank and side pieces of gold cover its edges.

Claim.—1. An ornamental chain-link or other equivalent article of jewelry composed of a blank of cheap metal, a band of gold or gold plate covering the edges of the blank, and plates of gold covering the sides of the plate, as set forth.

2. An ornamental chain-link or other equivalent article of jewelry composed of a blank of cheap metal, a band of gold plate covering the edges of the blank, and plates of gold covering the sides of the plate and the edges of the band, as set forth.



253,966.

3. An ornamental chain composed of a series of links or bars, each composed of a blank of cheap metal, a band of gold plate covering the edges of the blank, and provided with rigidly-attached eyes, gold plates covering the sides of the blank and the edges of the band, and ordinary links connecting the links or bars, substantially as shown and described.

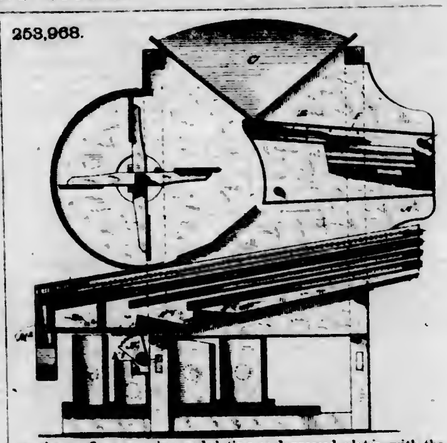
253,967. MACHINE FOR CUTTING PAPER. ROBERT BIRRS, South Windham, Conn. Filed Apr. 30, 1881. (No model.)

Brief.—The lower cutting-blade is attached to a swinging frame and rests upon an adjustable elastic cushion that allows the blade to yield sufficiently to insure its proper contact with the stationary blade. The swinging frame carries pressure-rods that force the clamp-bar against the paper, which rods are provided with springs that allow them to yield when the paper is clamped, so that the blade can finish its cut. The swinging cutter-frame is actuated by a cam-shaft.

Claim.—1. In a paper-cutting machine, a knife held in contact with an elastic cushion between said knife and its bed by means of screws loosely connected to said bed, the cushion being located at a point nearer the cutting-edge of the blade than are the holding-screws, whereby the blade may rock so as to tip its side edges, substantially as described, and for the purpose specified.

2. The combination of a pair of shear-blades, *e g*, the bed for supporting the broad side of the blade *g*, the elastic cushion *i*, against which the broad side of the blade rests, the set of screws *h*, for holding the broad side of the blade in contact with said cushion, but loosely connected to the bed, so that the blade may rock and tip its side edges, and the set of adjusting-screws *j*, for acting upon the cushion near the cutting-edge of the blade *g*, substantially as described, and for the purpose specified.

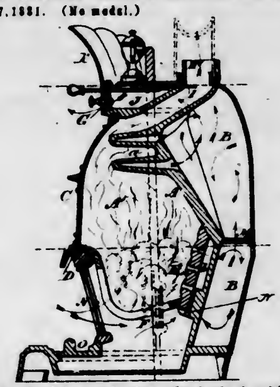
3. The combination of the main frame bearing the fixed blade, the frame G, carrying the movable blade, the pressure-rod mounted in the frame G, the spring mounted on said pressure-rod, the arms *f*, and clamp-bar F, mounted on said arms, substantially as described, and for the purpose specified.



4. The combination of the main frame bearing the fixed blade *e*, the frame G, bearing the blade *g* and carrying it edgewise by the fixed blade with their broad sides toward each other, the bed on the frame G, which the broad side of the blade *g* faces, and the elastic cushion interposed between said bed and broad side of the blade, substantially as described, and for the purpose specified.

5. The combination of the continuously-acting feed-rollers, the fixed shear-blade *e*, frame G, blade *g*, and spring pressure-rod *k*, mounted on said frame, the arms *f*, clamp-bar F, mounted on said arms, and the cam-shaft E, bearing cam *d*, for acting upon the frame G.

253,968. PARKING-MILL. FRANCIS M. RUSSELL, Coldwater, Mich., assignor of one-half to John Stearns and Andrew J. McGowan, same place. Filed July 20, 1881. (No model.)



Claim.—In a fanning-mill, the combination of the shaking-shoe having a series of inclined sieves, and a horizontal bottom section or floor provided with rack-plates, and an upper inclined

253,968.

section or floor carrying undulating or depressed plates, with the rock-shaft provided with spur-segments engaging with the rack-plates, and the mill-casing having rollers engaging with the depressed plates, as and for the purpose herein set forth.

253,969. HEATER. PHILIP BERCHER, Louisville, Ky. Filed Sept. 17, 1881. (No model.)

Claim.—1. A heater having a fire-back, A, with hollow air-circulating chambers projecting into the fire-chamber formed by the walls of the teats *a*, and communicating with a hot-air chamber in rear of said plate A, substantially as described.

2. The combination, in a heater, of a fire-back, A, with hollow projections or teats *a*, arranged staggering, the two hot-air chambers in rear of said plate, and a reticulated or air-jet diaphragm between said chambers, substantially as described.

3. A heater having a fire-back, A, provided with hollow projections or teats *a*, an air-space, B, divided by a numerously-perforated diaphragm, M, in combination with the lower perforated fire-back, E, air-space *b*, passage N', leading into this space, and the registers F N, substantially as described.

4. The combination of a fire-box, A', an inclined back, A, provided with hollow projections *a*, arranged staggering, a divided air-space, B, a lower perforated fire-back, E, an air-space, *b*, passage N', registers F G N, heating-chamber J, damper I, flues H H', doors G, and a deflector or hood, K, all arranged substantially as described.

5. In a heater, the combustion-chamber provided with an ordinary grate, having a fire back or wall, A, with a series of hollow pins or conical teats, *a*, cast thereon, which project into said combustion-chamber or fire-box, in combination with the upwardly and backwardly directed flue L, substantially as described, and for the purposes specified.

6. In a heater, the combustion-chamber A', having a fire back or wall, A, provided with hollow pins or conical teats *a*, cast thereon, which project into and nearly across the fire-box, arranged in two or more rows in a staggering manner, as shown and described, and for the purposes specified.

7. In a heater, a combustion-chamber having a fire back or wall, A, provided with hollow pins or conical teats *a*, arranged in two or more rows in a staggering manner, whose outer surfaces project into and nearly across the fire-box, and whose inner surfaces or hollows lead into and form part of the air-chambers B in rear of the same, substantially as shown and described, and for the purposes specified.

8. In a heater, a combustion-chamber with a fire back or wall, A, provided with hollow pins or conical teats *a*, arranged in two or more rows staggering, in combination with a divided air-space, B, in rear of said wall, the said air-space being divided by a reticulated or numerously-perforated diaphragm, M, into two compartments, substantially as described, and for the purposes specified.

9. In a heater, a combustion-chamber having a fire back or wall, A, provided with hollow pins or conical teats *a*, arranged in two or more rows staggering, and an air-chamber, B, divided into two compartments by the reticulated or numerously-perforated diaphragm M, in combination with the registers F N, substantially as described, and for the purposes specified.

10. In a heater consisting of a combustion-chamber having a fire back or wall provided with hollow pins or conical teats *a*, arranged in two or more rows in a staggering manner, whose outer surfaces project into and nearly across the fire-box, and whose inner surfaces or hollows lead into and form part of the air-chamber B, which is divided by the perforated diaphragm M, the registers F N, in combination with the vents H H, dampers I I, hot-air flue L, smoke-flue H', air-space J, register G, and heat and dust deflector K, all arranged in the manner shown and described, and for the purposes specified.

11. In a heater, the combination of the combustion-chamber A', having a fire back or wall, A, provided with hollow pins or conical teats *a*, cast thereon, arranged in two or more rows in a staggering manner, whose outer surfaces project into and nearly across the fire-box, and whose inner surfaces or hollows lead into and form part of the divided air-chamber B, which is divided by a reticulated or numerously-perforated diaphragm, M, the registers F N, vents H, dampers I, arch and main hot-air flue L, smoke-flue H', air-space J, register G, hood or deflector K, and doors C, all arranged substantially as described, and for the purposes specified.

253,970. HAND CORN-HUSKER. ALEXANDER W. BRINKERHOFF, Upper Sandusky, Ohio. Filed Oct. 10, 1881. (Model.)

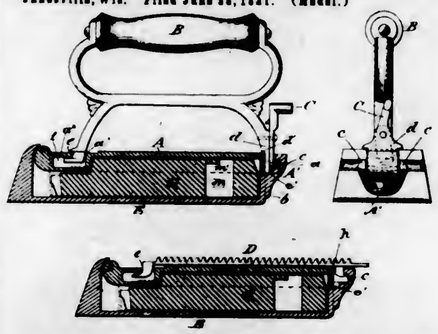
Claim.—In a corn-husking implement, the combination, with the section A, provided with the spur *c*, curved guard *c'*, and lips and grooves *a a* and *b b*, of the section B, having the curved guard and the lips *c c*, substantially as specified.

253,971. FERTILIZER. ISAAC BROWN, Elm Croft Grange, Edinburgh, Scotland. Filed Nov. 21, 1881. (No specimens.) Patented in England Nov. 16, 1878.

Claim.—As a manure or ingredient of manure, the product herein denominated "supersulphate," said product consisting of a solid mixture of sulphuric acid and gypsum, peat, or equivalent medium, substantially as described.

253,972. GLOVE. REMUS D. BURR, Kingsborough, N. Y. Filed Dec. 19, 1881. (No model.)

Claim.—1. In a glove or gauntlet, the combination of a palm-section having the inner portion of the first and third fingers integral therewith, and the separate inside portions of the second and little fingers seamed at their bases to the palm-section, substantially as described.

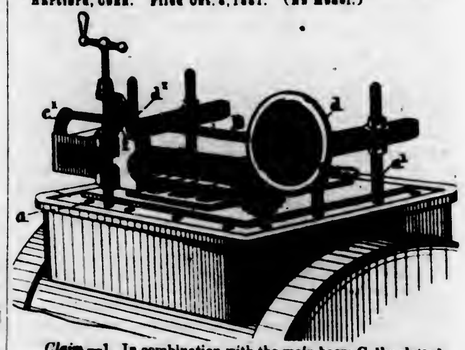


2. In a glove or gauntlet, the combination of a palm-section having the inner and side portions of the first and third fingers integral therewith, and the separate inside and side portions of the second and little fingers seamed at their bases to the palm-section, substantially as described.

3. In a glove, gauntlet, or mitten, the combination of a palm-section having a thumb-opening provided with a curved open slot at its upper end, and also with an inward angular projection adjacent to said slot, with a thumb-section provided with an angular projection and a concaved edge, substantially as described.

4. In a glove or gauntlet having inside finger and side sections seamed to the palm-section at their bases, the reversely curved or concaved coincident edges *b'*, substantially as described, whereby when said edges are stitched together the seam is relieved from strain at the ends or corners thereof, as set forth.

5. A glove or mitten having two side openings at the wrist, and a back wrist-piece overlapping said openings and secured by suitable fastenings to a front wrist-piece, substantially as described.

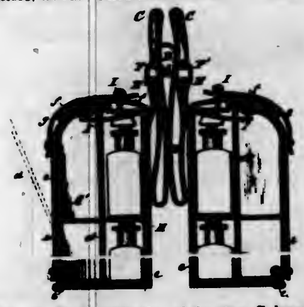


253,973. COMBINED SAD-IRON AND FLUTER. IRA I. BURR, Janesville, Wis. Filed June 25, 1881. (Model.)

Claim.—1. The combination, with the body E, provided with the heel A', the latter being constructed substantially as shown, and the cover A, hinged to the said body E, and provided with the recess *f* and projecting lip *a²*, of the fluting-plate D, adapted to be secured to the said cover when the handle is removed, and provided at its front end with the toe *e*, adapted to fit under the lip *a²*, and at its rear end with the depending flange h, adapted to occupy the space formerly occupied by the shank *d*, substantially as set forth.

2. The combination, with the body E, constructed substantially as described, and having the cover A hinged thereto, the latter being provided with the cavity *f* and lip *a²* and arm *e*, of the handle B, the front shank of which is provided with a toe having two lips, which fit respectively above and below the said lip *a²*, while the rear shank is adapted to rest between the said arms *e*, and is provided with a pawl, C, having a catch, *a*, on its lower end, adapted to move in a semicircular groove in the heel A', and a shoulder, *d'*, formed integral with the shank *d*, and adapted to bear on the cover A and prevent it from being raised when the handle is in position, substantially as set forth.

253,974. MILLING-MACHINE. ALEXANDER E. CAMPBELL, Hartford, Conn. Filed Oct. 6, 1881. (No model.)



Claim.—1. In combination with the main beam C, the slotted arms B B and the independent threaded standards *a' a'*, the construction being such that adjustment to chests of different sizes may be made either in a vertical, lateral, or longitudinal direction, according to the necessities of the case.

2. In combination with the beam C, having the projection *c*, the slotted arms B B, having a recess corresponding to said projection, as described.

3. In combination with the beam C and the mechanism, substantially as described, for securing the beam to any desired base, the tool-carrier E and the feed-shaft J, for actuating the same.

4. The milling-machine described, having the standards *a' a'*, the slotted arms B B, the main beam C, the main shaft D, with gearing *d²*, the tool-carrier E, with gearing, and the feed-shaft J, as described.

253,975. MEDICAL SADDLE-BAGS. GEORGE H. CARPENTER, Moorefield, W. Va. Filed Mar. 21, 1881. (No model.)

Claim.—1. The combination of the strap C, loops F F', and catch or hook G with the pouches A A and saddle-piece B, having devices for attachment of the strap, as shown and described.

2. The improved saddle-bags, consisting of the pouches formed of the self-supporting part A, having lateral wings *c c*, and the folding part A', which is hinged at its lower edge to part A, so as to fold between its wings, and the seat-piece B, which connects the pouches, as shown and described.

3. The combination, with the pouches A A' and seat-piece B, of the rods or pintles E, by which said parts are jointed together, as and for the purpose specified.

253,976. GATE-LATCH. GEORGE E. CHANDLER, Jacksonburg, Ind. Filed Aug. 29, 1881. (No model.)

Claim.—1. The combination of the latch-lever *l*, extending nearly the entire length of the gate, provided with a notch at the rear end and a cross-bar handle, *d*, at the front end, and pivoted to the gate by the bolt *o* nearly midway the length of both lever and gate, with the staple *r* and catch *c*, adapted to strengthen the gate itself and to prevent sagging, substantially as described.

2. The catch *c*, fixed in the hinge-post and extending toward the front end parallel with the gate when closed, and having a shoulder, *n*, running across the same diagonally, in combination with the lever *l*, adapted to secure an easy and sure latching of the gate and to prevent unlatching in any other manner than by raising the latch end of the lever, substantially as described.

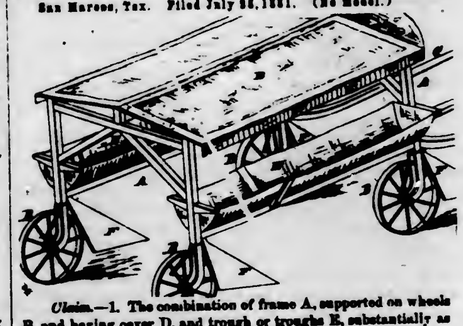
253,977. CARBON TELEPHONE-TRANSMITTER. GEORGE D. CLARKE, Chicago, Ill. Filed Oct. 16, 1880. (No model.) Patented in England Nov. 29, 1878.

Claim.—An elastic support for the carbon button, which consists in the combination of the bed-piece with ball I, spring-clamp M, yielding bar K, and means for adjusting said bar, substantially as shown and described.

253,978. PAINT FOR ROOFING, &c. GEO. J. CLINE, Goshen, Ind. Filed Nov. 16, 1881. (No specimens.)

Claim.—The water-proof paint herein described, consisting of coal-tar, silicate of soda, alkali, and water-lime, with asphaltum, compounded in the proportions and manner set forth.

253,979. WIRE SCREEN-WORK. ARTHUR COLLINS, Brooklyn, N. Y. Filed June 30, 1881. (No model.)



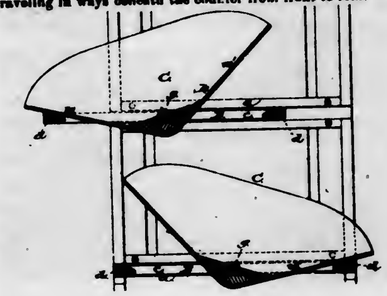
Claim.—1. The combination of the wire cloth or net-work and the split tubing or slotted tubes surrounding the net-work and firmly compressed upon the edges of the net-work to constitute the outer framing or support for the net-work, substantially as and for the purpose hereinbefore set forth.

2. The combination of the wire cloth or net-work and the double frame completely surrounding it, and consisting of the wire or light internal frame and the outer or split tubing frame firmly compressed thereon, substantially as and for the purpose hereinbefore set forth.

3. The combination of the wire cloth or net-work, the split tubing, and the braces, the net-work and braces being clamped in the tubing, substantially as and for the purpose hereinbefore set forth.

4. The combination of the framed wire net-work, the swinging hook E, the movable disks or plates to which the hook is jointed, and the set-screws or pinch-nuts, whereby the guard-supporting hook may be adjusted in the openings or meshes of the net-work, substantially as and for the purpose hereinbefore set forth.

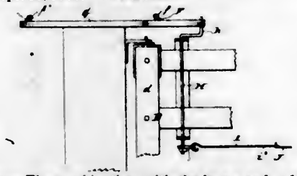
253,980. COTTON-PICKER'S WAGON. CHARLES P. COLLINS, San Marcos, Tex. Filed July 26, 1881. (No model.)



Claim.—1. The combination of frame A, supported on wheels B, and having cover D, and trough or troughs E, substantially as set forth.

2. The cotton-picker's wagon consisting of frame A, wheels B, cover D, trough or troughs E, and shafts C.

3. The cotton-picker's wagon consisting of frame A, wheels B, cover D, trough or troughs E, and separator F, as set forth.

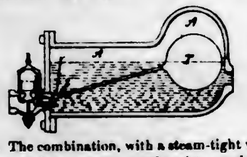


253,981. STORE-COUNTER. WILLIAM J. CONRAD, Gainesville, Tex. Filed Nov. 26, 1881. (No model.)

Brief.—Tilting angular boxes are mounted in sliding frames traveling in ways beneath the counter from front to rear.

Claim.—The store-counter described, having the horizontal slideways *a*, extending from front to rear, the rectangular slide-frames B, having the central pivot-rods, *g*, and the end rests, *d*, and the symmetrical angular boxes C, pivoted by their angular portion to said rods of the slide-frames and reversible therein, substantially as specified.

253,982. GATE. JOHN F. COPPOCK, West Newton, Ind., assignor of one-half to Tertius A. Hill, Pleasant Plain, Iowa. Filed Sept. 21, 1881. (No model.)



Claim.—The combination, with the levers and rods for operating a gate, of the crank-lever H, having arms h' h' upon one end thereof, and rods I I', having loops i' i' upon their ends, which engage with the latch-rod J, whereby, when the lever H is turned in either direction, the latch will be withdrawn from the catch, substantially as shown and described, and for the purposes specified.

253,983. COMPOUND FOR PRESERVING FOOD. THEODORE L. CORWIN, Marathon, N. Y. Filed Jan. 9, 1882. (Specimens.)

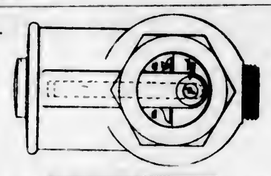
Brief.—Consists of a mixture of potassium nitrate, salicylic acid, and sodium chloride, each one ounce, in powder, dissolved in one quart of boiling water, to which is afterward added one dram of hydrochloric acid diluted with one ounce of water.

Claim.—The above-described combination or compound of nitrate of potassium, salicylic acid, chloride of sodium, hydrochloric acid, and water in the proportions before stated, for the use and purpose herein set forth.

253,984. STEAM-TRAP. NELSON CURTIS, Newton, Mass. Filed Dec. 14, 1881. (No model.)

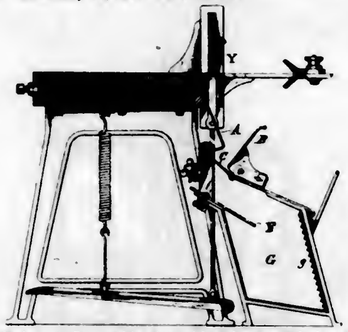
Claim.—1. The combination, with a steam-tight water-chamber, of a discharge pipe or passage and a piston-valve therein, a smaller passage connecting the two parts of said discharge-passage, the one above the piston and the other below the port of the said piston-valve, an auxiliary valve in the said smaller passage, and suitable mechanism within the said water-chamber for automatically controlling said auxiliary valve, substantially as described.

2. The combination, with a steam-tight water-chamber, of a discharge-passage and a piston-valve therein, a smaller passage connecting the two parts of said discharge-passage, the one above the piston and the other below the port of the said piston-valve, an auxiliary valve in the said smaller passage, and a float in said water-chamber connected with said auxiliary valve, substantially as described.



3. The combination of the blow-off pipe R with the steam-tight water-chamber A, a discharge-passage and piston-valve therein, a smaller passage connecting the two portions of said discharge-passage, one above the piston and the other below the port of said piston-valve, and an auxiliary valve in said smaller passage, substantially as described.

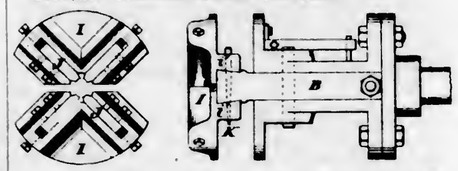
4. The combination of the steam-tight water-chamber A and blow-off pipe R with an exterior discharge-passage and a valve therein, substantially as described, for the purpose specified.



253,985. STEAM-TRAP. NELSON CURTIS, Newton, Mass. Filed Dec. 14, 1881. (No model.)

Claim.—A main passage for steam or other fluid under pressure and a piston-valve therein, a smaller passage connecting the two portions of the main passage which lie on either side of the port of the piston-valve, and a thermostatic valve within said smaller passage, in combination with the steam-tight water-chamber of a steam-trap, the stem of the thermostatic valve extending into and connected with said water-chamber, substantially as described, for the purpose specified.

253,985.

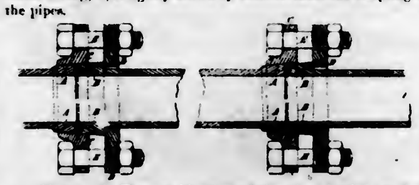


253,986. SEPARATOR FOR SQUARING-SHEARS FOR CUTTING SHEET METAL. WILLIAM R. DANDALS, Philadelphia, Pa. Filed May 18, 1881. (No model.)

Claim.—1. In combination with a sheet-metal shears, Y, an apron, A, fender B, and pivoted trap C, constructed substantially as and for the purposes described.

2. In a separating attachment for squaring-shears, the fender B, pivoted trap C, and inclined plane F, in combination with the box or frame G, having inclined bottom and sides and corrugated surface *g*, substantially as and for the purposes set forth.

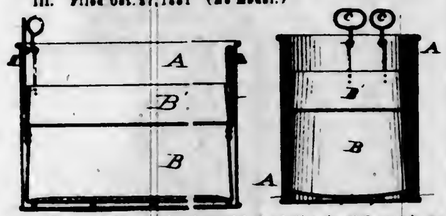
253,987. SCREW-CUTTING MACHINE. JOHN DELKER, St. Louis, Mo. Filed June 16, 1881. (No model.)



Claim.—1. The combination, with the oscillating levers B B, of the removable die-holders I I, the said levers and holders having tongue-and-socket connection and a suitable locking device inserted through the tongues and sockets, as set forth.

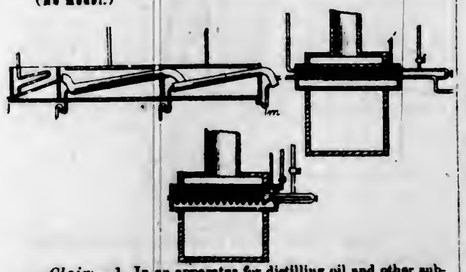
2. The combination of tapering key or pin K with the lever B and die-holder I, the said pin adapted to be withdrawn and forming the device for securing the holder to the lever, as set forth.

253,988. PIPE-COUPLING. LOUIS DE MARNEF, Brussels, Belgium, assignor to Naeyer & Co., same place. Filed Nov. 21, 1881. (No model.) Patented in Belgium May 13, 1879.



Brief.—The pipes to be coupled have conical flanges A B at their ends, forming when together a frustum of a cone, upon which a ring, C, is tightly drawn by bolts to effect the coupling of the pipes.

Claim.—1. The combination of the pipes having at their meeting ends the external conical flanges, A B, conjointly forming, when the ends of the pipes meet, the frustum of a cone, with the ring C, having its inner side beveled, substantially as described, the ring D, held upon one of the pipes, and the bolts E, passing through said rings, substantially as and for the purpose set forth.



2. The combination of the pipes having at their meeting ends the external conical flanges, A B, conjointly forming, when the ends of the pipes meet, the frustum of a cone, with ring C, having its inner side beveled, substantially as described, the ring D, arranged to abut against the end of the beveled flange B, and the bolts E, passing through said rings, as and for the purpose set forth.

253,989. CLOTHES-STRAINER. ANNA M. DENNISON, Chicago, Ill. Filed Oct. 27, 1881. (No model.)

Claim.—The combination, with the boiler A, of the strainers B B', having inwardly-inclined sides, perforated bottoms, and jointed handles, substantially as shown and described.

253,990. APPARATUS FOR FRACTIONAL DISTILLATION. ERNEST F. DIETERICHS, Cleveland, Ohio. Filed Sept. 23, 1881. (No model.)

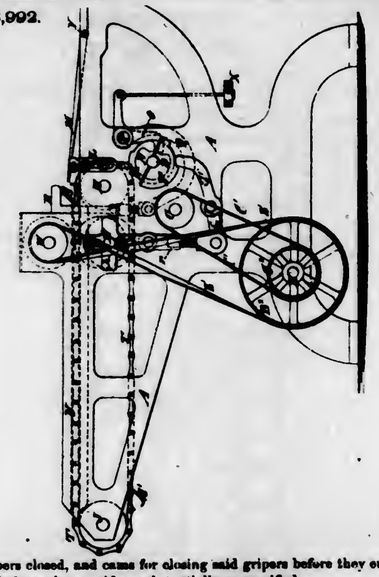
Claim.—1. In an apparatus for distilling oil and other substances, the combination of a retort located in a suitable furnace and a distilling-coil located in said retort with the steam-supply and eduction pipes leading to and from the retort, the said pipes being connected with the retort and a suitable oil-supply pipe, and provided with an injector for forcing the oil into the distilling-coil, substantially as specified.

2. In combination with the still or stills, the condensers consisting of a series of tubes arranged in step-like form in a series of suitable vessels, the said tubes increasing in diameter successively, and being provided with suitable traps, substantially as specified.

253,991. FERTILIZER. ISAAC ELSASSER, Houston, Tex. Filed Sept. 24, 1881. (No specimens.)

Claim.—The fertilizer herein described, consisting of bat-guano, cotton-seed meal, the crude pulverized shell known as "*Goathaden cumsata*," and bone-dust, as and for the purpose specified.

253,992. MACHINE FOR CLEANING PAPER, &c. FRANCIS J. RUMRICH, New York, N. Y. Filed Aug. 31, 1880. (No model.)



Claim.—1. In a machine for cleaning paper or other fabrics, the combination, with two brushes, of two chains or carriers and gripers attached to and extending between them and adapted to take the sheets and carry them between said brushes, substantially as specified.

2. In a machine for cleaning paper and other fabrics, the combination, with two brushes, of two chains or carriers, gripers attached to and extending between them and adapted to carry the sheets between said brushes, and mechanism, substantially such as described, for moving one brush away from the other to permit the gripers to pass between them, substantially as specified.

3. In a machine for cleaning paper and other fabrics, the combination, with a brush or brushes, of two chains or carriers, gripers attached to and extending between them, and channels or guides through which the chains or carriers pass and which hold the gripers tightly closed, substantially as specified.

4. In a machine for cleaning paper and other fabrics, the combination, with a brush or brushes, of two chains or carriers, gripers attached to and extending between them, channels or guides through which said chains or carriers pass and which hold the

253,992.

gripers closed, and cams for closing said gripers before they enter said channels or guides, substantially as specified.

5. In a machine for cleaning paper and other fabrics, the combination, with a brush or brushes, of two chains or carriers having an intermittent motion, gripers attached to and extending between them, and stops for arresting the forward movement of said chains or carriers, substantially as specified.

6. In a machine for cleaning paper and other fabrics, a brush composed of a shaft, flanges fitted thereon and having their faces parallel to each other and oblique to the shaft, and disks of fabric held between said flanges in corresponding oblique position relatively to the shaft, substantially as specified.

7. The combination, with the chains or carriers having an intermittent motion and provided with gripers, of a feed-table having a rising motion to permit the gripers to pass under it and a falling motion to permit the sheets to be fed therefrom into the gripers, substantially as specified.

8. The combination, with the brush H, feed-table M, and sliding rods or bars R, of the shaft D, with its cams F, K, and N, the rock-shaft I, arms G, lever G', and rods r, the slide-bar L, and the rock-shaft I', arms Q, and lever O, substantially as specified.

9. The combination, with the chains T and gripers S, of the rising and falling rods or bars R, having the stop lips or ears *l*, substantially as specified.

253,993. RAILWAY-CAR. AUGUSTE RUTHARD, Perpignan, France. Filed Nov. 21, 1881. (No model.) Patented in France Sept. 16, 1876, and June 16, 1881, and in England Aug. 23, 1881.

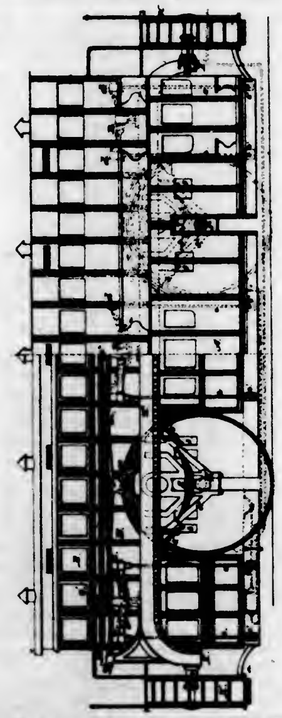
Claim.—1. The combination, with an exterior frame sustained above the axles of the vehicle through the medium of springs, of the vehicle-body arranged over the said surrounding frame and extending downward below the same, thereby inclosing it, and springs or their described equivalent suspending the exterior body from the upper portion of the interior surrounding frame, substantially in the manner and for the purpose described.

2. The combination of an interior surrounding frame, T, sustained above the axle through the medium of interposed springs, the exterior body arranged over the interior frame and extending downward to inclose the same, and springs or their described equivalents suspending the exterior body from the upper portion of the interior frame, said body being vertically recessed at its sides to receive the supporting or driving wheels, substantially in the manner and for the purpose described.

3. The combination of the interior frame having the downward-curved ends I, and supported on the axles through the medium of springs, with the exterior body arranged over said frame and extended downward to inclose the same, and devices, substantially as described, suspending the body from supports on the interior frame, substantially in the manner and for the purpose described.

253,993.

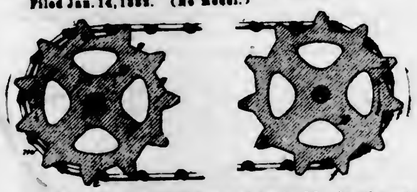
253,995.



253,997. MACHINE FOR MAKING DOWEL-PINS. EDWIN GAGER, Norwalk, Ohio. Filed Dec. 10, 1881. (No model.)

Brief.—The end of the pin is driven through the former and

253,999.



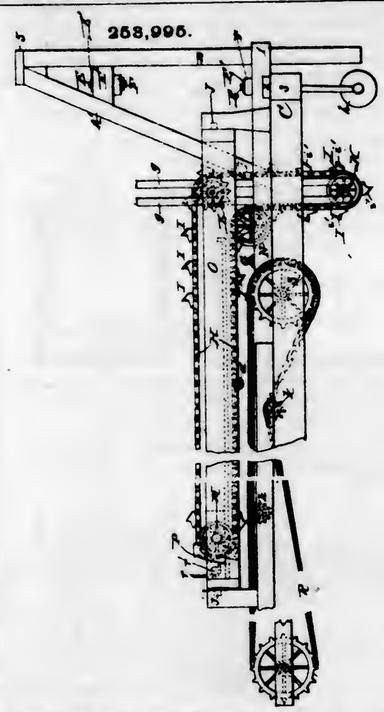
253,993.

4. In a locomotive-engine having its body suspended by springs within a frame that is carried by other springs upon the wheels, the rollers *f*, carried by the said frame and bearing against rails or ribs *e'* on the body, substantially as and for the purposes set forth.

5. In a locomotive-engine having its body suspended by springs within a frame that is carried by other springs upon the wheels, the connection of the cylinders A' with the body A' by means of the plate E' and frame F', substantially as herein described.

253,994. CHAIN-WHEEL. WILLIAM D. EWART, Chicago, Ill. Filed Jan. 14, 1882. (No model.)

Claim.—A chain-wheel or sprocket-wheel having the roots of the teeth of different depths at their opposite sides, so as to produce a differential pitch according to whichever of said sides may be made the working sides of the teeth, for the purpose set forth.



253,995. MACHINE FOR EXCAVATING EARTH IN TRENCHES. CHARLES A. FERRY, New Haven, Conn. Filed Feb. 19, 1881. (No model.)

Brief.—The endless bucket-chain is carried in a tilting frame and is horizontally and vertically adjustable therein. Pivoted and laterally-movable pile-drivers are secured on the front end of the machine to drive sheeting. An endless canvas-carrier is secured to its driving-ropes by hooks secured in the edges of the canvas, said carrier having cross-braces.

Claim.—1. The combination, with the main frame C, of the drivers D, bolts E, slotted planks F, and bolts G, substantially as and for the purpose set forth.

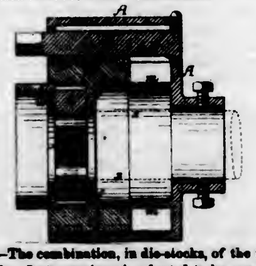
2. The combination of the wheels K L M N, endless chain H,

253,995.

wheel *d*, buckets I, and the frame O, substantially as and for the purpose set forth.

3. The combination of the frame O, trunnions J, guides *g*, and frames *f*, constructed and operating substantially as and for the purpose set forth.

4. The buckets I, having a separable scraping-edge, *i'*, pivots *c*, strengthening-rib *b*, and prongs *i*, substantially as and for the purpose set forth.

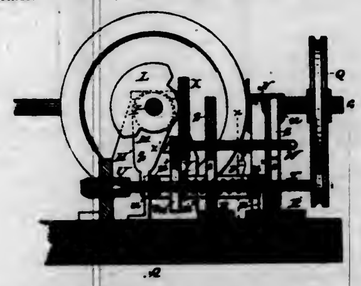


5. The combination of the carrier B, consisting of two endless wire ropes, the wheels S and T, wire hooks H' H', and endless trough U, substantially as and for the purpose set forth.

6. The wheels S and T, having teeth T' and shoulders S', as and for the purpose described.

7. The combination of the buckets I, chain H, wheels K and M, drive-wheel L, wheel N, and endless concaved trough U, substantially as and for the purpose set forth.

8. The brace Q, in combination with the canvas trough U, substantially as and for the purpose described.



253,996. SCREW-CUTTING DIE. WM. D. FOSSUS, Bridgeport, Conn. Filed Nov. 14, 1881. (No model.)

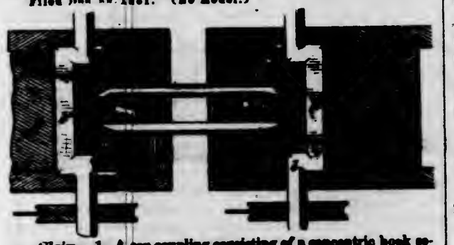
Claim.—The combination, in die-stocks, of the following elements, namely: first, a casing, A, adapted to be secured to the object to be threaded; second, a threaded die-carrying ring having teeth on its periphery and a screw-thread adapted to a corresponding thread in the casing; and, third, an elongated pinion having teeth adapted to those of the die-carrying ring, all substantially as set forth.

253,997. MACHINE FOR MAKING DOWEL-PINS. EDWIN GARNS, Norwalk, Ohio. Filed Dec. 19, 1881. (No model.)

Brief.—The end of the pin is driven through the former and pointed by a revolving cutter while the body of the pin remains in the former.

Claim.—1. In a machine for making wooden pins, the combination, with the driving crank-shaft, of a pitman and a plunger adapted to drive the pin-blanks, a block upon which said plunger is guided, suitable stationary shaping-dies, and a revolving hollow cutter, substantially as described.

2. In a machine for making dowel-pins, the combination, with devices for squaring and rounding the pin-blank, of a revolving shaft carrying a hollow cutter, and means, substantially as described, for automatically retracting, raising, and lowering said shaft, as set forth.



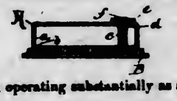
3. The combination, with the standards and the revolving shaft and pointing-cutter, of the vibrating frame and the eccentric and connecting-link, substantially as described.

4. In a machine for making dowel-pins, the combination, with the base A, the standards H H', and the shaft I, mounted in bearings of said standards, of the slotted guides S and guide-plate X, a cam, L, and eccentric M, mounted on the shaft I, a vibrating frame, V, a link, Z, connecting said frame to the shaft I, a shaft, T, carrying a hollow cutter, U, and means for rotating the latter, substantially as set forth.

5. In a machine for making dowel-pins, the combination, with the blank feeding and shaping devices, of the slotted guides S, the frame V, the guide-plate X, the revolving shaft T, the collar Y, and spiral spring Y', arranged as described, and adapted to retract the shaft T, substantially as set forth.

6. The combination, with the standards H and H' and the gearing, of the vibrating frame V, the revolving shaft T and hollow cutter U, the rod Y, having the projection *a'*, and the spring Y', encircling the shaft T, substantially as set forth.

253,998. CAR-COUPLING. LLOYD W. GAYER, Calhoun, Ky. Filed Dec. 29, 1881. (No model.)



Claim.—1. A car-coupling consisting of a concentric hook secured to a crank-shaft, combined with a draw-head having a cylindrical chamber for containing the hook and a stop for limiting the rotation of the shaft, substantially as shown and described.

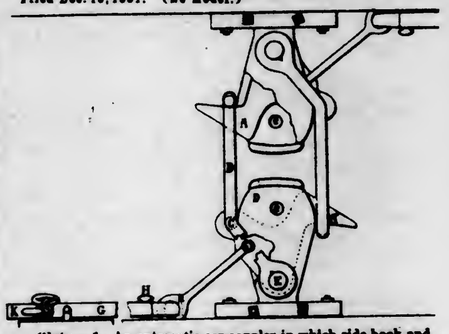
2. The combination of a draw-head having a cylindrical chamber formed at the rear of its mouth and transversely thereto, a crank-shaft having its crank weighted and provided with a concentric hook, and means for limiting the rotation of the shaft, and a suitable device for operating the shaft, substantially as shown and described.

253,999. WATCH TRAIN-PLATE. JAMES H. GERRY, Newark, N.J. Filed Oct. 28, 1880. (No model.)

Claim.—1. The combination, with the front train-plate, B, of the back train-plate, A, post *c*, having the shoulder *d* thereon and fastened to said plate B, as shown, the bridge or cock *e*, and screw

253,999.

f, all arranged and operating substantially as and for the purpose set forth.

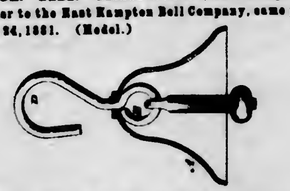


2. The combination of the front train-plate, B, having the undercut shoulder *b*, the back train-plate, A, having a returned portion or flange, *a*, sprung into engagement with the shoulder *b* of plate B, post *c*, having the shoulder *d* thereon and fastened to plate B, as shown, the bridge or cock *e*, and the screw *f*, all constructed substantially as and for the purpose set forth.

254,000. KNOB ATTACHMENT. JAMES A. GIBBS, Chicago, Ill., assignor to the Union Brass Manufacturing Company, same place. Filed Sept. 19, 1881. (Model.)

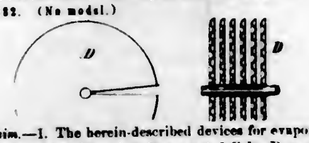
Claim.—The combination, with a latch-case, of the fixed part *b* of the knob-shank, the pivoted arms C C, and the collar *f*, holding the arms apart, substantially as set forth.

254,001. CAR-COUPLING. ELLIOT GLOVER, Cortland, N. Y. Filed Dec. 19, 1881. (No model.)



Claim.—1. An automatic car-coupler in which side hook and draw-bar are firmly united, and are attached to a draw-head by a single pin, on which they turn in unison, substantially as set forth.

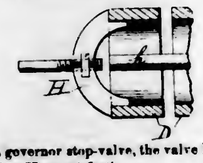
2. The duplex draw-bars B, arranged as shown, and the hooks A A', combined with the lever G and connections, as and for the purposes set forth.



3. The draw-bars B, having vertical arms C, and the hooks A A', arranged in pairs, and each pair secured to the draw-bar by a single pivot, E, combined with the Hook J, lever G, and chain K, as and for the purposes set forth.

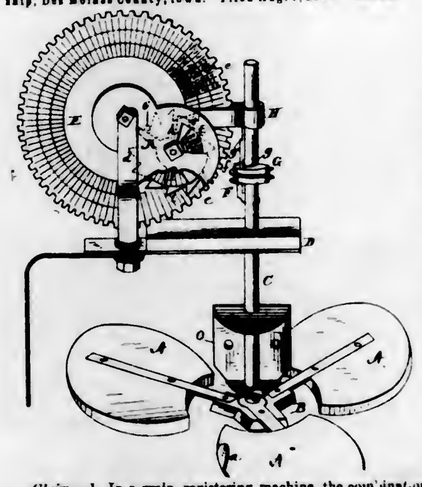
254,002. BELL. GUSTUS W. GOFF, East Hampton, Conn., assignor to the East Hampton Bell Company, same place. Filed Dec. 24, 1881. (Model.)

Claim.—The combination of the bell A, constructed with a perforation through its head end and a wire inserted through said perforation, with the hammer hung to the inner end of the wire, the outer end bent to form an open hook, D, the bend serving also to secure the parts together, substantially as described.



254,003. EVAPORATING AND COOLING APPARATUS. A. GONTARD, Mockau, near Leipsic, Saxony, Germany. Filed Jan. 6, 1882. (No model.)

Claim.—1. The herein-described devices for evaporating liquids, which consist of a series of corrugated disks, D, mounted spirally upon a shaft, S, in combination with a suitable vessel for containing the liquid to be evaporated, in the contents of which said disks are partially immersed and caused to revolve, whereby the liquid is not only more rapidly evaporated, but kept continuously moving from one end of the vessel to the other, as set forth.



2. The combination, with a supporting-shaft, of a series of disks, D, provided with a central aperture and a radial slot gradually increasing in diameter from the central aperture to the periphery of the disk, whereby said disks may be mounted upon the shaft in the form of a spiral or Archimedean screw, substantially as and for the purpose specified.

254,004. GOVERNOR-VALVE. PAUL W. GARDEN and ALEXANDER E. TURNER, Philadelphia, Pa. Filed Dec. 16, 1881. (No model.)

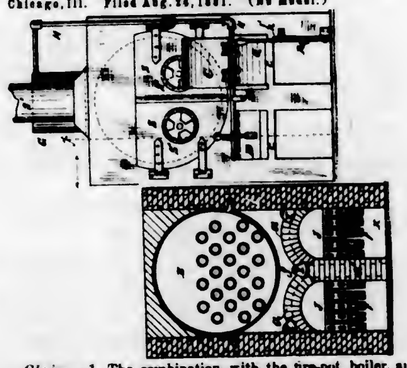
Claim.—In a governor stop-valve, the valve D, provided with the divided cross-bar H, as set forth.

254,005. GRAIN-TALLY. JAS. GRIFFITH, Flint River Township, Des Moines County, Iowa. Filed Aug. 1, 1881. (Model.)

Claim.—1. In a grain-registering machine, the combination of the frame B, revolving covers A, standard C, and worm-gear G with register-plate E, having its edges toothed or serrated at e, and provided with stud or trip e', disk I, and plate M, all substantially as and for the purposes set forth.

2. In a grain-registering machine, the combination of worm-gear G, having slot g, with standard C, provided with stud or trip F, having shoulder g' and spring f, and the disk E, having toothed edge e, substantially as and for the purposes described.

3. In combination with the register-disk E, operated as described, and having stud or trip e', the plate K, provided with an opening, k, plate M, and register-disk I, having saw-teeth i, substantially as and for the purposes set forth.

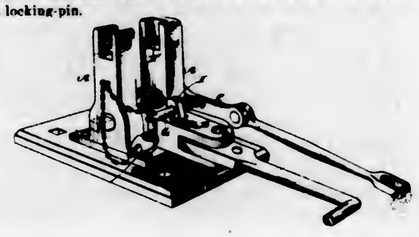


254,006. BOUQUET SUPPORT AND FORMER. FRANK D. HAAS, Milwaukee, Wis. Filed Sept. 19, 1881. (No model.)

Claim.—1. The bouquet support and former described, consisting of a number of concentric vertical cylinders of different heights and diameters, secured together and provided with movable stem-holders adapted to be supported by the upper edges of the cylinders and to move laterally thereon, as and for the purpose set forth.

2. In a bouquet support and former, the series of concentric cylinders arranged in the form of a stepped cone, secured together and provided with movable stem-holders adapted to be supported by the upper edges of the cylinders and to move laterally thereon, as and for the purpose set forth.

254,007. SMOKE-CONSUMING FURNACE. JOSEPH J. HALL, Chicago, Ill. Filed Aug. 24, 1881. (No model.)



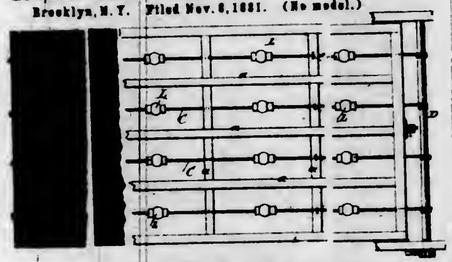
Claim.—1. The combination, with the fire-pot, boiler, and grate of a smoke-consuming furnace, of the retort B, open at its rear or inner end, and arranged in the forward part of the fire-pot and between the boiler and the grate and containing the central wall, a', dividing the retort into two longitudinal chambers, each having the grate of the furnace for a floor, substantially as and for the purposes specified.

2. The combination, with the fire-pot, boiler, and grate of a smoke-consuming furnace, of the retort B, arranged in the forward part of the fire-pot and having over it the air-space g, and open at its inner or rear end and arranged between the boiler and the grate, and containing the central longitudinal wall, a', the grate serving as the floor of the retort, substantially as and for the purposes specified.

3. The combination, in a smoke-consuming furnace, of the fire pot or chamber A, the boiler E, the grate J the retort B, arranged in the forward part of the fire-pot and extending over the grate and underneath the boiler and having an open rear end, and the bridge-wall F, arranged in the rear of the pot or chamber A and having its upper portion, F', inclined toward the rear or open end of the retort, substantially as and for the purposes specified.

254,008. RAILROAD-SWITCH. ARCHIBALD HARLEY, Topeka, Kans. Filed Dec. 16, 1881. (No model.)

Brief.—The switch-rails are shifted through a vertically-swinging jointed hand-lever pivoted at its inner lower end between vertical standards, in which it is secured when, in vertical position, and when horizontal it is secured by lugs on the base-plate which enter a mortise in the lever, and through which passes a locking-pin.



Claim.—1. The combination, in a railroad-switch, of the switch-rod with a vertically-swinging jointed switch-lever, pivoted at the inner end of its lower section, the upper part of said jointed switch-lever being adapted to be swung down and secured to a supporting-standard of the apparatus after the lower part of said lever has been brought into a vertical position, substantially as described.

2. The combination, in a railroad-switch, of the vibratory jointed switch-lever for operating the switch-rod with the standards between which the switch-lever is pivoted, one of these standards having its upper end formed with a mortise to secure the upper part of the switch-lever when said part is swung down to a horizontal position, suitable openings being formed through the switch-lever and the mortised standard for receiving the locking-pin, substantially as and for the purpose described.

3. The combination, in a railroad-switch, of the standards A with the jointed switch-lever pivoted between said standards, the arms I, the jointed locking-pin, and the padlock, the upper part of the jointed switch-lever being adapted to be secured by the locking-pin in a mortise in one of the standards when the lower part of said lever is brought into a vertical position, and the arms I being each adapted to receive the locking-pin, so that after the switch-lever has been turned down and either arm received in the mortise of the switch-lever the pin can be engaged with the arm and secured by the padlock, substantially as described.

254,009. SIEVE-CLEANING ATTACHMENT. JOHN HARVEY Brooklyn, N. Y. Filed Nov. 6, 1881. (No model.)

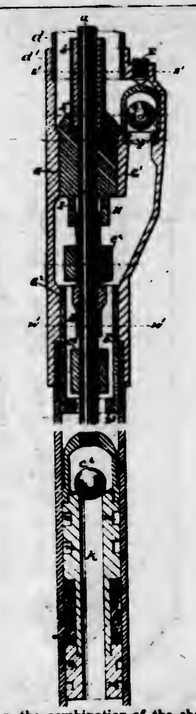
Claim.—1. The combination of a shaking sieve, a rope or cord attached at one end thereto and at the other end to a fixed object, and one or more bulbs or disks mounted upon said cord and adapted to strike said sieve as the cord is alternately slackened and tightened by the motions of said sieve, substantially as set forth.

2. The combination, with the shaking sieve, the cord or cords, and one or more bulbs or disks attached thereto, of one or more pads or cushions attached to the cloth of sieve to prevent injury thereto from the action of the bulb or disk, as set forth.

254,010. PUMP. JOSEPH A. HAYDRICK, Barnhart's Mills, Pa. Filed Oct. 8, 1881. (No model.)

Claim.—1. In a pump, the combination, with the tubing d and the follower-chamber d^3, of the intermediate double shell d', having upper packer-seat, G G', and lower packer-seat, G^3, and intermediate passage for fluid, substantially as shown and described, and for the purpose set forth.

2. In a pump, the combination, with the rod a and the shell d', having seat G, of the packer b', and the pipe b, inclosing a layer of Babbitt metal and screwing into the top of said packer, substantially as shown and described.



3. In a pump, the combination, with the rod a, the shell d', having seat G^3, and the packer b', having collar H and ports I, of the packer b^3, constructed of two cylindrical portions connected by longitudinal ribs, and having ports between the ribs, and the drop-valve C^3, adapted to close said ports, substantially as shown and described.

4. In a pump, the combination of the packer b^3, having a cage formed in its lower portion, the drop-valve C^3, arranged therein, the seat b^3, screwed into the lower end of said packer, and the seat G^3, substantially as shown and described.

5. In a pump, the combination of the shell d', its partition G', seat F, ball-valve E, the valve-cage, the set-screw E, for holding the cage, and means for supporting and operating the said parts, substantially as shown and described.

6. In a pump, the combination, with the chamber d^3 and the rod a, of the follower K, made in two sections and having sand-recesses m and cups n and rings o, and the valve-cage of ball-valve C^3, screwed to the said rod and follower, substantially as shown and described.

254,010.

7. In a pump, the combination of the shell d', having two packer-seats, the packer b', and the packer b^3, connected together by a screw substantially as shown and described, whereby both packers shall be adjusted to their seats, as set forth.

8. In a pump, the combination, with the packers b' and b^3, of the collar H, secured to packer b', and provided with a female thread, and ports I, leading to the rod a, substantially as shown and described, whereby the continuous packing shall be relieved, as set forth.

9. In a pump, the combination, with the rod a and shell d', of the packing b, b', and b^3, extending continuously above and below the packer-seats, substantially as shown and described.

10. In a pump, the combination of the double shell d', the packer b', the ball-valve C, the rod a, the packer b^3, and seat b^3, the drop-valves C^3 C^3, the follower K, ball-valve C^4, and follower-chamber d^3, substantially as shown and described.

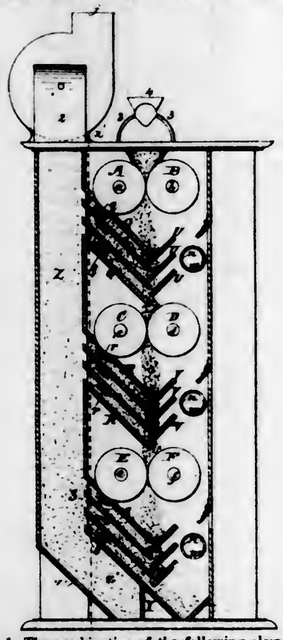
11. In a pump, the combination, with a shell or chamber and the rod a, of the valves C^3 C^3 and the packer b^3, having seats for the said valves, substantially as shown and described.

254,011. ELASTIC-CENTER EMERY GRINDING AND POLISHING WHEEL. MARTIN HOPKINS, San Leandro, Cal. Filed Aug. 3, 1880. (No model.)

Claim.—1. A combined grinding and polishing wheel consisting of a central hub, a polishing-disk, a removable grinding-rim, and means, substantially as described, for securing the polishing-disk upon the hub and the grinding-rim upon the polishing-disk.

2. The combination, with the flanged hub, the clamping-rings C, and the yielding or elastic center F, of the outer removable clamping-rings, B, and the detachable grinding-rim A.

3. The combined grinding and polishing wheel composed of the outer rim, A, the outer clamping rings or flanges, B, the inner clamping-rings, C, the yielding center, and the hub having fixed and loose flanges, all substantially as described.



254,012. PROCESS OF AND MACHINERY FOR GRADUAL REDUCTION OF GRAIN TO FLOUR AND MIDDLINGS. NOAH W.

the coarser middlings from the material before it reaches the lower rollers, an inclosed adjacent air-trunk into which said coarser mid-

of the month to an aperture, a weighted disk, 34, having offset 36 for said stop pin or rod, pawl 38, acting on mouth-cylinder, latch

8. In combination, the fixed case 10, having heads 9 and 11, and central opening, the cylinder 6, fixed to shaft 1, the cylinder

254,012. PROCESS OF AND MACHINERY FOR GRADUAL REDUCTION OF GRAIN TO FLOUR AND MIDDLINGS. NOAH W. HOLT, Buffalo, N. Y. Filed Aug. 15, 1881. (No model.)

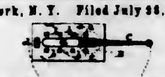
Claim.—1. The combination of the following elements, viz: the rollers A B, the inclosed trunk Z adjacent thereto, the boards Q Q, arranged to have unobstructed air-passages between them communicating with said trunk Z, a screening mechanism below said unobstructed air-passages, mechanism which forces the air through said passages and through the material immediately below the rollers A B before it reaches the screen, and the rollers C D, which receive the tailings from the screening mechanism when said rollers A B, the air-passages, the screen, and the rollers C D are all arranged to have the material pass downward from one to the other entirely by the action of gravity.

2. The combination of the series of rollers, the air-forcing mechanism which withdraws the flour, the dust, and fine middlings from the crushed material immediately below each pair of rollers before subjecting it to the action of screens or of succeeding rollers, the inclosed trunk which receives said flour, dust, and fine middlings, devices which mingle in said trunk the middlings from the several rollers of the series and guide them to a receptacle, devices which receive the bran portion from the rollers and guide it to another receptacle, and devices which receive the flour and dust from the inclosed trunk and guide them to a third receptacle, whereby the remingling of the middlings either with the flour or bran is avoided.

3. The combination, with two or more pairs of crushing-rollers and the hopper or receptacle for conducting away in a separate mass the bran portion of the material which they do not reduce, of a suction-fan which causes an air-current to pass below all the rollers and carries with it a portion of the crushed material, a separating-chamber adjacent to the rollers, which receives the materials removed by the air-current, and which is provided with one outlet for the light material carried by the air-current and another outlet, separate from the flour-outlet and from the bran-outlet, for the heavier material which drops by gravity from said air-current.

4. The combination of rollers A B, fan I, rollers C D, the inclined reciprocating screen G' H' between the pairs of rollers, air-passages adapted to guide the air-current through the material as it passes down from the upper rollers and before it reaches the said screen G' H', the trunk Z, in which the air-current carries the flour, dust, and fine middlings, a dust at X which receives the bran from the rollers, the dust Z', in which the middlings pass by gravity, and the dust *j*, into which the flour is forced by the air-current, substantially as set forth.

5. The combination of the rollers A B, the lower rollers, C D, the reciprocating screen above the lower rollers, which removes the coarser middlings from the material before it reaches the lower rollers, an inclosed adjacent air-trunk into which said coarser middlings are delivered, air-passages above said screen, mechanism for forcing air through said passages into said trunk to remove the flour, dust, and fine middlings before the material reaches the screen, whereby clogging of the screen is prevented, substantially as set forth.

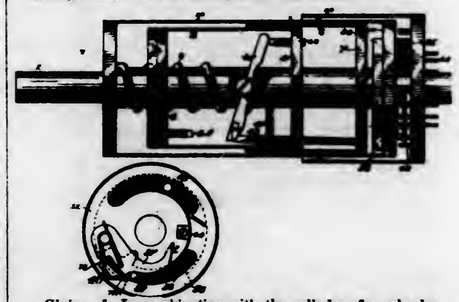


6. The combination, with the upper rollers, A B, the lower rollers, C D, and the screening mechanism above the lower rollers, of a series of two or more chutes, Q Q, above said screen, arranged to have inclined air-passages between them and to successively receive the material one from the other before it passes to the screen below, substantially as set forth.

7. The combination of the crushing-rollers, the casing around them, the dust-collector, the fan, the air-trunk leading from the fan to the collector, and the air-trunk leading back from the collector to the roller-casing, substantially as set forth.

8. The herein-described method for treating grain in the manufacture of flour, it consisting in first subjecting the grain to the action of rollers, then by means of a current of air removing from the crushed material the flour, dust, and middlings, and carrying them into a common compartment, then removing from the residue of the crushed material the coarser middlings by the action of a screen, then subjecting the tailings of the screen to further crushing, air-currents, and screening, then separating the flour and dust from the middlings by an air-current, then conducting the middlings in a separate mass to a purifying mechanism, conducting the bran portion in a separate mass to other mechanism for further reducing it, and conducting the flour and dust to a third mechanism for collection.

9. The herein-described method for treating grain in the manufacture of flour, it consisting in first subjecting the grain to the action of crushing-rollers, then by means of air-currents dividing the crushed material into a mass of light particles, a separate mass of coarser particles, and another mass of mingled coarser particles and bran, next conveying the first aforesaid mass to a dust-collector, the second to a middlings-purifier, and the third to a mechanism for further reduction, substantially as set forth.

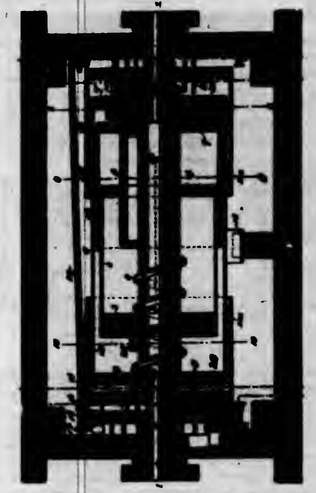


254,013. FASTENER FOR GLOVES, GAITERS, &c. ANTON HOFFER, New York, N. Y. Filed July 26, 1881. (No model.)

Claim.—1. A fastener consisting of the hook C, pivotally secured upon a suitable attaching-plate, and having the seat *s* and the catch *d*, also mounted upon an attaching-plate, the hook being adapted to have a horizontal swinging movement and to be retained by the catch *d* when closed, substantially as set forth.

2. A fastener consisting of the plate A, having a guide-slot the disk B, pivotally-secured hook or arm C, and catch *d*, the disk being adapted to be locked at different points along the guide-slot, substantially as set forth.

254,014. CALENDAR. THOMAS H. HAVENDEN, Ingersoll, Ontario, Canada. Filed Oct. 20, 1881. (No model.)



Claim.—1. In combination with the cylinder of a calendar having characters indicating the numbers of the days of the month, and adapted to turn to bring these characters successively to view, and with a cylinder carrying the names of the months arranged in proper order, a variable arresting device, substantially as described, regulated by the month-cylinder and adapted to arrest the numeral-cylinder at the proper point for each month, substantially as set forth.

2. The combination of a cylinder having stop pin or rod and turning on its axis to bring successive numbers representing days of the month to an aperture, a weighted disk, 34, having offset 36 for said stop pin or rod, pawl 35, acting on month-cylinder, latch 37, and devices, as described, for operating the same, said latch acting on pin 39 of the weighted disk, substantially as described.

3. The combination of the weighted disk, having offset adapted to act in connection with stop pin or rod on the cylinder, and carrying pawl 35, the latch pivoted on the head 11, having stops to act on pin 39 in weighted disk, and arm 40, adapted to be operated upon by the pins upon the head of the month-cylinder, the whole constructed and operating substantially as described.

4. The improved double pawl 19 23, formed out of one piece of wire, having an eye formed to fit over its holding-pin, and with the pawls extending on opposite sides of the wheel, said pawls being formed with V-shaped bends to form yielding stops, and adapted to the pins of the wheel and head and in combination therewith, substantially as described.

254,015. CALENDAR. THOMAS H. HAVENDEN, Ingersoll, Ontario, Canada. Filed July 14, 1881. (Model.)

Claim.—1. In a calendar, a cylinder having a series of unit figures, from 1 to 9, inclusive, arranged in direct line around its periphery, in combination with a cylinder telescoping therewith and provided with a spirally-arranged series of numerals, adapted to act as decimal figures, with the aforesaid unital figures, substantially as described.

2. The described series of calendar-slips, each series representing six months of successive years, in proper order, one above and the other below the line of apertures, said slips being suitably attached to the front or frame, substantially as described.

3. The cylinders carrying numerals indicating days of the months, in combination with a cylinder having the names of the days of the week, and with intermediate connecting mechanism, substantially as described, whereby the said numeral-cylinder carries the name-cylinder step by step in its advance, but leaves it undisturbed in reverse movement, as set forth.

4. The cylinders carrying numerals indicating days of the month, in combination with cylinders having names of the days and months, respectively, and with intermediate connecting mechanism, as described, whereby advance only of the numeral-cylinders moves the day-name cylinder and reverse movement only of the same moves the month-name cylinder, as set forth.

5. The numeral-carrying cylinders, in combination with the cylinder carrying the names of the months, and with pawl and stop mechanism, as described, whereby the last backward movement only of the numeral-cylinders moves the month-cylinder one step, as set forth.

6. In a calendar, and in combination, cylinders carrying on their peripheries numbers of the days of months rotated by positive movement of shaft, a cylinder carrying names of the days, and intermediate mechanism, substantially as described, between the shaft and name-cylinder, adapted to transmit to the said name-cylinder an amount of motion varied from that of the shaft.

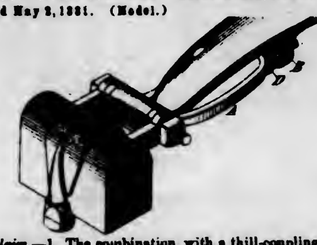
7. In combination, the cylinder 6, fixed on shaft 1, the cylinder 2, connected to shaft by spline, and the fixed spiral 8, substantially as described.

8. In combination, the fixed case 10, having heads 9 and 11, and central opening, the cylinder 6, fixed to shaft 1, the cylinder 2, telescoping therein, and the spiral 8, as set forth.

9. In combination, cylinder 6, fixed to shaft, cylinder 2, telescoping therein, fixed case 10, and cylinder 13, carrying the names of the days of the week and operated from the shaft by the push and pull pawls, substantially as described.

10. The cylinders 2 and 6 and the fixed case 10, all arranged as described, in combination with the wheel 16, shaft 1, and the connected pawls 17 and 18, substantially as described.

11. The combination of the rod 22, pawls 17 and 18, wheel 16, and head 15, both provided with pins, as set forth.

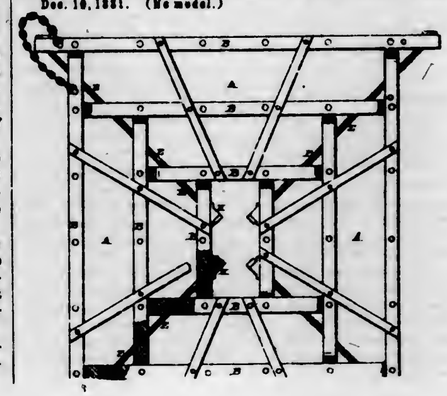


12. The wheel 16 and head 15, provided with pins, as described, in combination with the connected push and pull pawls 17 and 18 and the yielding stop-pawls, as described.

13. In a calendar, the combination of the fixed cylinder carrying the unit figures, telescoping cylinder carrying the spirally-arranged decimal figures, the stop pin or pins in the head of the telescoping cylinder, and the shoulders, as described, adapted to arrest the rotation of the telescoping cylinder, all as set forth.

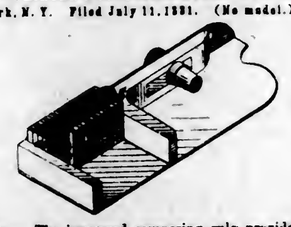
14. The head 11 of the fixed case 10, slotted as described, in combination with weighted wheel 34 and pawl carried thereon by pin extending through slot in head 11 and connecting with pins in the head of cylinder 14, substantially as described.

15. In combination with a cylinder having characters arranged spirally upon its surface, and with a fixed case having openings to display such characters, the revolving shaft, fixed spiral rod surrounding said shaft, and the cylinder splined to the shaft, its head having a hole adapted to the shaft, and a surface bearing on the shaft, approximately spiral, said surface being adapted to pass between the coils, and the overlapping or meeting ends of said spiral bearing-surface saddling closely the spiral rod, all the parts being combined in a calendar and operating substantially as described.



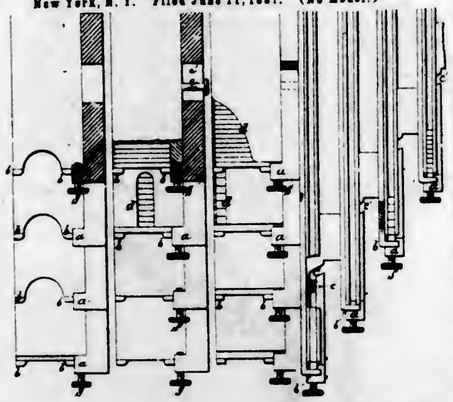
254,016. THILL-COUPLING. ELIAS HOXIE, Red Creek, N. Y. Filed May 2, 1881. (Model.)

Claim.—1. The combination, with a thill-coupling, of an adjustable brace secured to the thill and connected to the bolt of the coupling, substantially as shown and described, and for the purpose set forth.



2. The brace A, having a threaded stem at one end and perforated prongs at the other, in combination with a nut, D, screwed on said stem, a bracket, B, for holding said stem, the thill-iron C, and the bolt of the coupling-joint, substantially as shown and described, whereby the brace may be adjusted to take up wear, as set forth.

254,017. HARROW. GEORGE JACKSON, Boscobel, Wis. Filed Dec. 10, 1881. (No model.)



Claim.—In a harrow, the combination of a number of sections, A, each one of which is composed of a number of beams or bars, B, of unequal length, with the pivotal rods E, which pass diagonally through the ends of the beams, substantially as shown.

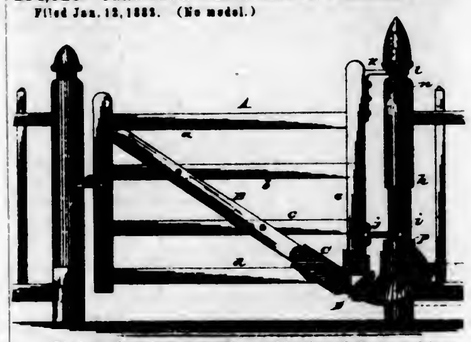
254,018. PRINTER'S COMPOSING-RULE. LOUIS K. JOHNSON, New York, N. Y. Filed July 11, 1881. (No model.)

Claim.—The improved composing-rule, provided with the combined guide and protector, substantially in the manner and for the purposes described.

254,019. TYPE AND SPACE HOLDER. LOUIS K. JOHNSON, New York, N. Y. Filed June 11, 1881. (No model.)

Claim.—1. In a type and space holder for the purpose indicated, one or more bearings or shoulders, *b b*, situated in the frame or case A, and affording support for the columns of type independent of the channels containing them, in combination with the said type-containing channels, substantially in the manner and for the purposes described.

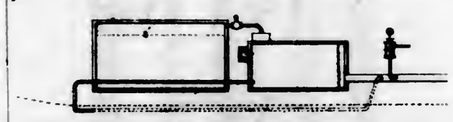
2. In a type or space holder for the purpose indicated, the bearing-shoulders *a*, for supporting the channels independent of the columns of type contained therein, in combination with the type-supporting shoulders *b b*, substantially in the manner and for the purpose set forth.



3. In a type or space holder substantially such as described, the adjustable bearings or rests S, for supporting the channels independent of the columns of type contained therein, in combination with said channels and with the type-supporting shoulders *b b*, for the purpose and substantially in the manner designated.

4. A type or space holder for the purpose indicated, provided with the type-supporting shoulders *b b*, constructed and arranged, substantially as described, to support the lowest type of a column at or near its extremities, while the intervening space between said points of support is unobstructed, for the purposes and in the manner substantially as described.

5. A type and space holder substantially such as indicated, provided with sockets, recesses, or seats arranged relatively in advance of and one above another, substantially as described, and constructed to receive, support, and present the type-containing channels with their broad sides toward the operator, for the purpose and substantially in the manner set forth.



6. In a type and space holder for the purpose indicated, the combination of the channel-supporting recesses or seats arranged with relation to each other, substantially as described, so as to leave the spaces P between them for the purpose of allowing the channels to be inserted from the front of the case into their respective positions therein, substantially in the manner and for the purpose described.

254,020. FARM-GATE. JAS. J. JOHNSTON, Columbiana, Ohio. Filed Jan. 13, 1882. (No model.)

Claim.—In a farm-gate, the combination of the curved inclined tread *g*, having vertical flange *p*, friction-roller D, forming the frustum of a cone, adapted to said inclined tread and pivoted in bearing C on the lower end of the brace B, so that the angle of strain of the gate A will be upon said roller and tread, the forked hinge *j*, pintle *m*, and post *h*, constructed, arranged, and operating substantially as herein described, and for the purpose set forth.

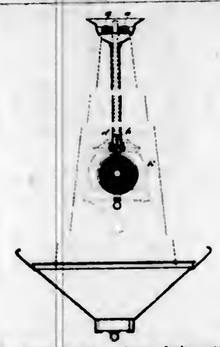
254,021. APPARATUS FOR PROPELLING TORPEDOES. W. F. JOHNSTON, Clifton, N. Y. Filed Aug. 8, 1881. (No model.)

Claim.—1. The method of maintaining the combustion of the fuel employed to heat the liquefied gas used as a motor-fluid on submerged torpedoes, which consists in supplying the chamber containing the ignited combustible with gas drawn from a reservoir containing a liquefied gas—such as nitrous-oxide gas—which is a supporter of combustion, substantially as hereinbefore set forth.

2. The improvement in the art of producing a motor-fluid for submerged torpedoes and like purposes, which consists in conducting a liquefiable gas—such as nitrous-oxide gas—which is a supporter of combustion, on its way to the engine into and through a combustion-chamber containing ignited carbon or other fuel, substantially as and for the purposes hereinbefore set forth.

3. The method of increasing the volume of the motor-fluid by injecting water, or water and oil, into the gas after it is heated and before it passes into the engine, substantially as and for the purposes hereinbefore set forth.

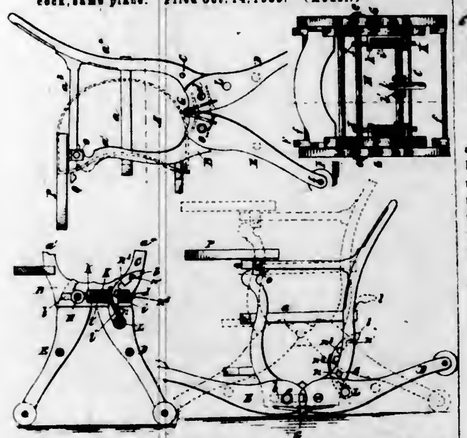
4. The combination of a reservoir containing a liquefied gas—such as nitrous-oxide gas—which is a supporter of combustion, a combustion-chamber containing carbon or other suitable fuel, and pipes or connections, substantially as described, whereby the products of combustion from the chamber are caused to heat the liquefied gas in the reservoir and the gas from said reservoir is conducted both to the chamber to serve as a supporter of combustion and to the engine to serve as a motor-fluid, substantially as hereinbefore set forth.



5. The method of obtaining a motor-fluid for driving the engines of submerged torpedoes and for similar purposes, consisting in acting upon ignited carbon or other fuel with a compressed liquefiable combustion-supporting gas, which unites with the combustible to form a highly-heated gaseous motor-fluid, substantially as and for the purposes hereinbefore set forth.

254,022. EXTENSION LAMP-FIXTURE. AUGUSTUS H. JONES, Meriden, Conn., assignor to Bradley & Hubbard Manufacturing Company, same place. Filed Dec. 19, 1881. (No model.)

Claim.—1. In an extension lamp-fixture, the combination of the pulleys *a a*, a coiled spring arranged below said pulleys and rigidly supported, with two or more cords or chains attached by one end to said spring running upward over said pulleys, thence downward, and respectively attached to the lamp holder or support, substantially as described.



2. In an extension lamp-fixture, the combination of the pulleys *a a*, a coiled spring arranged below said pulleys and rigidly

254,022.

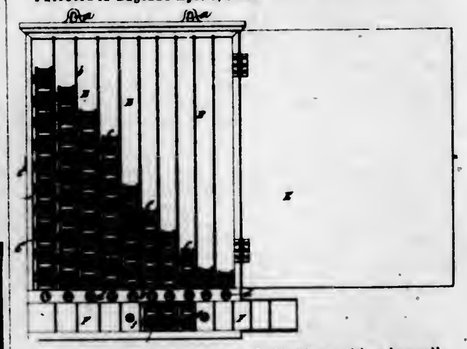
supported, with two or more cords or chains attached by one end to said spring, running upward over said pulleys, thence downward, and respectively attached to the lamp holder or support, with the shield E inclosing said spring, substantially as described.

254,023. CHILD'S CHAIR AND CARRIAGE. JOSEPH W. KNUSA, Chicago, Ill., assignor of one-half to Reuben A. Hitchcock, same place. Filed Oct. 14, 1880. (Model.)

Claim.—1. In an adjustable chair, one pair of supports, in combination with independent movable bearings provided with springs for the purpose of holding them at a fixed distance from the points of attachment of the other pair of supports, substantially as described.

2. A chair-body, in combination with a pair of front supports and a pair of back supports pivotally attached near their upper ends to its lower part, each pair independently of the other, but hinged together, as described, one pair having its pivotal motion on fixed points and the other in horizontally-movable bearings provided with springs tending to hold them at a fixed distance from the pivotal points of the first pair, substantially as described.

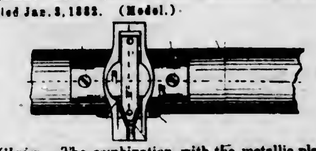
3. A chair-body whose frame extends below the seat and is provided near its lowest part with a transverse stretcher, in combination with a pair of front supports and a pair of back supports pivotally attached to the lower part of the body independently of each other, but hinged together, as described, one pair having its pivotal motion on fixed points and provided with a stretcher carrying a spring-catch, (arranged to engage at several points in its length with the stretcher on the chair-body,) the other pair having its pivotal motion in horizontally-movable bearings provided with springs tending to hold said bearings at a fixed distance from the fixed pivotal points, substantially as and for the purposes described.



4. The chair-body A, provided with the side bars, B, and stretcher C, in combination with the supports D and E, shaped and hinged together as described, pivots *d*, pivotal rods H, rods I, provided with the rings *i* and springs *i'*, stretcher L, bent arm *l*, and spring *l'*, substantially as and for the purposes described.

5. A chair-body, provided with a transverse stretcher, C, in combination with pivoted supports D and E, the stretcher L, bent arm *l*, and spring *l'*, substantially as and for the purposes described.

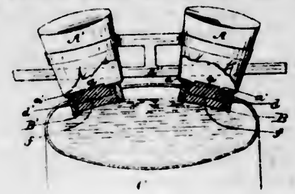
6. A chair-body, in combination with the pivoted supports D, supports E, hinges G, rod H, and rods I, provided with the ring *i* and spring *i'*, substantially as and for the purposes described.



7. In a child's chair, the pivoted shelf P, provided with the pin *p*, in combination with the grooved chair-arm *a*², the pin *s* set therein, and the spring-catch Q pivoted therein, tapering as described, and having the slot *q*² arranged to engage with the pins *s* and *p*, the back margin of said slot projecting beyond the front margin, substantially as and for the purpose described.

254,024. SHOW-BOX FOR SPOOLS. ROBERT KNOX, Paisley, County of Renfrew, Scotland. Filed Oct. 28, 1881. (No model.) Patented in England Apr. 6, 1881.

Claim.—The cabinet or case A, divided by partitions into cells or compartments B, extending to the bottom thereof, the indicator bar or rail D, extending across the front of the cabinet or case, near the bottom thereof, the hinged door or doors E, for closing the front above said bar or rail, and which may be opened to fill the cabinet or case, and the sliding door or doors F, for closing the front below said bar or rail, and which may be opened to withdraw the spools one by one, substantially as herein described.



254,025. REEL-LOCK. LOUIS A. KIEFER, Indianapolis, Ind. Filed Jan. 3, 1882. (Model.)

Claim.—The combination, with the metallic plate provided with a button cut away on one side, of the metallic block having a boss and recess, the boss being cut away in front to permit the device to be passed over the head of the button, and the spring and angular plate attached thereto, and the transverse strip for operating the same, all constructed and arranged substantially as and for the purposes specified.

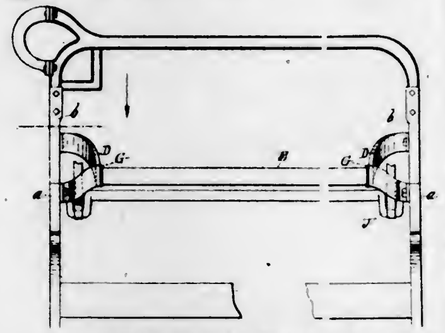
254,026. FIRE-ANNIHILATOR. ISIDOR KITZER, Cincinnati, Ohio. Filed Nov. 25, 1881. (No model.)

Brief.—This invention contemplates holding chemicals in separate receptacles until required for use. Two inverted vessels, A A', are mounted on a frame, E', over a common reservoir, C. The mouths of the bottles are closed by stoppers *a*, which are held in place by the fusible solder *f* between them and the outer serrated edges of the mouths B B'. The vessels hold the chemicals necessary to the formation of a fire-annihilating gas, and do not discharge their contents into the reservoir C, filled with water, until the requisite temperature fuses the solder which confines the stoppers.

Claim.—1. In an automatic fire-annihilator, inverted vessels sealed with a fusible composition and supplied with chemicals, which, when united, form a fire-extinguishing gas or vapor, and a

254,028.

Claim.—1. The combination, with the two crank-shafts B B', arranged at different angles, as described, and the paddle-uprights F, journaled therein, of the connecting-rods M M, attached re-



254,035. SLEEVE OR OTHER BUTTON. SAMUEL MOORE, Providence, R. I., assignor to Frank Buffington, same place. Filed June 13, 1881. (No model.)

Claim.—1. In an automatic fire-annihilator, inverted vessels sealed with a fusible composition and supplied with chemicals, which, when united, form a fire-extinguishing gas or vapor, and a generating-reservoir to receive the contents of said vessels, substantially as described.

2. In an automatic fire-annihilator, the combination of the vessels A A', having mouths B B', provided with serrated interior surfaces, *d d'*, and flanges *a' a'*, with stoppers *a a*, sealed with fusible composition, and a receiver, C, substantially as described

254,027. BACK ROLL AND SUPPORT THEREFOR FOR LOOMS. LUCIUS J. KNOWLES, Worcester, Mass. Filed July 16, 1881. (No model.)

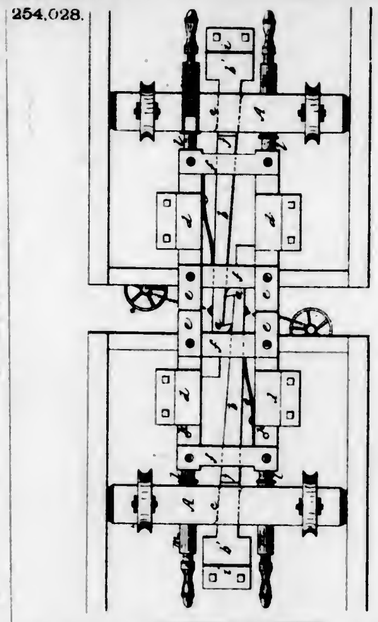
Brief.—The back roll is composed of a hollow metal cylinder having heads inserted in its ends and held in position in the loom by means of a tie-rod passing through it and fastened to the supporting-stands by nuts. The openings through the heads are made flaring on the inside to facilitate the passage of the tie-rod. The supporting-stands are curved so as to extend out over and down between the circles described by the cranks, and are secured at one end to the main frame and at the other to the arch-stands. They are slotted to permit of adjustment forward or back of the roll.

Claim.—1. The combination of back-roll stands or supports D D with tie-rod H, provided with suitable nuts, *e*, heads F F, provided with rims G G, and made with conical-shaped openings upon their inner faces, and shell part or cylinder E', substantially as and for the purposes set forth.

2. The combination of back roll, E, provided with heads F F, and tie-rod H, back-roll stands or supports D D, and the loom-sides *a* and arch-stands *b* of the frame of a loom, constructed and arranged substantially as shown and described, for the purpose stated.

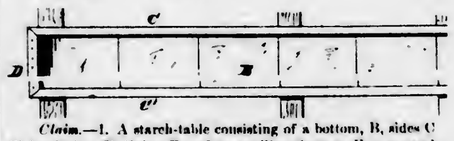
254,028. CAR-COUPLING. ELIAS LARNER, Germantown, N. Y. Filed Dec. 22, 1881. (No model.)

Claim.—1. The combination, with the fixed cross-timber A, of the cushioned pins *l l*, secured therein, the hook-bar *b b'*, also secured therein, the stop *i*, and the bumper-frame, the latter supporting said hook-bar and having a sliding movement over and independent of it, and the said hook-bar having a sliding movement within the bumper-frame and independent of it, substantially as described, for the purpose specified.



2. The combination, with the fixed cross-timber A, of the cushioned pins *l l*, secured therein, the hook-bars *b b'*, also secured therein, the stop *i*, and the bumper-frame, consisting of the side bars, *e e*, and the cross-bars *f f* pivoted together, whereby, although connected, each side bar is free to have a limited movement independent of the other against their cushioned pins, substantially as described, for the purpose specified.

3. The bumper-frame consisting of the side bars, *e e*, and the under cross-bars, *f f*, in combination with the hook-bar arranged between the side bars and supported upon the cross-bars, and the fixed mortised cross-timber A, supporting the cross-head end of said hook-bar and forming the draft-abutment therefor, substantially as herein set forth.

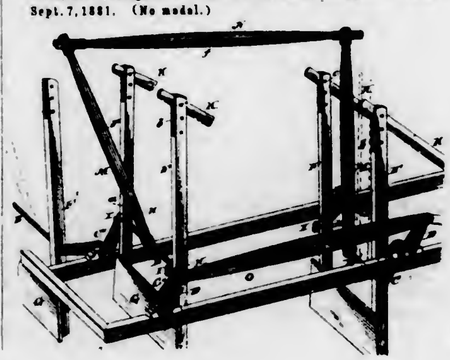


4. In combination, the bumper-frame having the stops *k k*, the fixed guides *d d*, the hooked cross-head bar having the rib *j*, the mortised cross-timber A, the separate cushioned pins *l l*, and the stop *i*, substantially as described, for the purpose specified.

5. In combination, the hooked cross-head bar *a b*, the fixed mortised cross-timber A, the bumper-frame *e f*, its guides *d d*, the springs *g g*, the cushioned pins *l l*, and the stop *i*, all constructed and arranged substantially as described.

254,028.

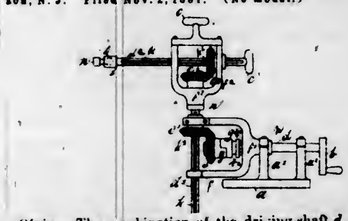
254,029. STARCH-TABLE. CHARLES LAUTZ, Buffalo, N. Y., assignor to Wesp, Lautz Brothers & Co., same place. Filed Dec. 6, 1881. (No model.)



Claim.—1. A starch-table consisting of a bottom, B, sides C C', head-piece D, lining F, and an auxiliary bottom, E, composed of slabs of calcareous or argillaceous stones, substantially in the manner as and for the object specified.

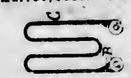
2. A starch-table consisting of a bottom, B, sides C C', head-piece D, lining F, and an auxiliary bottom, E, composed of slabs of calcareous or argillaceous stones coated or saturated substantially in the manner as and for the object specified.

3. In a starch-table, the combination, with the bottom B, of the sides C C', head-piece D, lining F, and the auxiliary bottom E, said auxiliary bottom E being composed of slabs of stone placed upon the lining F in said table, substantially in the manner as and for the object stated.



254,030. CRANK-PADDLE. JULIUS I. LEMONFIELD, Grenville, Miss., assignor to William A. Pollock, same place. Filed Sept. 7, 1881. (No model.)

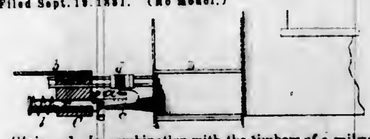
Claim.—1. The combination, with the two crank-shafts B B', arranged at different angles, as described, and the paddle-uprights F, journaled therein, of the connecting-rods M M, attached respectively to the two crank-shafts, and the walking-beam N, jointed to the upper ends of said connecting-rods, as described.



2. The combination, with the crank-shaft B, of the paddle-uprights F, having slots *a*, the sliding block H, carrying the crank-shaft and made adjustable in said slot, and the oscillating rods K, as set forth, and for the purpose described.

254,031. DRILLING-MACHINE. GEORGE W. LONGMAN, Paterson, N. J. Filed Nov. 2, 1881. (No model.)

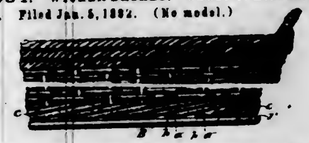
Claim.—The combination of the driving-shaft *d*, adjustable frame *f*, sleeves *f'*, gear-wheels *e e'*, collars *h*, clutch *g*, feathers h^2, standards *a'*, driving-spindle *d'*, provided with a groove, *k*, feathers *k'*, adjustable frame f^2, gear-wheels e^2 e^3, spindle d^3, having groove *k*, collar *i*, socket *l*, chuck *n*, operating-handles *o o'*, bed-plate *a*, and crank *b*, all arranged as shown, operating as and for the purposes set forth.



254,032. ELECTRIC LAMP. HIRAM S. MAXIM, Brooklyn, assignor to the United States Electric Lighting Company, New York, N. Y. Filed Mar. 31, 1881. (No model.)

Claim.—1. In an incandescent electric lamp, the combination, with the conductors sealed therein, of a continuous conductor of carbon gradually enlarged at or near its ends, substantially as and for the purposes set forth.

2. A continuous conductor of carbon for use with an incandescent electric lamp, consisting of the stem C, having enlarged portion A and gradually-tapering portion B, substantially as and for the purposes set forth.



254,033. CAR-COUPLING. RICHARD N. MCKAY, Carlton, N. Y. Filed Sept. 19, 1881. (No model.)

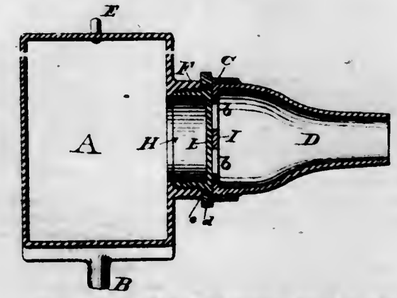
Claim.—1. In combination with the timbers of a railway-car platform a coupling device consisting of a cylindrical part, *r*, with offset-hook *e*, provided with a retroverted part, *c*, and means to turn said hook in its bearing, substantially as described.

2. In combination, the timber C of the platform, and the offset coupling-hook *e*, with retroverted part *c*, said hook being provided with a slot, *r*, substantially as and for the purpose set forth.

254,034. WICKER BASKET. JAMES O. MILLER, Liverpool, N. Y. Filed Jan. 5, 1882. (No model.)

Claim.—The combination of the bottom board, B, having cut out of its upper edge the rabbet *r*, and provided in the inner shoulder of said rabbet with the horizontal holes *a* and *b*, the standards *c*, having their lower extremities bent and inserted in the holes *a*, and the wickers *d* of the bottom braiding having their ends bent around the exterior of the standards *c* and terminating in the holes *b*, the horizontal portion of the rabbet projecting over the base of the basket-body, all constructed and combined substantially in the manner described and shown

254,035. SLEEVE OR OTHER BUTTON. SAMUEL MOORE, Providence, R. I., assignor to Frank Buffington, same place. Filed June 13, 1881. (No model.)



Claim.—1. A sleeve or other button with a shoe fastened to and turning on the end of a hollow post, a spring-actuated link attached to said shoe running through said post and the bottom plate of the button to a spring located in said button, the post being rigidly attached to the bottom plate and slotted its whole length, with the link so attached to shoe at one side of the fulcrum of same on the post that the tension of the spring is made to keep the shoe in its respective positions, substantially as herein described

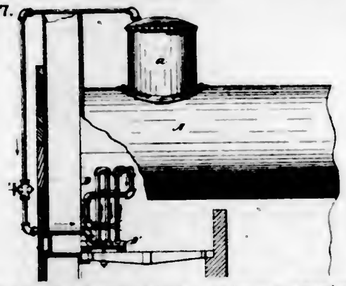
2. The combination, with a button-head having a perforated plate, A', and a post, B, secured thereto and provided with a groove, *b*, and pivots *b' b'*, of a spring, D, located in the button-head, a link, E, connected to said spring, and a shoe provided with a disk, C', pivoted, as described, to the post and to the link.

3. The combination, as before set forth, with a button-head having a perforated plate, A', and a post, B, secured thereto and provided with a groove, *b*, and pivots *b' b'*, located as described, of a spring, D, located in the button-head, a link, E, connected to said spring, and a shoe composed of a shell, C', a disk, C^2, and a disk, C^3, and pivoted, as described, to the post and to the link.

254,036. MEASURING-FAUCET. JOHN C. NORRIS, Crate, Nebr. Filed Nov. 14, 1881. (No model.)

Claim.—1. A box, A, having openings B and E, in combination with the disks L and I, having openings *a a* and *b b*, substantially as shown and described, and for the purpose set forth.

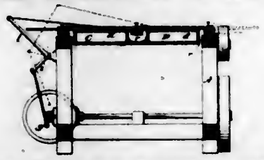
2. The combination of the box A, provided with vent and discharge openings E and B, the nipple H, with disk L, having openings *a a*, stock D, with disk J, having openings *b b*, and coupling or sleeve C, substantially as shown and described, and for the purpose set forth.



3. In a measuring device, the combination of a rotatable box provided with a vent and discharge opening, a nipple attached to said box and having a disk provided with openings, a stock adapted to be attached to a barrel or other vessel and provided with a perforated disk, and a coupling connecting said stock and nipple, whereby the measuring-box is adapted to be rotated so as to cause the openings in said disks to coincide and permit the passage of liquids or other materials to the interior of the box when the discharge-opening is turned upward and escape therefrom when said opening or spout is turned down, substantially as described.

254,037. SMOKE-CONSUMER. CARUTH OLSON, Chicago, Ill., assignor of one-half to the Tobey Furniture Company, same place. Filed Oct. 25, 1881. (No model.)

Claim.—1. The steam-heater D, in combination with the shoe D', attached to the grate-bars of the furnace, and the boiler A, between which and the furnace-wall the upper end of the heater is held, substantially as described.



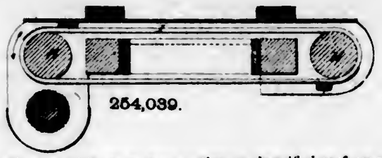
2. An apparatus for consuming or preventing smoke, consisting of a single steam holder or receiver, D, arranged within the furnace and at one corner of the draft end thereof, and provided with a horizontal fan-jet nozzle, D^2, extending diagonally from the receiver and arranged just above the bed of coals, whereby the steam is superheated and then delivered in an unbroken horizontal sheet just over the coal-bed, but not in contact therewith, substantially as and for the purpose set forth.

254,037.

3. In combination with the fire-box of a furnace, a superheater, steam-pipes for supplying said superheater, a discharge-pipe attached to said superheater, having a horizontally-slotted nozzle arranged a little above the grate, and adapted to discharge an unbroken and a continuous sheet of steam horizontally over practically the whole fire, substantially as described

254,038. MIDDLINGS-PURIFIER. THOMAS B. OSBORNE, New Haven, Conn. Filed Dec. 19, 1881. (No model.)

Claim.—1. The combination of a receiver arranged and operated to agitate the ground material passing thereon, one or more plates arranged substantially parallel with the surface of the moving material and so as to present an electrified surface to the passing material, guides for said plates arranged transversely across the receivers, and mechanism, substantially such as described, to impart to said plates a reciprocating movement, substantially as described.



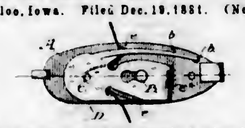
2. The combination of a receiver arranged and operated to agitate the ground material passing thereon, one or more plates arranged substantially parallel with the surface of the moving material and so as to present an electrified surface to the passing material, guides for said plates arranged transversely across the receivers, mechanism, substantially such as described, to impart to said plates a reciprocating movement, and brushes to electrify the working-surface of the said plates, substantially as described.

3. The combination of a receiver arranged and operated to agitate the ground material passing thereon, one or more plates arranged substantially parallel with the surface of the moving material and so as to present an electrified surface to the passing material, guides for said plates arranged transversely across the receivers, mechanism, substantially such as described, to impart to said plates a reciprocating movement, and strippers to take the particles from the plate which have been attracted to it in its passage over the moving material, substantially as described.

4. The combination of a receiver arranged and operated to agitate the ground material passing thereon with one or more plates arranged substantially parallel with the surface of the moving material and so as to present an electrified surface to the passing material, guides for said plates arranged transversely across the receiver, and mechanism, substantially such as described, to impart to said plates a reciprocating movement, the said guides made adjustable, whereby the position of the reciprocating plates relative to the material over which they pass may be adjusted, substantially as described.

5. The combination of a receiver arranged and operated to agitate the ground material passing thereon, one or more plates arranged substantially parallel with the surface of the moving material and so as to present an electrified surface to the passing material, guides for said plates arranged transversely across the receivers, mechanism, substantially such as described, to impart to said plates a reciprocating movement, and brushes to electrify the working-surface of the said plates, said brushes made adjustable with relation to the plates, substantially as described.

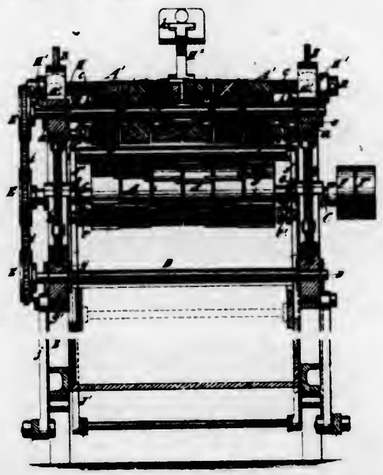
254,039. MIDDLINGS-PURIFIER. THOMAS B. OSBORNE, New Haven, Conn. Filed Dec. 19, 1881. (No model.)



254,039.

Claim.—1. The combination of a receiver for the ground material, arranged and operating to agitate the ground material passing thereon, with one or more stationary electrified surfaces above the surface of the ground material passing in the receiver, substantially as described.

2. The combination of a receiver for the ground material, arranged and operating to agitate the ground material passing thereon, with one or more stationary electrified surfaces above the surface of the ground material passing in the receiver, and a brush or brushes, *e*, arranged to travel on the working-surface of said plates between that surface and the ground material, substantially as and for the purpose described.



3. The combination of a receiver for the ground material, arranged and operating to agitate the ground material passing thereon, with one or more stationary electrified surfaces above the surface of the ground material passing in the receiver, with a stripper or strippers arranged to travel between the surfaces of the ground material and the electrified surface of the plates to take from the surface of the plates the particles attracted thereto and carry them to a receptacle, substantially as described.

254,040. SEWING-MACHINE SHUTTLE. WINSLOW E. PARSONS, Waterloo, Iowa. Filed Dec. 19, 1881. (No model.)

Claim.—In a sewing-machine shuttle having its lid hinged at its forward end, the lid A, provided with the adjusting-screw hole *a*, depressions *c c*, hole *b*, and the pin C, in combination with the tension-spring D, provided with the slots *d d'*, points *d'' d'''*, the finger *b'*, hole *c*, bent end *c'*, and the adjusting-screw B, all constructed and combined to operate substantially as and for the purpose set forth.

254,041. FELTING-MACHINE. AUGUSTE PALISSE, Newark, N. J., assignor to John T. Waring, New York, N. Y. Filed Nov. 23, 1881. (No model.)

Claim.—1. In a felting-machine, a felting-roller the periphery of which is capable of being extended or contracted lengthwise, substantially as specified.

2. A felting-machine comprising two or more felting-rollers capable of being extended or contracted lengthwise, substantially as specified.

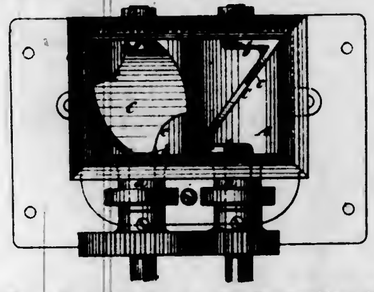
3. In a felting-machine, a felting-roller composed of sections capable of approaching and receding from each other in the direction of the length of said roller, substantially as specified.

4. The combination, in a felting-machine, with a roller or rollers composed of sections capable of movement toward and from each other in the direction of the length of the roller or rollers, of mechanism for producing such movement, substantially as specified.

5. In a felting-machine, the combination of a roller-shaft, sleeves mounted thereon and movable longitudinally thereof, roller-sections fitted to said sleeves, and mechanism for moving said sleeves toward and from each other, substantially as specified.

6. The combination, with the roller-shaft, of the sleeves *b*, provided with oblique flanges *c*, the cams *c'*, and the roller-section adapted to be moved by the longitudinal movement of said sleeves, substantially as specified.

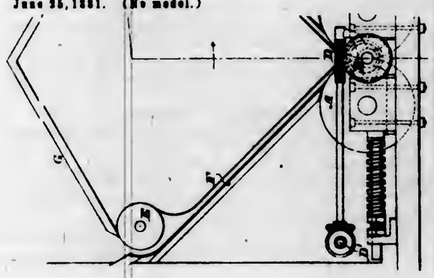
7. In a felting-machine, the combination of the lower rollers and the rising and falling upper roller or rollers, of a back roller for preventing the rolls being felted from being thrown out at the back of the machine, substantially as specified.



8. In a felting-machine, the combination of the lower rollers, the rising and falling upper roller or rollers, the back roller, and mechanism for adjusting it toward and away from the felting-rollers, substantially as specified.

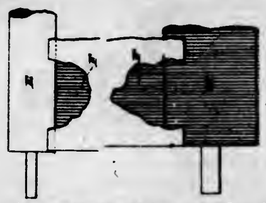
9. In a felting-machine, the combination, with the two lower felting-rollers, the rising and falling upper roller or rollers, and a shaft below said lower rollers, having its bearings connected with those of the upper roller or rollers, of wheels upon said rollers and shaft, and a chain or band passing around all said wheels for imparting rotary motion from one wheel to all the others, substantially as specified.

10. The combination of the three roller-shafts C C C', the shaft D, the rods A, connecting the bearings of the shafts C' and D, the wheels E, and the chain or band *i*, and the treadle and rods for raising the shafts C' and D, substantially as specified.



11. In a felting-machine, the combination of the upper rising and falling roller, A, the rock-shaft H, the levers H', and the lever H'' and weight *k*, substantially as specified.

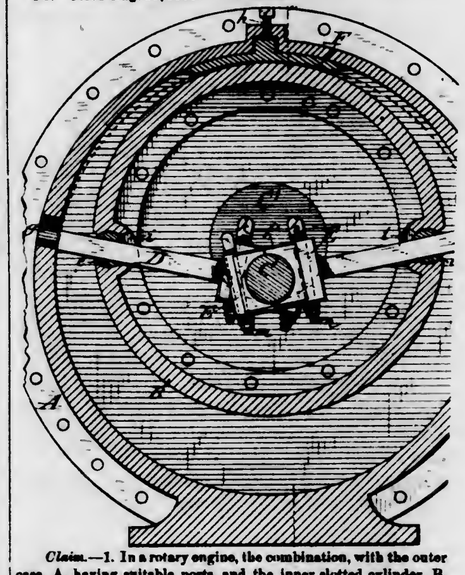
254,042. KNEADING AND MIXING MACHINE. PAUL PELNIDERRE, Norwood, County of Surrey, England. Filed Feb. 10, 1880. Patented in England Dec. 31, 1878, in France June 30, 1879, in Belgium July 7, 1879, in Austria Nov. 11, 1879, in Italy Jan. 31, 1880, and in Germany Aug. 13, 1880.



Claim.—The combination, in a kneading-machine, with a trough or case, of blades adapted to rotate therein, and composed of elliptical or ellipse-like disks set obliquely to their axes of rotation and having gaps *e* in their perimeters, substantially as specified.

254,043. ROLLER-MILL. HENRY H. POMEROY, Madison, Wis., assignor of one-third to Charles E. Hall, same place. Filed June 25, 1881. (No model.)

254,043.

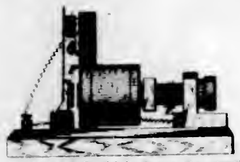


Claim.—1. The combination of two grooved grain-splitting rolls having intervening sharp-edged projections or cutting-edges passing or overlapping each other and not opposite each other, the rolls being adapted to be revolved at a uniform speed for splitting kernels of wheat or like grain longitudinally without grinding them, substantially as described.

2. The combination of the corrugated grain-delivery apron F and the grooved rolls, constructed and operating substantially as set forth.

3. The combination of the apron G, the feed-roll E, the inclined corrugated apron F, and the grooved rolls A A, substantially as set forth.

254,044. ROTARY ENGINE. HENRY W. PETTIS, Titusville, Pa. Filed Aug. 29, 1881. (No model.)

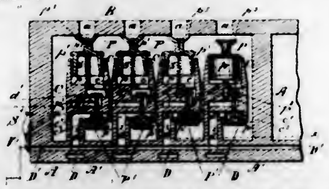


Claim.—1. In a rotary engine, the combination, with the outer case, A, having suitable ports, and the inner slotted cylinder, B, journaled eccentrically within said case and provided with adjustable pistons D D, of a fixed pin for the attachment of the piston-boxes, said pin consisting of the shaft C, concentric with the outer case and having an enlarged eccentric head, C', concentric with the inner cylinder, said head C' being detachably connected with the outer case and adapted to form a bearing for one head of the inner cylinder, substantially as shown and described.

2. In a rotary engine, the combination of the outer chambered case, A, having ports *g g*, inner slotted cylinder, B, journaled eccentrically within said case, fixed crank-pin C, having an eccentric head or bearing, C', adjustable pistons D D, journaled on the shaft of said pin concentrically with the outer case and eccentrically with the inner cylinder, and the adjustable plate or abutment F, arranged at the upper chambered portion of the outer case, substantially as shown and described

254,045. ELECTRO-MAGNETIC RELAY. CHARLES A. RANDALL, New York, N. Y. Filed Apr. 5, 1880. (No model.)

Claim.—1. The combination, in an electro-magnetic relay, of the elastic or spring arm constituting one terminal of the apparatus, the carbon or other suitable button constituting the other terminal, and with which the elastic arm is in permanent contact, an elec-

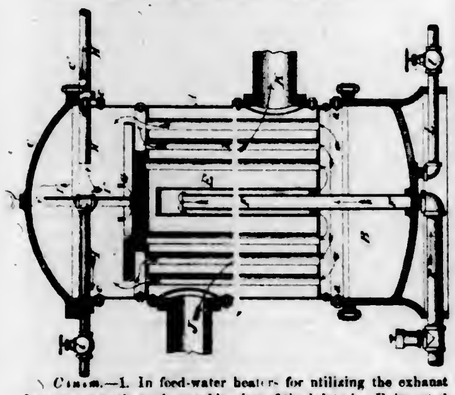


254,045.

tro-magnet the attraction of which draws the elastic arm against the carbon button, and suitable electrical connections whereby the terminals may be held in contact with a varying force and the current correspondingly varied, the spring-arm affording the proper elasticity of contact, substantially as and for the purpose set forth.

2. The combination, in an electro-magnetic relay, of the elastic or yielding lever, a suitable fixed terminal or button in permanent contact with the lever, an electro-magnet which draws the lever against the fixed terminal, and a screw for adjusting the magnet, substantially as and for the purpose set forth.

254,046. PNEUMATIC ACTION FOR ORGANS. MORITZ REITER, Berlin, and GUSTAV SANDER, Breslau, assignors to Oswald Dinse and Paul Dinse, Berlin, Germany. Filed Dec. 1, 1881. (No model.)



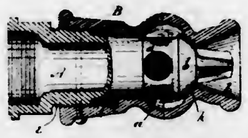
Claim.—1. In wind-instruments of the class described, the combination, with the wind-chest, its air-ducts *a*, *a'* *d* D, and *d*² *d*³ D', and the valves V V', of the double valves P P", all constructed and arranged for operation substantially as and for the purpose specified.

2. The combination of the wind-chest, its air-ducts *a*, *a'* *d* D, *d*² *d*³ D', and the valve-casings C, of the valves P P' and V V', all arranged for operation substantially as and for the purpose specified.

3. The combination of the wind-chest, its air-ducts *a*, *a'* *d* D, *d*² *d*³ D', and the valve-casings C, open at one end and having ports *c c'* *c*², of the valves P P", each provided with a valve-head, *p*', and a valve-flange, *p*', and the valves V V', all arranged for operation substantially as and for the purpose specified.

4. In a wind-chest for musical instruments of the class described, a valve-casing having a hollow cylindrical body, open at one end to form a valve-seat, and ports *c c'* *c*², and air-ducts *d d'* *d*² *d*³, in combination with the valves P P', all constructed, arranged, and operating substantially as and for the purpose specified.

254,047. FEED-WATER HEATER. EDWIN REYNOLDS, Milwaukee, Wis. Filed Dec. 1, 1881. (No model.)



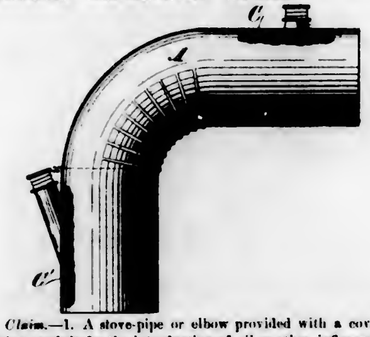
Claim.—1. In feed-water heaters for utilizing the exhaust from steam-engines, the combination of the inlet-pipe F, inverted descending pipe E, and settling-chamber B, substantially as and for the purpose described.

2. In feed-water heaters for utilizing the exhaust from steam-engines, the combination of the tubes D D D, deposit-pan G, and removable cap C, substantially as and for the purpose described.

3. In feed-water heaters for utilizing the exhaust from steam-engines, the surface blow-off I I' I', arranged in the head of the heater, in combination with the deposit-pan G, substantially as and for the purpose described.

254,048. HOSE-NOZZLE. FREDERICK W. ROBERTSHAW, Pittsburg, Pa. Filed Oct. 3, 1881. (No model.)

Brief.—The central conical valve, which has its seat within the shell, is adjustable axially and controls the only outlet for the water.



Claim.—1. A hose-nozzle constructed with a central conical valve and a surrounding conical valve-seat, the adjacent surfaces of both valve and valve-seat converging toward the discharge end of the nozzle, said valve-seat being formed in a shell placed around the central valve and confining the discharge to the space between the valve and seat, substantially as described.

2. A hose-nozzle constructed with a central conical valve and a surrounding conical valve-seat, the adjacent surfaces of both valve and valve-seat converging toward the discharge end of the nozzle and adjustable to and from each other axially, substantially as described.

3. In a hose-nozzle, the piece A, having lateral openings *a* and solid plug *b*, in combination with the movable outer shell, B, having internal enlargement, *h*, and convergent discharge-surface *k*, substantially as described.

4. The combination of piece A, threaded externally and having part of its thread cut away, with shell B, provided with set-screw *m*, substantially as specified.

254,049. STOVE-PIPE. EDGAR ROBINSON, Cincinnati, Ohio, assignor, by mesne assignments, of one-half to Guy Webber, same place. Filed Jan. 10, 1882. (No model.)

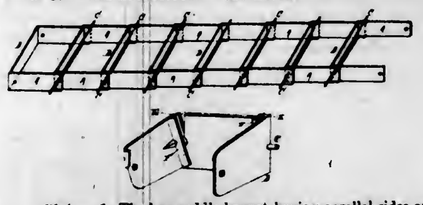
Claim.—1. A stove-pipe or elbow provided with a covered priming-conduit for the introduction of oil or other inflammable material, as and for the purpose specified.

2. A priming device formed on a stove-pipe, consisting of the covered priming-hole and a spreading-plate, C, arranged upon the inside of the pipe, under the priming-hole, substantially as herein set forth.

3. A priming device in a stove-pipe, consisting of a priming-hole, a surrounding screw-cap, and a spreading-plate attached to the interior of the pipe, under said priming-hole, said plate being attached so as to spread the oil over the interior sooty surface of the pipe, substantially as herein set forth.

254,050. COOKING APPARATUS. EDGAR ROBINSON, Cincinnati, Ohio. Filed Nov. 21, 1881. (No model.)

Claim.—1. A cooking apparatus composed substantially of the water-boiler A and one or more cooking-vessels, B, having the outside sectional supply-pipes, E, and a secondary intersecting supply-pipe, G, substantially as herein set forth.

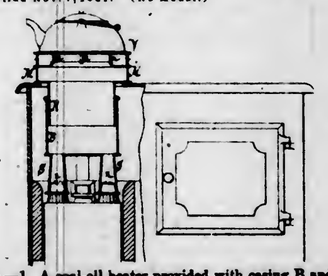


2. A cooking apparatus composed substantially of water-boiler A, cooking-vessels B, having the outside supply-pipe, E, and a secondary intersecting supply-pipe, G, extending below the false bottom C and terminating near the real bottom *c*, so as to form the water seal, substantially as set forth.

254,050.

3. The sectional removable cooking-pan B, having a permanent outside supply-pipe, E, and the intersecting supply-pipe G, projecting into pipe E, substantially as described.

254,051. CHAIN-PROPELLER. JAMES M. ROGER, Tarrytown, N. Y. Filed Nov. 21, 1881. (No model.)

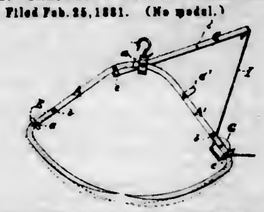


Claim.—1. The box paddle-bucket having parallel sides and an end or cross piece substantially at right angles with said sides, of equal width therewith, and having an axle-projection on each side close to the junction of the parallel sides with the cross piece or end, said axle-projections being located midway between top and bottom of the bucket, substantially as shown and described.

2. The chain of paddles herein described, consisting of buckets having side wings at right angles to the float, and projections extending from the ends of the float or side of the arms, to which projections the succeeding buckets are pivoted about midway of their height, thereby forming a series of inclosures composed wholly of the buckets and side pieces, substantially as described.

3. In combination with the wheels D D, the chain of paddles herein described, consisting of buckets having side wings at right angles to the float and projections extending from the ends of the float or side of the arms, to which projections the succeeding buckets are pivoted about midway of their height, thereby forming a series of inclosures composed wholly of the buckets and side pieces, said chain of paddles being mounted upon the wheels, and the whole constructed and arranged to operate substantially as herein shown and described.

254,052. COAL-OIL HEATER. JARED S. ROWLAND, Jamaica, N. Y. Filed Nov. 7, 1881. (No model.)

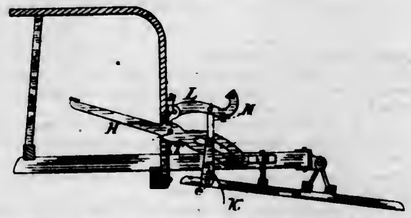


Claim.—1. A coal-oil heater provided with casing B and adjustable hollow cylinder R, sliding on said casing and carrying a drum, M, substantially as and for the purpose set forth.

2. A coal-oil heater provided with casing B and adjustable hollow cylinder R, carrying the drum M and stand V, substantially as and for the purpose set forth.

3. A coal-oil heater provided with chimneys S, casing B, and adjustable hollow cylinder R, carrying the drum M and stand V, substantially as and for the purpose set forth.

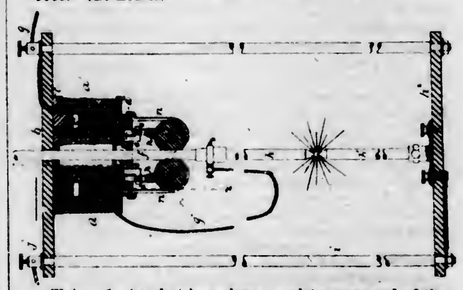
254,053. GRAPPLE HAY-FORK. GEORGE RUSSELL, Palmyra, Wis. Filed Feb. 25, 1881. (No model.)



Claim.—1. The fork-heads A A', formed of metallic bars, bent or shaped as shown and described, and pivoted on a central assembling-pin, *a*, in combination with the adjustable teeth B B', the whole operating to form a grapple hay-fork, substantially as described and set forth.

2. The fork-teeth B B' and the fork-head A A', adjustably combined together by means of the pivot-pins *b*, sliding plates or clamps E, and set-screws *e*, substantially as described and set forth.

3. The lever C, provided with a transverse pin, *c'*, near its central part, arranged to be engaged by an automatic spring-latch, C', secured to the central bar, F, of the rake-head, so as to hold or release the parts as required by the operation of the fork, substantially as described and set forth.



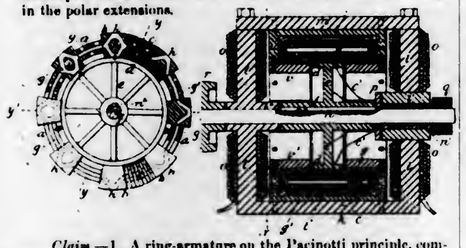
254,054. CORN-PLANTER. ANDREW RUSSTETLER, Dayton, Ohio, assignor to the Farmers Friend Manufacturing Company, same place. Filed Sept. 10, 1881. (No model.)

Claim.—1. In a corn-planter having the rear frame mounted on driving-wheels, to which is pivoted a front runner-frame, the foot-lever L, pivoted to the front of the seat-standard and connected with the rear end of the runner-frame by pendent links for forcing the runners into the ground, in combination with the independent treadle H, also pivoted to the seat-standard for raising the runners from the ground, substantially as described.

2. The foot-lever L, pivoted to the front of the driver's seat, and connected to the rear end of the runner-frame by means of link-connections K M, all substantially as herein set forth.

254,055. ELECTRIC LAMP. GEORGE W. SAWYER, New York, N. Y., assignor to Bernard Lande, same place. Filed Nov. 28, 1881. (No model.)

Claim.—1. An electric-arc-lamp regulator composed of the following instrumentalities in combination: friction guide-pulleys embracing the upper-carbon-holding rod, and the moving core or armature of an electro-magnetic device provided with brake-arms adapted to prevent the rotation of the guide-pulleys and raise them with the carbon-holding rod clamped between them, when the core or armature is acted on by induction from the electric current passing through the coils of the electro-magnetic device, substantially as set forth.



2. In combination with the moving core or armature of an electro-magnet, the brake-arms *n n*, pulleys *l l*, fitted in vertically-sliding bearings, and the carbon rod *f*, substantially as and for the purpose hereinbefore set forth.

3. In combination, the rod *f*, pulleys *l l*, yokes *k k*, having slotted necks, brackets *e e*, having set-screws *e' e'*, and brake-arms *n n*, connected to bar *d'* of the moving cores *d d*, substantially as set forth.

4. The electro-magnetic device composed of the helices *a a'*, fixed connected cores *c' c'*, and movable connected cores *d d*, in combination with the brake-arms *n n*, pulleys *l l*, yokes *k k*, and carbon rod *f*, substantially as set forth.

254,056. DYNAMO-ELECTRIC MACHINE. WILLIAM E. SAWYER, New York, N. Y., assignor to Bernard Lande, same place. Filed Dec. 3, 1881. (No model.)

Brief.—The pole-pieces of the field-magnets nearly surround the cylindrical armature within and without. The armature is cast in one piece, and has air-passages extending through those portions upon which the wire is wound, and having external openings in the polar extensions.

Claim.—1. A ring-armature on the Pacinotti principle, composed of one piece of metal, and having air-passages extending through the parts on which the induced conductor is wound and out at the external periphery of the polar projections, substantially as and for the purpose set forth.

2. A ring-armature on the Pacinotti principle, composed of one piece of metal, and having air-passages extending through the parts on which the induced conductor is wound and out at the external and internal peripheries of the polar projections, substantially as and for the purpose set forth.

3. A ring-armature core composed of the parts *a a* and polar extensions *b*, having air-passages *g g* and openings *h h*, in combination with the conductor *c*, wound on the parts *a a*, substantially as set forth.

4. A ring-armature core having the polar projections *b b*, depressions *a a*, for the reception of the conductor *c*, the air-passage *g g*, openings *h h* in the outside periphery and openings *i i* in the inside periphery of the polar projections *b b*, substantially as set forth.

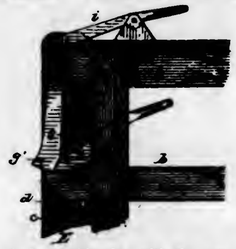
5. The armature composed of a paramagnetic ring with polar projections *b b*, and having air-passages, as described, and an insulated electric conductor wound thereon between the polar projections, in combination with the diamagnetic wheel *d e f*, substantially as set forth.

6. A frame for dynamo-electric machines, composed of a base-plate, *k*, and side pieces, *l l*, having bearing *l' l'* in their center for the armature-shaft *a*, and forming cores for the coils of the field-magnets *o o*, substantially as described.

7. In combination with the frame *k l l m*, the grooved curved poles *s s'*, substantially as set forth.

8. In combination, the frame *k l l m*, poles *s s'* having side flanges, *u u'*, and the curved plates *v v'*, substantially as described.

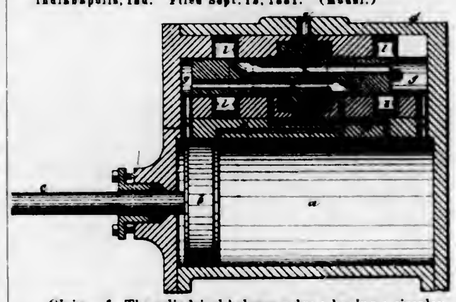
9. In a dynamo-electric machine, the ring-armature *a b c*, diamagnetic wheel *d e f*, poles *s s'*, frame *k l l m*, field-armature coils *o o* on the side pieces, *l l*, and bearings for the armature-shaft in the center thereof, substantially as set forth.



10. A ring-armature core composed of the parts *a a* and polar extensions *b*, having air-passages *g g* and openings *h h*, in combination with the deflectors *i i*, substantially as set forth.

254,057. MARKING-TAG. STEPHEN D. SHATTUCK, Cohoes, N. Y. Filed Dec. 31, 1881. (No model.)

Claim.—As an improved article of manufacture, a double hook, to be used in suspending articles exposed for sale, and which is provided with an eye or bend near its center, into which the tag is made to catch, substantially as shown.



254,058. LATCH FOR SLIDING GATES. ISAAC S. SHERWIN, Battle Creek, Mich. Filed Nov. 10, 1881. (No model.)

Claim.—1. In combination with the gate-post E, provided with a transverse pin, *d*, and with a drop-pawl, *g*, a sliding gate provided with a projecting tapering beveled rail, *b*, which rides over the pin *d* and engages with the pawl *g*, the gate being further provided with the connected levers *h i*, adapted to unlock the gate by tripping the pawl, substantially as specified.

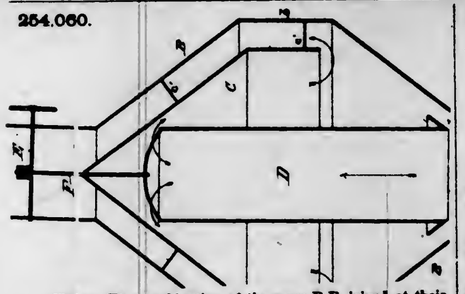
2. The slotted gate-post E, provided with a pivoted drop-pawl, *g*, and a transverse pin, *d*, in combination with a sliding gate provided with the projecting tapering beveled rails *a b*, and the lever *h*, whereby the gate may be secured either in a horizontal position or with one end raised, substantially as and for the purpose set forth.

254,059. STEAM-ACTUATED VALVE. ALONSO J. SIMMONS, Indianapolis, Ind. Filed Sept. 13, 1881. (Model.)

Claim.—1. The cylindrical balance-valve *s*, having a circular recess, *t*, and beveled sides, and provided with the opposite cylindrical valve-stems, *u*, having annular recesses *v w*, and angular main steam and exhaust passages *x x'*, substantially as described, and for the purpose set forth.

2. The cylindrical steam-chest *d*, provided with the opposite cylindrical valve-stem seats, *g g*, having annular exhaust-ports *l l*, annular steam-passages *o*, annular central chamber, *h*, between the valve-stem seats, and valve-chambers *h'*, substantially as described, and for the purpose set forth.

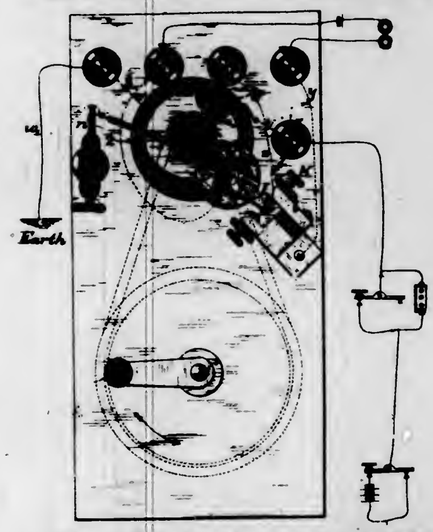
3. The combination, with the cylindrical balance-valve *s*, having opposite valve-stems, *u*, all constructed as set forth, of the cylindrical steam-chest *d*, provided with the opposite valve-stem seats, *g g*, ports *l l*, annular steam-passages *o*, annular steam-chamber *h*, and valve-chambers *h'*, substantially as described, and for the purpose set forth.



4. The combination, with the automatic cylindrical balance-valve *s*, having opposite valve-stems, *u*, and main steam and exhaust passages *x x'*, of the steam-cylinder *a* and angular steam-passages *p p'*, whereby the valve is automatically reciprocated, substantially as described, and for the purpose set forth.

5. The combination, with the steam-chest *d*, provided with annular exhaust-ports *l l*, of the valve *s* and valve-stems *u*, having the angular passages *x x'*, connecting alternately with both opposite exhaust-ports at the same time, substantially as described.

6. The combination, with the cylindrical steam-chest *d*, provided with opposite cylindrical valve-stem seats, *g*, annular chamber *h*, valve-chambers *h'*, and balance-valve *s*, having valve-stems *u*, all constructed as set forth, of the steam-cylinder *a*, provided with the piston *b* and rod *c*, and angular steam-passages *p p'*, leading from the steam-chest to the cylinder, substantially as described, and for the purpose set forth.



254,060. HEATING-DRUM. ALEXANDER STARK, Merrillan, Wis. Filed Feb. 21, 1881. (No model.)

254,060.

Claim.—The combination of the cones B B, joined at their bases to the section *b*, and the cone C, arranged within the upper cone, B, with the straight funnel D, connecting-rod F, and crank-shaft E, all arranged to operate substantially as and for the purpose set forth.

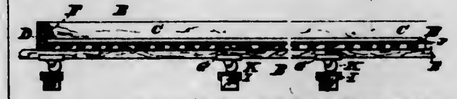
254,061. TELEGRAPHIC RECEIVING-INSTRUMENT. GRANITT SMITH, Astoria, N. Y. Filed Dec. 29, 1881. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, of a rotating cylinder of magnetic metal, a magnetizing-coil acting upon said cylinder, an armature maintained in permanent magnetic contact with the moving surface of said cylinder and capable of receiving motion therefrom by friction, a retractor exerting a constant force upon said armature in a direction opposed to that derived from its frictional contact with the moving cylinder, and fixed stops for limiting the movements of the armature in each direction.

2. The combination, substantially as hereinbefore set forth, of a rotating cylinder of magnetic metal, a magnetizing-coil acting upon said cylinder, an armature maintained in permanent magnetic contact with the moving surface of said cylinder and capable of receiving motion therefrom by friction, a retractor exerting a constant force upon said armature in a direction opposed to that derived from the moving cylinder, an electric circuit including said magnetizing-helix, and a key or transmitter in said circuit for alternately increasing and decreasing the strength of the current traversing said circuit.

3. The combination, substantially as hereinbefore set forth, of a rotating cylinder of magnetic metal, a magnetizing-coil acting upon said cylinder, an armature maintained in permanent magnetic contact with the moving surface of said cylinder and capable of receiving motion therefrom by friction, a retractor exerting a constant force upon said armature in a direction opposed to that derived from the moving cylinder, and an independent circuit traversed by an electric current which is controlled by the movements of said armature.

254,062. FIRE-PLACE GRATE. LUTHER H. SMITH, Pittsburg, Pa. Filed June 28, 1881. (No model.)



Claim.—1. The fore plate, *b'*, having slit *i* and notch *i'*, in combination with socketed shaker-stem *e* and handle *n*, having pin *n'* and test *n²*, substantially as set forth.

2. In combination with a grate set back from the fire-front, a horizontal fore plate, *d*, having a register therein, front plates, *b' b²*, and fender *b*, making a close front, substantially as set forth.

3. The vertical plates *m m*, having lugs *e e'*, in combination, by bolt and nut *z*, with fore plate, *d*, substantially as set forth.

254,063. STARCH-TABLE. RICHARD J. STARK, Buffalo, N. Y., assignor to Wasp, Lauts Brothers & Co., same place. Filed Dec. 6, 1881. (No model.)

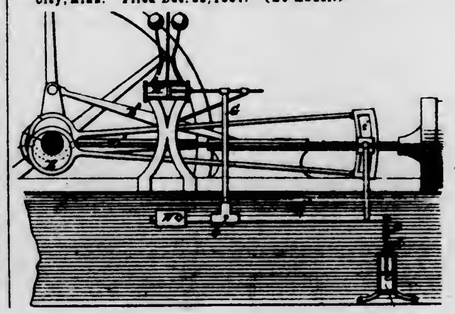
Claim.—1. A starch-table composed of a bottom, B, sides C C', end pieces, D, and an auxiliary bottom, E, placed above the true bottom B, substantially as described, for the object specified.

2. A starch-table composed of a bottom, B, sides C C', end pieces, D, lining or sheeting F, and an auxiliary bottom, E, placed above the lining F and bottom B, substantially as and for the object stated.

3. In starch-tables, an auxiliary bottom, E, placed upon the true bottom B, substantially as described.

4. In starch-tables, a device for instantly raising and lowering, consisting, in combination with the bottom B, of plates G, having lugs H H', a cam-disk, K, provided with means, substantially as described, for rotating said disk, and a base-plate, I, substantially in the manner as and for the object specified.

5. The improved starch-table hereinbefore described, consisting of a bottom, B, sides C C', end piece, D, lining or sheeting F, an auxiliary bottom, E, saturated or coated with materials, substantially as described, and means whereby the said table can be raised and lowered, the whole being constructed for operation substantially in the manner as and for the use and purpose stated.

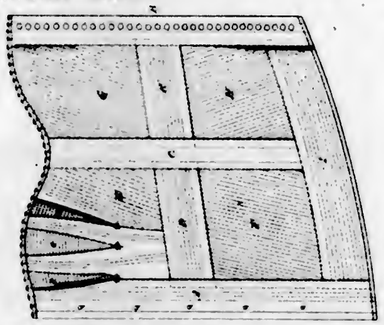


254,064. DYE-STUFF OR COLORING-MATTER. JAMES H. STEBBINS, Jr., New York, N. Y. Filed Jan. 16, 1882. (Specimens.)

Claim.—The blue dye-stuff produced by the action of diethyl-paraphenylendiamine chloride upon an alkaline solution of the soda salt of alpha-naphthol monosulpho-acid in presence of an oxidising agent, substantially as set forth.

254,065. DYE-STUFF OR COLORING-MATTER. JAMES H. STEBBINS, Jr., New York, N. Y. Filed Jan. 16, 1882. (Specimens.)

Claim.—The blue dye-stuff produced by the action of diethyl-paraphenylendiamine chloride upon an alkaline solution of alpha-naphthol in the presence of an oxidising agent, substantially as described.

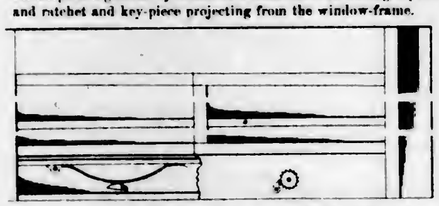


254,066. CUT-OFF-VALVE GEAR. HOYT T. STEVENS, Lake City, Minn. Filed Dec. 28, 1881. (No model.)

Claim.—1. The combination of the auxiliary steam-cylinder, the steam-valves thereof actuated directly by the governor, the balanced levers G' G', connected to the piston-rod of the said cylinder, the adjustable link connected to the lever G', and also to one or two eccentrics on the main shaft, and the dash-pot piston-rod connected to said lever G', substantially as described.

2. In an automatic link-motion of the character substantially as described, the combination of the spring attached to the piston-rod of the dash-pot, the balanced lever G', its connection with the link, and also its lever-connection with the rod of the piston in the steam-cylinder when controlled by the governor, substantially as described.

254,067. CORSET. ISAAC STROUSS, New Haven, Conn. Filed Nov. 9, 1881. (Model.)

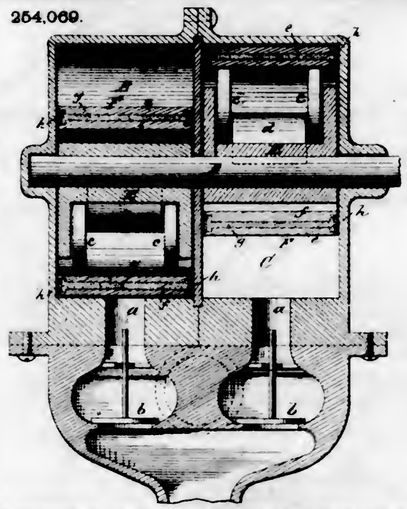


Claim.—1. The herein-described corset, consisting of the front and rear sections, A B, the transverse sections D E', respectively extending from section A to section C, and from section C to section B on the waist-line, combined with the sections E and F between the two sections A C, and respectively above and below the transverse section D and sections G H between the sections C B, and respectively above and below the transverse section E', substantially as described.

2. The herein-described corset, consisting of the front and rear sections, A B, the vertical central stayed section, C, with the transverse sections D and E', stayed longitudinally, and the sections E F G H, introduced between the vertical and waist sections, with the transverse corded section I, extending from the front to rear on the lower edge of the corset, substantially as described.

254,068. WINDOW-FRAME. WILLIAM STORM, Galveston, Tex. Filed Dec. 2, 1881. (No model.)

Brief.—The tension of the springs of the sash-holding vertical strips is regulated by a cam on a transverse rod having a pawl and ratchet and key-piece projecting from the window-frame.

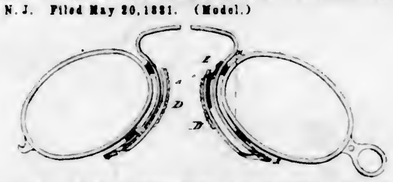


Claim.—The combination, with a window-frame and the sashes thereof, of the movable vertical strips, the flat springs secured thereto, and the cams mounted upon the transverse shafts, the latter being provided with ratchets controlled by suitable pawls, whereby the tension of the springs may be regulated, substantially as specified.

254,069. ROTARY PUMP. JOHN MITCHELL TAYLOR, Hartford, Conn. Filed Aug. 18, 1881. (No model.)

Brief.—An eccentrically-mounted piston revolves upon a shaft within a cylindrical case, carrying rollers *c d*, of different diameters, their peripheries bearing against the interior face of a ring, F, revolving in chambers B and C. Ring F is composed of two sections, *e* and *f*, between which is a packing, *g*, which presses against flat metal rings *h*, keeping them in close contact with the interior of chambers B and C.

Claim.—1. In a rotary pump, the shaft D, having connected thereto crank E, carrying rollers *c d*, in combination with the rings



254,069.

F, consisting of the sections *e f*, packing *g*, and bands *h*, substantially as and for the purpose set forth.

2. In a rotary pump, the combination, with the crank E, carrying rollers *c d*, and ring F, of the cut-off valve G, containing packing *l* and plates *m*, substantially as and for the purpose set forth.

254,070. EYEGLASS-FRAME. FRED TRESTROWE, Elizabeth, N. J. Filed May 20, 1881. (Model.)

Claim.—1. As an improvement in nose-pieces for eyeglasses, a nose-piece adapted to be moved out of the plane of the glasses and fastened in the required position, substantially as herein described.

2. In combination with a nose-piece provided with a suitable device for fastening it in the desired position out of the plane of the glasses, a suitable spring for automatically closing the nose-piece, substantially as herein described.

3. A nose-piece for eyeglasses, having both ends connected with the frame or lenses and adapted to be moved out of the plane of the glasses, in combination with a suitable device for fastening the nose-piece in the required position, substantially as herein described.

4. A nose-piece for eyeglasses, having both ends connected with the frame or lenses and adapted to be moved out of the plane of the glasses, in combination with a suitable device for retaining the nose-piece in the required position and a spring for automatically closing the said nose-piece, substantially as herein described.

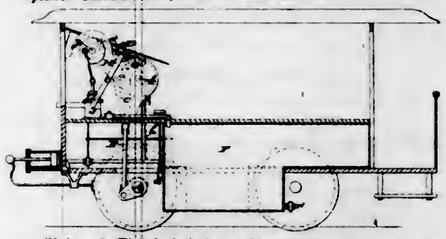
5. In combination with the nose-piece D, provided with the pin *d*, the slotted connecting-link E, provided with a notch, *e*, substantially as described.

6. The combination of the nose-piece D, provided with a spring for automatically closing the same, with the link E, for connecting its swinging end with the frame, lens, or bow-spring, substantially as described.

7. A nose-piece for eyeglasses, adapted to adjust itself axially to the surface it bears against, in combination with a suitable spring to retain it in place and automatically adjust it to a position out of the plane of the glasses, substantially as herein shown and described.

254,071. BOOT. ROBERT THOMPSON, San Francisco, Cal. Filed Aug. 2, 1881. (No model.)

Claim.—1. In a boot, the front thereof and quarters cut in a single piece on parallel perpendicular lines down the sides to the



254,071.

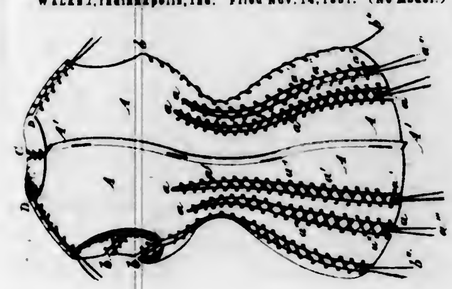
height of the ankle-bone and thence at that height around the heel, in combination with the rear portion, D, as set forth.

2. In a boot, the upper, front of the leg, and quarters formed in a single piece cut on parallel perpendicular lines down the sides to the height of the ankle-bone and thence on that level around the heel, in combination with the rear leg portion, D, and stiffening-piece F, extending up the leg above the quarters, as set forth.

254,072. COMPRESSED-AIR MOTOR. R. STOCKTON TICE, Camden, N. J., assignor of one-half to GIDEON RICHMAN, same place. Filed Nov. 22, 1881. (No model.)

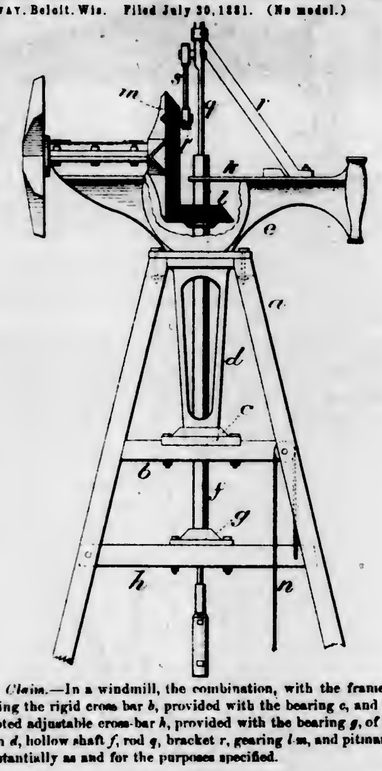
Claim.—1. The shaft A, in combination with the piston-cylinder and connecting-rods, the valve and valve mechanism, the pumps, and the tanks F with the connecting-pipes *a a* G, substantially as and for the purpose set forth.

2. The engine, the pumps, and tanks, in combination with the exhaust-pipes H, leading from the valve of the engine to said pumps, substantially as and for the purpose set forth.



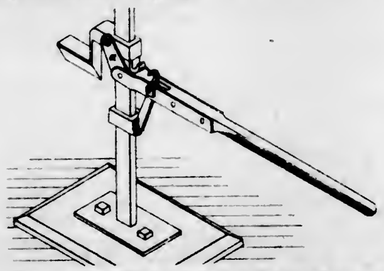
254,073. GATE. WILLIAM H. TOPPER, St. Johns, assignor of one-half to Lawrence A. Lawrason, Fowler, Mich. Filed Oct. 27, 1881. (No model.)

Claim.—1. A gate having a sliding plate, *a*, provided with the fixed pin *c*, in combination with the pins *d* and the spring-latches *p*, the parts being constructed and secured in position substantially as and for the purposes described.



2. In a gate, the sliding plate *a*, having the fixed pin *c*, and moving in guides, in combination with the spring-latch *g*, the vertical pins *d*, pulleys *n*, and spring-latches *p* on platform D, the plate being provided with connections A and *o*, substantially as set forth.

254,074. DRESS CUTTING AND FITTING MOLD. KATE WALKER, Indianapolis, Ind. Filed Nov. 14, 1881. (No model.)

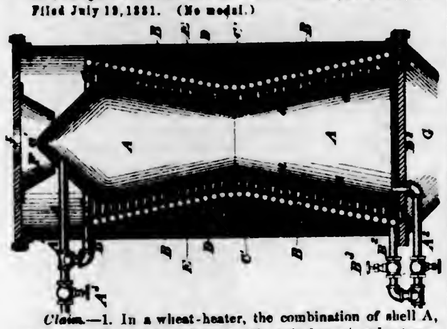


Claim.—A mold for fitting dresses, consisting of a foundation, A, having a front overlapping seam, A', front slits, *a a a a*, in the bottom part of the mold, their edges being provided with lacing-eyelets *a''*, in which are placed lacing-cords *a'''*, curved slits *b b b*, also furnished with lacing-eyelets *b''* and lacing-cords *b'''*, a rear slit, C, extending from the bottom to the top of the mold, furnished with lacing-eyelets and lacing-cords, and shoulder-slits D D, also provided with eyelets and lacing-cords, all substantially as and for the purposes specified.

254,075. WINDMILL. JOHN WARWICK and WALTER C. WHITAWAY, Beloit, Wis. Filed July 30, 1881. (No model.)

Claim.—In a windmill, the combination, with the frame *a*, having the rigid cross-bar *b*, provided with the bearing *c*, and the pivoted adjustable cross-bar *h*, provided with the bearing *g*, of the stem *d*, hollow shaft *f*, rod *q*, bracket *r*, gearing *l m*, and pitman *s*, substantially as and for the purposes specified.

254,076. LIFTING-JACK. JAMES WEATHERS, Indianapolis, Ind., assignor of one-half to John A. Robbins, same place. Filed Jan. 12, 1882. (Model.)

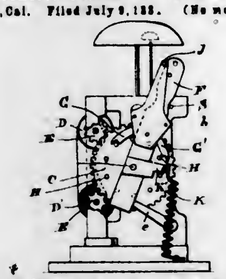


Claim.—1. In a lifting-jack, the combination of the vertical standard, the dog adapted to slide upon the same, the lever fulcrumed thereto, and the slotted bracket adapted to slide upon the standard and connected to the lever by suitable links, the whole arranged to operate substantially in the manner specified.

2. In combination with the standard, the dog, the lever, and the bracket and the engaging-hook on the dog and bracket, substantially as and for the purposes specified.

Brief.—Vertical standards upon a horizontal frame carry a

264,077. WHEAT-HEATER. JAMES E. WELCH, Petersburg, Ill., assignor of one-half to Albert B. Bowman, St. Louis, Mo. Filed July 19, 1881. (No model.)



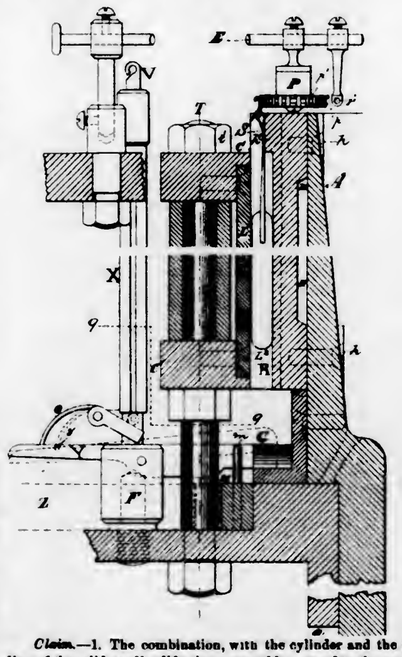
Claim.—1. In a wheat-heater, the combination of shell A, contracted at the waist and formed with conical top *a'*, and a steam-coil, B, surrounding the shell, as set forth, the lower portion of the shell being provided with downwardly-projecting circumferential ribs, the upper faces of which are inclined downward and outward, as and for the purpose set forth.

2. The combination of the shell A, having projections *a*, steam-coil B, conforming thereto, case D, packing E, and induction and eduction pipes A' B' A³ B³, all arranged substantially as and for the purpose set forth.

3. The combination of shell A, ribs *a*, coil-pipe B, annular space C, case D, with hoppers F G, and openings *f g*, packing E, and induction and eduction pipes, for the purpose set forth.

264,078. STATION-INDICATOR. HERMANN J. WEHRLE, San Francisco, Cal. Filed July 9, 1881. (No model.)

Claim.—1. The movable reversing-plate J, pivoted to the lever F, and provided with pins *b b*, adapted to engage with the pawls G G', whereby the movement of the lever F throws said pawls alternately out of engagement, substantially as and for the purpose specified.



2. The combination, with the indicating-rollers D D', having pinions E E, and the wheel C, gearing with said pinions, and provided upon its face with pins H H, of the lever F, having pawls G G' pivoted thereto, and reversing-plate J, pivoted to lever F, and provided with pins *b b*, for engagement with said pawls, whereby the pawls G will alternately engage with the pins H when the lever is moved to the right or left, and thus operate the indicating-rollers, substantially as shown and described.

3. The combination, with the lever F, having lug K', spring K, and pawls G G', provided with lugs *d d*, of the reversing-plate J, having pins *b b*, adapted to engage with the lugs at the ends of the pawls G G' and lift them alternately, substantially as and for the purpose set forth.

4. The triangular piece M, connected to the hammer-shaft L by means of the arm *e*, and operating upon the pin *h* between the two pins upon the face of the wheel C, so that the wheel C will be held in position and be made to strike the gong at the proper time when the position of the indicator is changed, the whole constructed, arranged, and operating substantially in the manner as herein set forth and specified.

264,079. CIRCULAR WEFT-THREAD KNITTING-LOOM. NATHANIEL W. WESTCOTT, Providence, R. I. Filed Aug. 9, 1881. (No model.)

Brief.—The guide or partition plates separating the needles and their jacks are secured in grooves in the needle-cylinder. This construction enables the operator to remove a division-plate when damaged and substitute for it another and a perfect plate. That portion of the needle-cylinder containing the needles is removably secured to the main portion, by which the machine is readily adapted to different grades of work. The toes of the needle-jacks extend through the slot of the cam, and are always in sight and easy of access in the event of their requiring special attention. The cam-slot is of such form as to permit of but one stitch being completed at a time, and during a greater portion of the time in the operation of the machine the needles are held in a half-elevated position, which affords means for the ready repairing of broken threads, &c. The weft-thread is introduced by a notched wheel having a groove extending around its periphery, into which the weft-thread is laid. The filling-thread takes its place behind the needles which rise in the notches of the wheel and in front of those which are pressed out by the beveled projections. The stop-motion consists of a lever latched in elevated position. The thread passes through and sustains a light drop-wire guided in a tube arranged over the latch. Upon the breaking of a thread the wire drops upon the latch and unlocks the lever, the outer end of which falls in the teeth of a ratchet-ring and is carried around, unshipping the belt and stopping the machine.

Claim.—1. The combination, with the cylinder and the needles, of the solid needle-slide ring removably secured to the outside of the cylinder, and the guide-plates secured in vertical grooves in said ring, substantially as set forth.

2. The combination, with the cylinder and the needles, of the solid needle-slide ring H, removably secured to the outside of the cylinder and having shoulder *h'*, and the guide-plates R, secured in vertical grooves in said ring, substantially as described and shown.

3. The combination, with the vertical wires or rods of the stop-motion, of a lever, a latch supporting said lever in an elevated position, and a ratchet-ring engaging said lever when released and operating the shipper, substantially as set forth.

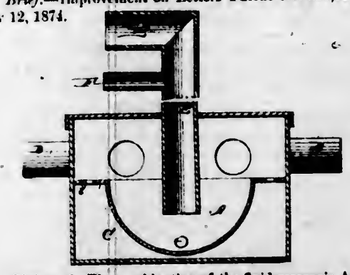
4. The pivoted block F, vertical wires or rods V, and guides therefor, the latch O, lever Y, ratchet-ring G, ring M, and lever Z, substantially as described and shown.

5. The combination, with the cylinder, the needles, the solid needle-slide ring removably secured to the outside of the cylinder, and the guide-plates secured in vertical grooves in said ring, of the cam-plates L' L², forming between them the cam-groove L, and means for supporting said plates with relation to the needles, substantially as described.

6. The combination, with the pivoted block F, lever Y, provided with notch *y*, latch O, and guides X, of the vertical wires V, as and for the purposes set forth.

7. The combination, with the bolts T and rings C C', of the cam-plates L' L², secured to said rings, and the thimble *t* and nuts *t'*, as and for the purposes set forth.

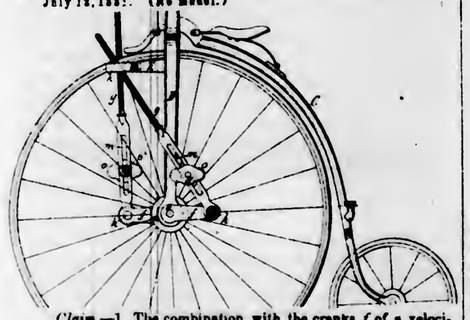
254,080. RAILWAY-POINT AND MANNER OF WORKING THE SAME. HENRY WHITEHEAD and THOMAS DODD, London, England. Filed Aug. 26, 1881. (No model.) Patented in England Apr. 8, 1881.



Brief.—Vertically-moving switch-rails operated through wedge-blocks are actuated by a rock-shaft through connecting crank-arms and links.

Claim.—The combination, with the fixed rails, of the chairs secured to said rails, the movable rails B' and C', received in recesses in the chairs, the rock-shaft M, the wedge-shaped blocks connected with lever-arms upon the rock-shaft, and the links connected with the movable rails and with the said levers, said members being organized and adapted to operate substantially as described.

254,081. AIR COOLING AND PURIFYING APPARATUS. SAMUEL WHITNUM, Brooklyn, N. Y. Filed Sept. 28, 1881. (No model.)

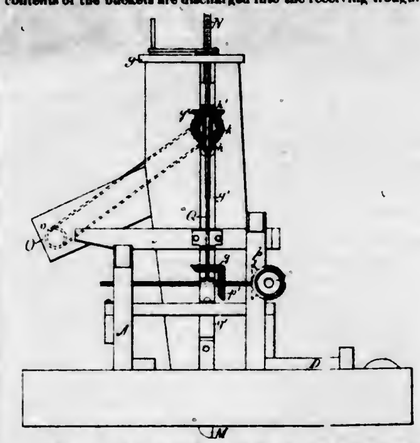


Brief.—Improvement on Letters Patent No. 150,920, dated May 12, 1874.

Claim.—1. The combination of the fluid-reservoir A, the air-chamber C, the blast-pipe E, leading down into the reservoir, the feed-pipe F, located below the elbow of the blast-pipe, the waste and gage pipes, and the pipes for conducting the cooled or charged air out of said air-chamber, substantially as described.

2. Means substantially as described for cooling air and charging it with a watery vapor containing any of the well-known soluble muriates, for the purpose set forth.

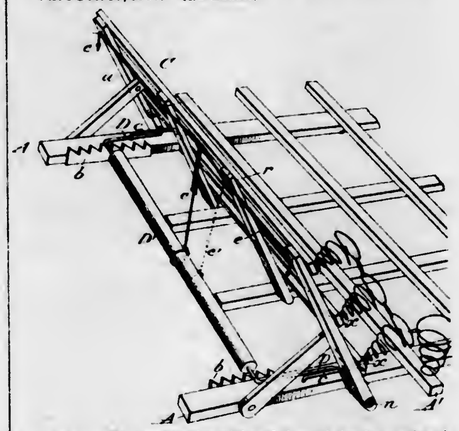
254,082. VELOCIPEDE. GEO. WIARD, Batavia, N. Y. Filed July 13, 1881. (No model.)



Claim.—1. The combination, with the cranks *f* of a velocipede, of rods *g*, attached to said cranks and supported at their upper ends in guides *h*, and treadles *e*, made vertically adjustable on the rods *g*, substantially as set forth.

2. The combination, with the cranks *f*, of the connecting-rods *g*, provided with slots *m*, and adjustable treadles *e*, secured to the rods *g* by set-screws *e²*, substantially as set forth.

254,083. DITCHING AND TILE-LAYING MACHINE. WILLIAM WILSON, Earlville, Ill. Filed May 24, 1880. (No model.)



Brief.—Vertical standards upon a horizontal frame carry a vertically-sliding frame, within which works an endless bucket-chain. The lower upper sprocket-wheel of said frame has lugs which engage projections on the hinged bucket-backs, whereby the contents of the buckets are discharged into the receiving-trough.

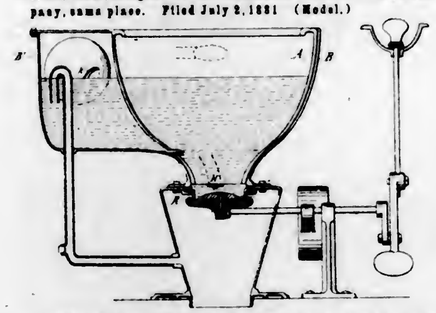
Claim.—1. In a ditching-machine, the combination of the horizontal frame, vertical standard fixed thereto, and vertically-sliding frame H, said sliding frame having a lower and two upper sprocket-wheels carrying a belt and buckets, said upper sprocket-wheels being arranged with the rear lower than the forward and in the described relation to the discharge-spout O, all as set forth.

2. The combination of the buckets M, attached in the chain as described, with the hinged bottom *s'* and spur *s²*, and the projections *j'* on the sprocket-wheel J, substantially as described.

254,084. BED-BOTTOM. DANIEL D. WYMAN, Lockport, N. Y. Filed Dec. 27, 1881. (No model.)

Claim.—The combination of the side bars, A, having ratchets *b* and guides *c*, the rods D, secured by nuts *n*, and the movable head-rest C, connected with said rods by means of suitable cords, and adapted to be raised from the back or sides, substantially as shown and described.

254,085. PLASHED HEDGE. WESLEY YOUNG, Dayton, Ohio. Filed Dec. 16, 1881. (No model.)



Claim.—1. A hedge fence composed of live plants bent down in the plane of the fence and held in place by suitable fastenings, and having a line of wire extending along the base of the plants near the ground, said wire being secured to the plants and operating to prevent the passage through the spaces between the plants of small stock before said spaces have become closed or protected by the growth of the shoots, substantially as described.

2. A hedge fence composed of live plants bent down in the

plane of the fence and held in place by suitable fastenings, and having a horizontal line of wire extending along the upper portion of the plants and secured thereto to give increased lateral strength, and having also a horizontal line of wire extending along and secured to the bases of the plants, for preventing the passage through the spaces between the plants of small stock before said spaces have become closed or protected by the growth of the side shoots, substantially as described.

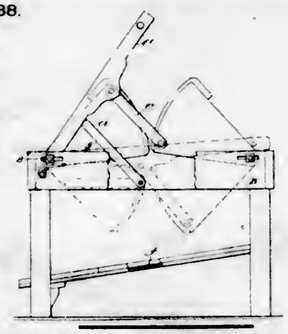
254,086. WATER-CLOSET. ALEXANDER G. ALEXANDER, Detroit, Mich., assignor to the Alexander Manufacturing Company, same place. Filed July 2, 1881. (Model.)

Claim.—In a water-closet, the combination of the bowl A, bowl B, having the passage H cast therein, and valve-seat R, the upper portion thereof being beveled to deflect the stream of water passing through passage H, as and for the purposes described.

254,087. SLEEVE-BUTTON. FREDERICK P. BJORBY, Newark, N. J., assignor to Bjoran Brothers, same place. Filed Jan. 10, 1882. (No model.)

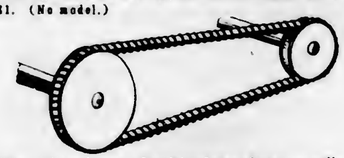
Claim.—1. In a button, the combination, with the slotted shank having a cross-head, *d*, thereon, of a cross-bar pivoted thereon, having a lug, *g*, and a spring secured to the face of the shank engaging with said lug, the whole being arranged and operating substantially as and for the purposes set forth.

2. The combination, in a button, of the slotted shank, the spring secured to the face of said shank, and the cross-bar, having a projecting lug working in said slotted shank and engaging with said spring, all being arranged and operating substantially as and for the purposes set forth and shown.



3. The combination, with the body *a* and shoe *b*, of the slotted shank secured to said body, the cross-bar pivoted on said shank and secured to said shoe, and the spring secured upon the face of the shank and bent backward through the slot therein and bearing forward against the lug, all substantially as and for the purpose set forth and shown.

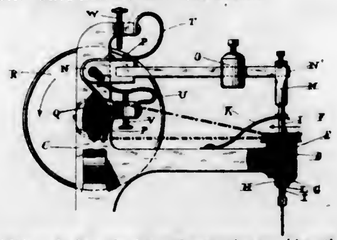
254,088. BUTTER-WORKER. GEO. A. BLANCHARD, Concord, N. H. Filed Nov. 7, 1881. (No model.)



Claim.—1. The movable bed and the pivoted segmental presser connected and adapted to move with it, substantially as described, combined with the handle attached directly to the presser, to operate the said parts in one and then in the opposite direction in unison, substantially as specified.

2. The pivoted segmental presser and handle and movable bed, combined with the links *c*, each pivoted at one end to the presser and at its other end to the bed, to thus cause the presser and bed to travel together in the same direction, substantially as described.

254,088.



254,089. ELASTIC PULLEY-BAND. ARTHUR E. BRIGGS, Road Hill, assignor to Post & Co., Cincinnati, Ohio. Filed Dec. 5, 1881. (No model.)

Claim.—As an improved article of manufacture, a pulley-band consisting of an elastic cord surrounded with metallic rings or spirals, substantially as shown, and for the purpose set forth.

254,090. CHASING AND ENGRAVING MACHINE. LEWIS T. CARR, Providence, R. I., assignor to Godfrey & Gardiner, same place. Filed Mar. 29, 1881. (No model.)

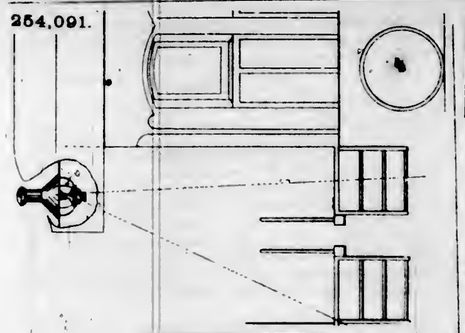
Claim.—1. In a chasing and engraving machine, the combination of the spindle I, spring K, and thumb-screws V and W with the combined cam and spring actuated hammer N N', substantially as described.

2. In a chasing and engraving machine, the combination of the spindle I, spring K, and thumb-screw V with the combined cam and spring actuated hammer N N', substantially as set forth.

3. In a chasing and engraving machine, the combination of the spindle I, spring K, and thumb-screw W with the combined cam and spring actuated hammer N N', substantially as described.

4. In a chasing or engraving machine, springs K and U and thumb-screw V, arranged to operate substantially as set forth.

5. In a chasing or engraving machine, springs K and T and thumb-screw W, arranged to operate substantially as set forth.



6. In a chasing or engraving machine, the spindle I, spring K, and thumb-screw V, arranged to operate substantially as set forth.

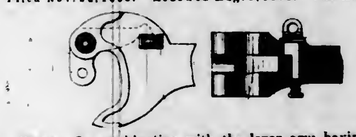
7. In a chasing or engraving machine, the spindle I, spring K, and thumb-screws V and W with the combined cam and spring actuated hammer N N', together with a device for rotating the tool, all substantially as described.

254,091. APPARATUS FOR LIGHTING THE PLATFORMS AND STEPS OF RAILWAY-CARS. WILLIAM E. CHAMBERLAIN, Providence, R. I., assignor of one-half to Edgar G. Windsor, same place. Filed May 17, 1881. (No model.)

Claim.—The combination, substantially as described, of a car-hood, a lamp mounted centrally therein, and an inclined reflector surrounding said lamp, having its angles of reflection arranged, as described, with special reference to lighting an area extending beyond the end of the platform and the steps thereof, as set forth.

254,091.

254,092. OVERALLS. GEORGE FRANK and JOHN GALLIGAN, Kalamazoo, Mich., assignors of one-half to Abraham I. Frank and Joseph H. Frank, both of Chicago, Ill. Filed Aug. 30, 1881. (No model.)



Claim.—1. Overalls and like garments constructed with seamless backs, and having the point at which the inner leg-seam terminates in the seat located in the rear of the center of said seat, substantially as described and shown.

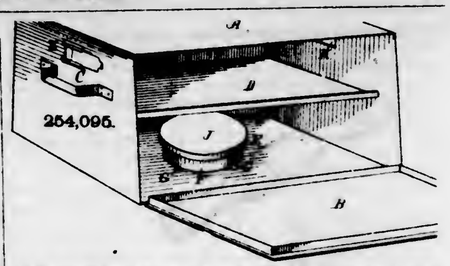
2. Overalls and like garments constructed with seamless backs, composed of the rear and two front pieces, with the point at which the upper end of the inner leg-seams terminate located as set forth, all substantially as described.

3. Overalls and like garments composed of a seamless rear piece, with point *c*, and two front pieces, with portions *a a*, and cut in circular form from *a* to *c*, all substantially as described and shown.

254,093. CAR-COUPLING. ELI H. JANNEY, Fairfax County, assignor to Janney Car Coupling Company, Alexandria, Va. Filed Nov. 24, 1880. Renewed Aug. 9, 1881. (No model.)

Claim.—In combination with the lever-arm having an inclined face, the vertically-moving locking-pin provided with an inclined face.

254,094. BLACKBOARD-ERASER. CHAUNCEY M. LOTHROP, Norwood, Mass., assignor to Stillman C. Davis, same place, and John P. Preuss, East Walpole, Mass. Filed June 6, 1881. (No model.)



Claim.—The improved tablet erasing-block, consisting of the connected parts A B, in combination with the serrated metal plates E E, the holding-bar H, provided with a depression, *j*, the stop-pin K, and screw G, all arranged to operate substantially as and for the purpose described.

254,095. BREAD-RAISING OVEN. LEWIS B. HORNAR, West Liberty, W. Va., assignor of one-half to John E. Wayt, same place. Filed Nov. 28, 1881. (No model.)

Brief.—Designed for raising dough for bread preparatory to baking.

Claim.—The combination of the oven A B C, having the sliding shelf D, with the heating pan or vessel F, having the movable lid J, the inside shoulders or brackets H, and the removable circular body or disk I, as shown, all constructed and arranged substantially as and for the purpose herein set forth.

254,096. MEDICAL COMPOUND. WILHELM PICKHARDT, New York, and HERMANN ENDEMANN, Brooklyn, N. Y., assignors to Wilhelm Pickhardt and Adolf Kuttroff, both of New York, N. Y. Filed Dec. 6, 1881. (Specimens.)

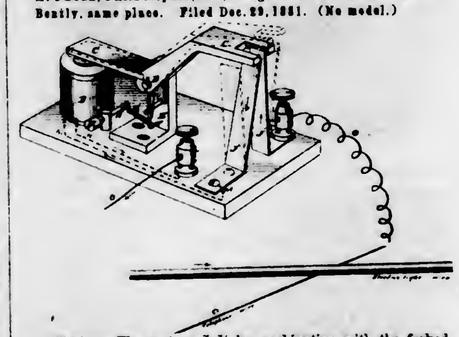
Brief.—The improvement consists in the separation of impurities from the commercial chinoline and the conversion of the latter into an acid tartrate of that base.

Claim.—As a new article of manufacture, the acid tartrate of Skraup's chinoline, hereinbefore described, and having the characteristics above set forth.

254,097. MEDICAL COMPOUND. WILHELM PICKHARDT, New York, and HERMANN ENDEMANN, Brooklyn, N. Y., assignors to Wilhelm Pickhardt and Adolf Kuttroff, both of New York, N. Y. Filed Dec. 6, 1881. (Specimens.)

Brief.—The compound produced is the hydrochlorate of chinoline purified from the presence of associated bases.

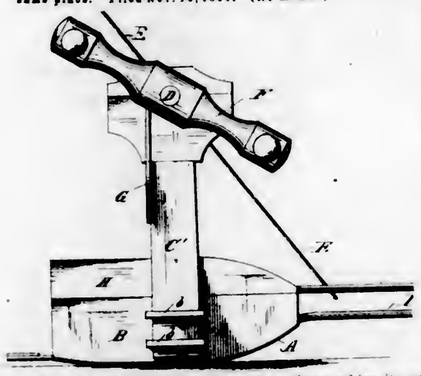
Claim.—The hydrochlorate of chinoline prepared from Skraup's chinoline in the manner hereinbefore described, and having the characteristics above set forth.



254,098. MANUFACTURE OF CHINOLINE. WILHELM PICKHARDT, New York, and HERMANN ENDEMANN, Brooklyn, N. Y. Filed Dec. 6, 1881. (Specimens.)

Brief.—Purification of the commercial chinoline of Skraup so as to render it suitable for medical use.

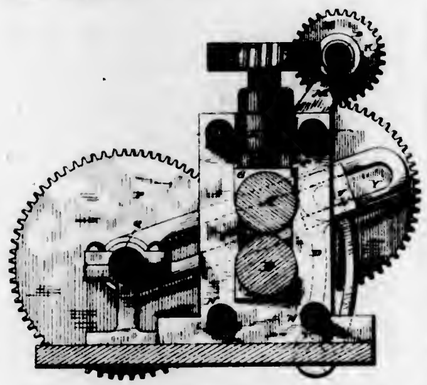
Claim.—1. The within-described process of preparing and refining chinoline by exposing the chinoline of Skraup to the action of tartaric acid, then separating from the solution the acid tartrate of chinoline, and finally, liberating from this acid tartrate the chinoline by the action of caustic alkalies.



2. The refined chinoline hereinbefore described and having the characteristics above set forth.

254,099. SAFETY DEVICE FOR ELECTRIC WIRES. SAMUEL M. PLUSH, Philadelphia, Pa., assignor of one-half to Henry Bently, same place. Filed Dec. 29, 1881. (No model.)

Claim.—The springs J J', in combination with the forked pivoted armature C and magnet B, all forming parts of an electric circuit, and the spring G, which resists said magnet, whereby a weak current of electricity is allowed to pass in said circuit for telephonic or other purposes, but a dangerously strong current causes the magnet B to overcome the resistance of spring G and draw one end of the armature down, so as to free said springs from the other end, and thereby break the current.



254,100. CLOVER-SEED GATHERER. JOHN P. RIMEL, Stribling Springs, Va., assignor of one-half to Emanuel Kircher, same place. Filed Nov. 10, 1881. (No model.)

Claim.—1. The combination, with a mowing-machine, its cutter-bar, and finger-bar, of the platform secured to the finger-bar, the standards C C', shaft D, provided with notches *c c*, rake-teeth E, spring G, crank F, and the fingers I I, substantially as and for the purpose set forth.

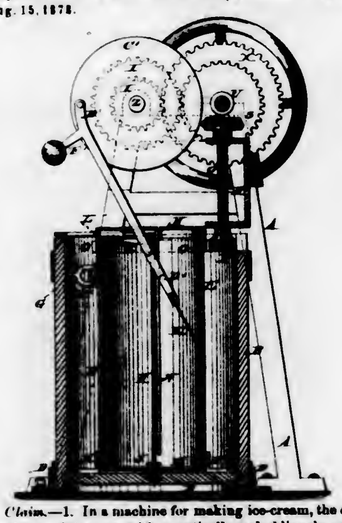
2. The combination, with a mowing-machine, its cutter-bar, and finger-bar, of the platform A, secured to said finger-bar, and having sides B B, provided with staples *b b* and holes *c c*, the standards C C', having tenon *h h*, and cleats H H, having pins *d d*, shaft D, provided with notches *c c*, rake-teeth E, spring G, crank F, and fingers I I, all constructed and relatively to operate substantially as and for the purpose herein shown and described.

254,101. MACHINE FOR ROLLING BLANKS FOR CLOCK-SPRINGS. WALLACE BARNES, Bristol, Conn. Filed July 20, 1881. (No model.)

Claim.—1. In a machine for making clock-spring blanks, the combination, with two rolls, one of which is arranged to recede from the other by the gradual withdrawal of screws which impinge upon its journal-bearings, of a train of gearing adapted to actuate said screws, the driving and driven gears of said train being changeable, the intermediate gear being provided with a vertically and laterally adjustable bearing adapting it to be meshed with changeable driving and driven gear-wheels, substantially as set forth.

2. The combination, with a stationary and a receding roll, the recession of the latter being effected by the gradual withdrawal of screws from its journal-bearings, of a train of gearing to actuate the screws, the intermediate gear of said train being provided with a vertically and laterally adjustable bearing, consisting of a two-armed plate, the upper end of which is provided with an elongated slot in which the stud upon which the gear is mounted is adjusted, the lower arm of the bearing being provided with an arc-shaped slot which receives a stud adapted to be secured in any part of it, substantially as set forth.

254,102. MANUFACTURE OF BOOTS AND SHOES. THOMAS LAYCOCK, Northampton, England. Filed Nov. 7, 1881. (No model.) Patented in India Nov. 4, 1881.



Claim.—1. That improvement in the manufacture of boots and shoes provided with a double insole or combined sock and insole, consisting in lasting the insole to the upper as usual, then removing the last and placing within the lasted shoe an additional insole or sock, and then attaching an outer sole and securing all the parts together by screws passing through the outer sole, upper, inner sole, and into the second inner sole or sock, all substantially as set forth.

2. A boot or shoe having its outer sole, upper, and double inner sole connected together by screw-fastenings passing through the outer sole, upper, and inner sole and into the insole or sock, all substantially as set forth.

REISSUES.

10,038. ICE-CREAM FREEZER. CHARLES L. DEXTER, Philadelphia, Pa. Filed Jan. 6, 1882. Original No. 121,056, dated Aug. 15, 1878.

Claim.—1. In a machine for making ice-cream, the combination of a revolving can with a vertically and obliquely reciprocating scraper or paddle, so connected and operated by intermediate mechanism with the driving-shaft as to scrape the side of the can throughout its descending stroke, substantially as and for the purpose set forth.

2. In a machine for making ice-cream, the combination of a progressively-revolving can with a vertically-reciprocating scraper or paddle rigidly attached to a bar connected at its upper end to a revolving crank, and pressed obliquely against the side of the can during its descending stroke, substantially as and for the purpose set forth.

3. In a machine for making ice-cream, the combination of a progressively-rotating can and a vertically and obliquely reciprocating scraper with propelling-gearing adapted to operate the can and scraper at different relative velocities, substantially as and for the purpose set forth.

4. The combination, in an ice-cream freezer, of the outer tub, B, having arms G, friction-rollers F, and angle-irons H, with the inner revolving can, E, and operating-gearing, substantially as herein described, for the purpose set forth.

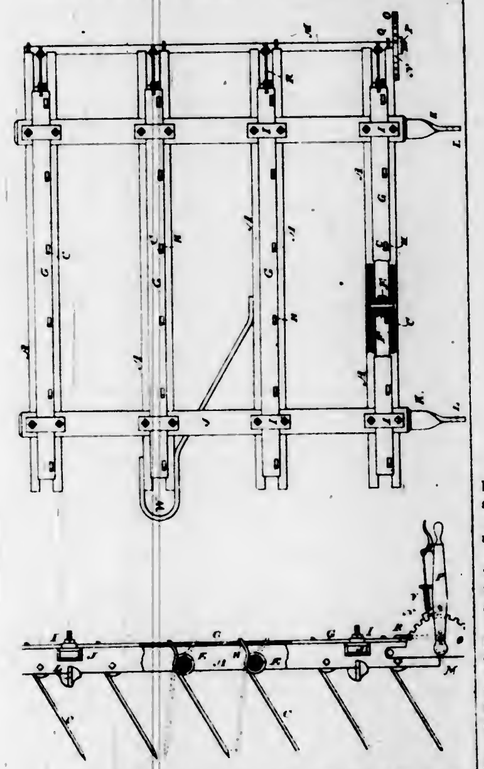
5. The combination of the cross-bar J, the rods K, the arms L, the cross-bar M, and the floats N with the can E and tub B, substantially as herein shown and described.

6. The combination of the gear-wheels X X, the sliding gear-wheels Y Y, the crank-wheel C', and the pivoted bar D', provided with a paddle, E', and the weighted arm F C', substantially as herein shown and described.

7. In a machine for making ice-cream, the combination of stationary scrapers or floats M with the rotating can and vertically-reciprocating paddle, arranged to operate substantially as and for the purpose set forth.

10,039. COMPOSITION FOR DRYING PAINTS AND OILS. ALPHEUS W. PRATT, Flushing, N. Y., assignor of one-half to Henry S. Lambert, Orange, N. J. Filed Nov. 10, 1880. Original No. 211,838, dated Feb. 4, 1879.

Claim.—1. The within-described process of producing a manganese-lead soap by treating oil with caustic alkali, or its equivalent, and the resulting plastic mass with a mixture of manganese and lead salts, as described.



2. The within-described process of producing a manganese-lead soap by treating oil with caustic alkali or its equivalent, and the resulting plastic mass with a liquid mixture of manganese chloride and lead salts, and adding thereto rosin or other resinous substances.

10,040. LIQUID DRIER FOR OILS. ALPHEUS W. PRATT, Flushing, N. Y., assignor of one-half to Henry S. Lambert, Orange, N. J. Filed Nov. 10, 1880. Original No. 211,783, dated Jan. 28, 1879.

Claim.—1. The within-described process of producing a manganese-soap by treating oil with caustic soda, or its equivalent, and then with a solution of chloride of manganese or its equivalent.

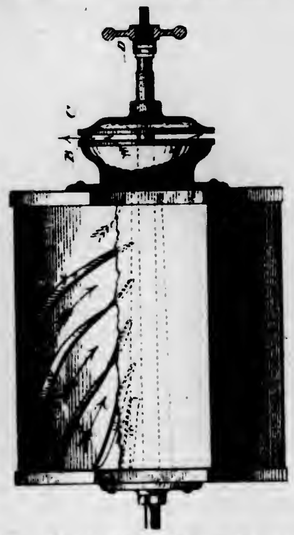
2. The within-described process of producing a manganese-soap by treating oil with caustic soda, or its equivalent, and then with chloride of manganese, or its equivalent, and adding thereto rosin or other resinous substances.

10,041. HARROW. ABRAHAM J. STEWART, Chillicothe, Mo., assignor to Charles La Dow, Albany, N. Y.; said La Dow assignor of one-half to Wheeler & Melick Company, Albany, N. Y. Filed Nov. 21, 1881. Original No. 144,236, dated Nov. 4, 1873.

Claim.—1. In a harrow, the combination of a frame, two or more series of adjustable teeth which are springs within themselves and which act in concert on the soil, one tooth being capable of passing an obstruction without raising the other teeth, and mechanism for holding the teeth at the angle adjusted.

2. In a harrow, the combination of a frame, two or more series or rows of teeth which are springs within themselves and which act in concert on the soil, one tooth being capable of passing an obstruction without raising the other teeth, and lever mechanism for simultaneously varying the angle of the different series of teeth and holding them in their adjusted position.

3. A harrow-frame having sections and teeth which are adjustable at different angles and able to rebound independently when passing obstructions.



4. In a harrow, the combination of a frame, digging points or teeth which support the frame, arranged in two or more series or rows, and coil-springs which encircle the bearings of and coact with the teeth.

5. In a harrow, the combination of a frame, digging points or teeth arranged in series or multiple rows and supporting the frame, and coil-springs which connect the teeth directly to the frame.

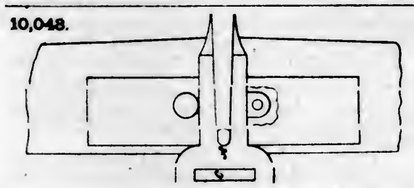
6. In a harrow, the combination of a frame with two or more series of spring-teeth vibrating independently thereon and capable of being angularly adjusted, said teeth being arranged between opposing parts of said frame for the purpose of securing the teeth to their bearings and regulating their angle and vibration.

7. The spring-harrow teeth C, supported on bearings in the beams A, in combination with the slides G, operated by the rock-shaft M, provided with lever P, ratchet O, and pawl N.

10,042. RAG-WASHING MACHINE FOR RAG AND PAPER WASHING ENGINES. JOHN TYLER, Claremont, N. H. Filed May 21, 1881. Original No. 216,585, dated June 17, 1879.

Claim.—1. The bell-shaped outlet B and the concave movable head C, in combination with the regulating-wheel and nut D, as and for the purpose herein described.

2. The curved wings or guides on the inside of the bucket, substantially as set forth.



3. A rag-washing machine for rag and paper washing engines with scroll-shaped buckets with one or more graduated and curved wings with varying angles running toward the center of the outlet, as represented in Fig. 1.

4. A movable head to a rag-washing machine for rag and paper washing engines, in combination with the outlet, substantially as and for the purpose described.

5. A gate attached to and sliding on a hollow cylinder, with which to regulate the discharge of water from the washer, in combination with the outlet, substantially as and for the purpose described.

10,043. HARNESS-HOOK. J. J. WILKINS, Virden, Ill., assignor, by mesne assignments, to Eberhard Manufacturing Company, Cleveland, Ohio. Filed Sept. 24, 1881. Original No. 55,942, dated June 26, 1866.

10,048.

Claim.—1. A pad-hook provided with the transverse opening or hole *n*, and also with the horizontally-projecting ears *a*, the whole constructed and operating as and for the purposes set forth.

2. A pad-hook provided with the transverse opening or hole *n*, substantially as and for the purpose described.

3. A pad-hook the base of which is provided with horizontal transverse ears *a* projecting from opposite points of the sides of the base, substantially in the manner and for the purpose specified.

UNITED STATES COURTS IN PATENT CASES.

DECISIONS OF THE U. S. COURTS.

Supreme Court of the United States.

VINTON *et al.* v. HAMILTON *et al.*

Decided January 9, 1882.

1. REDUCING SLAG—PRIOR KNOWLEDGE AND USE.

Patent granted October 14, 1873, to John J. Vinton, for an improvement in the manufacture of iron from furnace-slag, *held* to be invalid in view of facts developed by the testimony as to knowledge and use of the invention therein claimed by others prior to the invention or discovery of the patentee.

2. SAME—INVENTION—DOUBLE USE.

In a process of reducing slag, the application for the first time to a cupola-furnace of the cinder-notch previously used in the blast-furnace to accomplish the same end is devoid of invention. When applied to a cupola-furnace, the cinder-notch performed the same function in the same way.

APPEAL from the Circuit Court of the United States for the Northern District of Ohio.

Mr. A. W. McCallum for the appellants.

Mr. T. W. Sanderson for the appellees.

STATEMENT OF THE CASE.

The bill of complaint alleged that the defendants were infringing certain letters patent, dated October 14, 1873, granted to the complainant, John J. Vinton, for an improvement in the manufacture of iron from furnace-slag, and prayed for an injunction to restrain them from further infringement and for damages and an account of profits. The answer of the defendants denied that Vinton was the original or first inventor or discoverer of the improvement in the manufacture of iron from furnace-slag or from the slag of blast or smelting furnaces, set out in his patent, and denied infringement. Upon final hearing in the circuit court the bill was dismissed because the process described in complainant's letters patent was known and in common use before the complainant's application for his letters patent, and the same were therefore null and void. The complainants have therefore appealed the case to this Court.

The specifications of the letters patent declare as follows:

My invention relates to the production of cast-iron from the slag or refuse of the smelting or blast furnace. Heretofore a large percentage of good metallic iron has been thrown away with the slag and become lost to commerce so far as its use as metallic iron is concerned. This is more particularly the case with rich ores, such as the Missouri and lake ores, which, from their nature, flux imperfectly in the ordinary smelting-furnace. When imperfectly fluxed the slag assumes a thick consistency and cools with a general grayish color, and though the presence of metal in it cannot be detected by the eye, yet the slag will be found to be of comparatively great specific gravity, and in fact contains a very large percentage of good metallic iron, often as great as the amount of metal reduced from the ore in the process of smelting. To reduce this metal from the heavy slag of the smelting-furnace, and thereby increase the production of iron from the same amount of ore, is the object of my invention.

To accomplish the desired result I employ a cupola-furnace, but furnaces specially adapted to the purpose may be constructed and conveniently used in connection with the blast-furnaces where the iron is smelted.

The heavy slag is first pulverized or broken up into small pieces, or it may be made granulous or spongy by passing water or air through it when in a molten state, or in any of the well-known ways. A bed of coke or other suitable material is first placed in the cupola, and on the top of the coke a small quantity of scrap or other oxidized iron (preferably scale or black oxide of iron) is sprinkled. The slag to be operated on is then introduced as evenly as possible on the top of the coke and iron oxide, and on the top of the slag I sprinkle a small quantity of limestone broken up into small pieces, then a layer of coke, followed with scrap and scale slag and lime, as before, alternately, until the whole cupola is charged. The fuel is then ignited, and when the fire is above the tuyeres the blast is turned on to the full. Owing to the presence of the iron oxides the heat is very great when brought in contact with the slag, and the latter is speedily reduced, and as the operation goes on fresh charges of the materials are supplied from the top of the cupola, provision being made for the passage of the remaining slag from the furnace at a point below the tuyeres. In this way it will be seen that the process is continuous, and the furnace is not permitted to get cool.

The charge is made up in about the following proportions, but may be slightly varied as occasion requires: After the furnace is in operation, first, three bushels of coke; second, fifty pounds iron oxide (scrap or scale;) third, eight hundred pounds slag; fourth, one-fourth of a bushel of limestone, thrown into the cupola in succession, and from time to time, as required.

When there is much sulphur in the iron a small quantity of the black oxide of manganese may be blown in through the tuyeres, and salt or litharge, or a mixture of any two or all three of these ingredients, may be used in this manner with good effect. The iron thus obtained is run into molds in the usual way.

What I claim as my invention, and desire to secure by Letters Patent, is—

The herein-described method of reducing iron from the slag or refuse of blast or smelting furnaces, substantially as set forth.

Mr. Justice WOODS delivered the opinion of the Court.

It is matter of general knowledge that pig-iron is made from iron ore in a blast or smelting furnace; that to secure this product the furnace is charged, first, with a layer of coke or charcoal, then with a layer of iron ore mixed with broken limestone, and so on in alternate layers until the proper quantity of these materials is placed in the furnace. The fuel is then ignited, and for the purpose of increasing the heat, streams of air are forced into the furnace by means of blast-pipes, the nozzles of which, called "tuyeres," are inserted in openings in the walls of the furnace, usually from four to six feet above its bottom. The limestone is used merely as a flux. The ore under this process undergoes a chemical change, and iron is formed and sinks in a molten state to the bottom of the hearth, by which is meant not only the bottom of the furnace, but its sides as high up as the foot of the boshes. The refuse left after the melted iron has dropped into the hearth is also in a molten state, and, being lighter than the iron, floats on its top. This is indifferently called "cinder and slag." About three or four times in every twenty-four hours the melted iron is drawn from the furnace. This is accomplished in the following manner: The furnace is constructed with two holes, one called the "iron" and the other the "cinder" notch. The iron-notch is made at the bottom of the hearth. The cinder-notch is higher up the side of the furnace, just below the level of the tuyeres—so high that the cinder can be drawn through it without letting off the molten iron. These holes are kept habitually closed with clay or other similar material. At frequent intervals, and always just before drawing off the molten iron, or making a "cast," as the

iron-mongers call it, the cinder-notch is opened and the cinder or slag is allowed to escape, and is carried away from the furnace in a trough made of moistened sand. The cinder-notch is then closed and the iron-notch is opened, and the molten iron is drawn off through a sand trough, and conducted into molds made in sand beds, called the "sow and pigs," where it is allowed to cool. The result is the pig-iron of commerce. In the meantime the furnace is supplied with constant charges of fuel and ore mixed with limestone in alternate layers, dumped in from the top, and this process is kept up without cessation for months and sometimes for years. The sand trough which connects the pig-beds with the iron-notch is usually larger and deeper, but more elevated than the sow or general gutter which conducts the iron into the molds or grooves in the pig-beds. When the metal is first let into the trough it accumulates so as to fill it nearly to the brim. As the flow from the iron-notch decreases, the iron and a small quantity of cinder or slag, which has been chilled by coming in contact with the cold surface of the trough, adhere to its sides and bottom. When the molten iron on the hearth is about exhausted the blast is increased, and the material left on the hearth is blown out through the iron-notch into the sand trough. This also cools in the trough, and thus is formed what are known as "trough-runners," consisting of iron and slag, which have been forced through the iron-notch by letting on the blast, as just mentioned.

A cupola-furnace is one used for melting pig-iron for the purpose of casting it into useful forms and articles. It constitutes part of the equipment of a foundry. In shape it is generally a hollow cylinder. The iron is melted by substantially the same process as the ore in a blast-furnace. The cupola-furnace has an iron-notch, but no cinder-notch, because there is generally so little cinder or slag in pig-iron as to render such an opening unnecessary.

In order to reach the merits of the controversy it is necessary to obtain a definite idea of what, if anything, the appellants are entitled to under their patent. The specifications are ambiguous in respect to the particular kind of slag which is to be used in the process therein described—that is to say, whether it is the slag drawn off through the cinder-notch or the runners which are left in the trough through which the molten iron is discharged from the iron-notch of a blast-furnace. It appears, however, from the evidence that the use of the latter only is contemplated, the former containing such a very inconsiderable quantity of iron as to be valueless.

We observe, in the first place, that the patent cannot be held to cover the discovery that the slag which is to be used in the process described in the specifications contains so large a percentage of good metallic iron that it can be profitably extracted by again smelting it.

The evidence shows beyond controversy that for many years before September 18, 1873, (the earliest date assigned to the discovery or invention of the complainant,) it had been well and generally known that the trough-runners contained a large proportion of metallic iron, and they were broken up and resmelted in blast-furnaces. They were thrown into the furnace with scrap-iron and iron ore, and smelted in the same manner. It was formerly a notion among old-fashioned furnacemen that the use of this material injured the furnace and deteriorated the quality of the iron produced: but this conceit had been exploded long before the date of appellant's patent, and the runners and other heavy slag were used habitually in many blast-furnaces, as above stated.

Secondly. The appellant cannot claim as any part of his invention the use of a cupola-furnace for the purpose of resmelting trough-runners and heavy slag. The evidence in the record shows that as early as the year 1844, at the Jackson Furnace, in Venango county, Pennsylvania, which was a blast-furnace, a cupola-furnace was erected and used for the purpose of smelting heavy slag, from which was manufactured plow-points and hollow ware, such as skillets, pots, and Dutch ovens. Sometimes the product was made into pig-iron. This cupola-furnace was thus used for three or four years. The fact of such use was public; no effort was made to keep it secret, and it was known, in the language of the witnesses, "all around the furnace."

The testimony of Robert Paisley, William J. Shaner, and Thomas W. Kennedy, which is found in the record, shows that the Beaver Falls Co-operative Foundry Association, in April, 1872, made the experiment of using slag and runners in their cupola-furnace, and, the experiment proving successful, the runners, as early as August, 1872, were procured by the car-load and mixed with pig-iron and run into stove-plates. In this way fifty-eight or sixty tons of runners were used prior to October 1, 1873, the date of appellant's patent. This use of heavy slag and runners was open and public. No one was excluded from the foundry where the work was carried on. Any one was at liberty to enter and see what was going on, and persons not interested in the furnace, among them the witness, Thomas W. Kennedy, did so. No injunction of secrecy was imposed on them. It is true the operatives at the furnace, who were all stockholders of the association, said nothing about the use they were making of trough-runners because, as they said, if it was a good thing they wanted to keep it to themselves, but they took no steps to keep it a secret, except that they did not talk about it. In fact, it was at the suggestion of Kennedy that the Beaver Falls Co-operative Foundry Association made the experiment of melting runners and heavy slag in their cupola-furnace. After the experiment made by the Beaver Falls Co-operative Foundry Association in April, 1872, had proved successful, Kennedy, in August, 1873, furnished the defendant Hamilton with a quantity of trough-runners to be smelted in his cupola-furnace, and before October 1, 1873, had sold to foundrymen not less than one hundred tons of the same material to be used for the same purpose. In fact, the record shows that Kennedy, more than a year before the date of appellant's patent, revived the practice of smelting trough-runners and heavy slag in a cupola-furnace. As early as the spring of 1872 he declared to the defendant, Hamilton, Thomas Struthers, and others the feasibility of the process, and suggested to Struthers that they ought to take out a patent for it; but Struthers said that unless they could get up some new way of extracting the iron it would not be patentable, and that was the conclusion they came to after talking the matter over. But Kennedy at once, in the spring of 1872, commenced buying up the trough-runners from the blast-furnaces and selling them to foundrymen for use in cupola-furnaces. It is therefore abundantly shown in the record that

before the date of complainant's patent or of his invention the smelting of trough-runners and other heavy slag in cupola-furnaces was practiced and well known.

Thirdly. The method of making slag granulous or spongy by passing water or air through it when in a molten state is not new, nor is it claimed to be new. Besides, there is no evidence that this process is used by the appellees.

Fourthly. The method of charging the cupola-furnace and of smelting the slag as described in the specification of appellant's patent is as old as the art of making pig-iron, except, perhaps, the sprinkling of scale or black oxide of iron on the top of the coke, and this is not done by the appellees.

Fifthly. The appellant does not claim that his invention covers a cupola-furnace. A review of the case shows therefore that appellant did not first discover the value of furnace-runners or heavy slag for resmelting; that he was not the first to smelt them and use them for running into pigs or castings either in a blast-furnace or a cupola-furnace, and that there is nothing new in his process of smelting which is used by the appellees.

All therefore that is left for his invention to cover, and which appellant can claim as infringed by the appellees, is the employment of a cinder notch or hole in a cupola-furnace to draw off the cinder when the furnace is employed in smelting furnace-runners or heavy slag. But if the testimony of unimpeached and uncontradicted witnesses is to be believed, as early as June, 1872, at Beaver Falls, Pennsylvania, a cinder-notch was used by the Beaver Falls Co-operative Association in a cupola-furnace when employed in smelting furnace-runners. The notch was put in the cupola at the suggestion of the witness, Thomas W. Kennedy, who was not a member of the association, but who, being the owner of a blast-furnace, was selling to it furnace-runners to be resmelted and used for making castings. He testifies to the fact distinctly and clearly, and designates the part of the cupola where the notch was placed, namely: between the tuyeres at the back of the cupola to draw off the slag. He is fully corroborated by the witness, W. J. Shaner, who was a member of the association, and whose business was to do the smelting.

This use of the cinder-notch in the cupola was public. No effort was made to exclude spectators from the foundry or to conceal the notch. The invention therefore of a cinder-notch in a cupola-furnace, if it was an invention at all, was made by Thomas W. Kennedy fifteen months before the appellant, according to his own testimony, ever conceived the idea, and Kennedy during all that time allowed it to be used by others, without any injunction of secrecy or any restriction or limitation, in a foundry which was open to all who might choose to visit it, and which was visited by many spectators not concerned in its operations. But even if the application of a cinder-notch to a cupola-furnace was first made by the appellant, the question remains whether, standing alone, it implies invention and is patentable.

We think this question must be answered in the negative. Neither a cupola-furnace nor a cinder-notch is new. The use of a cinder-notch for drawing off cinders from a blast-furnace is as old as blast-furnaces themselves. The function which the cinder-notch performs in the process covered by the appellant's invention is precisely the same for which it is used in a blast-furnace. In smelting slag in a cupola-furnace it was found that the molten cinder accumulated and floated on the top of the molten iron. The application to a cupola-furnace, for the purpose of drawing off the cinder, of the cinder-notch used in the blast-furnace to accomplish the same end would occur to any practical man. When applied to a cupola-furnace the same function was performed in the same way by the same means. In making this application there was no invention. (*Pearce* v. *Mulford*, 102 U. S., 112.)

We are of opinion, therefore, that the application of a cinder-notch to a cupola-furnace for the purpose designated is neither patentable nor new, and that all the other parts of the process and appliances covered by appellant's patent were old and well known long before the date of his alleged invention and the patent therefor. The complainant was not the first inventor, either in fact or in law, of the discovery or invention described in his letters patent. The patent is therefore void, and the decree of the circuit court dismissing the bill was right and must be affirmed.

Mr. Justice MATTHEWS did not sit in this case and took no part in its decision.

WORLEY *et al.* v. THE LOKER TOBACCO COMPANY *et al.*

Decided January 16, 1882.

1. DATE OF APPLICATION, IN ABSENCE OF PROOF, DATE OF PATENT.
   In the absence of all other proof the date of the patent will be taken as the date of application and the date of assignment.
2. PLUG-TOBACCO—PUBLIC USE—PATENT INVALID.
   Letters patent granted to Christian Worley and Henry McCabe, August 22, 1876, for an improvement in the mode of finishing plug-tobacco, applied for on same date, *held* to be invalid, the evidence showing that the invention had been in open and public use for more than two years prior to the filing of the application.
3. SAME—SAME—EMPLOYER'S USE.
   If a person employed in the manufactory of another, while receiving wages makes experiments at the expense and in the manufactory of the employer, has his wages increased in consequence of the useful results of his experiments, makes the article invented, and permits his employer to use it, no compensation for its use being paid or demanded, and then obtains a patent for it, the patent is invalid and void. (*McClurg* v. *Kingsland*, 1 How., 202.)
4. SAME—PUBLIC USE—BY ASSIGNEE.
   The inventor cannot relieve himself of the consequences of the prior public use of his patented invention by assigning an interest in his invention or patent to the person by whom the invention was thus used.

APPEAL from the Circuit Court of the United States for the Eastern District of Missouri.

Mr. R. H. Parkinson for the appellants.

Mr. Justice WOODS delivered the opinion of the Court.

The bill of complaint averred that on August 22, 1876, letters patent of that date were issued to Christian Worley and Henry McCabe, the complainants, for an improvement in the mode of finishing plug-tobacco, of which Worley was the inventor and McCabe was his assignee of an undivided half, and that the defendants were infringing said patent, and prayed for an injunction to restrain further infringement, and for damages and an account of profits. The answer asserted the invalidity of the patent and denied infringement. Upon final hearing the circuit court dismissed the bill, and the complainants have appealed to this Court.

The specifications on which these letters patent were issued declare as follows:

The common way to proceed in finishing plug-tobacco is to press the bunches into plugs having the form seen in the retail stores. The plugs are next removed from the molds in which they are pressed and packed in boxes, and the boxes placed in a room where the tobacco is sweated and cured. The plugs are afterward

taken from the boxes and subjected to a second pressing before they are packed in the boxes for sale.

My improved mode consists in finishing tobacco by placing the plugs in a box in alternate layers with thin metal plates, applying extreme pressure thereto, and subjecting the plugs to dry heat for several hours while they are tightly compressed between the plates, which are in contact with the broad sides of the plugs; and, finally, removing the box and leaving the contents therein until cold, the whole process being adapted to give a fine and smooth finish to the wrapper, and, by putting the plug in proper condition, doing away with its tendency to bulge out at the sides, as plugs are apt to do when they have not been thus treated.

The claim was thus set forth:

I am aware that there is not any novelty in, first, the simple finishing of tobacco by placing it in a heated room, and, secondly, the simple pressing of tobacco between metallic plates, and therefore I do not claim this distinct heating and pressing of tobacco broadly; but

What I do claim as new and of my invention, and desire to secure by Letters Patent, is—

The mode of finishing tobacco substantially as described, consisting of placing the plugs in a box in alternate layers with thin metal plates, applying extreme pressure thereto, and subjecting the plugs to dry heat of about 140° Fahrenheit for several hours while they are tightly compressed between the plates, which are in contact with the broad sides of the plugs, and finally removing the box and leaving the contents therein until cold.

It will be seen that the patent disclaims the simple pressing of tobacco between plates and the finishing of it by simply placing it in a heated room.

What appellants insist is new is this, namely: that while the plugs of tobacco are still confined in the finisher, (which is the name given to the box in which they are placed before being subjected to extreme pressure,) and while still tightly compressed between the metallic plates, they are placed in a sweat-room and allowed to remain several hours, and before being removed from the finisher are taken from the sweat-room and allowed to cool. This process, it is contended, brings the oil of the tobacco to the surface of the plug and gives it a glossy coating, which improves its appearance and keeps the tobacco from molding or swelling. The patent is therefore for the process described, and nothing more. None of the appliances by which it is carried on are claimed as new, and the evidence abundantly shows that they are all old devices.

The appellees insist that the patent is void because the improvement described therein was in public use at the factory where Worley, the patentee, was employed for more than two years prior to his application therefor.

The law applicable to the case is section 24 of the act of July 8, 1870, now embodied in the Revised Statutes as section 4886, which declares—

Any person who has invented or discovered any new and useful art, machine, manufacture, or composition of matter, or any new and useful improvement thereof, not known or used by others in this country, and not patented or described in any printed publication in this or any foreign country before his invention or discovery thereof, and not in public use or on sale for more than two years prior to his application, unless the same is proved to have been abandoned, may, upon payment of the fees required by law, and other due proceedings had, obtain a patent therefor,

Neither the bill of complaint nor the evidence shows the date of Worley's application for his patent nor of the assignment of an undivided half of his invention to McCabe. The patent itself bears date August 22, 1876, and this must consequently be taken as the date of the application and of the assignment. The question is therefore whether the improvement patented to Worley was in public use for more than two years prior to that date—that is to say, whether a public use prior to August 22, 1874, is proven. We think that the testimony of the appellants themselves shows that this question must be answered in the affirmative.

From their depositions the following state of facts appears: McCabe was the proprietor of a tobacco-manufactory in the city of St. Louis and Worley was in his employment as a workman in the factory. In the summer of 1869 McCabe moved his factory from Second Street to Cass Avenue, and lost about two months of good working-weather in so doing. The work of the factory was consequently carried on pretty late in the fall, and McCabe told Worley that they should have to go to work early in the spring. It was to prevent the sweating of tobacco which was manufactured in the spring of the year that Worley, in the fall of 1869, conceived the process for which he afterward obtained his patent. It was at the suggestion of McCabe that he turned his attention to the subject, and the process was contrived for McCabe's benefit. It is not pretended that Worley and McCabe were joint inventors. The invention was made by Worley alone. He at once began using his invention in McCabe's factory. He testifies that it was complete and he became satisfied with its results in 1871. It is true that after that date he made experiments to decide upon the best mode of constructing his finishers so as to secure the requisite strength, but the finisher constituted no part of his patented invention. In 1871 his invention was complete, and in his opinion successful, and was adhered to from that date without change. The process was used in the factory of McCabe under the direction of Worley until the application was filed for the patent in 1876, and, according to the testimony of McCabe, Worley continued the process for McCabe's benefit, who paid him a salary larger than was usual, for his knowledge as a tobacco-manufacturer. During all the time from 1870 to 1876 thousands of pounds of tobacco finished by means of this process in the factory of McCabe were sold in the market every year. No injunction of secrecy was laid on McCabe by Worley, no one was excluded from the factory where his process was carried on, and at least one manufacturer learned the process from observing it in McCabe's factory, and adopted it and used it in his own. Worley, it is true, testifies that he told several of the hands employed in the factory not to say anything about what they were doing, and McCabe says that before the patent was obtained there was "an outside understanding" that they were "to keep it away from the public eye as much as possible." The testimony of the appellants on this point is most vague and unsatisfactory, and it is evident that no means were taken by them to keep the process invented by Worley a secret, and it was not kept a secret. Worley, according to his own testimony, communicated his process not only to McCabe, but to others, and used it openly in McCabe's factory for a period of six years before applying for his patent.

It has been repeatedly held by this Court that a single instance of public use of his invention by a patentee for more than two years before the date of his application for his patent will be fatal to the validity of the patent when issued. (*McClurg* v. *Kingsland*, 1 How., 202; *Consolidated Fruit Jar Company* v. *Wright*, 94 U. S., 92; and *Egbert* v. *Lippman*, decided at the present term.) We think the testimony of the appellants themselves shows such a public use of the process covered by Worley's patent as to render it invalid. This evidence brings the case clearly within the terms of the decision of *McClurg* v. *Kingsland*, (1 How., *ubi supra*,) where it was declared that if a person employed in the manufactory of another, while receiving wages makes experiments at the expense and in the manufactory of the employer, has his wages increased in consequence of the useful result of the experiments, makes the article invented, and permits his employer to use it, no compensation for its use being paid or demanded, and then obtains a patent for it, the patent is invalid and void. Suppose Worley had not assigned an interest in his invention to McCabe, and after obtaining his patent had brought suit against the latter for infringement, it is perfectly clear that McCabe could have defended the suit successfully on the ground of his own public use of the invention for two years before the date of the patent. If such defense could be made by McCabe it could be made by any one else, for the facts relied on would render the patent void.

The fact that McCabe, just before the patent was applied for, became the assignee of an interest in it does not make this defense any the less effectual, for the assignee of a patent-right takes it subject to the legal consequences of the previous acts of the patentee. (*McClurg* v. *Kingsland*, 1 How., *ubi supra*.)

The inventor cannot relieve himself of the consequences of the prior public use of his patented invention by assigning an interest in his invention or patent to the person by whom the invention was thus used.

We think the evidence of the appellants themselves establishes clearly the defense under consideration. The decree of the circuit court must therefore be affirmed.

DESIGNS.

12,792.—CARD-RECEIVER.—*Henry Berry*, Birmingham, Conn., assignor to *The Derby Silver Company*, same place. Application filed November 26, 1881. Term of patent 3½ years.

12,793.—FORK OR SPOON HANDLE.—*Joseph B. Knowles*, Providence, R. I. Application filed December 27, 1881. Term of patent 7 years.

12,794.—ORNAMENTAL CHAIN.—*Sigmund L. Lederer*, Providence, R. I. Application filed December 22, 1881. Term of patent 7 years.

12,795.—SCALES.—*James T. McNally* and *Walter H. Harrison*, New York, N. Y. Application filed January 6, 1882. Term of patent 7 years.

12,796.—FONT OF PRINTING-TYPE.—*Carl Müller*, Chicago, Ill., assignor to *Marder, Luse & Co.*, same place. Application filed November 18, 1881. Term of patent 7 years.

12,797.—BACK OF A BRUSH.—*George A. Scott*, New York, N. Y. Application filed January 10, 1882. Term of patent 14 years.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 8,191 and upward are registered under the act of March 3, 1881.]

9,141.—CIGARS.—*Rocky Ca.*, New York, N. Y. Application filed February 6, 1882.

"The arbitrary word 'FAUSTO.'"

9,142.—VIOLIN-STRINGS.—*Estey Organ Company*, Brattleborough, Vt., and Atlanta, Ga. Application filed October 31, 1881.

"A millstone suspended on a single violin-string between two uprights and the face of the millstone bearing the words 'CLEAR GRIT.'"

9,143.—CHEWING AND SMOKING TOBACCO AND CIGARS.—*Robert Hamilton*, Covington, Ky. Application filed January 31, 1882.

"The flowing ribbon fastened to the package by means of a seal or rosette."

9,144.—FLOUR.—*Holt & Co.*, New York, N. Y. Application filed October 17, 1881.

"The words 'LA FAVORITA.'"

9,145.—MANUFACTURED SMOKING-TOBACCO FOR PIPES.—*E. G. Irvine*, Lynchburg, Va. Application filed January 14, 1882.

"The picture of the Indian girl represented as a queen and the words 'INDIAN QUEEN.'"

9,146.—MEDICINAL OIL.—*Theodore W. Poole*, Williamston, N. C. Application filed January 23, 1882.

"The word-symbol 'ST. PATRICK.'"

9,147.—STOCKINGS.—*Smyth & Co.*, Dublin and Ballbriggan, Ireland. Application filed February 3, 1882.

"The representation of a stockinged leg on a shield."

9,148.—CIGARS, CIGARETTES, CHEWING AND SMOKING TOBACCO, AND GRANULATED AND PLUG TOBACCO AND SNUFF.—*G. W. Van Slyke & Co.*, Albany, N. Y. Application filed February 1, 1882.

"The arbitrarily-selected letters 'P's & Q's.'"

LABELS.

2,622.—Title: "DONAHUE'S DRESSING."—*T. J. Donahue*, Philadelphia, Pa. Application filed December 22, 1881.

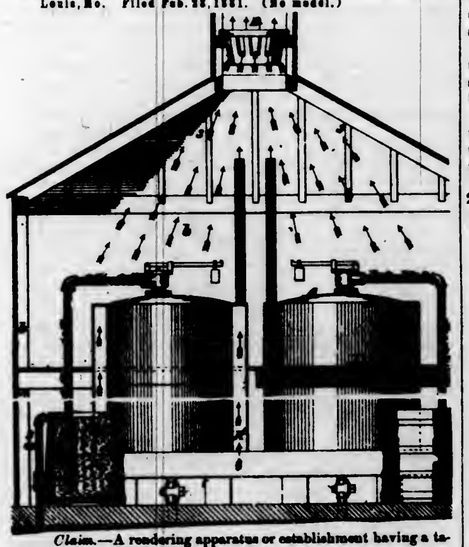
2,623.—Title: "HUMECTIC PEPSIN."—*Clarence A. Fowerden*, New York, N. Y. Application filed January 30, 1882.

2,624.—Title: "DR. WM. SHEPPARD'S COLIC REMEDY FOR HORSES." *Oakley Griggs*, Streator, Ill. Application filed January 30, 1882.

2,625.—Title: "GRIGG'S SPECIFIC FOR THE PREVENTION AND CURE OF HOG CHOLERA."—*Oakley Griggs*, Streator, Ill. Application filed January 30, 1882.

2,626.—Title: "DR. MINOR'S SPECIFIC LINIMENT FOR RHEUMATISM." *Oakley Griggs*, Streator, Ill. Application filed January 30, 1882.

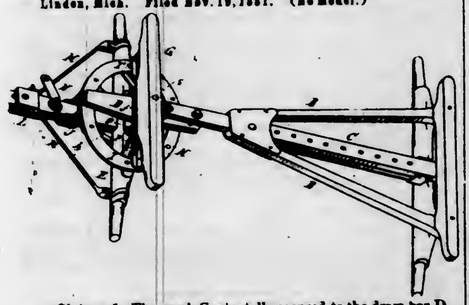
2,627.—Title: "DR. LOCKERBY'S LIVER PILLS."—*F. S. Le Bosquet*, Concord, N. H. Application filed January 12, 1882.



2,628.—Title: "SUPERIOR SCREW CUTTING OIL."—*J. S. Ramsey & Co.*, Pittsburg, Pa. Application filed December 29, 1881.

2,629.—Title: "THE FAMOUS UNTEARABLE OVERALL."—*Joseph H. Rice* and *Ignatius Friedmann*, Milwaukee, Wis. Application filed January 3, 1882.

PATENTS.

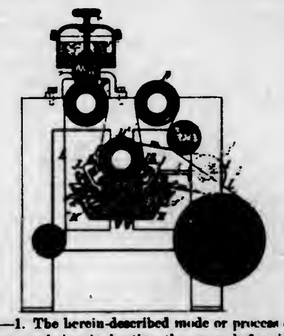


GRANTED FEB. 28, 1882.

254,103. RENDERING APPARATUS. GEORGE BAYNE, St. Louis, Mo. Filed Feb. 28, 1881. (No model.)

Claim.—A rendering apparatus or establishment having a tapering roof and a flue at the top of the latter, wherein is placed a basket for fire, in combination with the inclosed tanks surrounded by casings, from which pipes run upward to the roof, the whole constructed and arranged as and for the purpose set forth.

254,104. RUNNING-GEAR FOR VEHICLES. ALLEN J. BEACH Linden, Mich. Filed Nov. 19, 1881. (No model.)



Claim.—1. The reach C, pivotally secured to the draw-bar D, in combination with the circle I below the draw-bar D, the bolster G, and the bolster-barrier F above said draw-bar, and the bent bearing-brackets I', secured to the bolster and adapted to act against the circle I, and the axle E, as and for the purpose specified.

2. In combination with the draw-bar D, bolster G, and axle E, the circle I, secured to the axle, and the bent bearing-plates I', secured to the bolster and adapted to act against the circle, substantially as specified.

3. In a wagon, and in combination with the axle E thereof, the bolster-barrier F and draw-bar D, provided with the double-shouldered thimble *d*, adapted to support the center of the bolster-barrier, substantially as and for the purposes described.

4. In a wagon, and in combination with the circle H, provided with the hanger J, in which is pivotally hung the tongue K, the sliding sleeve L, and draft-rods M, substantially as and for the purposes set forth.

254,105. MODE OF AND MACHINE FOR WAXING PAPER. JOSEPH T. BEDFORD, New York, N. Y. Filed June 3, 1881. (No model.)

Claim.—1. The herein-described mode or process of making waxed paper, consisting in heating the paper before it is waxed, supplying the paraffine or other wax to the paper in thin films, at points above the mass or body of paraffine, by having it pass through felt rubbers or feeders by capillary attraction, and reheating the paper and wax thereon, and simultaneously rubbing the thin films of paraffine into the traveling heated paper, substantially as described.

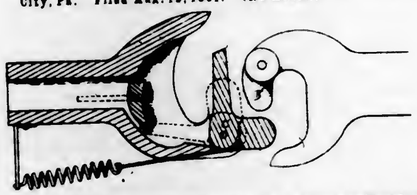
2. The combination of felt feeders, applied nearly in contact with a revolving hollow heated roller, and caused to reciprocate in a tank containing melted paraffine or other wax, and by capillary attraction and a rubbing action to apply melted wax in thin films to the surface of the paper, and a hollow revolving roller for heating the paper between the supply-roll and the tank, substantially as and for the purpose described.

3. The combination of a paraffine or other wax-holding tank provided with steam-pipes for keeping the wax melted, reciprocating felt feeders partly immersed in the tank, hollow revolving heating-rollers D D^2, and deflecting-rollers, substantially as and for the purpose described.

4. The combination of the auxiliary or upper waxing mechanism, provided with a felt feeder, with the lower main waxing mechanism, also provided with a felt feeder, which by capillary attraction supplies the paraffine to the paper in thin films at points above the mass or body of paraffine, and with hollow rolls which heat and deflect the paper, substantially as described.

5. The felt feeders applied in clamps, and made adjustable by means of rocking guide-bars I, lever-arms e^2, and set-screws, substantially as and for the purpose described.

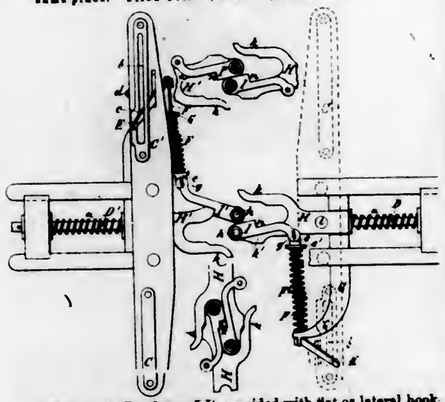
6. Felt feeders, in combination with mechanism, substantially as described, whereby they are reciprocated beneath the paper and within the paraffine or other wax-holding tank, as set forth.



7. The combination of the supplying-roll, heating-rolls, main and auxiliary waxing mechanisms, provided respectively with a felt feeder, main and auxiliary tanks for holding and keeping the paraffine or other wax melted, and a roll for receiving the waxed paper, the whole being substantially as and for the purpose described.

8. The upper tank provided with steam-pipes for heating the paraffine or other wax, a felt holder or clamp, and a regulating-valve applied centrally over the perforated and raised portion of the felt-holder, substantially as described.

9. The combination of a felt feeder, a tank for holding the paraffine or other wax, and hollow heating-rollers D D' D², arranged in a triangle, or nearly so, substantially as and for the purpose described.



10. The clamps H, having hinged inner jaws, *f*, lever-arms J', and set-screws *c*, substantially as described.

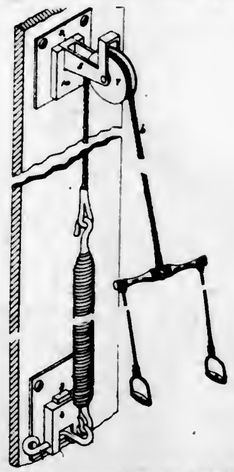
254,106. CAR-COUPLING. CLINTON BROWNING, Shousetown, assignor of one-half to Lindsay & McCutcheon, Allegheny City, Pa. Filed Aug. 15, 1881. (No model.)

Claim.—In a car-coupling composed of a bifurcated head and rotary interlocking hook, the combination, with said rotary hook, of means, substantially such as described, for automatically opening and retaining said hook in proper position for coupling.

254,107. CAR-COUPLING. CLINTON BROWNING, Allegheny City, Pa., assignor of three-eighths to Lindsay & McCutcheon, same place. Filed Oct. 10, 1881. (No model.)

Claim.—1. The levers I I', provided with flat or lateral hooking or interlocking shoulders *n* between their front and rear extensions, and with pivot-pin holes in their front extensions, in combination with the draw-heads H H', formed as described, and with the pivot-pins *h* *h*, substantially as and for the purpose described.

2. The levers I I', provided respectively with a flat or laterally-extended shoulder, *n*, and a bevel, *n'*, and with two arms at their front and two at their rear ends, and with pivot-pin holes in their front ends, and both levers united by a body of metal, which forms also a shoulder from top to bottom of the respective draw-heads, in combination with the draw-heads formed respectively, as described, with a bifurcated end and with a depression, *l*, substantially as and for the purpose described.



3. The levers I I', provided respectively with a flat or lateral shoulder, *n*, and upper and lower rear and front extensions, in combination with the bifurcated draw-heads H H', rods F, springs F', hand-levers E, and locking-bars C', substantially as and for the purpose described.

4. The combination of the bifurcated draw-heads H H', levers I I', provided with flat or lateral shoulders *n*, and the spring draw-bars D D', connected to the draw-heads by vertical hinge-pivots *i*, substantially as and for the purpose described.

5. The hinging-ears *m* of the draw-heads H H', having a space, *m'*, between them, and rounded at their corners *p*, in combination with the binging ears or ends of the levers I I', and with the vertically-sliding or removable pivot-pins *h*, substantially as and for the purpose described.

6. The bifurcated draw-heads H H', provided with interlocking levers which have flat or lateral interlocking shoulders *n*, and are pivoted as described, and are arranged and constructed to pull squarely against the respective flat shoulders *n* of one another on a line diagonal to a central line of draft of the cars, and thereby relieve the springs of the levers I I' from strain while at the same time the draw-heads maintain their coupled position, substantially as described.

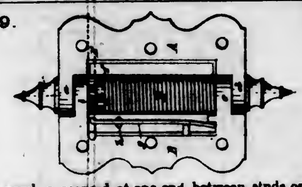
254,108. EXERCISING APPARATUS. WILLIAM J. O. BRYON, Jr., New York, N. Y. Filed Dec. 1, 1881. (No model.)

Claim.—1. In an exercising apparatus provided with an elastic spring or other suitable resistance, the combination of a pulley and a hook or fixed attachment interchangeable in position with one another, substantially as described.

2. The combination, with the fixed socket-plates, of a pulley whose frame is provided with a tongue or extension at right angles thereto for entering said sockets, and a hook or ring whose shank is provided with a similar tongue, substantially as and for the purpose described.

3. In an exercising apparatus which is provided with an elastic spring or other suitable resistance, the combination, with a pulley over which passes the cord attached to one end of said spring, of a hook, eye, or other suitable device, to which the fixed end of said spring may be attached, and means whereby said pulley and hook may be interchanged in position, for the purpose described.

4. In a wall exercising apparatus, the combination of fixed holders or supports and removably-attached pulley and hook or its equivalent, substantially as and for the purpose described.



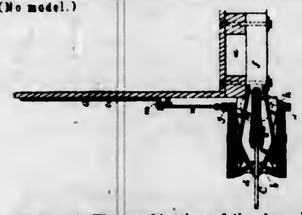
5. In a wall exercising apparatus, a hook or eye for attaching the fixed end of the resistance-spring, whose shank is provided with a tongue or extension at right angles thereto, substantially as and for the purpose described.

6. In a wall exercising apparatus, a pulley block or frame provided with a tongue or extension at right angles thereto, in combination with a socket fixed to the wall or other suitable support, substantially as described.

7. In combination with the removable pulley and hook and their tongues or extensions, sockets or clamps consisting of the side pieces, cross-piece, and base-plate, whereby said clamp may be attached to a wall or other suitable support.

254,109. SPRING-HINGE. THEODORE BUTLER, Cleveland, Ohio, assignor to the Butler Door Spring Company, same place. Filed Sept. 13, 1881. (Model.)

Claim.—The combination, with the pintle, ratchet, spiral spring, and leaves A and B, the latter having a perforation, *h*, of a spring-pawl, *g*, secured at one end between studs on the inner side of leaf B, and then passing under the perforation *h* and terminating in a bent end secured in a perforation of the leaf B, and engaging with said ratchet, substantially as set forth.



254,110. CIRCULAR-SAW MILL. JOHN CAMPBELL, Windsor, Ontario, Canada. Filed Dec. 9, 1881. (No model.)

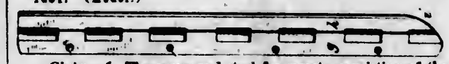
Claim.—1. The combination, with a gang of two circular saws arranged at a suitable distance apart, of a chain-supporting way arranged between said saws and extending on opposite sides thereof, and an endless-band chain arranged to travel upon said way between said saws, and provided with a series of spaced links having outwardly-projecting log-holders arranged to pass between said saws and carry logs longitudinally between the same, substantially as described.

2. The combination, with the two circular saws and a chain-way between and extending on both sides thereof, of the band-chain provided with the spaced log-carriers and means for driving said saws and chain, the said chain and its supporting-way being of sufficient length and properly arranged to support simultaneously a log that is being sawed, another that has been sawed and is being carried away from the saws, and another that is approaching the saws, so that receiving, sawing, and delivering the logs are performed as a continuous operation, substantially as described.

254,111. CAR-COUPLING. LUE L. CHASE, Swanton, Vt., assignor to Fletcher Tarble, same place. Filed Jan. 3, 1882. (No model.)

Claim.—1. The combination of the draw-head having the double inclined partition, and its mouth, with the link extended through such partition and supported by an arm, as set forth, and also with the catch-levers applied to such draw-head, and provided with mechanism for moving them, (the said catch-levers,) as explained.

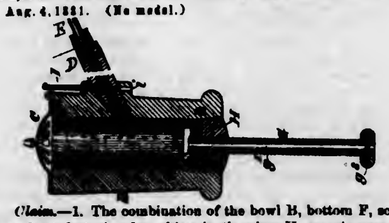
2. The combination for operating the two lever-catches D to effect disengagement of one of them from a link, C, such combination consisting of the rock-shaft *k*, two crank-wheels, *i*, four links, *h*, and two cross-bars, *g*, all arranged and applied, and the rock-shaft having handles, substantially as set forth.



3. The combination of the lever *m*, lifter-rod *o*, and link *n*, the rock-shaft *k*, two crank-wheels, *i*, four links, *h*, and two cross-bars, *g*, all arranged and to operate essentially as set forth.

254,112. HARBOR DEFENSE. ROBERT A. CHESEBROUGH, New York, N. Y. Filed Feb. 3, 1881. (No model.)

Claim.—The method of defending harbors by delivering inflammable liquid through submerged pipes or conduits into the water thereof, allowing it to rise to the surface, and then igniting and burning the liquid as it floats upon the water, substantially as herein specified.



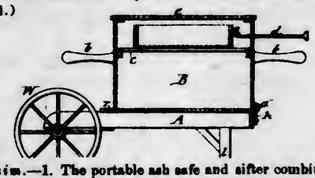
254,113. STEEL FOR CORSETS. DWIGHT H. CHURCH, Birmingham, Conn., assignor of two-thirds to Lyman H. Loomer and Andrew F. Loomer, both of same place. Filed June 23, 1881. (Model.)

Claim.—1. The compound steel for corsets, consisting of the two narrow removable pieces *g* and *h*, one of which is provided with a groove at one edge adapted to receive and slide upon the edge of the other piece, and the two, when in the same pocket, serving to hold each other in place, substantially as shown and described.

2. A corset having its front steels made in the two removable parts *g h*, as described, the part *h* having edge-clasps or their equivalents to receive the edge of the part *g*, and having its inner end of wedging shape, as and for the purposes described.

254,114. SMOKING-PIPE. JAS. COLE, St. Louis, Mo. Filed Aug. 4, 1881. (No model.)

Claim.—1. The combination of the bowl B, bottom F, screw G, perforated at *g'* and working in the plug H, carrying mouth-piece E, and gate I, substantially as described.

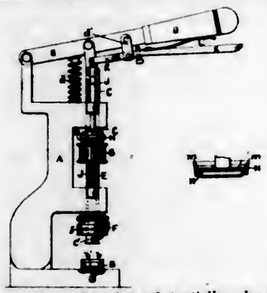


2. The combination of the bowl B, bottom F, plug H, perforated screw G, gate I, gate *g'*, and stem D, and mouth-piece E, substantially as described.

254,115. VEHICLE-SEAT. FRANK A. COMSTOCK, Columbus, Ohio. Filed Sept. 30, 1881. (No model.)

Claim.—A vehicle-seat back composed of sheet-metal sections having their proximate edges turned back toward the body of the sections, and strong strengthening-corners having grooves for the reception of the turned-back edges of the sections, and operating to hold the sections firmly together, substantially as described.

254,116. COMBINED PORTABLE ASH SAFE AND SIFTER. MARSFIELD J. COOK, Syracuse, N. Y., assignor of one-half to Jason I. Freeman, same place. Filed Jan. 14, 1882. (No model.)



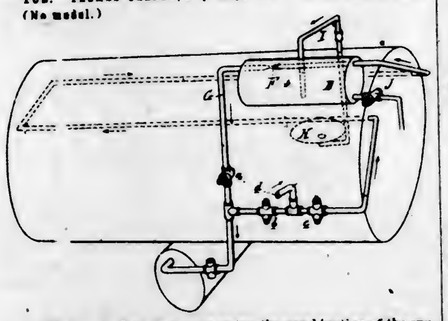
Claim.—1. The portable ash safe and sifter combined, consisting essentially of a frame provided with a carrying wheel or wheels or with sled-runners, and an ash-receptacle removably mounted on said frame and provided with a removable sieve sliding on guides in the interior of the ash-receptacle, all as set forth and shown.

2. The combination of the frame A, provided with the wheel W and with legs *l* and hook *k*, the box B, provided with the staple *a*, end handles, *b b*, secured to the sides of the box, guide-bars *c*, arranged removably inside of the said box, the sieve *e*, mounted on said bars, the handle *d*, detachably connected to said sieve, and the removable cover *e*, all constructed and combined substantially in the manner described and shown.

254,117. MACHINE FOR COMBINING THE BACKS AND FRONTS OF ARTICLES OF JEWELRY. DANIEL S. COOKE and JOHN HAGERTY, Providence, R. I.; said Hagerty assignor to said Cooke. Filed Oct. 29, 1881. (No model.)

254,117.

Claim.—1. The combination, substantially as herein set forth, of a stationary die for supporting the work, a plunger adapted to co-operate with said die, as described, a rotating and sliding sleeve mounted on said plunger and provided with a cutting-tool, and suitable means, as described, for moving the plunger and sleeve to and from the die.

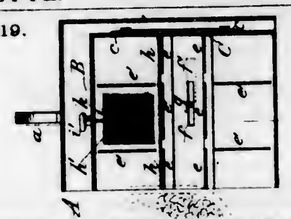


2. The combination, substantially as herein set forth, of a stationary die for supporting the work, a plunger adapted to co-operate with said die, as described, a rotating and sliding sleeve mounted on said plunger, engaging a shoulder on the same when in normal position, and provided with a cutting-tool, a lever for moving the plunger and sleeve simultaneously toward the die, a second lever for giving the sleeve a further movement toward the die independently of the plunger, and suitable means, as described, for retreating the parts.

3. The combination, substantially as herein set forth, of a stationary die for supporting the work, a plunger adapted to co-operate with said die, as described, a rotating and sliding sleeve mounted on said plunger and provided with a cutting-tool, a lever for moving the plunger toward the die, a second lever connected with the sleeve and with the first lever for moving the sleeve and cutting-tool up to the work, and suitable means, as described, for retreating the parts.

4. The combination of the stationary die B, the plunger C, the sleeve E, adapted to hold a cutting-tool, F, the lever D, the lever K, connected with the sleeve E and with the lever D, and springs for retreating the plunger and sleeve, substantially as set forth.

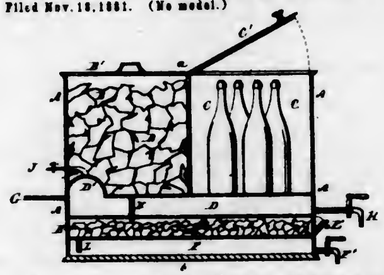
5. The combination of the detachable die B, having a shoulder, *b*, and cavity *b'*, the plunger C, provided with a detachable member, C', having a central cavity, the sleeve E, adapted to hold a cutting-tool, F, and provided with a pulley, G, the levers D K, the rods J J, yoke H, and springs *d* L, substantially as described and shown.



254,118. BOILER-CLEANER AND CIRCULATING APPARATUS. THOMAS CRANBY, Bay City, Mich. Filed July 8, 1881. (No model.)

Claim.—1. In a steam-generator, the combination of the supply-pipe J, drum D, injector F, pipe I, surface-pan H, and the pipe G, as and for the purpose specified.

2. In combination with the steam-generator and its water-supply pipe, the drum D, which incloses an injector, F, said drum being connected to the boiler by the pipe G and to the surface-pan within the boiler by a pipe, I, substantially as and for the purposes set forth.



254,119. CULINARY APPARATUS. WILLIAM H. DANIELL, Pottsville, Pa. Filed May 16, 1881. (No model.)

Claim.—1. In a culinary apparatus, the combination, with an outer inclosing shell having handles and suitable hinged sides, of an inner shell provided with handles and openings and having interior shelves or gratings supported on brackets, substantially as and for the purpose shown and described.

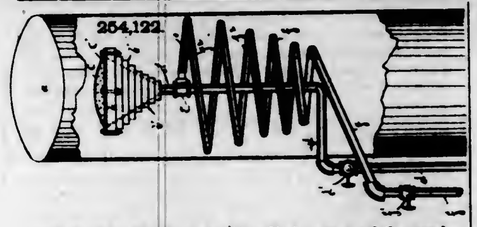
2. In a culinary apparatus, the combination, with the outer shell, A, of the inner shell, B, having brackets *c c'*, grated partitions *h h*, spit-rod *g*, supported in slot *f f*, and hook *i*, supporting a wire broiling-frame, *h'*, substantially as and for the purpose specified.

254,120. BEER-COOLER. PATRICK J. DARCY, Hartford, Conn. Filed Nov. 16, 1881. (No model.)

Claim.—1. In combination with a tight beer-chamber, D, provided with the inlet and outlet pipes G H, and the air-chamber D', provided with the cock J, the cooling-chambers C and E, above and below said beer-chamber, connected by the drip-pipe K, substantially as described.

2. In combination with the beer-chamber D, the ice-receptacles B and E and the separate cold-water receiver F, provided with the faucet F', and connected with the ice-receptacles by the pipes K and L, substantially as described.

254,121. RECIPROCATING CHURN. HENRY T. DAVIS, Sherman, Tex. Filed Apr. 14, 1881. (No model.)

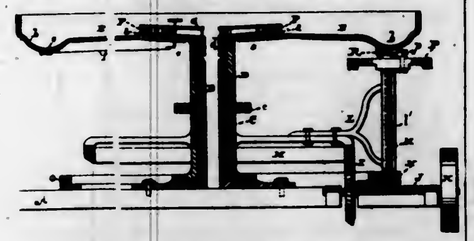


Claim.—In a reciprocating churn, the vertical open-ended flanges, perforated shell B, side tubes or pipes, C C, attached thereto, and cover E, formed with perforations *f e' e'*, for receiving the upper ends of the dasher-rod and tubes or pipes, in combination with the rod F, dasher D, and tub A, as set forth.

254,122. SPARK-EXTINGUISHER. ISAAC DEVELL, St. Thomas, Ontario, Canada. Filed Dec. 12, 1881. (No model.)

Claim.—1. The spark-extinguisher for smoke-stacks, consisting of the steam-receptacle *b*, having the exterior steps or shoulders, *b'*, and cap *c*, so arranged thereon as to leave the annular space *c'*, the whole being connected with the source of steam-supply through pipe *d*, and the coil of perforated pipe *f*, connected with the source of supply, all being combined and operating substantially as shown and described.

2. In a spark-extinguisher, the steam-receptacle *b*, provided



254,122.

with the series of steps or shoulders *b'*, the cap *c*, and the annular space or opening *c'*, as and for the purpose stated.

3. In a spark-extinguisher, the steam-receptacle *b*, provided with the series of steps or shoulders *b'*, the annular space or opening *c'*, and the perforated cap *c*, substantially as shown and described.

254,123. ORE-CONCENTRATOR. JOSEPH S. DUNCAN, San Francisco, Cal., assignor of a part to A. P. Brayton and John H. Wells, same place. Filed Aug. 5, 1881. (No model.)

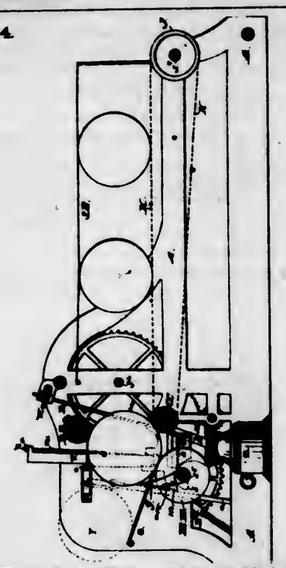
Claim.—1. The concentrating-pan E, with its peripheral channel *b*, said pan being journaled upon a central post and given a rotary motion thereon by means of the connecting-crank R, plate P, shaft M, traveling bracket L, gear-wheel H, pinion I, shaft J, and pulley K, and given an oscillating or shaking motion at the same time by means of the crank R, revolving crank-plate P, shaft M, pinion N, large gear-ring O, traveling bracket L, gear-wheel H, pinion I, shaft J, and pulley K, the whole constructed to act in combination, substantially as herein described.

2. The concentrating-pan E, with its peripheral channel *b* and central aperture, in combination with the hollow king-post B and mechanism, substantially as and for the purpose herein described, for imparting to said pan a rotary and vibratory movement.

3. The concentrating-pan E, with its peripheral channel *b* and central aperture, and having the S-shaped flanges F, in combination with the hollow king-post B, substantially as and for the uses and purposes herein described.

4. The concentrating-pan E, with its peripheral channel *b* and central aperture, and having the S-shaped flanges F and protecting-plate G, in combination with the hollow king-post B, substantially as and for the uses and purposes herein described.

5. The concentrating-pan E, with its peripheral channel *b*, said channel having an aperture, *c*, covered by a valve operated by the rod *f* and crank *g*, and the mechanism, substantially as and for the purpose herein described, for imparting to said pan a rotary and vibratory movement.



254,124. AUTOMATIC SOLDERING-MACHINE. JOHN ALEXANDER FORBES, Dover, Del., assignor of one-half to Frederic A. Williams, same place. Filed Sept. 17, 1881. (No model.)

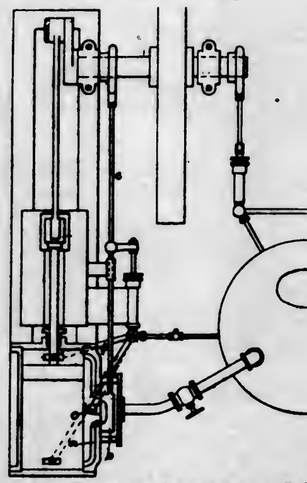
Brief.—The can is fed between clamping-disks and rotated by them and by rollers C C, D D, E E, while each end rests upon a grooved soldering-iron. Bits of solder cut by a knife fall upon the heated irons at regular intervals. Soldering-irons are pivoted and are oscillated gently to flow the solder. The can is discharged by arms *g* and an endless belt.

Claim.—1. The combination of the tube V, rod *a*, nut *c*, and pin *h* with the knife *e*, box *d*, screws *f* and *a*, lever *a*, pivot *b*, spring *p*, and the pin *i* and wheel I on shaft S', as and for the purpose herein set forth.

2. An oscillating iron reservoir, M, pivoted at *r* on the frame A, containing the copper bar N, the lug *m*, and the screw *n* *m*, M and N being shaped upon the upper end to fit the curve of a can, and the whole being moved by *s* and S', as and for the purpose herein set forth.

254,124.

3. The copper bar N, in combination with the grooved oscillating iron M and the adjustable rod R, pivoted to N, R and N being adjustable by means of the wheel W.

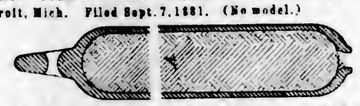


4. The combination of the pulleys E E with the disks P and P', the rollers C C and D D, and the parts M and N, for holding and guiding cans during the soldering operation.

5. In a soldering-machine, the combination of M and N with the means, P and P', D D, and C C, for rotating, and also with the means, O, *g*, and K, for carrying cans through the machine.

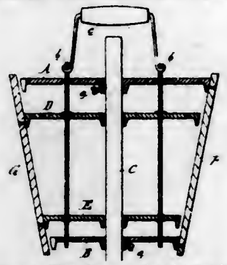
6. In a soldering-machine, the combination of the following parts for automatically reciprocating the disk P': shaft S', wheel I, and pin *i*, with the bar L', wedge *w*, shoulder *x* or other projection from shaft S', and S' carrying the disk P, and the spring P Z, substantially as herein described and set forth.

7. In a soldering-machine, the combination of the brake S B with the carrier K, substantially as and for the purpose specified.



254,126. STEAM-ENGINE. ERIK GUSTAF PRYTZBERG, Newark N.J. Filed Oct. 1, 1881. (No model.)

Claim.—The combination of a steam-cylinder of sufficient clearance, supplied with a valve mechanism for operating the steam expansively, induction-ports for the admission of live steam to the cylinder, and passages for the escape of water of condensa-

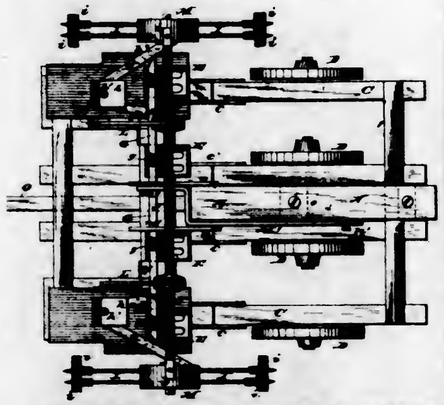


tion from the cylinder, and a pump connected with such water-passages, suitably connected and operated to return such water to the steam-generator, substantially as and for the purpose set forth.

254,126. CORE FOR SASH-WEIGHTS. P. HENRY GRIFFIN, Detroit, Mich. Filed Sept. 7, 1881. (No model.)

Claim.—A core for casting sash-weights, composed of sand and silicate of soda, as and for the purpose specified.

254,127. MANUFACTURE OF PAPER PAILS. ADELBERT J. GRINNELL, Detroit, Mich. Filed Dec. 12, 1881. (No model.)

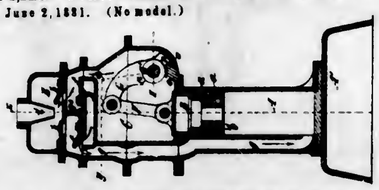


Claim.—1. A rolling former wherein one-half of the staves used are secured to one holding device and the remaining staves to a separate holding device, whereby each alternate stave is adapted to be partially removed, substantially as and for the purpose specified.

2. A roller-former for the purposes set forth, consisting of a fixed head and bottom secured to a central shaft, and with rigidly-secured staves, intermediate head and bottom, with staves secured thereto, each intermediate head and bottom having a limited reciprocating motion upon the shaft, substantially as and for the purposes specified.

3. A roller-former for the purposes set forth, consisting of the head A, bottom B, and staves F, the intermediate head, D, bottom E, and staves G, in combination with the shaft C, and means, substantially as described, for reciprocating the parts D E upon the shaft, substantially as and for the purposes set forth.

254,128. CORN-PLANTER AND CHECK-ROWER. HENRY P. HALL, Danvers, Ill. Filed July 28, 1881. (No model.)



Claim.—1. In a check-rower corn-planter, the combination, with the shaft J, of the hubs M M, mounted on the ends thereof, and each hub provided with two rows of radially-projecting marking-arms, I, the arms of said rows alternating with each other, as shown, whereby the inner row of arms on each hub will come on a line with the outer row of arms on the other hub, the dropping-bar and operating mechanism adapted to be alternately operated by the inner row of arms on the hubs, substantially in the manner as and for the purpose herein shown and described.

2. In a check-rower corn-planter, the combination, with the dropping-bar G, of the pivoted bent or elbow levers H H, connected to said bar by the short arms A^3 A^3, with their long arms A^4 A^4 projecting beyond the sides of the machine, and the shaft J, having hubs provided with rows of arms I I, adapted to alternately engage the long arms A^4 A^4 of said levers for operating the dropping-bar, substantially in the manner as and for the purpose herein shown and described.

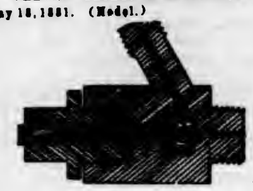
3. In a check-rower corn-planter, the combination of the dropping-plates having forked arms F, the dropping-bar G, provided with the studs *g g* and *g' g'*, pivoted bent or elbow levers H H, having short forked arms h^3 h^3 and long arms A^4 A^4 projecting beyond the sides of the machine, and the shaft J, provided with hubs M M, each hub having two rows of marking-arms, the several parts arranged and operating substantially in the manner herein shown and described.

4. The combination, with the bent or elbow levers H H, of the metallic caps *h h*, in which the bent or elbow portions of said levers are arranged, and a screw, pin, or its equivalent, passing through each cap and lever, by which they are pivoted upon the frame of the machine, substantially in the manner as and for the purpose herein shown and described.

254,129. PUMP. FRANK B. HANSON, New York, N. Y. Filed June 2, 1881. (No model.)

Claim.—1. In a pump, the combination of an upright cylinder and a piston, a chamber above the cylinder containing mechanism for imparting motion to said piston, suction and discharge chests containing suction and discharge valves arranged immediately above said chamber, and passages leading from said chests to said cylinder above and below the piston, substantially as specified.

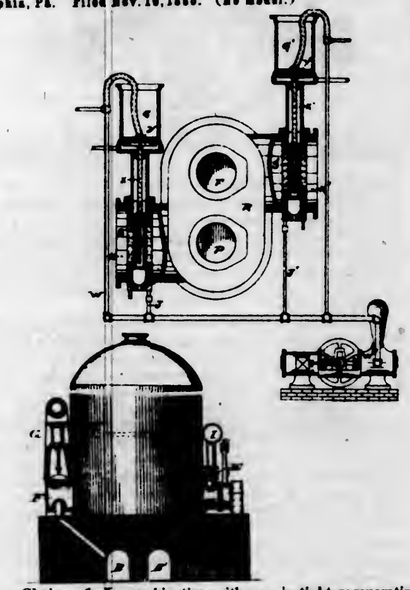
2. The combination of the cylinder A and piston B, the chamber C, arranged above and supported by said cylinder, mechanism for operating the piston, contained in said chamber, the suction and discharge chests B and E, containing valves *f h*, the passages *g g'*, and the partition g^4, separating said passages, all substantially as specified.



3. The combination of the cylinder A and piston B, the chamber C, arranged above and supported by said cylinder, mechanism for operating said piston, arranged in said chamber, the suction and discharge chests D and E, containing valves *f h*, the passages *g g'*, and the inwardly-projecting nozzle *i* in the chest E, whereby the latter is made to serve as an air-chamber, substantially as specified.

4. In a pump, the combination of a cylinder and piston, a lever or arm and a link for operating said piston, and a rock-shaft inserted through said lever or arm, and comprising square or polygonal shoulders, between which said lever or arm is held, and which enter corresponding seats in opposite sides thereof, one of said shoulders being formed by a sleeve fitting upon said shaft, substantially as specified.

5. The combination of the lever or arm G, the rock-shaft H, having a shoulder, *j*, the sleeve I, forming the shoulder *j'*, and the nut *h*, for securing said sleeve I upon the rock-shaft, substantially as specified.



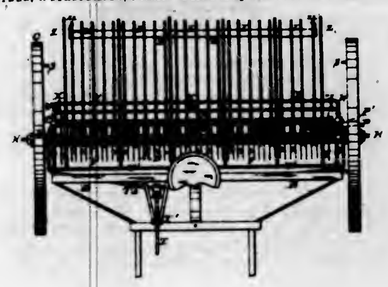
6. In a pump, the combination of a cylinder and piston, a link and a lever or arm for imparting motion to said piston, a rock-shaft to which said lever or arm is secured, stops upon the interior of the pump, and projections upon said lever or arm, which are adapted to engage with said stops for limiting the movement of said lever or arm, substantially as specified.

254,130. VALVE. THOMAS E. HARRISON, Philadelphia, Pa. Filed May 16, 1881. (Model.)

Claim.—In a valve for retaining and regulating the flow of gas under high pressure, the combination of a raised valve-seat of soft metal with a capped or conical concave valve of harder metal, provided with a guide to prevent rotation and insure the closing thereof at all times in the same position, substantially as and for the purpose set forth.

254,131. HOT-BLAST STOVE. JOHN M. HARTMAN, Philadelphia, Pa. Filed Nov. 10, 1880. (No model.)

Claim.—1. In combination with an air-tight regenerative stove, an external foundation having in it the flue B, for conveying the unburned gas to the stove, and the flue B', for conveying the burned gas to the chimney, the said flues being placed under the stoves, and the connections from the stoves to the flues being external to the stoves.



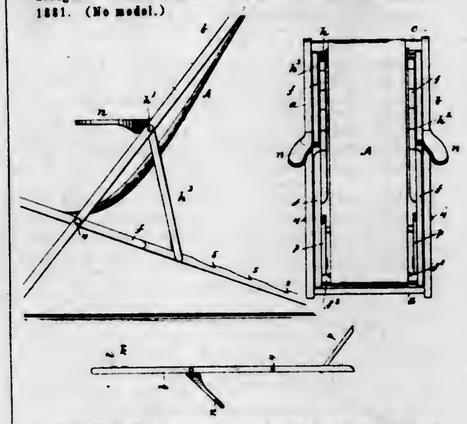
2. The method of cleaning the passages of a regenerative stove, which consists in stopping or closing part of the passages and discharging a current of compressed air through the remaining passages, whereby the air-blast is concentrated in the open passages and a thorough cleaning is obtained.

3. In combination with a regenerative stove having water-cooled valve-disks S S', the cylinders G G', the pistons V V', the piston-rods X X', and pipe T T', for operating the valve-disks.

4. In combination with a regenerative stove, a compound nozzle containing the valve bodies K K' and one or more openings, F F', into the stove.

5. The combination, with the valves and their seats, of a regenerative stove, the valves and valve-seats being provided with water-circulating passages, an eduction-pipe, and exhausting device, whereby a circulation of water is induced through the said passages by suction.

254,132. COMBINED HAY RAKE AND TEDDER. EDWIN A. HILLS, Wethersfield, Conn. Filed May 4, 1881. (No model.)

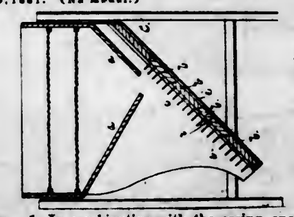


Claim.—1. In a hay rake and tedder, the combination of a series of teeth upon a shifting frame with a series of alternating cams and channels upon the revolving axle of the wheels, whereby the said teeth can be laterally shifted to remain at rest in the channels or be operated by the cams, substantially as described.

2. The combination of the teeth L, the sliding frame M, and the lever P with the fixed frame of the machine, substantially as described.

3. The combination of the bar R, having the jointed-lever ends R^2, with the pins S and the teeth L, substantially as described.

4. The horizontal perforated piece Z, in combination with the chains Z' and the teeth L, substantially as described.



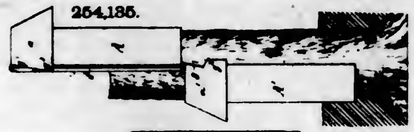
254,133. RECLINING-CHAIR. GEORGE F. HOLT, Boston, Mass., assignor to Nathaniel Cummings, same place. Filed May 2, 1881. (No model.)

Claim.—1. The convertible chair and screen composed of a seat supported by a suitable frame adapted to be folded together as shown, combined with the adjustable foot *p*, which, when the chair is folded, is extended out from the frame to enable the chair to stand upright to serve as a screen, substantially as described.

2. The convertible chair and screen composed of the main frame *a b c d*, the auxiliary notched frame *f*, braces A^3, and seat A, adapted to be extended in chair form, as shown, and to be folded together and supported as a screen by means of the foot *p*, substantially as specified.

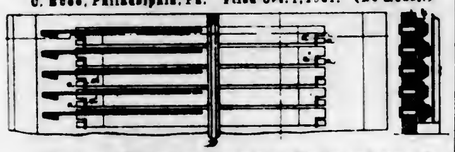
254,134. CORN-SILKING MACHINE. JOHN M. HOPKINS, Edgewood, Md., assignor to Rachel L. Hopkins, same place. Filed Sept. 8, 1881. (No model.)

Claim.—1. In combination with the casing, one or more removable inclined boards having pins projecting from the upper surface for retaining the silk, the boards acting as a chute to deliver the corn into a suitable receptacle, as set forth.



2. In combination with the casing having inclined cleats *i*, the removable boards *b*, resting thereon, and provided with pins *c*, as set forth.

254,135. TREE-PROTECTOR. AUGUST HORSUNG and ADOLPH H. FUSS, Castroville, Tex. Filed Dec. 31, 1881. (No model.)

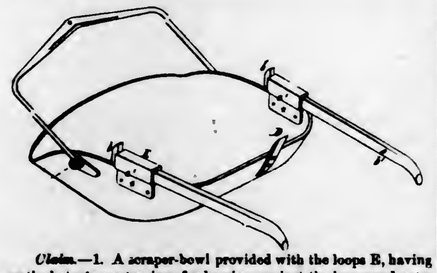


Claim.—1. A tree-protector composed of two half-cylinders, A and A', and two half-cones, *a a'*, and with means whereby said half-cylinders and cones can be interlocked together by a sliding joint, substantially as and for the purpose described.

2. In a tree-protector, the half-cylinder A', provided with a half-cone, *a'*, cut away so as to form an oblique edge, *g*, and an extended portion, g^4, in combination with a half-cylinder, A, provided with a half-cone, *a*, substantially as and for the purpose described.

254,135.

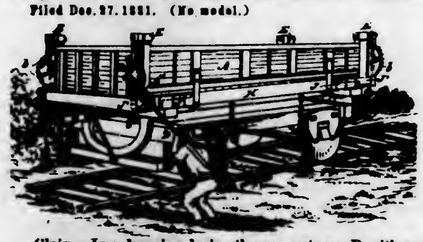
254,136. VALVE FOR MUSICAL WIND-INSTRUMENTS. GEO. C. HUGG, Philadelphia, Pa. Filed Oct. 1, 1881. (No model.)



Claim.—1. The organ-valve formed with the gudgeons *a* integral therewith, in combination with the eyes *a'*, secured to the reed-board and receiving said gudgeons, substantially as and for the purpose set forth.

2. The reed-board and valves, in combination with the guard extending under all of the valves as a common check or stop, substantially as and for the purpose set forth.

254,137. ROAD-SCRAPER. WILLIAM E. JACOBS and HENRY L. JACOBS, Columbus, Ohio. Filed Dec. 16, 1880. (No model.)

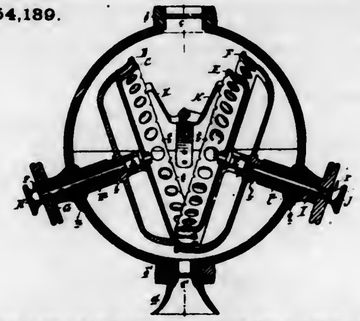


Brief—Loops secured by flanges upon the top of the sides of the scraper-bowl carry sliding handles, which may be fixed, the position of the loops permitting the handles to revolve with the bowl through the bail of the scraper.

Claim.—1. A scraper-bowl provided with the loops E, having vertical staying-extensions for bearing against the inner and outer surfaces of the bowl, said loops serving to receive and permit the handles to slide, and also as a means whereby the handles may with bolts be fastened and held from sliding, substantially as described.

2. A scraper provided with sliding handles, whereby the bowl with the handles is allowed to revolve through the bail of the scraper, substantially as described.

254,138. DUMPING-CAR. FRANK P. JOHNSON, Waltham, Mass. Filed Dec. 27, 1881. (No model.)



Claim.—In a dumping device, the segment-gear B, with cogs *b*, the corner-post E, with elongated strengthening-plate J, and strengthening-plate J', inserted in and attached to the sill H, the pin G, with lip *g'*, and the adjustable detachable lever D, constructed and arranged substantially as described and shown, and for the purpose set forth.

254,139. OPTOMETER. GEORGE JOHNSTON, Detroit, Mich. Filed Sept. 26, 1881. (Model.)

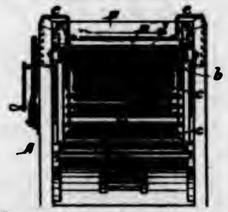
Claim.—1. In an optometer or eye-tester, one or more sets of frames carrying lenses of different focal power and quality, and adapted to revolve at different angles, whereby any one of the lenses

254,139.

of one frame can be brought into a direct line of vision with any one of the lenses of the other frame or frames, substantially as and for the purpose specified.

2. In an optometer, and in combination with a suitable supporting-frame, one or more sets of rings or frames carrying lenses of different focal power and quality, said frames being secured to shafts mounted at an angle to each other, substantially as and for the purpose described.

3. In combination with a series of lens-carrying frames supported at two different angles, as described, a frame for supporting said lens-frames, adapted to be turned or partly turned, whereby each lens in the lens-frames can be rotated upon the line or axis of sight, substantially as and for the purpose specified.



4. In an optometer, and in combination with a suitable supporting-frame, two or more sets of shafts mounted at different angles to the line of vision through the supporting-frame, and each shaft provided at its inner end with a frame or ring provided with a series of lenses of different focal power, and a blank opening, substantially as and for the purpose specified

5. In an optometer, the combination of the rings or frames C D E F, carrying lenses of different quality and power, and arranged in two sets, each set being mounted on shafts independent from and at an angle to the shafts of the opposite set, substantially as described.

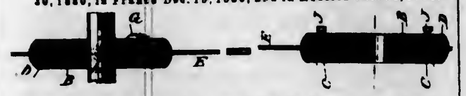
6. In an optometer, the frame B, consisting of one stationary and one revolving section, in combination with shafts and lens-frames arranged at different angles within said revolvible section, and suitable gages for indicating the proper movement of the supporting and the lens frames, substantially as and for the purpose specified.

7. In an optometer, the combination of the lens-frames D F, secured to tubular shafts *i i*, mounted at different angles, the lens-frames C E, secured to shafts *h h*, revolving in said tubular shafts *i i*, and the supporting-frame B, made in one stationary and one movable section, said movable section carrying the shafts and lens-frames, substantially as and for the purpose specified.

254,140. FANNING-MILL. HERBERT E. KNELSH, La Crosse, Wis. Filed Apr. 26, 1881. (No model.)

Claim.—The combination, in a grain-cleaning machine, of the hopper B, having a contractible throat or opening, *b*, the laterally-vibrating shoe C, and the bar D, provided at its ends with the arms *c c*, connected to the shoe, and the said bar having therein the depending teeth or fingers *d d*, the lower ends of which are arranged above the said throat or opening, substantially as and for the purposes specified.

254,141. CULINARY UTENSIL. WILLIAM W. KENFIELD, Canadaigua, N.Y. Filed Oct. 29, 1881. (No model.)



Claim.—The herein-described bottom for culinary utensils, consisting of a disk V-shaped in cross-section, and provided with radial grooves extending from the extreme edge of the disk down-

254,141.

wardly to a point near the center thereof, circumferential downwardly-extending vertical rim C, horizontal flange D, and upwardly-projecting rim E, substantially as and for the purpose specified.

254,142. HANGING CIRCULAR SAWS. JACOB KITZ, Neuschleusig, near Leipsic, Germany. Filed Dec. 12, 1880. (No model.) Patented in Germany Oct. 8, 1880, in England Nov. 30, 1880, in France Dec. 15, 1880, and in Austria Feb. 16, 1881.

Claim.—In combination with a hub, B, firmly secured to a driving-shaft, A, and provided with projecting pins or journals C C, the ring D, with saw-blade E, the screw G, and set-screws J J, constructed and arranged to operate in the manner and for the purpose substantially as described.

254,143. DRUM. GEORGE S. KNAPP, Chicago, Ill. Filed June 9, 1881. (No model.)

Claim.—1. As an improvement in drums, the combination of the hoops, the hooks or jaws engaging with the hoops, and the straining-rods provided with right and left threads, as described and shown.

2. In a drum, the combination of the threaded straining-rods and the hooks or jaws provided with the extended necks adapted to cover and protect the screw-threads of said rods, as shown.

3. In a device for stretching the head of a drum or similar instrument, the hook provided with the recess *b*, as and for the purpose described.

4. As an improvement in drums, the wooden straining-hoops provided with a circumferential groove, and the metal band seated in said groove, as described and shown, whereby the hoop is prevented from springing and the band supported in position to receive the devices attached thereto.

5. In combination with a drum and hinged knee-rest, a spring arranged, substantially as described, to urge the same to an open position.

6. In combination with a folding knee-rest upon a drum, a detent or locking device arranged to operate, substantially as described, to keep the knee-rest in a folded or closed position.

7. The combination of the drum-body and the straining-hoops provided with bearing-plates *i i*, the threaded rod *h*, seated in said plates, the snare-strings, and the clamping-plate *g*, secured to the ends of the strings and mounted upon the screw-rod, as described and shown.

8. In combination with a drum, a knee-rest having a pivotal connection therewith, the pivot having its axis in substantially a radial line with reference to the body of the drum.

9. In combination with the drum and the straining-rods applied thereto, folding arms applied to the rods, substantially as shown.

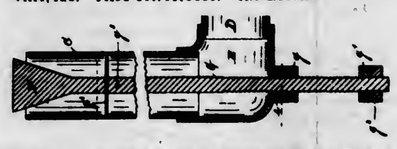
254,144. WIRE-SPLICING TOOL. WILLIAM T. LEMAN, Detroit, Mich., assignor to Wm. G. Avery, same place. Filed Dec. 2, 1881. (No model.)

Claim.—1. The wire-splicing tool consisting of a metallic hook and an adjustable shoulder projecting laterally from the shank of said hook, the hook being arranged to catch over a wire and the shoulder to engage the free portion of another wire being spliced therewith, substantially as described.

2. The combination, with the shank provided with the hook A', of the adjustable slide A', having the laterally-projecting shoulders A', substantially as described.

3. The combination, with the hooked and serrated shank A, of the serrated slide A' and means for clamping said slide to said shank, substantially as described.

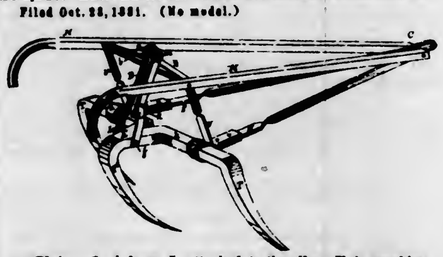
254,145. VEHICLE-WHEEL. PERRIN LINCOLN, Coldwater, Mich. Filed Sept. 24, 1881. (No model.)



Claim.—1. The combination, with the spoke C, felly D, and thimble A, having exterior threaded portion, *b*, of the screw-threaded band E, having inclined planes or cone-shaped edges *f*, and the ring or dog F, having similar inclined planes or cone-shaped edges *f'*, substantially as and for the purpose herein shown and described.

2. The combination, with the spoke C, felly D, and thimble A, having exterior threaded portion, *b*, of the screw-threaded band E, having the ratchet-teeth *h'* and inclined planes or cone-shaped edges *f*, and the ring or dog F, having similar inclined planes or cone-shaped edges *f'*, interior pawl, *h*, and teeth *g'*, substantially as and for the purpose herein shown and described.

3. The combination, with the ends of the fellies and connecting-band I, of the intermediate spring or springs, *i i*, substantially as and for the purpose herein shown and described.

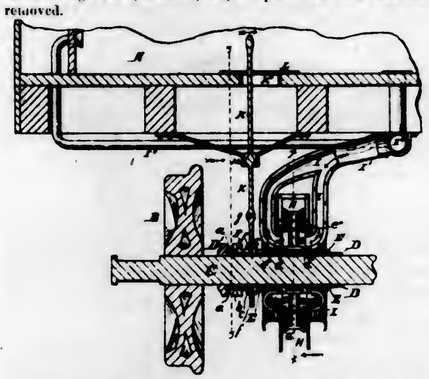


4. The combination, with the ends of the fellies and connecting-band I, of the springs *i i* and intermediate spring, *i'*, substantially as and for the purpose herein shown and described.

254,146. EXHAUST-NOZZLE. JAMES F. MANN, Crawfordsville, Ind. Filed Oct. 11, 1881. (No model.)

Claim.—The combination of the nozzle C, pipe D, elbow E, having boss *e*, cone F, and rod G, having cross-bars *g'*, a jam-nut, *g*, and a head upon its lower end, whereby the cone can be easily, conveniently, and expeditiously regulated to the desired position, substantially as shown and described, and for the purposes specified.

254,147. MANURE-HOOK. SIMON B. MINNICH, Landisville, Pa. Filed Oct. 28, 1881. (No model.)



Claim.—1. A lever, L, attached to the elbow E, in combination with the link B and bar *g*, having the yoke O, whereby, when the tines are in a horizontal position, the ends thereof are prevented from being thrown upward, substantially as set forth.

2. A hook having a tine or tines, T', set back of those, T, at the ends of the hook *h* by means of an elbow or elbows, E, in combination with the bearings *a* and lever L, substantially as and for the purpose specified.

3. The handles H, connected by a bar, *g*, having a yoke, O, in the middle thereof, combined with the link B, lever L, and uprights U, as herein specified.

254,148. RAILWAY-CAR VENTILATION. EDWARD H. MOTT, Chicago, Ill. Filed Sept. 5, 1881. (No model.)

Brief.—A blower is placed on a car-axle in order that it may be revolved by the revolution of the axle. It may be either thrown in or out of gear by the handle K. The car is ventilated by the suction of said blower, which exhausts the foul air. Fresh air will enter through doors, windows, &c., to replace that which has been removed.

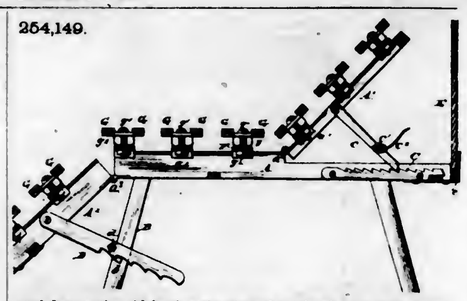
Claim.—1. The combination, in a car-ventilating apparatus, of a fan having a hollow axle, a rotating axle entering the said hollow axle, a fan-chamber surrounding the said hollow axle and fan, and having one or more ports, J J', and one or more ports or openings for communication with an air-tube, substantially as specified.

2. The combination, in a car-ventilating apparatus substantially as described, of a rotary fan, a fan-rotating axle, a fan-chamber having an induction and containing two ports, J and J', and valves or doors for opening and closing the said ports.

3. The combination, substantially as described, in a car-ventilating apparatus, of a rotary fan, a fan-rotating axle, a fan-chamber having an induction and containing two ports, J and J', the valves or doors P and P', and an automatic valve-shifting device for operating the said valve, as and for the purposes specified.

4. The combination, in railway-car-ventilating apparatus, of a fan adapted to be mounted on and rotated by the car-wheel axle, a fan-chamber communicating with an exhaust-tube and containing two exit-ports, and automatic valve-shifting mechanism adapted to open first one of the said ports and then the other upon the reverse rotation of the said fan, for the purposes set forth.

5. The combination, substantially as described, in a car-ventilating apparatus, of a fan having a hollow axle, the rotating axle C, the fan-chamber H, and the air-tube I, surrounding the said hollow axle and entering the central part of the chamber H, the latter having therein one or more air-ports, J J', for the purposes set forth.



6. The combination of the rotating axle C, carrying a clutch, D' *a*, the sliding sleeve E, adapted to be engaged by the said clutch and carrying the fan G G', the fan-chamber H, having therein induction and eduction ports, the air-tube I, entering the chamber H and connected to the said sleeve, and a lever for shifting the said sleeve in and out of engagement with the said clutch, substantially as and for the purposes specified.

7. The combination, with a blower containing ports J J', of the slide O, carrying the valves or doors P P', the yielding rocking lug R, the rotating fan-shaft C, and the air pipes or ducts of a car-ventilating apparatus, substantially as and for the purposes specified.

8. The gates A' A', one or more, arranged substantially as shown and described with relation to the exit-port of a blower containing a fan mounted on an axle, C, for the purposes set forth.

9. The combination, in a car-ventilating apparatus, of a blower containing a fan mounted on an axle, C, the slots h'' h'', the ports J J', the gates A' A', the slide O, the slotted bar W, and the yielding lug R, substantially as and for the purposes specified.

254,149.

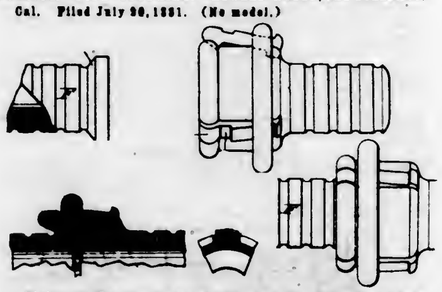
oted foot-section A', having the pivoted ratchet-bars D D, the several parts constructed and arranged relatively to each other substantially in the manner as and for the purpose herein shown and described.

2. The combination, with the side rails, A A, of the transverse spring-slats F, having the bent springs H H, transverse side slats, G G, connecting cross-bar *g*, and threaded bolt or screw and nut *g' g''*, substantially in the manner as and for the purpose herein shown and described.

3. The combination of the side rails, beveled on their inner and upper sides, spring-slats F, having slotted ends, headed securing bolts or screws *f'*, and the pieces of tin h, arranged between the ends of said slats and side rails, all substantially in the manner as and for the purposes herein shown and described.

4. The combination, with the side rails and head and foot boards, of the right-angled metallic straps *e*, secured to and projecting beyond the ends of said side rails, substantially in the manner as and for the purpose herein shown and described.

254,150. LAST. WILLIAM O. NICHOLS, Lynn, Mass. Filed Dec. 8, 1881. (No model.)



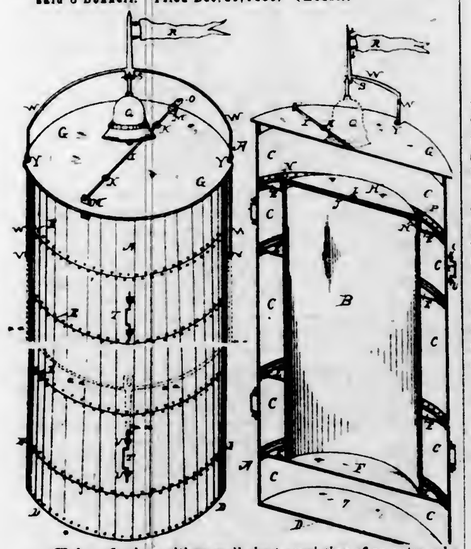
Claim.—1. As a new article of manufacture, the bottomless shell or expander for a boot or shoe, having flexible or elastic sides.

2. An improved device for expanding the upper of a boot or shoe for the purpose set forth, formed from a single piece or blank bent into shape and having free spring sides, all substantially as set forth.

3. An improved device for expanding the upper of boots or shoes, consisting of a hollow body portion of the contour of the front top portion of a last, terminating in rearwardly-extending spring side pieces having free ends, all substantially as shown, for the purposes set forth.

254,151. PIPE-COUPLING. EDWARD NUSAR, San Francisco, Cal. Filed July 20, 1881. (No model.)

Claim.—1. In a pipe-coupling the female portion of which is provided with longitudinal slots or openings and recesses at the base thereof, the arms or levers having holding lugs or projections at their upper and lower ends to fit into said recesses and receive and engage with the head of the male portion of the coupling, and adapted to be compressed or tightened and held in position by a tightening-ring, constructed, arranged, and operating substantially in the manner as herein set forth and specified.



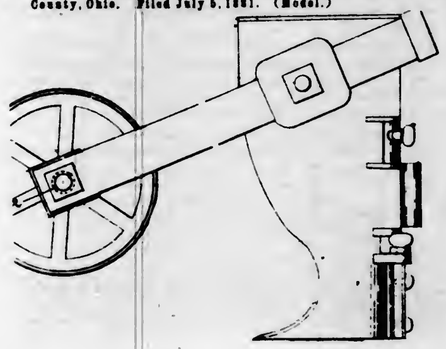
254,149. INVALID-BED. LORENZO D. MOTT, Jr., Marshalltown, Iowa. Filed Jan. 16, 1882. (No model.)

Claim.—1. The combination, with the side rails, A A, having ratchet-bars C C secured to their inner side, and supporting-legs B B, provided with lugs *b b*, of the hinged or pivoted head-section A' *a' a'*, formed from and forming a portion of the main side rails, A A, having pivoted pawls *e e*, and the hinged or piv-

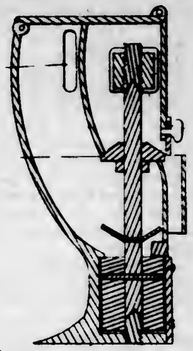
2. The combination, with a pipe-coupling having the arms or levers movable in longitudinal slots in the female portion thereof, of the eccentric ring provided with transverse slots and flanges adapted to engage with and compress the arms or levers so that the beveled ends thereof will engage with and firmly hold the beveled end or head of the male portion of the coupling, substantially in the manner and for the purposes herein set forth and specified.

3. In combination with the male portion of a pipe-coupling having a beveled head, the cap or female portion provided with longitudinal arms or levers having beveled ends to fit over and engage with the end of the male portion and hold it in place when surrounded or compressed by a ring or band, substantially as herein set forth and specified.

254,152. MARITIME MAIL-CHEST. JOHN O'DONNELL and SAMUEL JELLINEK, New York, N. Y.; said Jellinek assignor to said O'Donnell. Filed Dec. 28, 1880. (Model.)



Claim.—1. A maritime mail-chest consisting of an outer cylinder, A, inner cylinder, B, horizontal partitions E, intermediate cork-filled sections, C, weighted bottom D F, and removable interior and exterior covers, G and H, substantially as and for the purpose set forth.

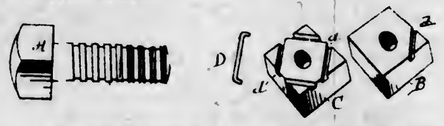


2. In a maritime mail-chest, the combination, with the outer cylinder, A, and its cover G, having recesses Y, of a pivoted bell-frame, W, carrying a central flag-rod and devices for attaching flag and bell, substantially as and for the purpose described.

3. The combination of a double-walled and bottom-weighted maritime chest having a cork-filled jacket and removable covers, with alarm and signaling devices adapted to be secured to the top of the chest, substantially as set forth.

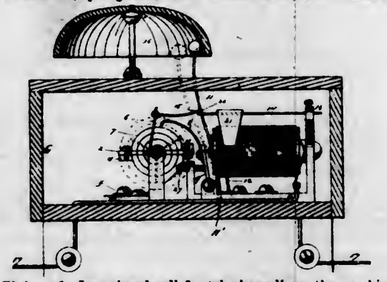
254,153. SEED-PLANTER. ALEXANDER W. PAGETT, Clarke County, Ohio. Filed July 5, 1881. (Model.)

254,153.



Claim.—1. A hoe for seed drills or planters, having within the shell of the same separate receptacles for holding seeds of different kinds, or seed and a fertilizer, in combination with a separate seed-sowing device for each of said receptacles, all of said seed-sowing devices being upon a single vertical shaft within said hoe, whereby they are operated together, as set forth.

2. A seed-planter in which the distributing or seed-sowing devices are operated by a traction-wheel revolving in a horizontal plane wholly or partially beneath the ground-surface, said wheel or driver deriving its motion from contact with the side of the furrow as the hoe or plow in which said wheel and seed-sowing devices are incased is drawn through the ground.

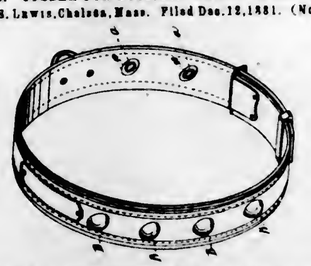


3. In a hoe or plow for seed-planters, the combination of a horizontal drive-wheel, operated as described, and distributing or seed-sowing devices for sowing different kinds of seeds, or seed and fertilizer, either separately or combined, on a single vertical shaft within said hoe or plow, as hereinbefore specified.

254,154. NUT-LOCK. JOSEPH PRESTON, Rochester, assignor of one-half to Margaret E. Preston, Buffalo, N. Y. Filed Oct. 8, 1881. (No model.)

Claim.—The combination and arrangement of the bolt A, with the right and left hand threads thereon, and the nuts B and C, having the diagonal grooves *d d* in the sides for the key-pin D to set in, all substantially as and for the purpose specified.

254,155. SIGNAL-CALL FOR TELEPHONE-LINES. FRANCIS R. RICHMOND, Springfield, Mass. Filed Aug. 8, 1881. (Model.)

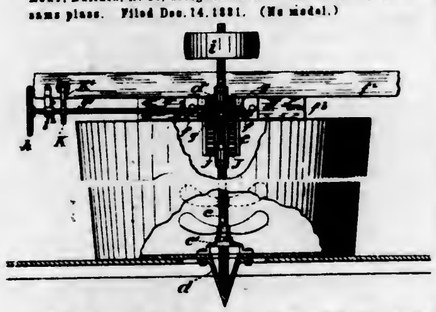


Claim.—1. In a signal-call for telephone-lines, the combination, with a bell-hammer, of a spring-catch adapted to engage with and hold said bell-hammer in a stationary position, a vibrating shaft connected with said spring-catch and regulated in its movements by a vibrating weight or bar secured thereto, and an actuating-spring secured to said shaft, substantially as described.

2. In a signal-call for telephone-lines, the combination, with the armature of a magnet and a bell-hammer, of a vibrating shaft provided with a vibrating weight or bar, an actuating-spring connected with said shaft and operated by said armature, and a spring-catch adapted to engage with and hold the bell-hammer in a sta-

tionary position and connected with said vibrating shaft, whereby the said bell-hammer may be released from engagement with the spring-catch and the alarm-bell struck by the combined movements of the vibrating shaft and the armature of the magnet, substantially as described.

3. In a telephone system, the combination, with the main line, of a series of signal-calls, each provided with a vibrating bar and shaft connected with and operating to disengage a spring-catch from the bell-hammer and actuated by the armature of an electro-magnet located in the main line, and a revolving cylinder provided with a series of contact-surfaces, each said series being in adjustment with and controlling the synchronous movements of the vibrating bar and shaft of one of said signal-calls, whereby any one of the signal-calls in said series may be struck from the central office, substantially as described.

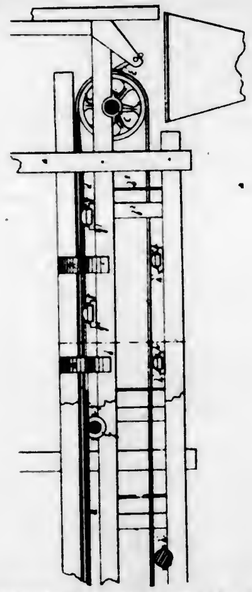


254,156. COLLAR FOR DOGS, &c. JOHN W. RICKER and THISTRAM S. LEWIS, Chelsea, Mass. Filed Dec. 12, 1881. (No model.)

Claim.—1. A dog or animal collar having one or more chambers or receptacles adapted to contain an insect or vermin exterminating substance or compound, each receptacle being provided with an outlet or eduction passage to allow of the escape of the exterminating substance, substantially as described.

2. A dog or animal collar having one or more hollow receptacles, B, for containing an insect or vermin exterminating substance or compound, each receptacle being provided with an open tubular shank, *a*, which forms a conductor or outlet for the exterminating substance, substantially as set forth.

254,157. APPARATUS FOR WASHING STARCH. EDWIN ROAT, Buffalo, N. Y., assignor of one-half to Harry Hamlin, same place. Filed Dec. 14, 1881. (No model.)

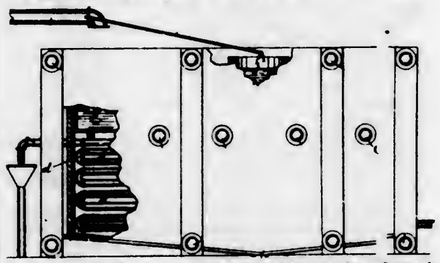


Claim.—1. A starch tank or vessel provided with a step or supporting-box, *c'*, and a recess, *d*, in combination with a rotating shaft having an agitating device, and made vertically adjustable by means substantially as described.

2. A starch-tank having a shaft, *e*, collars *e'*, and a rack-plate, *e*, having racks J, and projecting parts *d'*, adapted to receive said shaft, in combination with the pinions *g* and shaft *g'*, provided with a hand-wheel, A, and a ratchet-wheel and pawl, K K', substantially as and for the purposes described.

254,158. STARCH MACHINERY. EDWIN ROAT, Buffalo, N. Y., assignor of one-half to Harry Hamlin, same place. Filed Oct. 3, 1881. (No model.)

Claim.—1. An apparatus for conveying starch, &c., consisting of a frame-work suspended from the ceiling and having mounted therein a series of concave rollers, upon which the upper portion of an endless band or carrier travels, and inclined sides or strips for keeping the starch, &c., upon the carrier while in transit thereon, substantially as shown and described.



254,158.

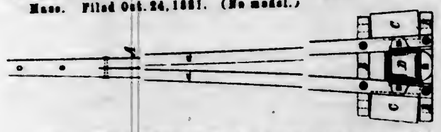
2. In an apparatus for conveying starch, &c., the combination of the endless band or carrier with the concave supporting-rollers, substantially as shown and described.

3. In an apparatus for conveying starch, &c., the combination of the endless band or carrier with the concave supporting-rollers and the inclined strips or sides for keeping the starch upon the carrier while in transit thereon, substantially as shown and described.

254,159. APPARATUS FOR COOLING SIRUPS AND OTHER LIQUIDS. EDWIN ROAT, Buffalo, N. Y., assignor of one-half to Harry Hamlin, same place. Filed Dec. 14, 1881. (No model.)

Claim.—1. The box cooler consisting of the perforated trough or receptacle, and the system of pipes below such trough, through which cold water is passed from bottom to top, the whole being suitably inclosed, and operating substantially as shown and described.

2. In a box cooler, the combination of the perforated trough or receptacle, and the system of pipes through which a continuous stream of water can be passed from bottom to top, with an automatic device for regulating and controlling the supply of sirup to be cooled, substantially as shown and described.

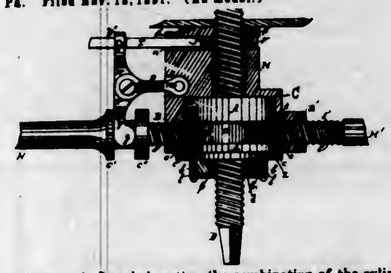


254,160. ANCHOR-SUPPORT. ELISHA ROBBINS, Worcester, Mass. Filed Dec. 8, 1881. (No model.)

Claim.—The combination, with the hull, rail, and cat-head of a navigable vessel, of a step, substantially as described, arranged below the cat-head and projecting from the hull, and serving not

only to support the lower end of the stock of an anchor when such anchor is catted and resting on the rail, but to facilitate in manner as explained the tripping of the anchor.

254,161. ANCHOR-SUPPORTER. ELISHA ROBBINS, Worcester, Mass. Filed Oct. 24, 1881. (No model.)



Claim.—The combination of the furcated tongue A, parallel bars B B, and anchor bill-pocket D, arranged as represented, with the rollers C C, supported by the said bars, and disposed nearly parallel to the axis of the tongue and inclined toward a common center, all being substantially and for the purpose as set forth.

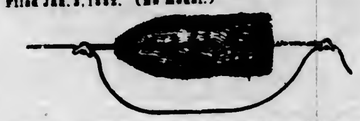
254,162. FELLY-CONNECTION FOR VEHICLE-WHEELS. O. O. ROSS, Penfield, N. Y. Filed Jan. 20, 1882. (No model.)

Claim.—In a carriage-wheel, the combination, with the beveled ends of a felly, of the felly plate or clip consisting of the wedge-shaped body *d* and thin-edged flanges *e e*, said body being thickest in the center in line with the joint of the felly and provided with the dovetailed hole *i* to receive the tenon of the spoke, and the flanges being secured to the felly by the cross rivet or bar *g*, as shown and described, and for the purpose specified.

254,163. STAY-BOLT CUTTER. CHARLES V. ROTH, Lancaster, Pa. Filed Nov. 15, 1881. (No model.)

Claim.—1. In a bolt-cutter, the combination of the cylinder C, having bosses B and B', handles H and H', with cylindrical ends *c*, and the sleeve A, having the groove G, by which the said sleeve is held in the cylinder when the cutter is not being operated, substantially as herein set forth.

2. In a bolt-cutter, the combination of the cylinder C, having bosses B B', handles H and H', with cylindrical ends *c* and tents *t*, and the sleeve A, having the groove G and sockets *s*, whereby the sleeve can be prevented from revolving within the cylinder, substantially as herein specified.

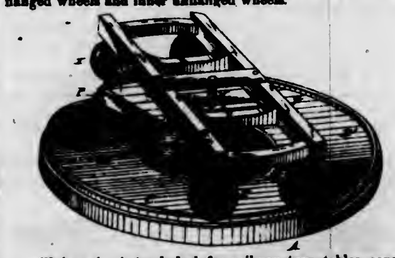


3. In a bolt-cutter, the combination of the cylinder C, having bosses B and B', handles H and H', with cylindrical ends *c*, the sleeve A, having a groove, G, and the box *b*, provided with the dies *d* and *d'* and thumb-screws *s*, whereby part of the cutter remains stationary, holding the whole in place while the other revolves in cutting a bolt, substantially as herein set forth.

4. The combination, in a bolt-cutter, of the sleeve A, having the box *b*, with dies *d* and *d'* and screws *s*, the cylinder C, having a neck, N, with an enlarged cylindrical opening, and the plate *p'*, with an opening the periphery of which fits closely to the bolt, as and for the purpose specified.

5. In a bolt-cutter, the combination of the handle H, working back and forth in the boss B, the walking-beam W, operating in the yoke *y'* of the post O, and the tool T, all constructed and operated substantially in the manner described.

6. The combination of the sleeve A, provided with the groove G and sockets *s*, and having attached thereto the box *b*, with the dies *d* and *d'*, and screws *s*, the cylinder C, with the bosses B and B' and neck N, handles H and H', with projections and tents, walking-beam W, and tool T, with blade *r*, all substantially as and for the purpose specified.

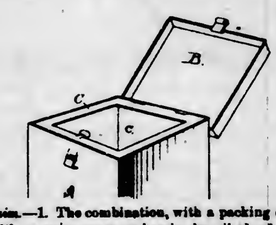


254,164. DRIVING-MITT. JULIUS E. SCHMIDT, St. Paul, Minn. Filed Jan. 3, 1882. (No model.)

Claim.—As a new article of manufacture, a driving-mitt having a strap or loop fixed therein, said strap or loop adapted to be attached to or form part of the driving-reins, substantially as set forth.

254,165. TURN-TABLE. JAMES SCHUYLER, Findlay, Ohio. Filed Dec. 9, 1881. (No model.)

Brief.—The track-bed consists of two inclined planes extending in opposite directions provided with an exterior and interior track. The table is pivoted to a cone and is provided with outer flanged wheels and inner unflanged wheels.



Claim.—1. A track-bed for railway turn-tables, consisting of two inclined planes, each of which forms a half-circle and inclined in opposite directions, and provided with tracks curved and inclined with the face of the plane to which they are secured, substantially as shown and described, and for the purpose set forth.

2. A track-bed for railway turn-tables, consisting of two inclined planes provided with an exterior and interior track, as described, and a cone and pipe secured to said bed and adapted to receive a guide-shaft secured to the center of the table, substantially as shown and described.

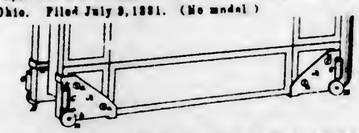
3. A turn-table provided with outer flanged wheels and inner unflanged wheels, and adapted to travel on tracks secured to inclined planes in such manner that the table will be level at any position, substantially as and for the purpose set forth.

4. The combination of the bed A, having the inclined surfaces B B', tracks C D, cone F, and pipe F', with the table G, provided with wheels I K, and shaft H, substantially as described, and for the purpose set forth.

254,166. PACKING CAN AND BOX. JOSEPH W. H. SHATTUCK, Albany, N. Y. Filed Jan. 18, 1882. (No model.)

Claim.—1. The combination, with a packing can or box provided with an outer cover, as herein described, of an inner cover attached to said can or box and provided with a transparent panel, as herein specified.

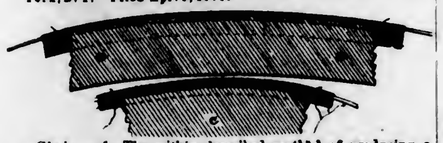
2. In a packing can or box, the combination, with the body A, provided with an outer cover, B, of the inner cover, C, hinged beneath the outer cover, B, to the body A, and provided with a detachable transparent panel, *c*, as and for the purpose herein specified.



254,167. BELT-FASTENER. JACOB SEUSTER, Washington, D. C., assignor of one-half to George W. Hensel, Jamestlle, N. J. Filed Dec. 1, 1881. (No model.)

Claim.—The plate A, one end of which is adapted to be rigidly attached to a belt, and having its sides turned up, imparting

to the plate an approximate U shape in central cross-section, provided with the fixed pointed tongue or tooth, and an opening into which the tongue or tooth projects and one end of the belt passes, substantially as and for the purpose set forth.

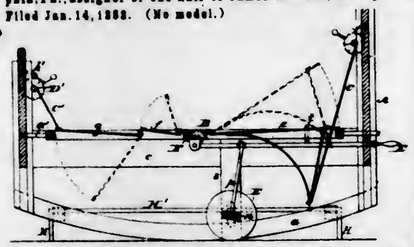


264,168. BOOK-PROTECTOR. OSCAR F. SILCOTT, Felicity, Ohio. Filed July 9, 1881. (No model.)

Claim.—1. A book-protector consisting of a metal plate to be secured to the corners and edges of the cover, said plate being provided with rollers to prevent the edge of the cover from sliding on the shelf and to prevent each book from rubbing against adjacent books or partitions, substantially as described.

2. A device for protecting the corners, edges, and sides of books, consisting of the plate A, provided with clamping-arms *a'*, and the rollers B and C, said rollers being secured to the outer face of the plate, substantially as and for the purpose set forth.

264,169. SWEAT-BAND FOR HATS AND CAPS. FRANK W. SMITH, Bethel, Conn., assignor to Thomas W. Brasher, New York, N. Y. Filed Apr. 9, 1879.



Claim.—1. The within-described method of producing a flared-edge sweat-band for hats and caps, consisting of covered reed and leather band.

2. The combination of a sweat-leather and a covered reed, united so as to form a flared-edge sweat-band for hats and caps, substantially as described.

3. The combination of a sweat-leather and a covered reed, united and formed substantially as described.

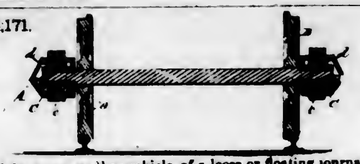
4. As a new article of manufacture, a machine-made flared-edge sweat-band for hats and caps, substantially as described.

264,170. INVALID-BEDSTEAD. HENRY D. SNYDER, Philadelphia, Pa., assignor of one-half to James McComb, same place. Filed Jan. 14, 1882. (No model.)

Claim.—1. The bottom B, provided with the pivotal sections *e f e*, which are adjustable independently of each other, substantial *j* as and for the purpose set forth.

2. The frame of the bottom B, pivoted to the frame of the bedstead, whereby said bottom may be tilted laterally, substantially as and for the purpose set forth.

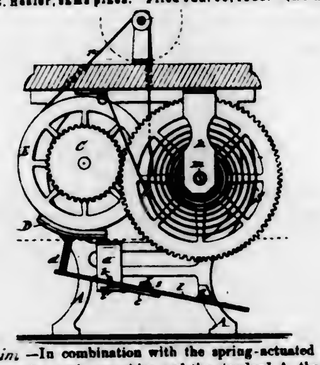
3. The bedstead provided with a rising and falling truck, whereby it may be set on the truck and thereby wheeled, substantially as and for the purpose set forth.



4. The bedstead, in combination with the truck F and lever K', substantially as and for the purpose set forth.

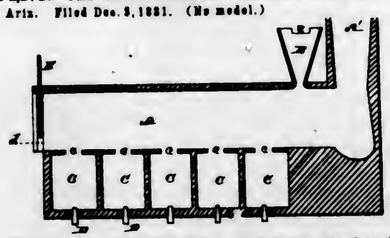
5. The bedstead provided with rockers and feet or props H, which are on the ends of a rod, H', pivoted to the bedstead, substantially as and for the purpose set forth.

264,171. CAR-AXLE BOX. JAMES SOPER and JONATHAN SLADE, Chicago, Ill. Filed Aug. 31, 1881. (No model.)



Claim.—The combination, with the main axle or journal of a

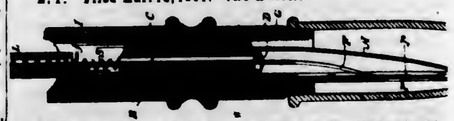
264,171.



wheel for a car or other vehicle, of a loose or floating journal and bearing, C, having lubricant-opening *c* and annular rib or ribs *a*, the cap D, and bearing *d*, substantially as and for the purpose herein shown and described.

264,172. MOTIVE POWER FOR SEWING-MACHINES. GEORGE W. SOWLES, Chittenango, N. Y., assignor of one-half to Lawrence C. Hosler, same place. Filed Jan. 28, 1882. (No model.)

Claim.—In combination with the spring-actuated driving mechanism of a sewing-machine and the standard A, the hanger *a*, provided with the stud *b*, the plate *c*, hinged on said hanger, the lever *l*, pivoted on the stud *b*, and provided over the plate *c* with the transverse slot *s*, the set-screw *r*, passing through said slot and entering the plate *c*, the post *d* on the end of the lever, and provided with the brake-shoe D, and a suitable catch, *e*, on the standard A, all constructed and combined substantially in the manner described and shown.



264,173. ORE-CONCENTRATOR. EDWARD STAHL, Prescott, Ariz. Filed Dec. 3, 1881. (No model.)

Claim.—1. The channel or passage A, having the funnel A' and hopper B in open connection therewith, as shown, and the discharge *d*, with its adjustable gate E, in combination with the series of chambers or compartments C under said channel A, and in open relation therewith, substantially as and for the purpose herein described.

2. The ore-concentrator consisting of the channel A, with its funnel A', hopper B, and discharge *d*, adjustable gate E, and the series of chambers C under said channel A, and in open relation therewith through openings *e*, said chambers having the plugs D, substantially as and for the purpose herein described

264,174. FOUNTAIN-PEN. WILLIAM W. STEWART, Brooklyn, N. Y. Filed Mar. 16, 1881. (No model.)

Claim.—1. The gutters A and supply-tube C, combined with the valve D and spring F, one end whereof is connected to said

valve and the other end attached to the point of said gutter, and the middle portion adjusted to bear against the inner side of the nibs of the pen, as set forth.

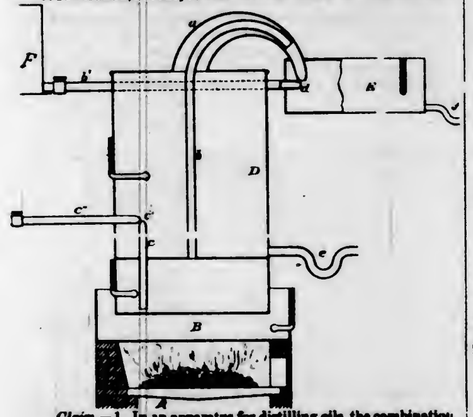
2. The supply-tube C of a fountain pen-holder, with a valve, D, and spring F, combined with a rod, R, extending from said valve up through said supply-tube, and a tube or rod, L, within the reservoir, whereby said valve may be opened independently of the pen, as set forth.

3. A supply tube or port provided with a reciprocating valve opening outward, and kept closed by pressure from the pen, and means, substantially such as described, whereby said valve may be opened at will, combined with an ink reservoir or barrel, provided with walls made elastic by slots K, or otherwise, as set forth.

4. In a fountain-holder, a reservoir and a supply-tube, C, combined with an open capillary tube, constituted by a coil, S, of fine non-corrodible wire, extending from said supply-tube upward into the reservoir, to conduct away the little air-bubbles without impeding the flow of ink.

5. In a fountain pen-holder, a reservoir and a supply tube or port, C, whereby ink may pass from the reservoir to the pen, combined with an open capillary tube, constituted by a coil of fine non-corrodible wire, extending upward from said supply-tube, and a tubular rod, L, to inclose and protect said coil, as set forth.

264,175. RESERVOIR PEN-HOLDER. WILLIAM W. STEWART, Brooklyn, N. Y. Filed Mar. 16, 1881. (No model.)



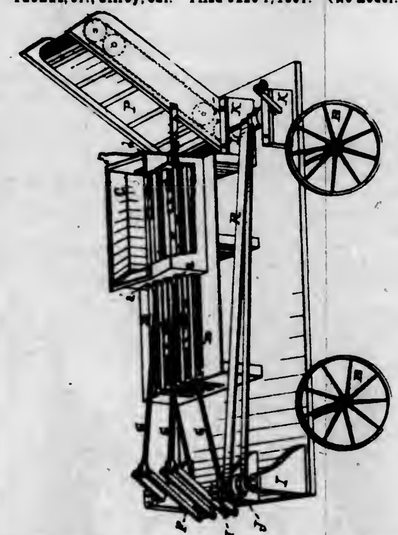
Claim.—1. In a reservoir pen-holder, a pen and an ink-tube arranged to deliver ink on its concave side, combined with the ink-chamber of the same, and one or more threads of permeable fibrous material arranged lengthwise in said chamber beneath the pen, for the purpose set forth.

2. In a reservoir pen-holder provided with an ink-chamber at its lower end, and combined with the same, a capillary wire, F, and a fibrous permeable thread or strand, G, substantially as and for the purpose set forth.

3. A fountain pen-holder provided with a pen and ink-tube, *b*, whereby the ink is delivered to said pen, combined with an exterior jacket, N, substantially as set forth.

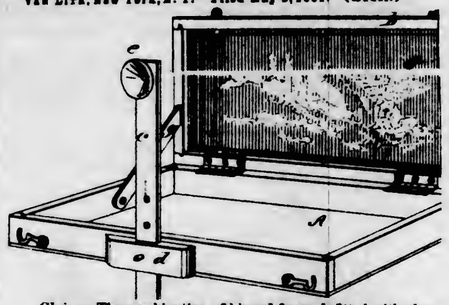
4. The combination, in a reservoir pen-holder, of an ink-chamber, E, at the lower end of said holder, provided with a capillary wire, F, and permeable thread or strand G, inclosed in said chamber, and one or more froth-chambers above said ink-chamber, provided with automatic agitators within said froth-spaces, as and for the purpose set forth.

264,176. APPARATUS FOR DISTILLING PETROLEUM. CHAS. J. TAGLIABUE, Brooklyn, N. Y. Filed Jan. 4, 1882. (No model.)



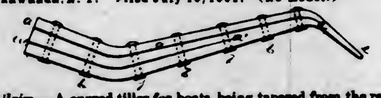
Claim.—1. In an apparatus for distilling oils, the combination of a furnace, a liquid-receptacle above the same, an oil-tank and vapor-chamber, a condenser, a vapor-pipe leading from the vapor-chamber to the condenser, a vapor-pipe leading from the oil-tank also to said condenser, an oil-lifting pipe extending from the oil-tank into the vapor-chamber, and a steam-pipe uniting at its end with the end of the oil-lifting pipe and forming therewith a steam-atomizer, all substantially as hereinbefore set forth.

2. In an apparatus for distilling oils, the combination, with an oil-tank and a vapor-chamber, of a steam-atomizer for spraying the oil and a water-atomizer for drawing over and condensing the vapor formed in the vapor-chamber, substantially as set forth.



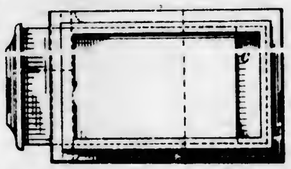
3. The combination of the furnace A, liquid-receptacle B, vapor-chamber D, oil-tank C, condenser E, tank F, pipes *a b' c c''*, and outlets *e f*, substantially as and for the purposes set forth.

254,177. FEEDER FOR THRASHING-MACHINES. HARRY THOMAS, Jr., Gilroy, Cal. Filed June 1, 1881. (No model.)



Claim.—The hopper C, having sliding door S, reciprocating arms E, having guide-tongues and forks *c*, constructed substantially as described, pitmen G, crank-shaft F, pulleys J and Q, belt B, shaft L, and the elevator P, pivoted in front and below said hopper, all constructed to operate in combination in the manner set forth, and for the purpose described.

254,178. PERSPECTIVE DELINEATOR. GERARD M. PERE VAN LITH, New York, N. Y. Filed May 3, 1881. (Model.)

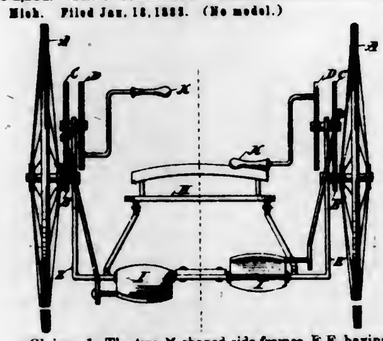


Claim.—The combination of hinged frame *b*, fitted with glass *a*, vertically-adjustable slide *c*, provided with an eye-piece or opening, and the supporting box or base A, having socket *d* and pivoted brace *g*, substantially as shown and described.

254,179. TILLER. HIRAM WALKER and ANDREW MILTNER, Tonawanda, N. Y. Filed July 18, 1881. (No model.)

Claim.—A curved tiller for boats, being tapered from the rear to the handle end and formed of a single piece of wood, having a long slit, *a*, extending nearly the entire length of the tiller, and a shorter slit, *a'*, stopped further back, steamed and bent into proper curved shape, and secured by rivets *b*, substantially as set forth.

254,180. PLATE-HOLDER FOR PHOTOGRAPHIC CAMERAS. WILLIAM H. WALKER, Rochester, N. Y. Filed Apr. 9, 1881. (No model.)

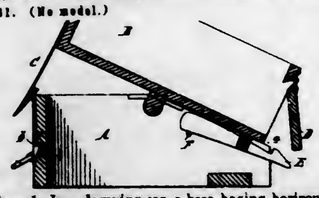


Claim.—1. As a new article of manufacture, the dry-plate holder or dark frame for photographic purposes having its body formed from plastic material in one continuous piece.

2. As a new article of manufacture, the seamless dry-plate holder or dark frame constructed of plastic material without joints or seams, substantially as shown and described.

3. As a new article of manufacture, a dry-plate holder consisting of an external frame cast in one continuous piece, having a plate or shutter inserted through an opening in one end and seated in grooves in its interior edges.

4. In combination with a plate-holder for photographic cameras, the shutter-recess F, bored or molded from one side of the frame and closed by a cap, D, substantially as described.



254,181. HAND-CARRIAGE. MARIA WHEELER, Farmington, Mich. Filed Jan. 18, 1881. (No model.)

Claim.—1. The two X-shaped side frames, E E, having their lower limbs connected by transverse bars, upon which the seat is supported below the axis of the wheels, in combination with wheels A A, gear-wheels C D, pinions B F, and cranks K K, all substantially as described.

2. The two connected X-shaped side frames, E E, the gear-wheels C D, pinions B F, wheels A A, pedals I I, connecting-rods, and hand-cranks K K, all combined and operating substantially as described.

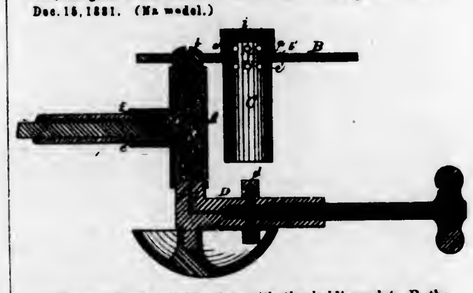
254,182. DUMPING-CAR. SAMUEL R. WHEELER, Dexter, Mich., assignor of one-half to F. H. KRANSE, same place. Filed Dec. 23, 1881. (No model.)

Claim.—1. In a dumping-car, a base having horizontal and inclined bearing-surfaces for the body in its respective positions of rest and dump, combined with said body, having a hinged dumping-door, means for automatically opening and locking said door, and means for automatically securing the body in a horizontal position, as specified.

2. The combination of the base A *a*, having stops F and notch *b*, with the body B, door D, weighted catch E, the spring-catch C, and crank-bar G *d*, all constructed, arranged, and adapted to serve as and for the purposes specified.

254,183. MILK-PAIL. DANIEL S. WILLARD and HENRY D. DUNBAR, North Hartland, Vt. Filed Oct. 19, 1881. (No model.)

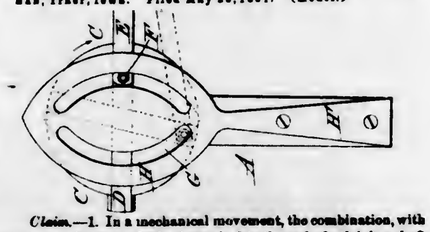
254,183.



Claim.—In an improved milk-pail, the combination, with the pail, of a cover therefor, and an inverted conical strainer-reservoir fitted into said cover and provided with a strainer at a point between its lower end and the cover, and a guard-reservoir adapted to be inserted into the strainer-reservoir and provided with side apertures near its lower end for the outflow of milk into the strainer-reservoir, substantially as set forth.

254,184. AUGER-BIT. THOMAS WOOD and JAMES HORRIS, Birmingham, Conn. Filed July 18, 1881. (No model.)

Claim.—A boring-bit having a cast-iron body and a steel point welded or fused thereto, all substantially as described, and for the purpose set forth.



254,185. VAPOR-BURNER. T. TRASK WOODWARD, Decatur, Ill., assignor of one-half to John F. Flood, same place. Filed Dec. 16, 1881. (No model.)

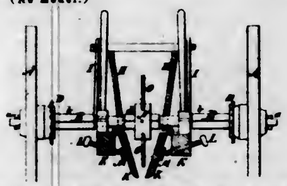
Claim.—1. In combination with the holding-plate B, the burner C, fitted into the central hole, *b'*, of the plate, and suspended therefrom by the shoulder or offset *a*, and provided with a row of holes, *c*, above the plate and a row of holes, *d*, below the plate, substantially as shown, and for the purpose described.

2. In a vapor-burner, the combination of the generator A, the holding-plate B, secured thereto by screw or rivet, and burner C, having two rows of holes, one above and one below the plate, the flame issuing from the lower row of holes being spread by the plate and compelled to continually envelop the generator, as herein set forth.

254,186. MECHANICAL MOVEMENT. OLISTHUS G. ALDERMAN, Traer, Iowa. Filed May 28, 1881. (Model.)

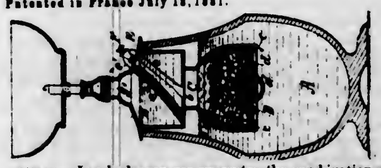
Claim.—1. In a mechanical movement, the combination, with a transversely-grooved wheel attached to the end of a driving-shaft journaled in suitable bearings, of a face-plate or bearing having an elliptical groove or slot, a sliding bar reciprocating within the grooved face of the wheel at each reciprocation of the same, and provided with a roller adapted to engage with the elliptical groove or slot, and a pitman attached to the sliding bar, whereby the movements of the pitmen are equalized and an elliptical motion imparted to its ends at each reciprocation, substantially as specified.

2. In a mechanical movement, the combination, with the transversely-grooved wheel C, attached to a driving-shaft, B, journaled in the bearing A, and a face-plate, H, having an elliptical slot or groove, G, and shank H', by which it is attached to the bearing A of the sliding crank-bar D, carrying a pitman, R, and a roller, F, adapted to engage with the elliptical groove in the face-plate, substantially as and for the purpose shown and described.



254,187. FLASHED-HEDGE FASTENING. WILLIAM BALDWIN, Marion, Ind. Filed Dec. 23, 1881. (No model.)

Claim.—1. In a hedge fence formed as described, the fastening consisting of a continuous wire or cord extending from end to end of the fence and formed into twisted loops, each of which embraces two or more of the inclined twigs, substantially as and for the purpose set forth.

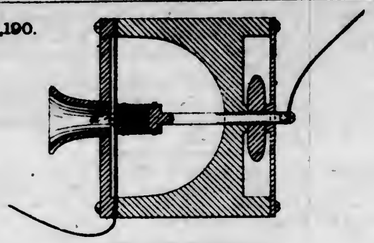


2. The combination, with a hedge fence consisting of twigs or plants bent at an angle, as described, of a continuous wire or cord extending from end to end of the fence and formed into twisted loops, each of which embraces two or more of the twigs or plants, substantially as and for the purpose specified.

254,188. COMBINED PLANTER AND FERTILIZER-DISTRIBUTER. BENJAMIN F. BARNES, Campbellton, Fla. Filed Jan. 13, 1881. (No model.)

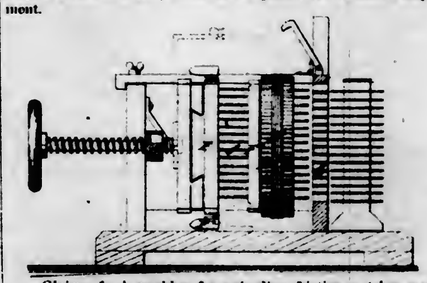
Claim.—In a combined cotton-planter and fertilizer-distributer, the combination, with the wheels A, having notched hubs C, and axle B, provided with the rounded ends *a*, squared parts *b*, rounded parts *c*, and squared middle *d*, carrying the stirrer N O, of the clutch-bars D, sliding on the axle, frame E, hopper H, provided with side extensions, J, and hinged sides K, having flat springs M, secured at their ends, and set-screws L, whereby the machine may be employed as a cart or fertilizer-distributer, substantially as described.

254,189. HYDROGEN-GAS GENERATOR. ALEXANDRE BERLAND, St. Petersburg, Russia. Filed Sept. 9, 1881. (No model.) Patented in France July 18, 1881.



Claim.—In a hydrogen-gas generator, the combination of the acid-reservoir A, carrying the burner, the carbureting-chamber B, arranged below said burner and carrying the inverted bell C, the zinc-holder D, provided with a perforated bottom and supported by and arranged within said bell, the two-branch pipe E, having stop-cock F, and the tubular wick *e'*, all combined, constructed, and arranged for operation substantially as and for the purpose specified.

254,190. TELEPHONE-TRANSMITTER. EMILE BERLINER, Boston, Mass. Filed Dec. 15, 1881. (No model.)

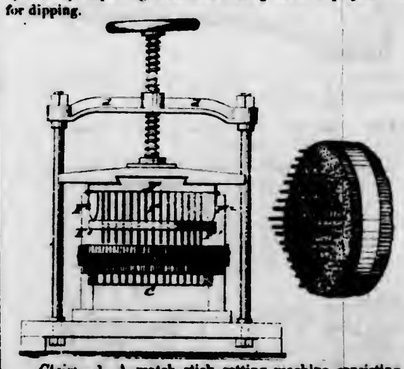


Claim.—A telephone-transmitter consisting essentially of a diaphragm, in combination with a button or mass of conducting pellets, globules, or similar well-rounded particles, which can be vibrated under the action of sound-waves, substantially as described.

254,190.

254,191. MACHINE FOR UNLOADING FRICTION-MATCHES AFTER DRYING. CHAS. F. BOSBACK, New York, N. Y. Filed Dec. 13, 1881. (No model.)

Brief.—The matches projecting from the bunch of splints are deposited by the push-pins in regular numbers on shelves, so that they can be conveniently removed and packed into boxes for shipment.

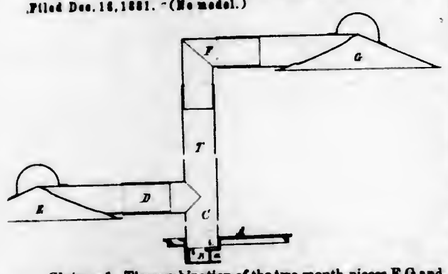


Claim.—1. A machine for unloading friction-matches, consisting of a horizontally-movable follower, of a setter applied thereto and holding the bunch with the set and finished matches, of a stop-frame having horizontal partitions, and of removable horizontal unloading-shelves, all substantially as and for the purpose set forth.

2. The combination, in a machine for unloading matches, of a guided setter having push-pins and a perforated guide-board with locking devices applied to the upper and lower parts of the guide-board, so as to retain the same and the bunch for withdrawing the push-pins from the latter, substantially as set forth.

254,192. MACHINE FOR SETTING MATCH-STICKS. CHAS. F. BOSBACK, New York, N. Y. Filed Dec. 13, 1881. (No model.)

Brief.—Match-splints are set in position by the machine, whereby they may be readily dipped and dried. The splints are held together by a strong rubber band. The push-pins are arranged equidistant and take against the ends of the splints, thereby forcibly displacing them and causing them to project suitably for dipping.



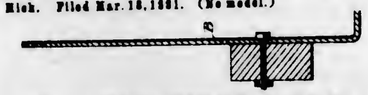
Claim.—1. A match-stick-setting machine consisting of a fixed wire grating, of means for locking the bunch of sticks to the grating, of a movable and detachable setter having a series of equidistant push-pins and a perforated guide-board, and means for operating the setter, all substantially as and for the purpose set forth.

2. The combination, in a match-stick-setting machine, of a

fixed grating, C, with locking side straps, E, pivoted to a fixed side piece, E', and locked to a hinged side piece, E², at the opposite side for retaining the bunch of match-sticks in position on the grating, substantially as set forth.

3. In a match-stick-setting machine, a stick-setter, F, consisting of a top piece having equidistant push-pins *f*, an adjustable perforated guide-board, F', and hinged side pieces, E², substantially as and for the purpose described.

254,193. STEAM-DISCHARGING APPARATUS FOR COOKING-STOVES. ALFRED B. BOWDEN, Barrington, assignor to Myron T. Kinyon, Pawtucket, and Caleb B. Parker, Warwick, R. I. Filed Dec. 16, 1881. (No model.)

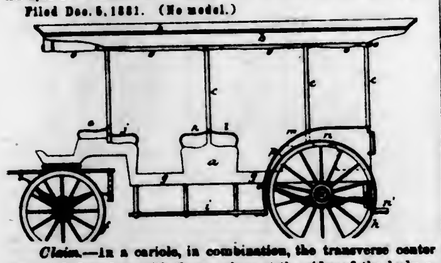


Claim.—1. The combination of the two mouth-pieces E G and their discharge and joining pipes C, D, T, and F, and the socket plate or cover A, the whole constructed and arranged substantially as set forth.

2. The stove plate or cover A, provided with the pipe-receiving socket B, having a lateral opening, and the pipe-sustaining shoulder, as set forth.

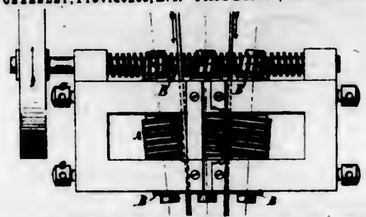
3. The stove plate or cover A, constructed with a socket, B, and having in combination therewith a rotating shoulder or valve, H, for the purpose of opening and closing the opening *a*, as specified.

254,194. FENCE-POST. JOSEPH H. BROKAW, Grand Rapids, Mich. Filed Mar. 18, 1881. (No model.)



Claim.—A fence-post composed of a base having a grooved seat, and the upright B, located in said seat and provided with a right-angled bend at its lower end, substantially as and for the purposes specified.

254,195. HAND-ANVIL. WILLIAM H. BROWN, Grand Forks, Dak. Filed Dec. 13, 1881. (No model.)

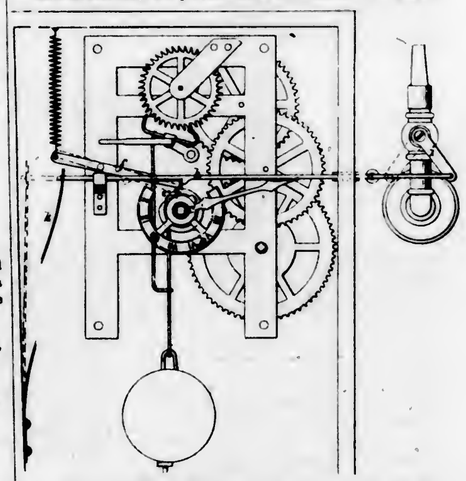


Claim.—The improved hand-anvil herein described, as and for the purposes set forth.

254,196. CARIOLE. GOTTFRIED BENGARD, Brooklyn, N. Y. Filed Dec. 5, 1881. (No model.)

Claim.—In a cariole, in combination, the transverse center seats, *j*, *h*, *l*, and *m*, with the openings at the sides of the body *a*, and side steps, *i i*, and the transverse rear seat, *n*, with the opening at the rear of the body, and rear step, *a'*, substantially as and for the purpose set forth.

254,197. MACHINE FOR ORNAMENTING WIRE. JAMES A. CHAMBLEY, Providence, R. I. Filed Dec. 27, 1881. (No model.)



Claim.—1. A machine for ornamenting wire, consisting of two or more rolls having two continuous spiral grooves formed on the same, one or both of which is engraved so as to produce ornamented designs, as described.

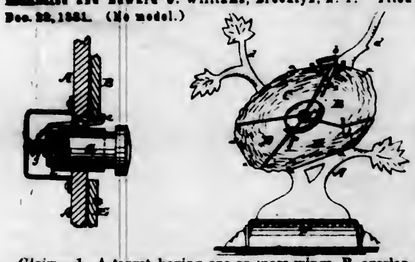
2. A machine for ornamenting wire, consisting of a central roll supported in fixed bearings, and two rolls, one on each side of the central roll, supported in adjustable bearings, on which rolls a pattern is engraved, the axis of which passes spirally around the roll, as described.

3. The combination, with the central roll A and the two side rolls A A, of the adjustable bearings B B, the screws C C, and the guides *g g*, arranged to roll and ornament two wires simultaneously, as described.

254,198. AUTOMATIC GAS-LIGHT EXTINGUISHER. WILLIAM CLANCHY, Providence, R. I., assignor of one-half to Bernard McTiernan, same place. Filed Nov. 11, 1881. (No model.)

Claim.—1. The combination, with a clock, of the auxiliary dial D, adjustably secured upon the hour-hand sleeve and provided with the notched flange E, the rod A, provided with a catch or shoulder and connected with a gas-cock, the lever having one end arranged to engage with said shoulder and to rest upon the periphery of the flange E, and a spring arranged to press said lever into the notch in said flange and release it from said shoulder, substantially as described.

2. The combination, with a clock and the cock of a gas-burner, of an adjustable tripping device upon the sleeve of the hour-hand, a rod operated automatically to move the gas-cock in one direction, and a device arranged to hold said rod at a point of its movement in the opposite direction and to be disengaged therefrom at a predetermined period by the action of tripping device upon the hour-hand, substantially as described.



254,199. PROCESS OF PREPARING THE SURFACES OF GRINDING-ROLLS. WILLIAM H. COSGROVE, Faribault, Minn. Filed Nov. 2, 1881. (No model.)

Claim.—1. The herein-described mode or process of dressing smooth metal rolls, consisting in pressing sand, emery, corundum, and other analogous or equivalent material into the surfaces of said rolls to form an indented dress, as set forth.

2. The process of indenting smooth metal rolls, consisting in passing sand, emery, corundum, or other like equivalent material between a pair of such rolls closely adjusted together, substantially as described.

254,200. TARGET. JESSE A. CRANDALL, Brooklyn, N. Y., assignor to Edward E. Ives, Bridgeport, Conn., and Cornelius Blakeslee and Edward O. Williams, Brooklyn, N. Y. Filed Dec. 22, 1881. (No model.)

Claim.—1. A target having one or more wings, B, overlapping its back A, and a movable bull's-eye or plug, G, separate from said wing or wings, and mechanism, substantially as described, for locking and moving said wing or wings, all arranged to unlock said wing or wings from said plug when said bull's-eye or plug is moved, and then to unfold said wing or wings, substantially as specified.

2. A target having a fixed body or back, A, one or more movable wings, B, means for locking the same, and a movable plug, G, separate from said wing or wings, said wing or wings being combined with a spring, *b*, for moving it or them in one direction, substantially as specified.

3. The target-back A, combined with the hinged wing B, spring *b*, catch *c*, and movable button or plug G, all arranged to operate substantially as specified.

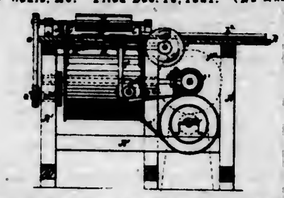
4. The target-back A, having one or more projections, *d*, in the plane of the back, combined with one or more hinged wings, catch *c*, and sliding button or plug G, as specified.

5. The folding wing B, provided with spring *b* and projection *i*, in combination with the folding wing C and supporting-back A, all arranged to move the wing C by the projection *i*, as specified.

6. The combination, on a target, of the folding wing B and its holding-catch *c*, for holding it down, with the projection *j* and folding wing E, the projection *j* on wing B serving to hold the wing E in one position, substantially as specified.

7. The combination of the back A with the hinged wings B C D E, plug or button G, spring *b*, for raising wing B, rests *d*, for wings to fold against, catch *c*, for locking wing B, and projections *i* and *j*, for holding the wings C D E, substantially as herein shown and described.

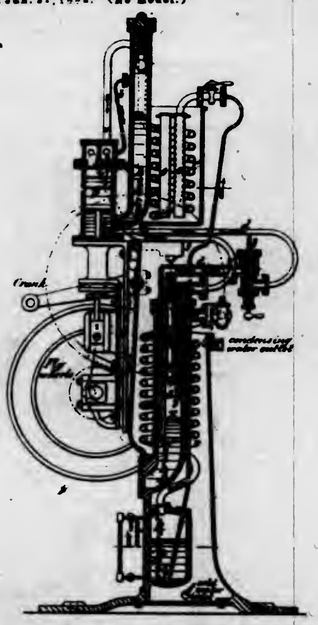
254,201. GATE. THOS. CRANE, Fort Atkinson, Wis., assignor of one-half to L. S. Kellogg, same place. Filed Apr. 14, 1881. (No model.)



Claim.—1. The gate C, having the central cross-bar, K, hinged to the center post, B, and having the end cross-bars, L, and intermediate cross-bars, L', said end and intermediate cross-bars being placed on one side for one half of the gate and on the opposite side for the other half, substantially as and for the purpose set forth.

2. In combination with the posts A and B, and gate C, hinged to said post B, the latch comprising the lever F, fulcrumed at its lower end to the face of the gate, the bar G, pivoted to said lever, guide *n*, catch *m* upon the post A, and cam H upon the bar G, substantially as described.

3. In combination with the posts A and B, and gate C, hinged to said post B, and with the latch, comprising the bar G, lever F, cam H, guide *n*, and catch *m*, arranged and operating as described, the posts D, eye *k* upon the gate, and cords *l*, connecting the said posts to the lever F and passing through the said eye, substantially as set forth and shown.



254,202. CIRCULAR SAWING MACHINE. ALEXANDER RUSSAW, St. Louis, Mo. Filed Dec. 16, 1881. (No model.)

Claim.—1. In a sawing-machine, the combination of table A, pairs of saws B B' and C C', said pairs being located in the table at right angles to each other, as described, and being driven by same shaft, *a*, guides b^2 and d^2, and traveling platform D, arranged to work between saws C C', provided with counter-weight d^1, and when at rest to be adjacent to the part A^2 of the table, said part A^2 being between the saws B B' and elevated above the plane of platform D, all constructed and arranged to operate as and for the purpose specified.

2. In a sawing-machine, the combination of table A, pairs of saws B B' and C C', said pairs being located in the table at right angles to each other, as described, guides b^2 and d^2, platform D, traveling on ways between saws C C', counterweighted at d^1 and recessed at d^3, rollers E E', and belt or apron F on drum F', said saws, rollers, and belt being all driven by same shaft, *a*, in the machine-frame, all constructed and arranged to operate as and for the purpose specified.

254,203. ICE-MACHINE. EDOUARD PIXARY, Paris, France. Filed Jan. 21, 1881. (No model.)

Claim.—1. The combination, with the pump or pumps for compressing ammonia or other gas, of a lubricant-chamber adapted to be kept cool, in free communication with the pump-cylinder, substantially as described, so that the lubricant flows back and forth between said cylinder and the lubricant-chamber.

2. The combination, with the pump cylinder, piston, and valves, of a lubricant-chamber in communication with the interior

of the cylinder on one side of the cylinder, and a pipe communicating with the upper part of said lubricant-chamber and with the valve-chamber on the other side of the piston, substantially as described.

3. The combination, with the pump and refrigerator, of a lubricant-chamber communicating with the interior of the pump-cylinder, and adapted to be cooled by the low temperature in the refrigerator, substantially as described.

4. The combination of the pump, the lubricant-chamber communicating with the pump-cylinder freely at the bottom and by a small pipe at the top, the lubricant receptacle or trap connected with the outlet-pipe from the pump, and the return-pipe for returning the lubricant to the pump, substantially as described.

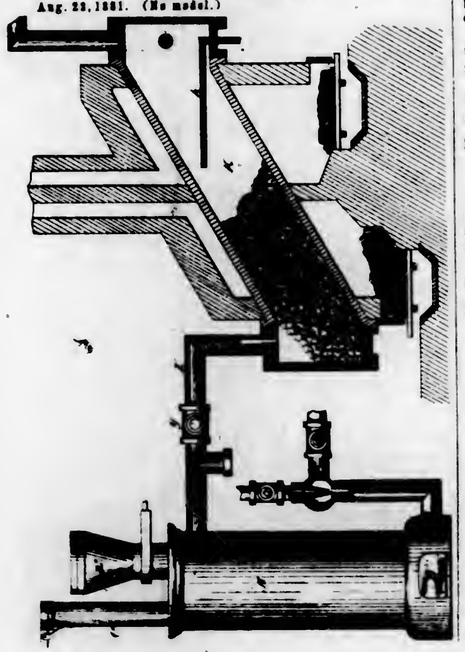
5. The pin and ball in the lubricant-chamber for indicating excess of lubricant therein, substantially as described.

6. The combination, with the lubricant-receptacle and pump, of a supply-controlling and relief valve in the connecting-pipe, substantially as described.

7. The supply-controlling and relief valve described, comprising a valve pressed toward its seat by a spring and a device for regulating the space between the said valve and its seat, substantially as described.

8. The combination of the regulator, pump, cooled lubricant-chamber, lubricant receptacle or trap, condenser, and connecting-pipes, substantially as described.

9. The lubricant receptacle or trap inclosed in the condenser, substantially as described.



10. In an ice-machine, the hollow column, serving both as the machine-frame and the jacket or vessel for containing the condenser-coils, substantially as described.

11. The combination, with the hollow column, of the pump and refrigerator supported thereby, and the condenser and refrigerant-reservoir inclosed therein, substantially as described.

12. The lubricant receptacle or trap, condenser-coils, and refrigerant-reservoir, attached together to form a single structure, and inclosed in a common jacket or vessel, substantially as described.

13. An ice-machine comprising in combination the hollow column, the condenser, lubricant receptacle or trap, and refrigerant-reservoir united in a single structure and inclosed therein, the pump, the communicating lubricant-chamber, and the refrigerator supported by said column, and the connecting-pipes, substantially as described.

254,204. PROCESS OF AND APPARATUS FOR MANUFACTURING GAS. THOMAS B. FOGARTY, Brooklyn, N. Y. Filed Aug. 23, 1881. (No model.)

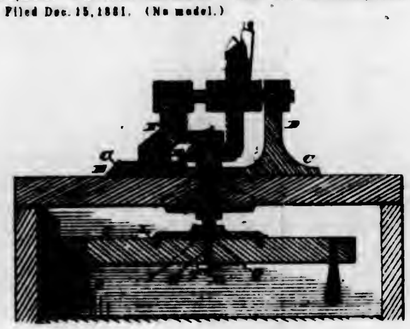
Claim.—1. The process herein described of generating and purifying gas, said process consisting of the several parts and processes described, substantially as follows: first, in injecting or forcing air and steam into or through incandescent carbon contained in a suitable furnace, causing the air and steam to combine with the carbon and to produce carbonic oxide and carbonic acid, the hydrogen of the decomposed steam and the nitrogen of the air being at the same time set free; second, in the separation of the nitrogen from the gas by converting it into ammonia, said conversion being effected by causing it to combine with carbon and alkali, so as to form cyanogen, and subsequently decomposing the cyanogen so formed by means of steam, the product being ammonia, the oxides of carbon, and alkali, and subsequently removing the ammonia, substantially as described; third, in decomposing the carbonic oxide in the gas and converting it into carbonic acid by means of incandescent steam, the product of said decomposition being carbonic acid and hydrogen gas; fourth, in the removal of the carbonic acid from the gas by means of ammonia, substantially as described.

2. In the manufacture of gas through the decomposition of steam and air by incandescent carbon, the process of separating the resulting nitrogen from the crude gas, which consists in introducing the latter into a suitable retort or series of retorts containing carbon and alkali, or any suitable form, compound, or combination thereof in an incandescent state, and causing it to combine therewith and to form cyanogen, and subsequently decomposing such cyanogen by means of steam and forming ammonia, substantially as described.

3. In the manufacture of water-gas, the process of separating nitrogen and carbonic oxide from the gas, consisting in, first, the introduction of the gas into a suitable retort or series of retorts containing carbon and alkali in an incandescent state, and causing it to combine therewith to form cyanogen, and subsequently decomposing the cyanogen so formed by means of steam, the products of said decomposition being ammonia, oxides of carbon, and alkali; second, the removal of the ammonia from the gas by means of suitable scrubbers; third, the removal of the carbonic oxide from the gas by causing it to be decomposed by incandescent steam, the result of such decomposition being carbonic acid and free hydrogen, substantially as described.

4. In a process for manufacturing gas by decomposing steam and air by incandescent carbon, and for purifying such gas from nitrogen and carbonic oxide by converting the former into ammonia and the latter into carbonic acid, the process of converting the nitrogen into ammonia and of separating the latter from the gas previous to the decomposition of the carbonic oxide by incandescent steam, substantially as described.

5. A furnace, U, containing a retort, V, and placed between the scrubbers X and *b*, in combination with said scrubbers, in the manner and for the purpose substantially as set forth and described.

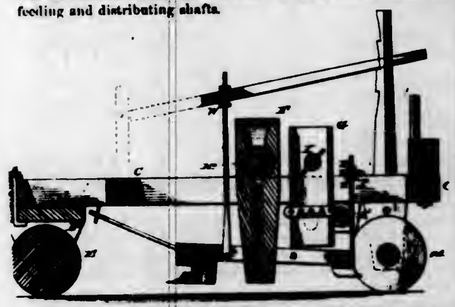


6. The combination of a furnace or cupola, A, retorts K and V, and scrubbers X and *b*, constructed and operated substantially as described.

254,205. TEMPORARY STOPPING FOR TEETH. GEORGE A. FOWLER, Philadelphia, Pa. Filed Nov. 28, 1881. (Specimens.)

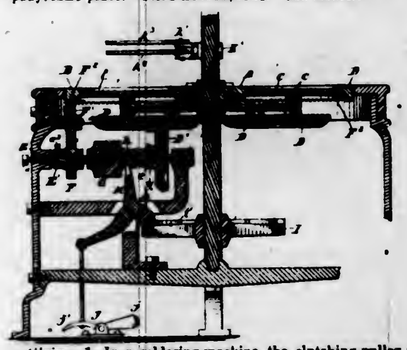
Claim.—1. The hereinbefore-described composition of matter to be used as a temporary stopping for teeth, consisting of wax, gutta-percha, oxide of zinc, and chalk or whiting, in the proportions as set forth.

2. The hereinbefore-described composition of matter, molded in a pencil or stick form for convenience in using the same.



254,206. WASHING MACHINE. JOHN FOX, Oskaloosa, Iowa. Filed Dec. 15, 1881. (No model.)

Claim.—The base-plate C, having upright D, and provided with transverse ribs b, E, between which a detachable upright, F, may be secured, substantially as set forth.



254,207. COMBINED CORN PLANTER AND FERTILIZER-DISTRIBUTER. JEREMIAH PEARCE, Centre Square, Pa. Filed Sept. 19, 1881. (No model.)

Brief.—The frame is mounted upon a front swiveled roller and a rear roller formed in three sections, the central one of which is removable. The hoppers for the seed and fertilizer are formed with downward extensions or tubes, and are mounted upon the feeding and distributing shafts.

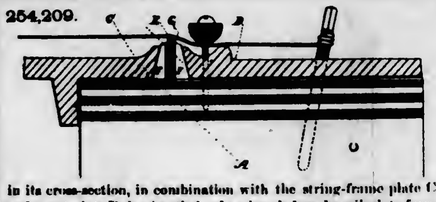
Claim.—The combination of the frame mounted upon rollers M, N, and E, the shafts H I, journaled in said frame and provided respectively with seed-cups and stirring-fingers, the hoppers F G, mounted upon said shafts and having downward extensions or tubes, and suitable operating mechanism, substantially as set forth.

254,208. SOLDERING-MACHINE. GEORGE B. GLEASON, Chicago, Ill., assignor to the Union Brass Manufacturing Company, same place. Filed Nov. 14, 1881. (No model.)

Claim.—1. In a soldering-machine, the clutching-pulley G, lever H, wheel I, with notches the width of which is greater than the thickness of the arm *h'* of said lever, table B, clutching-wheel F, and wheel F', combined and operating substantially as set forth.

2. In a soldering-machine, the clutching-pulley G, lever H, having arm *h'*, wheel I, table B, can-disk C, wheel D, clutching-wheel D', and treadle J, with weight end *j*, all combined and operating substantially as set forth.

3. In a soldering-machine, the clutching-pulley G, lever H, wheel I, with notches the width of which is greater than the thickness of the arm *h'* of said lever, table B, can-disk C, wheels F' and D, and clutching-wheels F and D', all combined and operating substantially as set forth.



4. In a soldering-machine, the clutching-pulley G, lever H, wheel I, table B, can-disk C, wheel D, and clutching-wheel D', having their digging-edges turned down, all combined and operating substantially as set forth.

5. In a soldering-machine, the clutching-pulley G, lever H, table B, can-disk C, wheel D, clutching-wheel D', and treadle J, with weight end *j*, all combined and operating substantially as set forth.

254,209. WREST-BLOCK BRIDGE FOR PIANOS. PAUL GUHRLIN, New York, N. Y. Filed Sept. 14, 1881. (No model.)

Claim.—1. A piano-forte wrest-block bridge of dovetail form

254,209.

in its cross-section, in combination with the string-frame plate C and wrest-plate D, having their edges beveled, as described, to form a dovetail groove to receive the bridge B, when mounted upon the wrest-block A, with its base resting thereon, for the purpose set forth.

2. A piano-forte wrest-block bridge of dovetail form in its cross-section, it being composed of three pieces of wood, F F G, the outside pieces, F F, having the grain running longitudinally, and the center piece, G, having the grain running transversely and vertically to the base of the bridge, and with the bearing-wire E, supported along the top of the center piece, G, in combination with the string-frame plate C and wrest-plate D, having their edges beveled, as described, to form a dovetail groove to receive the bridge when mounted with its base upon the wrest-block, as set forth.

254,210. ADJUSTABLE WRENCH. WILLIAM R. GODFREY, Sidney, Mohr. Filed Aug. 19, 1881. (Model.)

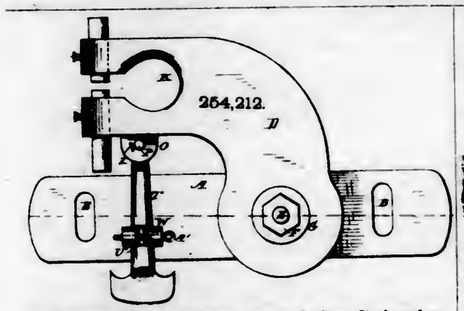
Claim.—As an improvement in wrenches, the combination, with the shank A, provided with straight screw-threaded portion E, having a central longitudinal slot, *c*, and a V-shaped portion, *c'*, of the jaws B B, pivoted in said slot and having their tops beveled to fit said V-shaped portion, and the single adjusting-nut C, arranged around portion E, substantially as and for the purpose herein shown and specified.

254,211. METHOD OF TREATING ANIMAL HAIR FOR MANUFACTURING FELT. GEORGE J. GREGERSEN, Millburn, N. J. Filed Dec. 3, 1881. (Specimens.)

Claim.—1. The herein-described process of treating the coarse hair of wild fur-bearing animals, such as hereinbefore specified, with a mixture of alum, muriatic acid, and a composition of a mixture of nitric acid and mercury, or their equivalents, and neutralizing with ammonia, substantially as herein described, and for the purpose described and set forth.

2. The changing of the tubular form of the coarse hair of wild fur-bearing animals, such as heretofore has been considered of no commercial value and entirely unfit for sizing, into straight, pliable, and partly-split fibers by boiling them in a solution of alum, muriatic acid, and a mixture of nitric acid and mercury, or their equivalents, substantially as described, and for the purpose described and set forth.

3. The changing of the tubular form of the coarse hair of wild fur-bearing animals, such as heretofore has been considered of no commercial value and entirely unfit for sizing, into straight, pliable, and partly-split fibers by boiling them in a solution of alum, muriatic acid, and a mixture of nitric acid and mercury, or their equivalents, drawing off the liquid, and neutralizing with ammonia, substantially as described, and for the purpose described and set forth.

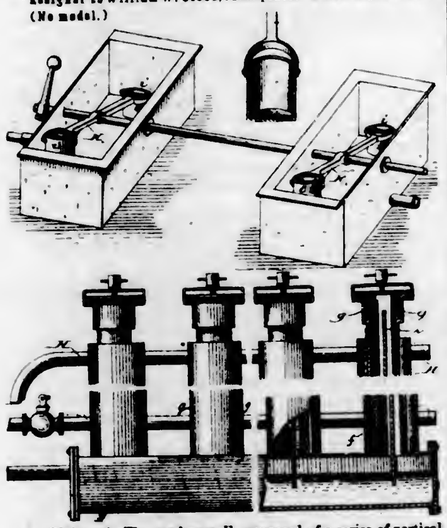


4. The changing of the tubular form of the coarse hair of wild fur-bearing animals, such as heretofore has been considered of no commercial value and entirely unfit for sizing, into straight, pliable, and partly-split fibers by boiling them in a solution of alum, muriatic acid, and a compound of nitric acid and mercury, or their equivalents, drawing off the liquid, neutralizing with ammonia, and disintegrating with suitable machinery into a product equivalent to the natural fur at present used in manufacturing fur hats, substantially as described.

5. The coarse hair of wild fur-bearing animals, such as herein described and specified, treated and changed into straight, pliable fine fibers of different lengths, as herein described, and for the purpose described.

6. The new product obtained as above substantially described.

254,212. SAW-GUIDE. JOHN F. HALL, Blafftos, Ind. Filed Dec. 31, 1881. (Model.)



254,213. FOLDING UMBRELLA. CHARLES L. HUBD, Newbury-

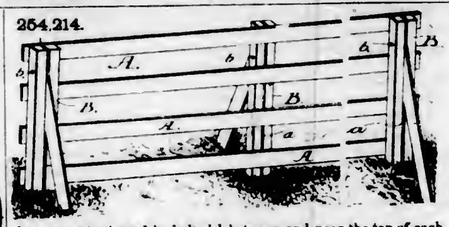
Claim.—1. The base-plate A, having the lever D pivoted on a boss projecting therefrom, and having at its bifurcated end the lug O, in combination with the screw-nut R, connected thereto, and the adjusting screw-shaft T, substantially as and for the purpose set forth.

2. The base-plate A, cast with the frustum-shaped boss C, in combination with the lever D, constructed as described, and having screw-nut R, to operate in connection with the adjusting screw-shaft T, and means, substantially as shown, for connecting said lever to the base-plate, substantially as and for the purpose set forth.

254,213. GAS APPARATUS. JOHN HANLON, New York, N. Y., assignor to William W. Gibbs, same place. Filed July 18, 1881. (No model.)

Claim.—1. The condenser F, composed of a series of vertical cylinders surrounded with water jackets and provided with diaphragms, in combination with a cold-water pipe connecting directly with each jacket and a discharge-pipe similarly connected, substantially as and for the purpose described.

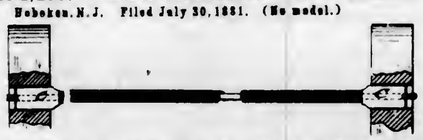
2. The cylinders *f*, having the caps *g*, provided with a rubber packing and water seal, in combination with the cylinder-cap provided with a dip-rim, substantially as and for the purpose described.



3. The purifier I, in combination with the central crank-shaft, J, and the seals *i*, connected therewith, whereby the compartments are cut off or opened, substantially as described.

4. The central shaft, J, provided with the cross-arms K, in combiantion with the journaled seals *i*, substantially as and for the purpose set forth.

5. The seals *i*, provided at their bottoms with a thin sheet of elastic packing, and on that a liquid seal, in combination with the dip-pipes of the purifier, substantially as described.

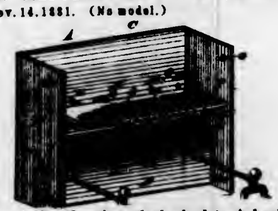


254,214. PORTABLE FENCE. WILLIAM H. HAY, Prospect, Pa. Filed Jan. 5, 1882. (No model.)

Claim.—The portable fence-panel consisting of the planks A A, held together by the posts B B, arranged on their alternating opposite sides in pairs with the intervening spaces, *a a*, and the swing-

ing supports pivoted by bolts *b b* between and near the top of each pair of posts, all constructed, arranged, and operated as set forth.

254,215. GYMNASTIC APPARATUS. WILLIAM HENSELER, Hoboken, N. J. Filed July 30, 1881. (No model.)



Claim.—1. A horizontal bar for gymnastic apparatus, composed of a square steel core and of a cylindrical shell or covering of moisture-absorbing material, substantially as and for the purpose set forth.

2. A horizontal bar for gymnastic apparatus, consisting of a square steel core and a covering or shell formed of disks of paper or other suitable material, substantially as set forth.

3. In a horizontal bar for gymnastic apparatus, the combination of a square steel core with a shell or covering formed of disks of suitable material, and with compressing end blocks and fastening devices, substantially as and for the purpose described.

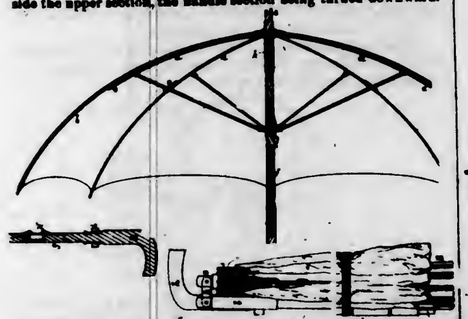
254,216. FIRE-PLACE. JOHN W. HOEY, Rhea's Mills, Tex. Filed Nov. 14, 1881. (No model.)

Claim.—1. In a fire-place, the back plate, A, having shoulder B, openings I, and bearings L, in combination with the adjustable cranes J, substantially as and for the purpose set forth.

2. In a fire-place, the combination, with the cranes J, of the top plate, M, having openings N, covers O, and flanges P, substantially as and for the purpose set forth.

3. As an improvement in fire-places, the combination of the back plate, A, having shoulder B, openings I, and bearings L, the side plates, F, having flanges H, the cranes J, and the detachable top plate, M, all constructed, arranged, and operating substantially as herein described, for the purpose shown and specified.

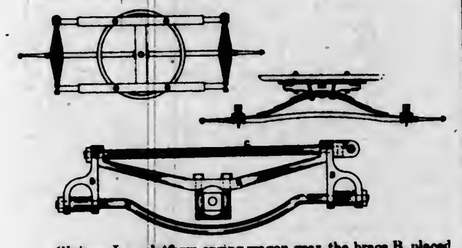
254,217. REVOLVING SHUTTLE FOR SEWING-MACHINES. ELIAS H. HULL, Warren, Ohio. Filed Oct. 24, 1881. (Model.)



Claim.—1. The combination of a revolving shuttle, a bobbin, a bobbin-casing having a spur-gear wheel attached thereto, an intermediate spur-wheel secured to the shuttle, and a stationary gear-wheel, arranged for operation in the manner substantially set forth.

2. The shuttle A, having the spur-gear wheels K S and the bobbin N, in combination with the circular track or shuttle-plate C, having the stationary gear-wheel E, substantially as described.

3. The revolving shuttle-carrier B, in combination with the loose circular rim or casing G, having an opening in the same corresponding with the opening in the shuttle-carrier, whereby the shuttle is entered and the rim revolved upon the carrier to secure the same.

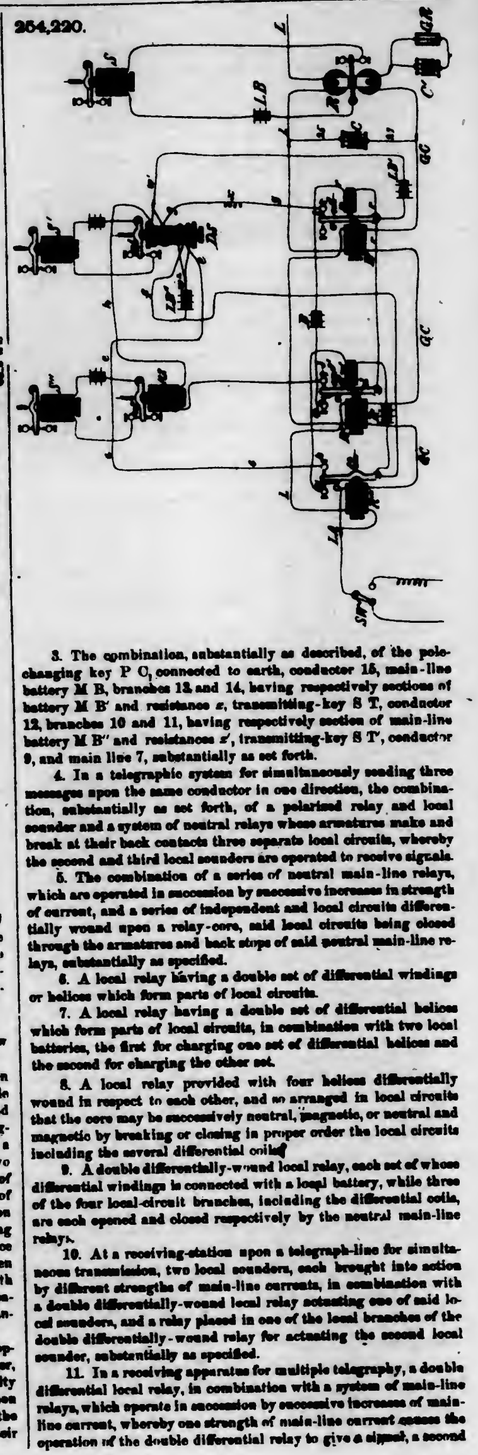


254,218. FOLDING UMBRELLA. CHARLES L. HUBB, Newburyport, Mass. Filed Dec. 16, 1881. (No model.)

Brief.—The middle section of the stick folds upward alongside the upper section, the handle section being turned downward.

Claim.—In a folding umbrella having its stick and each of its ribs in sections jointed or connected together as described, the brace-runner having a diameter larger than that of the hinge-ring, in combination with the ribs hinged to the said ring and the braces to the runner and inner sections of the ribs, and with the outer sections of each rib connected with the inner sections thereof, so as to be capable of being turned upward over alongside of them, all being substantially as set forth, in order that the ribs and braces may be turned upward alongside of each other and the upper section of the stick and the outer sections of the ribs be turned in between the stick and the inner sections of each rib, as explained.

254,219. PLATFORM-SPRING FOR WAGONS. JEREMIAH P. JOHNSON, Toronto, Ontario, Canada, assignor, by mesne assignments, to Johnson, Rose & Co., Detroit, Mich. Filed June 9, 1881. (No model.) Patented in Canada June 7, 1881.



Claim.—In a platform-spring wagon-gear, the brace B, placed at right angles with the axle, spread in the center to form a brace sidewise, and raised at each end about two and one-half inches to form a brace downward, and a lip on each end of the brace extending upward, in combination with rods C and E, shaft-coupling F, and hangers D.

254,220. SEXTUPLEX TELEGRAPH. FRANCIS W. JONES, New York, N. Y. Filed Feb. 9, 1881. (No model.)

Claim.—1. In a system for simultaneous transmission upon a single line, a transmitting or key system arranged upon a single conductor, consisting of the combination of a fragment of said conductor, whose ends may be reversed by means of pole-changing key in respect to the earth and main-line connections and a series of tension-changing transmitting-keys thereon, and two branch conductors at each transmitting-key, through either of which branches the main-line circuit may be established, one of said branches being normally open and having thereon a section of main-line battery, and the other branch normally constituting a portion of the main-line circuit, having an artificial resistance substantially equal to that of the battery in the normally-open branch, the two branches of each key also being so arranged with said key that by its movement the two branches may each separately and alternately be placed in the main-line circuit, substantially as described.

2. A fragmentary portion of a main-line conductor, the opposite ends of which are connected to a main-line pole-changer, said fragmentary portion of the main line having its continuity preserved through the branches having the resistances *s s'* when the transmitting-keys are upon their back stops and through the battery branches of M B' and M B'' when the keys are upon their front stops, substantially as described.

3. The combination, substantially as described, of the pole-changing key P C, connected to earth, conductor 15, main-line battery M B, branches 13 and 14, having respectively sections of battery M B' and resistance *s*, transmitting-key S T, conductor 12, branches 10 and 11, having respectively section of main-line battery M B'' and resistance *s'*, transmitting-key S T', conductor 9, and main line 7, substantially as set forth.

4. In a telegraphic system for simultaneously sending three messages upon the same conductor in one direction, the combination, substantially as set forth, of a polarized relay and local sounder and a system of neutral relays whose armatures make and break at their back contacts three separate local circuits, whereby the second and third local sounders are operated to receive signals.

5. The combination of a series of neutral main-line relays, which are operated in succession by successive increases in strength of current, and a series of independent and local circuits differentially wound upon a relay-core, said local circuits being closed through the armatures and back stops of said neutral main-line relays, substantially as specified.

6. A local relay having a double set of differential windings or helices which form parts of local circuits.

7. A local relay having a double set of differential helices which form parts of local circuits, in combination with two local batteries, the first for charging one set of differential helices and the second for charging the other set.

8. A local relay provided with four helices differentially wound in respect to each other, and so arranged in local circuits that the core may be successively neutral, magnetic, or neutral and magnetic by breaking or closing in proper order the local circuits including the several differential coils.

9. A double differentially-wound local relay, each set of whose differential windings is connected with a local battery, while three of the four local-circuit branches, including the differential coils, are each opened and closed respectively by the neutral main-line relays.

10. At a receiving-station upon a telegraph-line for simultaneous transmission, two local sounders, each brought into action by different strengths of main-line currents, in combination with a double differentially-wound local relay actuating one of said local sounders, and a relay placed in one of the local branches of the double differentially-wound relay for actuating the second local sounder, substantially as specified.

11. In a receiving apparatus for multiple telegraphy, a double differential local relay, in combination with a system of main-line relays, which operate in succession by successive increases of main-line current, whereby one strength of main-line current causes the operation of the double differential relay to give a signal, a second

or increased strength of main-line current renders the double differential relay inoperative, but causes a signal to be given upon an additional device, while upon a third or further increase in strength of main-line current the double differential relay is operated to give a signal as well as the device responding to give a signal upon the preceding strength of current.

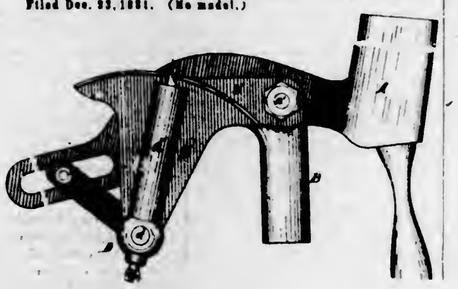
12. The combination of local relays R S and D S, main-line relays R' R'' R''', and circuit-connections, the said main-line relays being operated in succession by successive increases and decreases in strength of the main-line current, one strength rendering D S magnetic to give a signal, a second strength rendering it neutral, whereby it can give no signal, but said second strength of current at the same time causing R S to be energized to give a signal, while a third strength causes both R S and D S to respond, substantially as specified.

13. The combination of relays R S and D S, relay D S having branches *e f g h*, of which *e*, *g*, and *h* may be broken, in combination with main-line relays R' R'' R''', arranged and operated as described, a weak current operating R' and breaking branch *g* of D S to give a signal, a stronger current operating R' and R'' to break branches *g* and *h*, to render D S neutral and silent and R S operative, and a still stronger main-line current operating R', R'', and R''' to break branches *e g h*, whereby both R S and D S are actuated to give signals.

14. In combination with relay D S and its differential coils and local branch circuits, the relay R S, placed in branch *h*, whereby the second strength of main-line current simultaneously causes the operation of R S and neutralization of D S.

15. A double differential relay, D S, whose coils *h* and *p* are so wound in respect to the local batteries by which they are charged that the currents of electricity will, in passing around relay D S through coils *h f*, induce superposed magnetism of the same polarity in the ends of the core D S, whereby, when the magnetism of the core is first due to currents in coil of branch *f* and then to currents in coil of branch *h*, a magnetic reversal in said core will not occur.

16. The combination of a relay whose tongue is adjusted to be responsive only to strong currents of electricity, a relay in the same line whose tongue is responsive both to weak and strong currents, and an auxiliary retracting device which is automatically brought to the assistance of the retractor of the relay which is responsive to weak currents, said auxiliary retracting device being brought into action only upon the operation of the relay which is responsive to strong currents.

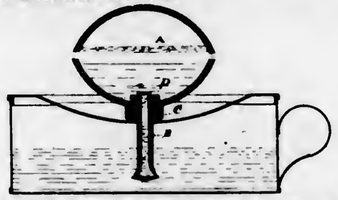


17. The combination, as set forth, of relay R', armature-lever *o'*, retractor *s*, local electro-magnet *m*, relay R'', armature *o''*, and local circuit, including battery B, which is opened and closed by armature *o''*, whereby the strength of current sufficient to actuate armature of relay R'' will automatically bring local electro-magnet *m* into action to aid retractile force of spring *s* in amount corresponding with the increase of current strength for which spring *s* is adjusted.

18. In combination with local relays R S and D S, local branches *e*, *f*, *g*, and *h*, so arranged that *g* and *h* are broken by action of relays R' and R'', while branch *e* is broken by an increased strength of current through the agency of relay R'''.

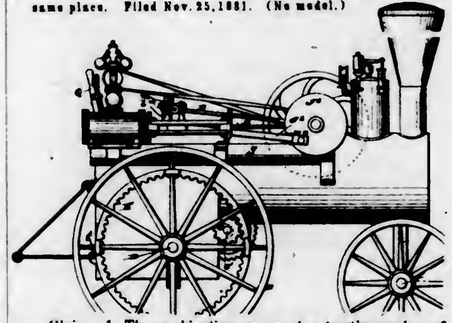
19. Armature-levers *o''* and *o'* of relays R'' and R''', provided with continuity-preserving devices, in combination with local electro-magnets *m* and *m'*, whereby the retractile force of *m* and *m'* may not be varied by slight movement of arms *o''* or *o'''* upon the reversal of line-currents.

20. The combination of the relay-arm *o''* of R'' and spring *40* with local retracting electro-magnet *m* of relay R', whereby the action of *m* may be uniform upon reversing the line-currents.



254,221. JACK OR LAST-HOLDER. JOSEPH E. KIMBALL, Milford, assignor to Henry S. Jenkins, Trustee, Boston, Mass. Filed Dec. 23, 1881. (No model.)

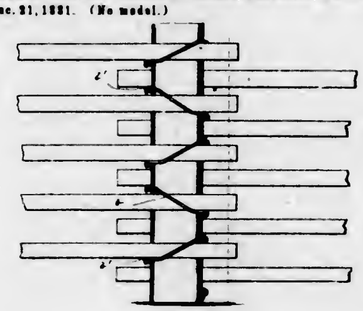
Claim.—The combination of the lever A, socketed to receive the stem of the last, the support B, and the second lever, D, substantially as described.



254,222. CLOTHES-SPRINKLER. JOHN KROCHE, Cincinnati, Ohio. Filed Nov. 22, 1881. (No model.)

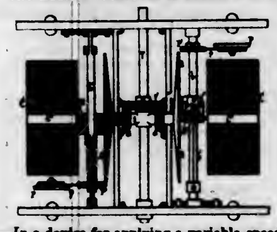
Brief.—The rubber bulb is secured to the metallic nozzle by the exterior collar and the interior nut, the collar resting against a shoulder on the stem of the nozzle.

Claim.—The combination, substantially as specified, of bulb A, nozzle B, flanged collar C, and threaded nut D, for the purpose set forth.



254,223. TRACTION-ENGINE. HORATIO M. LANE and HOWARD CAMPBELL, Richmond, Ind., assignors to Gaar, Scott & Co., same place. Filed Nov. 25, 1881. (No model.)

Claim.—1. The combination, in a road or traction engine, of the fire-box having curved sides and bottom extending below the boiler, the continuous rear axle provided with a central bow or inverted arch adapted to support and strengthen the fire-box, driving-wheels having internally-toothed gear-rings, the shaft journaled in bearings on the front of the fire-box, and having gears meshing with said internally-threaded toothed rings, and means for actuating said shaft, substantially as shown and described.



2. The combination, in a road or traction engine, of an arched axle surrounding the fire-box, a shaft carrying at each end a gear-wheel supported on the forward end of the fire-box, the rear driving-wheels having internally-toothed gear-rings, the bevel-wheel G, attached to and turning loosely with the gear F, bevel-wheel G', mounted firmly on the shaft *e'*, gear-wheel H, mounted loosely on the same shaft between the wheels G G', and provided with pinions *h h*, adapted to gear with said wheels and the driving-shaft J', and connecting mechanism, substantially as shown and described.

254,224. FENCE. ISRAEL L. LANDIS, Lancaster, Pa. Filed Dec. 21, 1881. (No model.)

Claim.—In a fence, the combination of the rails, the post, the diagonal and vertically-arranged wire loops which bind the rails to the post, and which pass vertically and diagonally around alternate rails, and the nails *b'*, driven into the posts for supporting the loops and rails, substantially as described.

254,225. MECHANISM FOR APPLYING POWER TO SEWING-MACHINES. IRENEE LECOEUR, Darnetal, France. Filed July 9, 1881. (No model.) Patented in France Mar. 16, 1881

Claim.—In a device for applying a variable speed to sewing-machines, the combination of the disk A with the friction-wheel B, collar *b'''*, pin *b''*, fork *c''*, treadle-shaft C', and treadle C, substantially as described, and for the purpose set forth.

254,226. CAR-SEAT LOCK. ADAM LOEFFELHOLZ, Milwaukee, Wis. Filed Nov. 22, 1881. (Model.)

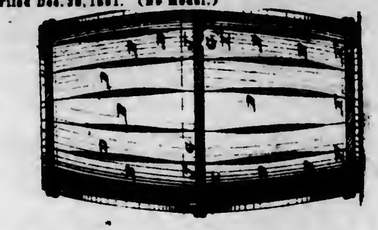
Claim.—In a car-seat lock, the combination of the seat-arm having aperture B and countersink *c* with the shell E F, cam-disk H G *d d*, and the bolt D, its base-plate, and a retracting-spring, as set forth.

254,227. PUMP. SAMUEL W. MARTIN, Springfield, Ohio. Filed May 18, 1881. (Model.)

Brief.—A cap, C, unites the base of the cylinder to the upper end of the suction-pipe. At its upper horizontal side the cap is centrally depressed, its inner wall raised to a narrow lip, and its outer end forming a seat for a packing-ring, *b*, which supports a metallic valve-seat whose other end is sustained by the raised lip. The valve is then inserted between the cylinder, the cap, and the valve-seat, and its edges are firmly held by these means.

Claim.—1. In combination with the cylinder and the cap, the non-corrodible valve-seat having its outer edge secured between the cylinder and cap and its inner edge supported by a narrow raised lip or rim on the cap, as described and shown.

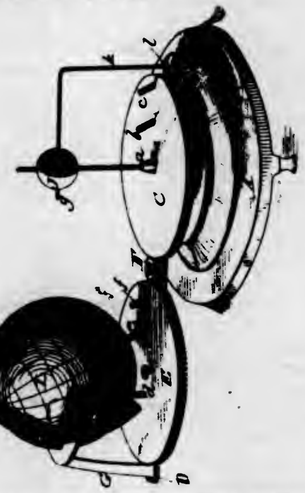
2. In combination with the pump-cylinder and cap, the thin metal valve-seat having its outer edge confined between the cylinder and cap, its inner edge supported upon a raised annular lip, and its middle portion depressed, substantially as described and shown.



3. The cylinder and its cap or base, in combination with the valve, the thin metal valve-seat, and the packing, all three inserted and secured between the cylinder and cap, substantially as described and shown.

4. In combination with a pump-cylinder and its cap, a thin metal valve-seat having its outer edge seated upon an elastic packing and subject to a downward pressure from the pump-cylinder.

5. The combination of the pump-cylinder, its cap, the leather valve, the packing-ring, and the thin metal valve-seat having its edge seated between the packing-ring and the valve, as described and shown.



6. In a pump, the combination, with the inlet or throat-piece, of an annular sheet-metal valve-seat sustained at its inner edge by an annular lip or flange upon the throat-piece.

254,228. BARREL. WILLIS B. MCCORMICK, Weimar, Tex. Filed Dec. 30, 1881. (No model.)

Claim.—The herein-described barrel having slotted sides and ends, and provided with a slotted diaphragm secured in place by means of wedges, so that an open space, S, shall be left between the edge of said diaphragm and the inside of the barrel, substantially as described, for the purpose set forth.

254,229. EDUCATIONAL GLOBE. THOMAS MCDERMOTT, Chicago, Ill., assignor of one-half to Thomas Kane, same place. Filed Aug. 28, 1881. (No model.)

Claim.—1. The combination of the central stationary disk provided with a central socket and an inclined eccentric socket, the second disk revolving upon its own axis and also around the stationary disk, and provided with an eccentric socket, and the two globes adapted for application to the sockets and to be transposed or exchanged one for the other, substantially as described and shown.

2. The combination of the base-frame, the horizontal revolving arm, the central stationary toothed disk provided with the vertical and the inclined sockets, the outer toothed disk pivoted upon the arm and provided with the vertical and inclined sockets, and the pinion mounted upon the arm and connecting the two disks, as shown and described.

3. In combination with a horizontally-rotating arm, a revolving disk mounted upon its outer end and provided with two inclined sockets, *e* and *f*, and an earth-globe, I, adapted for application to either of said sockets at will.

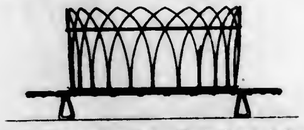
4. In combination with a tellurian and lunarian, two disks of equal size connected by an intermediate pinion, one fixed and the other caused to revolve around the same, in combination with inclined sockets upon both disks, the vertical socket at the center of the non-rotating disk, the earth and sun globes, each adapted to be applied to either of the various sockets, as required, whereby the transposition of the globes is permitted to illustrate the different phenomena of nature.

5. In combination with the central disk and the outer disk revolving around the same and geared therewith, an earth-globe adapted and arranged for eccentric attachment to the inner disk, and the moon-globe adapted and arranged for eccentric attachment to the outer disk, as described and shown.

6. The combination of the base-frame, the stationary toothed disk C, arm D, revolving disk E, pinion F, globes I and J, and arm L.

7. In a combined tellurian and lunarian, the stationary base-frame, the central disk, the outer disk revolving around the central disk, the sun and moon globes applicable to the disks and interchangeable at will, in combination with diagrams and graduations indicating the months and seasons applied to the two disks and base, as described and shown.

8. The disks C and E, having teeth formed in their under inner edges, in combination with the supporting-arm D and the intermediate pinion, F, having its outside constructed and arranged to engage with the under edges of the disks, as and for the purpose described.

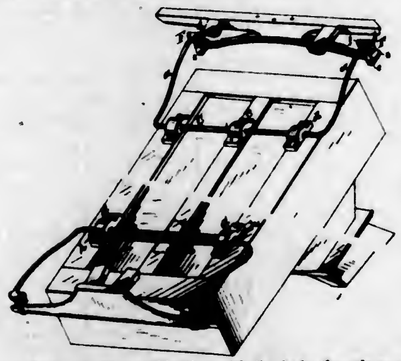


9. The combination of a central stationary disk provided with an eccentric inclined socket, the horizontally-revolving arm, the pinion, the outer disk mounted upon the arm, and also provided with an eccentric inclined socket, and the two interchangeable globes adapted for application to the sockets, as described and shown.

10. The disk E, arranged to revolve upon its own axis and also around the central disk, and provided with the vertical socket *d* and inclined socket *e*, adapted to receive the globes, as described and shown.

11. In combination with the revolving arm, the disks C and E, constructed and arranged to operate as described, the earth-globe upon the outer disk, the central sun-globe, J, the connection K, extending from the outer end of arm D to the central globe, J, independent of the outer globe, and the pointer *g*, as described and shown.

12. A miniature comet consisting of a standard provided with a pointer and an expanded tail extending in opposite directions, as described and shown.

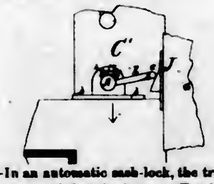


254,230. DISH-DRAINER. THOMAS W. MCFARLAND, Chicago, and CLARA L. FORD, Palatine, Ill.; said Ford assignor to said McFarland. Filed Sept. 13, 1880. (No model.)

Claim.—1. The combination, with the inner shell or receptacle and with or without the outer shell, of a wire bottom provided with a surrounding ring, and connected with and extending outside the inner shell and forming a support for the dishes, as and for the purpose set forth.

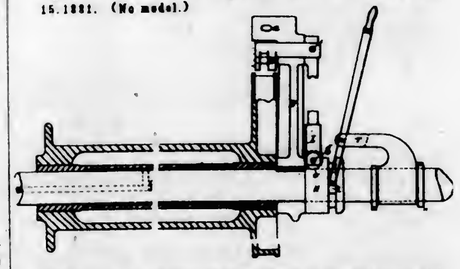
2. The combination, with the inner shell and with the wire bottom extending outside the same for supporting the dishes, of a ring surrounding said bottom and having supporting-legs formed by bends in said ring, substantially as and for the purpose described.

254,231. SPRING FOR VEHICLES. RICHARD HOLMOLLAND, Dunkirk, N. Y. Filed Sept. 27, 1880. (Model.)



Claim.—1. The combination, with the body, the axle or end bar of a vehicle, and torsion spring or springs, of the boxes G, having square or equivalent formed seats *h*, and circular bearings *i*, over which are placed caps *m*, substantially as and for the purpose specified.

2. The combination, with a torsion and semi-elliptical spring of the coupling device consisting of the shackles F, having eye-plates *e f*, arranged with relation to each other as shown, and for the purpose described.



3. In a vehicle, the shackle F, constructed substantially as shown and described, and having the rubber or elastic cushion *g* extending upon both sides of the bed portion thereof, substantially as and for the purpose set forth.

254,232. SASH-FASTENER. THOMAS OXTON, Chicago, Ill. Filed Oct. 13, 1881. (No model.)

Claim.—In an automatic sash-lock, the tripping-lug J, placed on the side casing, and the tripping-arm E *e*, in combination with each other and with the spring-bolt and its casing, slotted as described, and having the rounded shoulder or shoulders A, the said bolt and its casing placed on the top of the lower sash and the receiving-sockets on the side rail of the upper sash, substantially as specified.

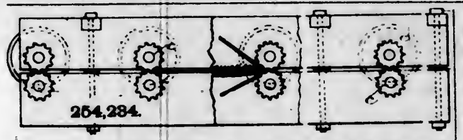
254,233. FRICTION-CLUTCH. RALPH E. OSGOOD, Troy, assignor to Osgood & MacNaughton, Albany, N. Y. Filed Dec. 15, 1881. (No model.)

Claim.—1. In a friction-clutch, a rocking lever connected with the friction-band, said lever being mounted in an arm keyed to the revolving shaft and provided with a crank, inclined as explained, a clutch-shipper mounted upon the revolving shaft and movable in the direction of the length thereof, and a connecting-rod having multiple joints, the several parts being combined and arranged to operate substantially as explained.

2. The clutch-collar movable in the direction of the axis of the shaft, a jointed connecting-rod hinged at its base to the clutch-collar and at the opposite end swiveled upon the crank of the rocking lever, the crank movable parallel with the face of the drum, the several parts being combined and arranged to operate substantially as shown and described.

3. In combination with the crank which controls the rocking lever, the thimble mounted thereon and journaled in the forked section of the coupling-rod, the base-section of said rod being hinged to the clutch-collar, substantially as and for the purpose set forth.

4. In a friction-clutch, the combination, with the clutch-collar made movable back and forth upon the shaft, of a traveling wheel mounted in said collar and bearing upon the shaft, substantially as and for the purpose set forth.

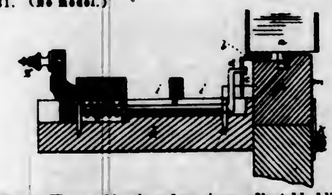


5. In combination with the drum-head, the wooden segments or blocks forming bearing-surfaces for the band, the same being held in place by and bearing against the ledges formed in or on the drum-head, substantially as shown and described.

6. The herein-described wooden blocks or segments forming the bearing-surface for the band, the same being held in place by the ledges formed in or on the drum-head and grooved for the reception of an angular band, substantially as and for the purpose set forth.

254,234. ASSORTING-MACHINE. SAMUEL M. PARK, Chicago, Ill. Filed Dec. 31, 1881. (No model.)

Claim.—1. An assorting-machine provided with sets of feed-rolls arranged at varying distances apart, substantially as described.



2. In an assorting-machine, the combination, with the sets of feed-rolls arranged at increasing distances apart, of the inclined guides, substantially as hereinbefore set forth.

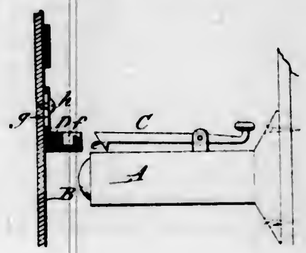
3. In an assorting-machine, the combination, with the series of lower feed-rolls, of the series of upper feed-rolls, set somewhat in advance thereof, and a series of inclined guides, substantially as described.

4. In an assorting-machine, a tray or receptacle having an inclined bottom and a longitudinal slot therein, as described.

254,235. BLIND-SLAT ADJUSTER. CHARLES H. PHILLIPS and EDWARD C. GARDNER, East New York, N. Y. Filed Nov. 21, 1881. (No model.)

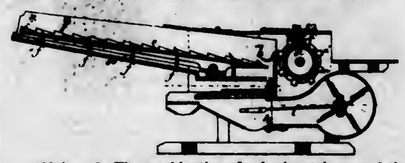
Claim.—The combination of a series of adjustable blind-slats *a*, provided with a connecting-strip, *b*, and stirrup *c*, a lever, *e*, provided with spring *g* and beveled seat *i*, and a window-frame, *h*, to which said lever is permanently attached, substantially as and for the purposes described.

254,236. BASKET. WILLIAM PHIPPS, Newark, N. J. Filed Jan. 12, 1882. (No model.)



Claim.—1. In a meat-basket, the combination of the body A, band B, and stiffening-bars D, secured to the said band and body by rivets *b* and burrs *b'*, substantially as herein shown and described.

2. The combination, with the body A and band B, of four stiffening-bars, D, cut and forced inside the band in the manner described, and secured to the band and body by rivets *b* and burrs *b'*, as herein shown and described.

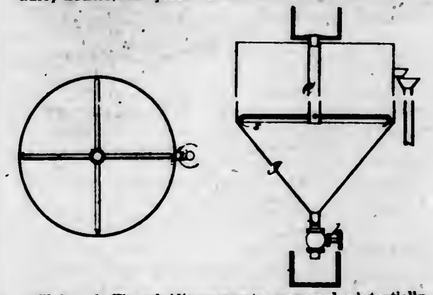


3. In combination with the body A, band B, attached to its upper edge, and corner-brackets E, secured to the inner or outer corners as described, the strap F, secured to the corners of the basket and extended to or under the bottom, as and for the purpose described.

254,237. DOOR-CHECK. JEREMIAH PICKERING, Lees, Iowa, assignor of one-half to J. A. Ray, same place. Filed July 19, 1881. (No model.)

Claim.—In a combined door-check and bumper, the stud A, having elastic bumper B, and latch C, provided with knob *e* and catch *e*, in combination with the adjustable latch-plate D, having recess *f*, slot *g*, and adjusting-screw *h*, substantially as and for the purpose shown and described.

254,238. THRASHER AND SEPARATOR. WILLIAM PIERPONT, Salem, N. J. Filed Mar. 29, 1880. (No model.)



Claim.—1. The combination of a horizontal grooved thrashing-cylinder having teeth on its periphery with a narrow-toothed concave or breast, *m*, located above it, where the grain is thrashed, and means for intercepting the grain-dust, &c., passing from the cylinder, for the purpose and in the manner specified.

2. In combination with parts *c d* of the separator, moving in opposite directions to each other, the pins *f*, affixed to *d* and moving through oblong slots in *c*, in the manner and for the purposes specified.

3. The combination, in a riddle-shoe having the central suspension at the rear of the stationary frame, as described, and the straight connecting-rods *i i*, rigidly attached to the sides of the shoe and connecting it with the sunk cranks on the fan-shaft, as and for the purposes specified.

4. The combination, with the overshot thrashing-cylinder and concave and the oscillating separating-table, of the concave plate *b*, arranged tangentially, or substantially so, to the cylinder, substantially as herein set forth.

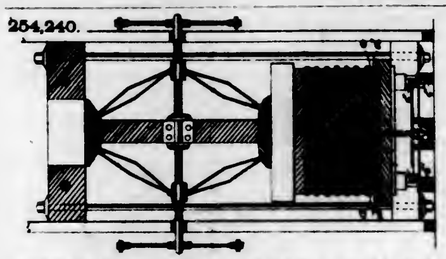
254,239. ART OF MANUFACTURING STARCH AND APPARATUS THEREFOR. EDWIN READ, Buffalo, N. Y., assignor to Harry Hamlin, same place. Filed Jan. 26, 1882. (No model.)

Claim.—1. The subsiding apparatus composed substantially, as before set forth, of the tank, the inlet-pipe, the outlet, and the overflow.

2. The process, substantially as before set forth, of concentrating starch from the running starch-milk by causing the same to flow at a slow speed through a tank in an upward direction.

3. The process, substantially as before set forth, of concentrating starch continuously from the running starch-milk by causing the same to flow slowly through a tank, permitting the larger portion of the liquid to overflow at the upper part of the tank, and withdrawing the concentrated residue from the bottom of the tank.

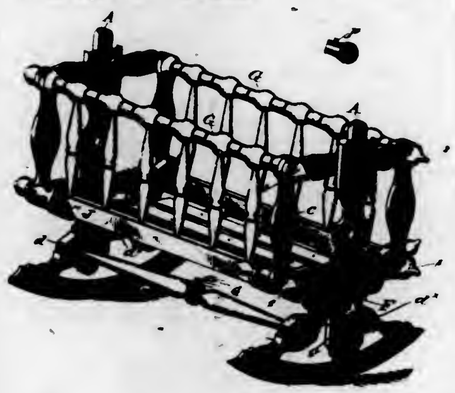
254,240. PROCESS OF AND APPARATUS FOR TREATING THE REFUSE OF STARCH AND OTHER SUBSTANCES. EDWIN READ and HARRY HAMLIN, Buffalo, N. Y.; said Read assignor to said Hamlin. Filed Jan. 26, 1882. (No model.)



Claim.—1. The process, substantially as before set forth, of preparing animal food from the refuse of the starch-manufacture by subjecting the wet material to graduated pressure, disintegration, and heat, substantially as before described.

2. The combination, substantially as before set forth, of the disintegrating mechanism and the drying mechanism.

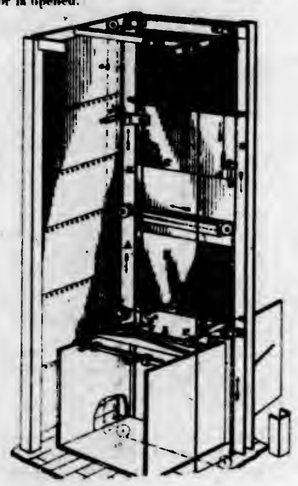
3. The combination, substantially as before set forth, of the disintegrating mechanism, the feeding device, and the drying mechanism.



4. The combination and arrangement of mechanism for operating upon the wet refuse of the starch-manufacture, comprising the elastic rollers by which the first grade of pressure is applied,

254,240.

the press by which the second grade of pressure is applied, the disintegrating mechanism, the feeding mechanism, and the drying mechanism, all substantially as before set forth.

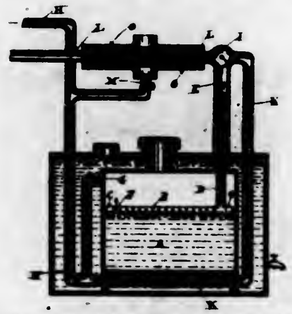


254,241. FOLDING CRADLE. JOHN Y. SAILOR, Tiffin, Ohio. Filed Sept. 17, 1881. (No model.)

Claim.—The combination of lock-boards A, having slots F, cross-legs *d d d x d x*, center under round, G *x*, and buttons *e x*, all substantially as and for the purpose shown and described.

254,242. HOIST. WILLIAM F. SEXTON, Sr., and WILLIAM F. SEXTON, Jr., Toronto, Ontario, Canada. Filed Apr. 25, 1881. (No model.)

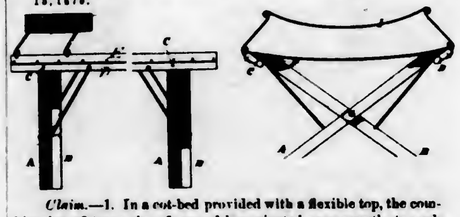
Brief.—Adjustable catches on the cage engage projections on the doors or on an endless band connected to the doors, the doors being operated by an endless band and branch ropes. A projection on the door engages a stop on the check-rope and operates it when the door is opened.



Claim.—1. In a hoist provided with independently-acting doors, an endless rope or band provided with branch ropes or bands connected to the doors, in combination with a cage provided with movable arms and projecting catches or brackets on the endless rope or the doors, substantially as and for the purpose specified.

2. In a hoist, a sliding door provided with a projecting arm, in combination with stops on the check-rope, and the check-rope, whereby the motive power moving the cage is stopped by the opening of the door, substantially as specified.

3. In combination with an endless rope or band having branch ropes and catches or projections on the cage, and sliding doors or endless rope, as described, a projecting arm on one of the sliding doors and stops on the check-rope, substantially as and for the purpose specified.



254,243. DEVICE FOR CARBURETING GAS OR AIR. DEXTER H. SMALL, East Providence, R. I. Filed Mar. 7, 1881. (No model.)

Claim.—1. The combination, in a carburetor, of the tank A, float B, pipes D and E, and pipes H, K, and L, with a valve at I, constructed to operate substantially as described.

2. The combination, in a carburetor, of a heating-chamber, O, constructed with partitions therein to form a narrow channel, in connection with the pipes M and L, all substantially as described.

254,244. FOLDING COT-BED. JAMES I SPENCER, Chelsea, Mass., assignor to Herman W. Ladd, same place. Filed June 18, 1879.

Claim.—1. In a cot-bed provided with a flexible top, the combination of two pairs of crossed legs pivoted permanently to each other at their crossing points, two side rails pivoted to said legs and extending without joint from head to foot of the cot, and diagonal braces permanently connecting said legs and rails, said flexible top and continuous side rails being wholly supported by the two pairs of crossed legs, the said rails adapted to yield and the whole adapted to fold, substantially as described, without disconnecting any of the supports or diagonal braces, for the purpose set forth.

2. The combination, substantially as described, of the frame with crossing legs pivoted thereto, united at their intersection by the bolt or rivet G, for the purpose set forth.

3. In a cot-bed provided with a flexible top, the combination of side rails supporting said top with crossing pivoted legs cut diagonally at their upper ends to avoid contact with said flexible top when it is depressed by the weight of the occupant, and metallic strengthening-pieces secured rigidly to the legs and pivoted to the side rails, so as to permit said legs to swing toward the longitudinal center of the bed when the sides approach each other, as set forth.

4. The combination, in a cot-bed substantially as described, of a flexible bolster suspended from spring-standards erected upon the side rails, with a flexible top supported by said rails and crossing pivoted legs, whereby the spreading of the legs in the use of the cot increases the tension of the bolster, for the purpose set forth.

5. The combination of the folding bed or cot frame with folding bolster-supports connected with the side rails, substantially as described, so that upon the folding of the leg-frames the bolster may be automatically folded, as set forth.

6. In a cot-bed provided with a flexible top, the combination and arrangement of the side rails, D D, and crossing legs A B, united to said rails by pivots C C, one of each pivots of each pair of legs being located higher on the side rail and farther from its end than the other, substantially as and for the purpose set forth.

7. As a new article of manufacture, a cot-bed consisting of a flexible top and side rails which support said top, with a flexible bolster mounted on spring-standards in said side rails, and with pivoted crossed legs which fold into parallelism with the frame when the side rails approach each other, substantially as set forth.

8. In a cot-bed, the combination of a flexible top secured only to the side rails with a flexible bolster mounted on spring-standards erected upon said rails, for the purpose set forth.

9. A folding cot-bed having a flexible bolster elevated horizontally above the side rails, as shown, and a flexible top secured only to said rails, in combination with supporting-legs adapted to fold into parallelism with the side rails when they approach each other, for the purpose set forth.

254,245. DOOR-HANGER. ALBERT L. SWEPT and WILLIAM H. SAMSON, Medina, N. Y. Filed July 11, 1881. (No model.)

Claim.—1. In a door, the combination of a plane-faced track and a carrying roller or wheel, R, mounted on said track, and having two treads, *a a*, of equal diameters, with an intervening circumferential recess, *r*, substantially as described and shown, for the purpose specified.

2. The combination, with a suspended sliding door, of the roller *c*, the plate *d*, extended over the roller and secured to the door by bolts *b b*, passing vertically through the ends of said plate and into the top of the door, and the pivotal pin *e*, inserted through the plate *d* and into the top of the door, substantially as described and shown.

254,246. CATTLE-CAR. HARVEY TOWNSEND, Alameda, Cal. Filed July 28, 1880. (No model.)

Claim.—1. A stock-car divided by two longitudinal partitions into two side compartments, having between them a clear central passage extending throughout the length of the car, in combination with transverse passages and with swinging doors E, forming when closed a portion of the flooring of the central passage, the stock being carried in the side compartments only.

2. The combination and arrangement of the side divisions, B and C, with the transverse passages G H I, when operated in connection with the trap-doors D, E, and F and the cross-bars S, substantially as and for the purposes set forth.

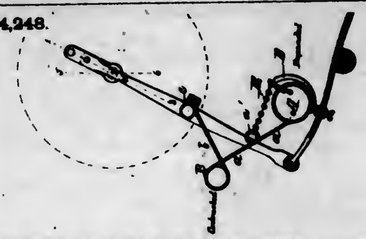
254,247. MANUFACTURE OF ARTIFICIAL STONE. STEPHEN TRUSC, Avoca, Ill. Filed Jan. 3, 1882. (No specimens.)

Claim.—1. The herein-described solution, consisting of water, rye-flour, Lewis's or any other lye, and common salt, combined in suitable proportion, for the purpose of producing the crystallization of the artificial stone, as specified.

2. An artificial stone composed of sand and cement moistened with a solution composed of water, rye-flour, Lewis's or any suitable lye, and common salt, substantially as set forth.

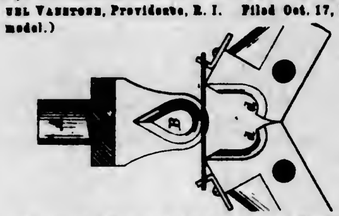
254,248. SPRING FOR KEEPING PITMEN OFF DEAD-CENTERS. CHARLES A. VAN ALLEN, Chicago, Ill., assignor to Robert K. Scott, Napoleon, Ohio. Filed June 18, 1881. (No model.)

Claim.—1. The combination, with a pitman and with its operating-treadle, of a spring connected with said pitman and treadle, and adapted to throw the pitman off its dead-centers, substantially as described.



2. The combination, with a pitman and treadle, of an actuating-spring consisting of two or more coils, and adapted to simultaneously contract and expand, for the purpose set forth.

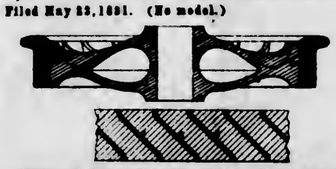
3. The combination, with a pitman and treadle, of a spring having two or more coils simultaneously expanding and contracting, and a tension chain or cord connected with and adapted to limit the expansion of one of said springs.



4. In a sewing-machine, the combination, with the pitman and treadle, of a spring consisting of the coils A B, an arm, *a*, connecting said coils, and an arm *b*, connecting the coil B with the pitman.

5. The combination, with the coils A B and arms *a b*, connecting said coils with each other and with the pitman and treadle, of an arm, D, and a tension chain or cord connecting the arm *a* with the arm D, substantially as and for the purpose set forth.

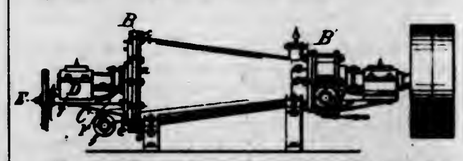
254,248.



254,249. MACHINE FOR BENDING CLEW-THIMBLES. SAMUEL VAUGHTON, Providence, R. I. Filed Oct. 17, 1881. (No model.)

Claim.—In a machine for forming clew or other thimbles, the combination, with the follower A and the former B, supported in the cheeks E E, of a yielding two-part die constructed to bend the thimble around the former, as described.

254,250. CAR-WHEEL. NATHAN WASHBURN, Alleton, Mass. Filed May 23, 1881. (No model.)



Claim.—1. In combination with a railway-car wheel having its body of cast-iron and its tire of steel, and united to the rim in the process of casting the body, a series of wrought-iron bars or re-enforces arranged obliquely, as described, in the tire, the latter being cast upon them, as set forth.

2. In combination with a railway-car wheel having its body of cast-iron and its tire of steel, and united to the rim in the process of casting the latter, a series of wrought-iron re-enforces, substantially as described, arranged in the body or rim and in close contiguity with the tire, all essentially as and for the purpose specified.

3. A car-wheel made of cast iron or metal, and having within its rim wrought-iron bars or re-enforces arranged therein obliquely, the metal of the part containing them being cast upon such re-enforce in the process of making the wheel.

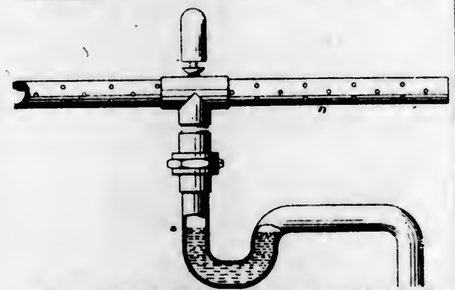
254,251. PAPER-PULP ENGINE. JOHN R. ANDS, South Windham, Conn. Filed Nov. 16, 1881. (No model.)

Claim.—1. In a paper-pulp engine, the shell having slotted flanges projecting from the sides thereof, at each end, in combination with the heads of corresponding diameters and correspond-

ingly slotted, substantially as described, and for the purpose specified.

2. In a paper-pulp engine, the pipe-connections consisting of the short piece C and the flanges *e f*, substantially as described, and for the purpose specified.

3. In a paper-pulp engine, the combination of the head B, box-supporting frame F, having ways *k k*, the feed-screw E, box D, connected to said screw, and the cone and its shaft connected to said box, all substantially as described, and for the purpose specified.



254,252. BUTTON OR STUD. GEORGE H. ADAMS, Providence, R. I. Filed Dec. 17, 1881. (No model.)

Claim.—In a sleeve-button composed of the front A, hinged shoe B, and slotted post C, having at its lower end the transverse bar *e*, provided with ends projecting beyond the sides of said slotted post, the combination, with the bar *e*, of the slotted cap-plate *a*, having three bearings, *a' a'*, adapted to engage with said bar, and two springs, *b b*, inclosed within the shoe, beneath said plate, and adapted to bear against the bar at the end of the post, thereby holding the shoe securely in a horizontal or vertical position, as specified.

254,253. AUTOMATIC FIRE-EXTINGUISHER. EDWARD H. ASHCROFT, Lynn, Mass. Filed July 5, 1881. (No model.)

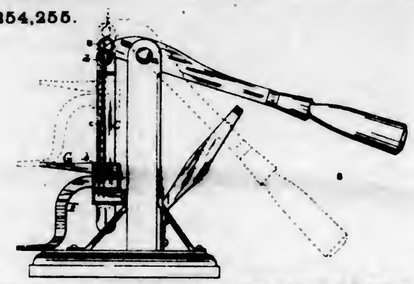
Brief.—Between the perforated distributing-pipe and the steam-supply pipe is a fusible diaphragm adapted to be melted by the increase of temperature in the apartment where it is located. In order that the fusible diaphragm may not be affected by the direct action of the steam a liquid cut-off is provided on the supply side thereof.

Claim.—The combination of the steam-supply pipe, the delivery-pipe, and a fusible plug or diaphragm, and water-chamber or cut-off upon the supply side of said plug or diaphragm, all arranged and adapted to operate substantially as described.

254,254. BIRD-CAGE PERCH. JOSEPH BAGOT, Brooklyn, N. Y. Filed Dec. 31, 1881. (Model.)

Claim.—1. A bird-cage perch made substantially as herein shown and described, and consisting of the rubber perch with attached hooks, as set forth.

2. In a bird-cage perch, the combination, with the ends of the perch A, of the ferrules B and the catches C, having wedge-shaped inner ends, substantially as herein shown and described, whereby said perches and catches are firmly connected, as set forth.



3. In a bird-cage perch, the catches C, having hook-shaped outer ends and wedge-shaped inner ends, in combination with the hollow rubber perch and cage-wire, substantially as herein shown and described, whereby the said catches are adapted for use in connecting the perch with the cage, as set forth.

4. The combination, with the rubber tube A, of end catches, whereby the said tube is adapted for use as a bird-cage perch.

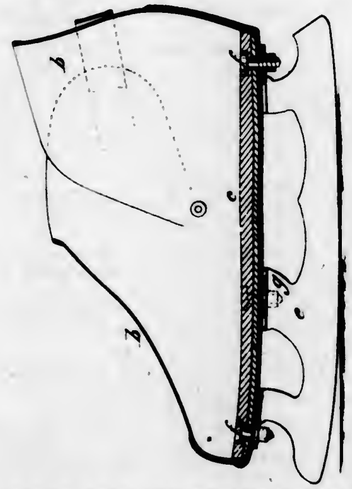
254,255. LIFTING-JACK. SELAH H. BAIRD, Rolly, Mich. Filed Aug. 30, 1881. (No model.)

Claim.—1. The bent and curved arm F and the horizontal arm G, both sliding on the vertical shaft C, substantially as shown and described, and for the purposes set forth.

2. The chain *e*, attached to the horizontal arm G, and passing

through the eye *d*, attached to the upper end of the shaft C, in combination with the bent and curved arm F and the horizontal arm G, substantially as shown and described, and for the purposes set forth.

254,256. BRACELET. WILLIAM H. BALL, Newark, N. J. Filed Nov. 9, 1881. (No model.)

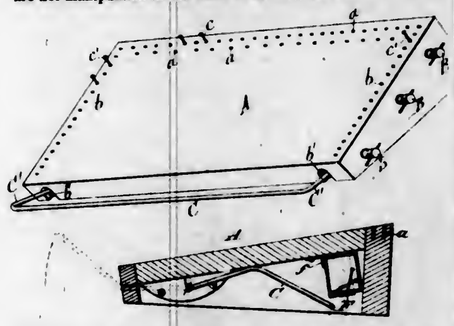


Claim.—1. The combination of the eye *b*, having an upper interior lug, *b'*, and the eye *b'*, having opening *a'*, with the sleeve C, provided with notch *c*, and its inclosed spring D, having impinging point *d* and extending arm *d'*, substantially as described.

2. In a segmental bracelet, the curved flanges B B', the eyes *b b'*, and the sleeve C, in combination with the coiled spring D, having impinging point *d* and extending arm *d'*, and the pivotal post E.

3. In a two-part bracelet joined by a spring-pressed hinge, each wing having a curved segmental flange provided with eyes *b b'*, in combination with the coiled spring D, having impinging point *d* and extending arm *d'* inclosed within sleeve C, and the pivotal pin E, substantially as described.

254,257. SKATING-SHOE. WILLIAM J. BARBER, Wallingford, Conn. Filed Aug. 15, 1881. (No model.)

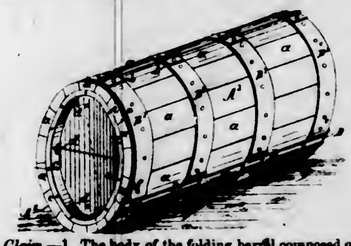


Claim.—1. A skating-shoe consisting of the rubber portion *a*, the water-proof cloth *b*, and the rubber-surfaced sole *c*, having holes for the head and shank of screws, as shown and described.

2. The combination of the screws *f*, the sole *c*, having holes for their heads and shanks, and the internally-threaded lugs on the front and rear of a skate, *c*, whereby said sole and skate may be fastened together, as shown and described.

254,258. DESK FOR MAKING MACRAMÉ LACE. THOMAS BARRON, Paterson, N. J. Filed Dec. 6, 1881. (No model.)

Brief.—The desk is provided with a folding horizontal bar for holding the ends of the fringe-forming threads that have been ordinarily held by attaching them to a button on the dress of the operator. Provision is made for pins in the top of the desk, and cleats are secured in the ends to hold the ends of the threads which are not manipulated in the work of making the lace.



Claim.—1. The combination, with the lace-desk A, of the horizontal bar C, having arms C' C', and adapted to be turned outward for holding the threads and to be folded beneath the desk when not required for use, substantially as described.

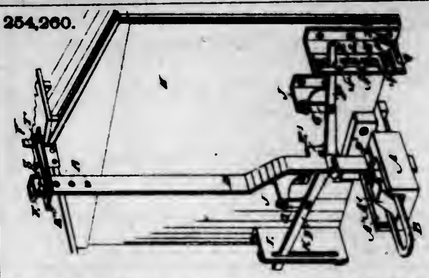
2. The combination, with the desk A, having notches *b' b'*, recesses *d d*, and springs E E, of the folding bar C, having arms C' C', provided with eccentric lugs *e e*, substantially as described.

3. The combination, with the desk A, having cleats B B and perforations *a b*, for the reception of pins *c c'*, of the folding bar C, having arms C' C', provided with eccentric lugs *e e*, adapted to be held rigidly in position by means of springs E E, substantially as shown and described.

254,259. FOLDING BARREL. ARMISTEAD BARKSDALE, Statesville, N. C. Filed Aug. 26, 1881. (Model.)

Claim.—1. The body of the folding barrel composed of stave-sections and bands which are connected by links C and D, the width of one of which equals the thickness of the staves, and devices for fastening the free ends of the bands, all as shown and described.

2. The improved folding barrel consisting of the sections composed of staves attached to bands, which are hinged together, and the removable heads F, the hoops G, secured to the heads, and the detachable bolts provided with thumb-nuts and applied as shown, for securing said heads detachably to the body of the barrel, as shown and described.



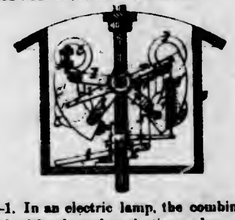
254,260. CAR-COUPLING. JEFFERSON E. BARRETT, Mount Vernon, Iowa. Filed Sept. 30, 1881. (No model.)

Claim.—1. The bar D, having two lugs, D' D', recess D^2, and flanges D^3, in combination with a draw-head having the vertical slot C, as and for the purpose specified.

2. The bar D, having a bent arm, E', connected by a pintle with the oppositely-extending levers F F, as shown and described.

3. In a car-coupling, the combination, with the draw-head A, provided with a U-shaped groove, A', of the bar D, the levers F, the connecting-bars G, and the brackets J, projecting from the car H, substantially as herein shown and described, and for the purpose set forth.

4. In a car-coupling, the combination, with the draw-head A, of the bar D, the levers F, the plates L, each provided with a vertical slot, K, and of the pivoted bars M, provided with teeth N' N^2, substantially as herein shown and described, and for the purpose set forth.



5. In a car-coupling, the combination, with the plate L, provided with a slot, K, of the pivoted bar M, provided with teeth N' N^2, &c., the guide-plate Q, and the latch P, substantially as herein shown and described, and for the purpose set forth.

6. In a car-coupling, the combination, with the plate L, provided with a slot, K, of the pivoted bar M, provided with a series of teeth, N' N^2, &c., and having its lower end, M^2, bent rectangularly, and of the pivoted latch P', provided with the lugs P' P^2, at the opposite ends, substantially as herein shown and described, and for the purpose set forth.

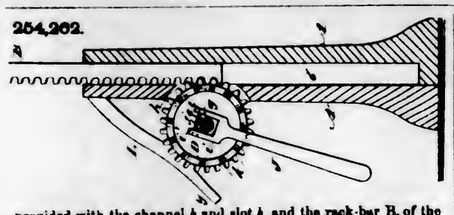
7. In a car-coupling, the combination, with the draw-head A, of the bar D, provided with a series of apertures, E, the slotted guide-plate E^2, the latch T, and the handle S, and the levers F, substantially as herein shown and described, and for the purpose set forth.

254,261. ELECTRIC LAMP. FRANKLIN H. BERRS, Newark, N. J., assignor, by mesne assignments, to the Metropolitan Electric Light and Power Company of the United States, New York. Filed June 27, 1881. (No model.)

Claim.—1. In an electric lamp, the combination of a rock-shaft provided with a lateral projection or lug, an armature connected with said shaft and arranged to oscillate in a vertical plane, and a clamp connected with the projection or lug on the rock-shaft, and operated thereby through the oscillating armature to lift the upper carbon, with two electro-magnets arranged at right angles to the plane of oscillation of the armature, one of said magnets being connected with the dynamo-electric generator and the other being in a circuit which includes the carbon sticks, substantially as and for the purposes described.

2. The combination, substantially as hereinbefore described, of the carbon sticks and their holders, the electro-magnets C D, the cores of which extend parallel to each other and at right angles to the carbon-holder *d*, the rock-shaft H, the armatures C' D', secured to a spider which is mounted on said rock-shaft, and the clamp L, connected to an arm extending from the rock-shaft.

3. The combination, substantially as hereinbefore described, of the carbon sticks and their holders, the electro-magnets C D, the rock-shaft H, the armatures C' D', secured to a spider mounted on said rock-shaft, the lever *l m*, set-screw *n*, bell-crank lever *i h*, adjusting-screw *h*, and spring *g*.



4. The combination, with the horizontal rock-shaft, the oscillating armature, and electro-magnets, of a depending rod, K, connected with the rock-shaft, a lever, *q*, pivoted to the lower end of the rod, and two jaws, *r r*, having a pivotal connection with the lever on opposite sides of the carbon, substantially as described.

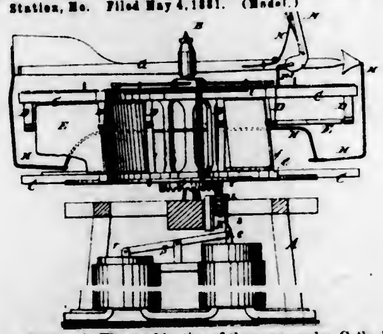
254,262. LIFTING-JACK. JONATHAN BRIDE, Slippery Rock, Pa. Filed Jan. 3, 1882. (No model.)

Claim.—1. In a lifting-jack, the frame composed of the part A, provided with the longitudinal channel *b*, and the part A', provided with the slot *h'*, and bolted to the part A, substantially as herein shown and described.

2. In a lifting-jack, the combination, with the frame A A',

254,262.

provided with the channel *b* and slot *b*, and the rack-bar B, of the shaft *g*, provided with the grooved enlargement *e i*, the pinion D, provided with the projections *k*, and the lever J, provided with the arms *i'* and the pin *j*, substantially as and for the purpose set forth.



3. In a lifting-jack, the combination, with the frame A A', provided with the channel *b* and the slot *b*, and the rack B, of the shaft *g*, provided with the grooved enlargement *e i*, the pinion D, provided with the projections *k* and ratchet *l*, the lever J, provided with the arms *i'* and the pin *j*, and the pawl L, substantially as and for the purpose set forth.

254,268. COMPOUND FOR ETCHING VITREOUS SURFACES. PAUL BITTERLIN, Jr., Paris, France. Filed Mar. 7, 1881. (No specimens.) Patented in France Jan. 21, 1880.

Claim.—1. A compound for etching glass, consisting of hydrofluoric acid mixed with some finely-divided material which the acid will attack, as described.

2. A compound for varying the etched surfaces of glass, consisting of hydrofluoric acid mixed with a finely-divided material which the acid will not attack, as described.

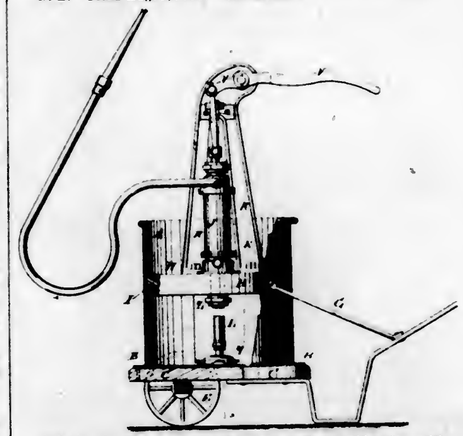
254,264. WINDMILL. CHRISTOPHER C. BOMBERGER, Crooker Station, Mo. Filed May 4, 1881. (Model.)

Claim.—1. The combination of the upper spokes C, the hangers D, carried by said upper spokes, the sails E, pivoted in said hangers, and the lower spokes C, provided with the ribs or shoulders *f*, as herein shown and described.

2. The vane G and the rod H, arranged, as shown and described, in combination with the pivoted sails E, substantially as and for the purpose herein set forth.

3. The fan M, spring *n*, and arms P P', in combination with the branches L L' and shaft J, as shown and described, for the purpose specified.

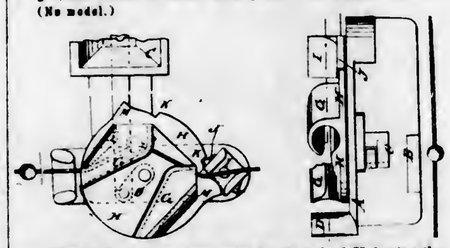
4. The combination of rings *i*, the shaft J and its arm *k*, branches L L', and arms P P' with the pivoted sails E, as shown and described, for the purpose specified.



254,265. ELASTIC WATER-BED. EDWIN J. BUSH, South Boston, Mass. Filed Dec. 17, 1881. (No model.)

Claim.—1. Elastic water beds, mattresses, cushions, pillows, &c., made of thin rubber, rubber cloth, or other suitable material, having cells or divisions which are inflated by filling the beds, &c., with water, or with water and air combined, as described in the specification and shown on the drawings.

2. An improved and direct means of circulating water through the beds and rapidly changing the temperature, as set forth in specification.



254,266. PORTABLE FORCE-PUMP. SAMUEL BOSSEN, Dover, N. H. Filed Aug. 8, 1881. (No model.)

Claim.—1. In a portable force pump, the combination, with the wheels and axle E D, of the platform C, the tank A, having a flange, B, around its bottom, the handle F, bent to form a foot and stirrup, and the handle-braces G, substantially as herein shown and described, whereby the pump and the liquid to be thrown by the pump can be readily held and carried, as set forth.

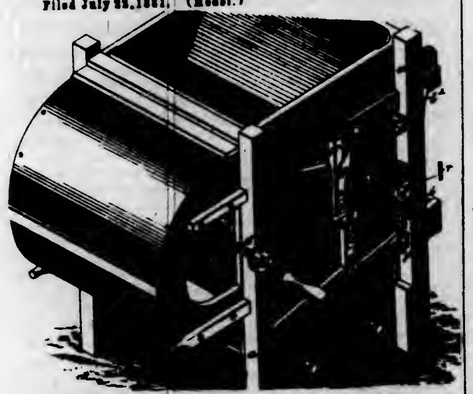
2. In a portable force-pump, the combination, with the tank A and the pump-barrel J, of the semicircular plate H, having its straight edge flanged, and the wooden strengthening-block I, substantially as herein shown and described, whereby the pump-barrel can be securely supported, as set forth.

254,267. CHECK-ROW CORN-PLANTER. LYCURGUS J. BOSWORTH, Monmouth, Ill., assignor to himself, A. Theny Clippinger, and James B. Clark, same place. Filed Sept. 14, 1881. (No model.)

Claim.—1. In a check-row planter, the wheel H, having the channels G G, bent at their rear ends and open at their inner sides, in combination with the rope or wire having balls at intervals, as and for the purpose described.

2. In a check-row corn-planter, the combination, with the wheel H, having shoulders K and inclined projections M, and the pivoted guide I, of the double pawl J, whereby the said wheel is held in place and prevented from rebounding, as set forth.

254,268. UNDERGROUND-TELEGRAPH LINE. DAVID BROOKS, Philadelphia, Pa. Filed Nov. 7, 1881. (No model.)

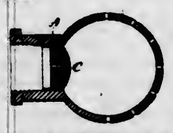


Claim.—The mode herein described of preventing the escape of insulating-fluid from the terminal pipes of underground-telegraph lines—that is, which consists in compressing paraffine or similar material around the wires in the pipe near the end of the pipe.

254,269. SLAB OR BLOCK FOR PAVEMENTS OR FLOORS. CALVIN BROWN, Vallejo, Cal. Filed Jan. 23, 1882. (No model.)

Claim.—A paving-block having its outer edge of a continuous thickness and the lower surface hollowed out, substantially as shown, whereby the sand or other material in which the block is laid may crowd up beneath the block, substantially as set forth.

254,270. GRAIN-SEPARATOR. JOHN BAUER, Albany, Oreg. Filed July 23, 1881. (Model.)

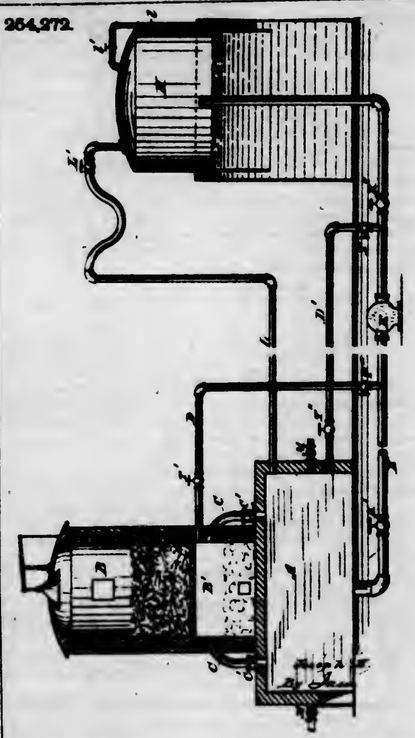


Claim.—1. The combination, with the shoe *l*, frame *a*, and hangers F F, the shoe being provided with the angular plate *m*, having a series of adjusting-holes, *m'*, of the shoe *l'*, arranged under the shoe *l*, and hangers F F, the lower shoe being provided with angular plate *n*, having adjusting-holes *n'*, bell-crank lever *j*, provided with a series of adjusting-holes, coupling-hooks *o*, and operating mechanism, substantially as described.

2. The combination, with the upper shoe, *l*, frame *a*, and hangers F F, the shoe being provided with the opposite perforated lugs *q*, of the lower shoe, *l'*, lying under the shoe *l*, and provided with opposite holes in the upper edges of the sides, and pins *r*, substantially as described, and for the purpose set forth.

254,271. FIRE-EXTINGUISHER. ALBERT M. BURRITT and ANGELO C. BURRITT, Waterbury, Conn., assignors to the A. Burritt Hardware Company, same place. Filed Dec. 24, 1881. (No model.)

Brief.—A hard-metal ring is secured in the water-way, which ring receives a soft-metal plug, which is adapted to be fused to open the passage for the water.



Claim.—The herein-described improvement in fire-extinguishers, consisting of the plug composed of the hard-metal ring A and the fusible part C, filling said ring, and the plug secured in the water-way by means of said hard-metal ring, substantially as described.

254,272. METHOD OF AND APPARATUS FOR ANNEALING AND TEMPERING GLASS. JOSEPH M. CAMPBELL, New York, N. Y., assignor of one-fourth to James McLain, Washington, D. C. Filed Jan. 24, 1882. (No model.)

Claim.—1. The method herein described of annealing and tempering glass and other articles, the same consisting in subjecting such articles to the action of gases heated and in motion, whereby the crystals are formed or are arranged in the line of direction of the traveling currents of the heated gases, as set forth.

2. The method herein described of annealing and tempering

glass, &c., the same consisting in submitting the articles to be annealed or tempered to the action of heated gases in motion until the proper degree of heat has been attained, and then to the action of said heated gases under regulated pressure until the desired molecular rearrangement, crystallization, or polarization has taken place, and finally cooling such articles by subjecting them to the action of carbonic-acid gas and nitrogen gas, as set forth.

3. The method herein described of annealing and tempering glass, &c., the same consisting in submitting the articles to be annealed or tempered to the action of heated carbonic-oxide gas and nitrogen gas in motion, as set forth.

4. The method herein described of annealing and tempering glass, &c., the same consisting in generating the gases for annealing or tempering the articles in a furnace, substantially such as described, and conveying the same direct in a heated condition to the annealing or tempering chamber, as set forth.

5. The furnace B, ash-pit B', pipes C, and sleeves C', in combination with the chamber A, pipe K, pressure blower or pump E, and gasometer H, whereby the articles in the chamber A are annealed or tempered by the passage therethrough of the heated gases, as set forth.

6. The furnace B and ash-pit B'; in combination with the pipes D D', pressure blower or pump E, valves K' K'', and chamber A, whereby the articles are annealed or tempered under pressure of the heated gases, as set forth.

7. The gasometer H, pipe L, and valve L', in combination with the annealing or tempering chamber A and pipes M M, whereby the cooling-gases from the gasometer are admitted to the annealing or tempering chamber and the articles cooled rapidly or slowly, as may be desired.

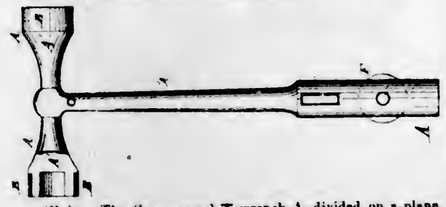
8. The method herein described of cooling annealed or tempered articles by convection, as set forth.

254,273. MANUFACTURE OF COACH-LAMPS AND DIES THEREFOR. FRED C. CANNON, New Haven, Conn. Filed Oct. 6, 1881. (No model.)

Claim.—1. The method herein described of making coach-lamp reflectors or linings, consisting in first spinning the center to produce the concave portion, then striking up the surrounding portion to produce the convex surface, and at the same time to

254,273.

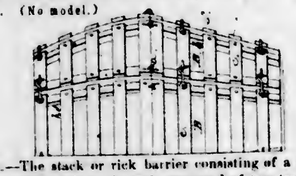
form the projecting flange A around the edge of the reflector, substantially as described.



2. The dies for forming coach-lamp reflectors or linings, consisting of the part A, with a recess, B, therein, of the shape of the reflector required, combined with the part C, having a projection, D, on its face to enter the recess B in the other part, with a cavity, E, in said projecting part D, the surrounding surface of the said part D corresponding to the convex surface of the reflector or lining required, substantially as described.

254,274. PRESERVING WOOD. JOSEPH P. CARD, St. Louis, Mo. Filed June 15, 1881. (No specimens.)

Claim.—1. The herein-described mode of preserving wood, which consists in impregnating the wood with a solution of a mineral salt or a soluble antiseptic, then removing the moisture from the entire outer portion of the wood to beneath the surfaces, (lateral and end thereof,) the wood meanwhile being free of any pressure operating to retain the moisture in such outer portion, and then introducing the oil or other moisture-repellent into and throughout such outer portion, substantially as described.



2. Wood impregnated throughout with a mineral salt or soluble antiseptic, and its entire outer portion, including its lateral as well as end surfaces, and to beneath such surfaces to a depth varying from about an eighth or tenth of an inch inward to, but not into, the central portion of the wood, with oil or other moisture-repellent.

254,275. ADJUSTABLE SOCKET-WRENCH. FELIX CHANTRELL, Bridgeport, Conn. Filed July 26, 1881. (No model.)

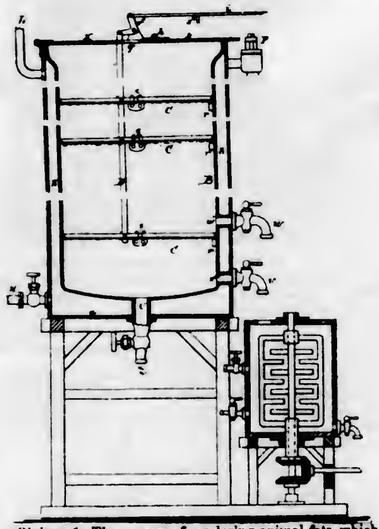
Claim.—The three-armed T-wrench A, divided on a plane passing through its three arms and their end sockets, and having its sections held together by the socket-bands B B on the short arms and intermediate rivet through the long arm and near the end of long arm by reversely-threaded screws on wheel F, and correspondingly-threaded sockets in the opposite sections of long arm, as shown and described.

254,276. DEVICE FOR INCLOSING AND PROTECTING STACKS. SAMUEL N. CLEVENGER, Rayville, Mo. Filed Dec. 24, 1881. (No model.)

Claim.—The stack or rick barrier consisting of a series of double trapezoidal sections, A, each composed of two trapezoidal frames hinged one above the other, said sections being connected side by side, forming an inclosing barrier, substantially as specified.

254,277. SPRING-BED. CLINTON S. COLGROVE, Winchester, Tenn. Filed Nov. 16, 1881. (No model.)

Claim.—In a bed-spring, the combination, with the end bars, A, the side bars, B, the intermediate bars, C, provided with notches a, the slats F, the spring G, secured to the upper surface of the said slats, and the springs H at their ends, of the arm D, hinged to the said intermediate bars and provided with the pawls E, the slats F, the springs G', secured to the upper surface of the slats, and the springs H' at their ends, substantially as and for the purpose set forth.



254,278. BARBED FENCE. JOSEPH H. CONNELLY, Pittsburg Pa. Filed Nov. 25, 1881. (No model.)

Claim.—As a new article of manufacture, a metallic fence-rail consisting of a twisted metallic ribbon having beveled or knife edges, substantially as and for the purposes described.

254,279. METHOD OF AND APPARATUS FOR RENDERING AND BLEACHING ANIMAL-FATS. GARRET COSINE, New York, N. Y. Filed Jan. 14, 1882. (No model.)

Brief—The fat is delivered from a hashing-machine, whence it falls in a stream through the heated air of the tank, being arrested momentarily by the diaphragms, which further subdivide it.

Claim.—1. The process of rendering animal-fats, which consists in causing the previously-comminuted particles thereof to pass through a heated atmosphere, the rendering being effected by the contact of the atmosphere acting upon the same in a finely-divided state, substantially as and for the purpose herein specified.

2. The process of rendering animal-fats, which consists in causing the previously-comminuted particles thereof to descend into a chamber or vessel containing a heated atmosphere to fall through one or more woven or perforated diaphragms therein and the melted fat to immediately flow therefrom, substantially as and for the purpose herein specified.

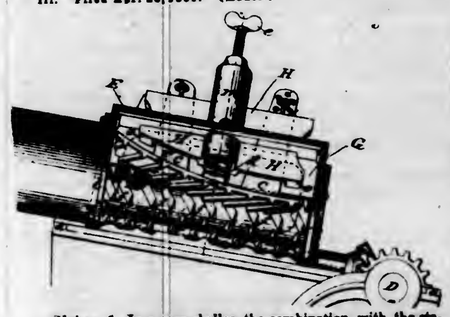
3. The process of rendering and bleaching animal-fats, which consists in causing the previously-comminuted particles thereof to fall into a vessel or chamber, in a separated state, through a heated and continually-renewed atmosphere therein, and the melted fat to immediately flow therefrom and into a bleaching-agitator, substantially as and for the purpose herein specified.

4. An apparatus for rendering animal-fats in a finely-divided and separated state by simple contact with a heated atmosphere therein, consisting essentially of a vessel, B, surrounded by a jacketed space for applying heat thereto, with one or more inlets for the fats at the top, one or more outlets for the melted fat near the bottom, and air inlets and outlets for renewing the heated atmosphere therein respectively at the bottom and top, substantially as and for the purpose herein specified.

5. In an apparatus for rendering animal-fats in a finely-divided state by simple contact with a heated atmosphere therein, two outlets, c c, for the fat, and inlets for the air, arranged one above the other, substantially as and for the purpose herein specified.

254,280. MANUFACTURE OF MATERIAL TO FORM ARTIFICIAL IVORY. FREDERICK W. COTTERELL, London, County of Middlesex, England. Filed Dec. 29, 1881. (No specimens.) Patented in England Aug. 4, 1881.

Claim.—1. In the manufacture of a material to form artificial ivory and for other uses, as above specified, the process of rendering fiber soluble in alcohol, (with or without addition of hydrocarbon,) which consists in immersing such fiber in a saturated solution of nitrous acid in sulphuric acid, substantially as described.



2. In the manufacture of a material to form artificial ivory and for other uses, as above specified, the process of rendering fiber soluble in alcohol, (with or without hydrocarbon,) which consists in immersing such fiber in a saturated solution of nitrous acid in sulphuric acid for a very short period, such as above specified, and then slightly pressing the fiber and allowing it to stand for from twenty minutes to an hour to complete its conversion, substantially as described.

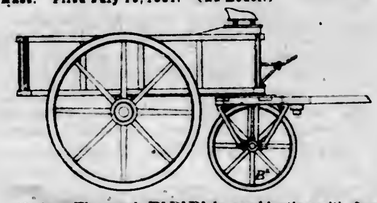
3. In the manufacture of a material to form artificial ivory and for other uses, as above specified, the process of treating fiber that has been rendered soluble in alcohol, (with or without addition of hydrocarbon,) which consists in washing such fiber with water and then treating it with a saline solution to neutralize any remaining acid and to render the treated fiber non-explosive, substantially as described.

4. In the manufacture of a material to form artificial ivory and for other uses, as above specified, the process of treating fiber that has been rendered soluble in alcohol, (with or without addition of hydrocarbon,) which consists in washing such fiber, then treating the same with saline solution to neutralize any remaining acid and to render it non-explosive, and afterward adding to such fiber strong solutions of alum, and of carbonate of soda and of silicate of soda, all substantially as described.

5. In the manufacture of a material to form artificial ivory and for other uses, as above specified, the process of treating fiber that has been rendered soluble in alcohol, (with or without addition of hydrocarbons,) which consists in washing such fiber, then treating the same with a saline solution, then adding strong solutions of alum, carbonate of soda, and of silicate of soda, and afterward drying the material and dissolving it in alcohol, either alone or combined with hydrocarbons, substantially as described.

254,281. CORN-SHELLER. CYPRIAN U. CHANDALL, Sterling, Ill. Filed Apr. 28, 1881. (Model.)

Claim.—1. In a corn-sheller, the combination, with the stationary but yielding rag-iron or follower, of the rotary cylinders provided with the knives or projections *f* and *g*, respectively, the knives or projections in any one longitudinal row being all arranged at substantially the same angle, which is different from, though in the same general direction with, the angle of the knives or projections in the rows at each side of it, substantially as and for the purpose set forth.



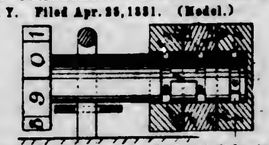
2. In a corn-sheller, the casing composed of the frame A, having one side higher than the other, and the jacket E, provided with the feed and discharge openings, in combination with the bladed or toothed cylinders mounted in said jacket and inclined, as described, from the feed to the discharge opening, for the purpose set forth.

3. The combination, with the cylinders and the rag-iron arranged opposite said cylinders, of the spring *d*, bearing upon the center of said rag-bar, and the tube *m*, in which said spring is supported, substantially as described.

4. The combination, with the oscillating spring-pressed rag-iron, provided with the lugs *c c*, and the jacket having slots for the passage of said lugs, of the plate H, projecting from the top of the jacket and provided with stops for said lugs, substantially as described.

5. The jacket having the partition-plate or stop G, and the tube-plate H, in combination with the spring-pressed rag-iron, having the lugs *c c* projecting between said plates and through slots in the top of the jacket, substantially as described.

254,282. DUMPING-CART. JAS. H. CRITTENDEN, Fall River, Mass. Filed July 15, 1881. (No model.)



Claim.—The perch D^1 D^2 D^3, in combination with frame F^6 and king-bolt G^2, all constructed, combined, and operating as set forth, for the purpose specified.

254,283. FRICTION-CLUTCH. LESTER D. DANA, Waupaca, Wis. Filed Aug. 15, 1881. (No model.)

Claim.—The combination, substantially as hereinbefore set forth, with the driven shaft, of the fixed disk, the two segments having an inwardly-projecting toe at one end, the double cam having toes adapted to catch the toes of the segments, and the loose disk engaging the double cam, for the purpose described.

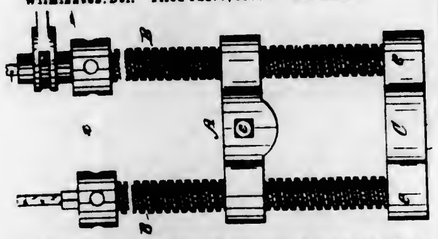
254,284. PERMUTATION-PADLOCK. JAMES E. DEAN, Fishkill, N. Y. Filed Apr. 28, 1881. (Model.)

Claim.—1. In a permutation-lock, a bolt having a polygonal head with numbered faces, and annular as well as longitudinal grooves on its end, in combination with a locking device formed of connected independently-rotating numbered sections provided with studs corresponding with the grooves of the bolt, as set forth.

2. In the locking device of a permutation-lock, the combination of several ring-sections, C, the central one having on each face a rigidly-secured ring, D, with projecting rim, and the others being provided with undercut grooves, as shown and described, whereby said sections are held together so that they can rotate independently of each other.

254,285. LABELING PLUG-TOBACCO. DAVID W. DE FORREST, Brooklyn, assignor to Donaldson Brothers, New York, N. Y. Filed Dec. 13, 1881. (No model.)

Claim.—1. A plug of tobacco having a flat label riveted thereto by a rivet formed of and integral with the body of the plug, substantially as shown and described.

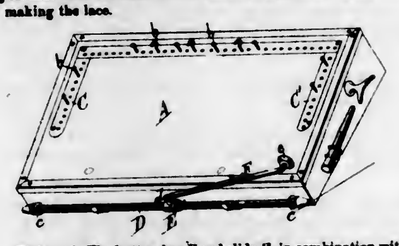


2. The method of attaching labels to plug-tobacco, which consists in forming a projection on the surface of a plug of tobacco, then placing a flat perforated label of less thickness than the height of the projection over said projection, and then subjecting the plug to pressure, so that the label will be riveted to the plug, and so that the outer surface of label, rivet, and plug will all be in the same plane, substantially as shown and described.

254,286. HOLLOW AUGER. FREDERICK S. DELLENBAUGH, New York, N. Y. Filed Apr. 21, 1881. (No model.)

Claim.—The combination of the tubular bit, the serrations C, the shoulder *a*, the brace H, having the angular curves, the socket G of the brace, having an opening through it, and means for securing the bit to the brace, substantially as described.

254,287. APPARATUS FOR DRAWING AND REPLACING BOILER-TUBES. LUCIUS M. DEBNEY and ALBERT C. JOHNSON, Wilmington, Del. Filed Jan. 6, 1882. (No model.)



Claim.—1. The tube extractor and replacer consisting of apertured yoke A, screws B, and set-screw *c*, substantially as shown, combined for operation as specified.

2. In tube-extractors, the block C, having aperture *d*, combined with yoke A, provided with set-screw *c* and screws B, substantially as and for the purposes set forth.

3. The starting-plug D, having shoulder *f*, in combination with the yoke A, screws B, and means for connecting yoke and plug, substantially as and for the purposes set forth.

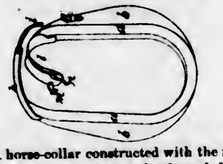
254,288. DESK FOR MAKING MACRAMÉ LACE. CHAUNCEY W. DIMMICK, Milford, Pa., assignor to Thomas Barbour, Paterson, N. J. Filed June 6, 1880. (No model.)

Brief.—The desk is provided with perforated metallic plates to receive the pins or hooks for holding the threads of which the lace is made. A cleat and pin is attached to the end of the desk, around which the loose ends of the "leaders" are wrapped. A button-bar provided with a button is arranged to slide on another bar placed lengthwise of and in front of the desk, which button-bar and button are designed to hold the free ends of the fringe-forming threads when the same are not immediately wanted in the work of making the lace.

Claim.—1. The button-bar F and slide E, in combination with the lace-board A and bar D, substantially as set forth.

2. The combination, with the board A and bar D, secured thereto by eyebolts *c*, of the slide E and pivoted button-bar F, as and for the purpose set forth.

254,289. BALE AND BOX HOOK. HENRY A. DIRKS, New York, N. Y. Filed Aug. 31, 1881. (No model.)



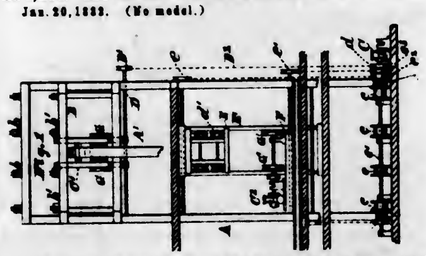
Claim.—1. A box or bale hook having its grasping end terminated with a broad or blunt abutting tip or head provided with one or more sharp teeth protruding from said head, and of limited length, adapted to enter the covering of the bale without reaching its contents, while the blunt surface of the abutting head bears upon the exterior thereof around the roots of the teeth, substantially as and for the purpose herein shown and described.

2. A box or bale hook formed of wrought or cast metal, with its hooked portion formed with a broad or blunt abutting tip or head, and with one or more sharp teeth or spurs formed separate from the hook and tightly inserted in the blunt abutting tip with the points protruding therefrom, substantially as and for the purpose set forth.

3. A cast-metal box or bale hook cast with a T-shaped section throughout its stem or body, with an enlarged and blunt abutting head at the tip end of the hook, and one or more isolated sharp teeth protruding therefrom, substantially as herein shown and described.

4. A box or bale hook formed with a broad or blunt abutting head at the tip of the hook, and with one or more pointed screws screwed into said head with the point protruding from the blunt abutting tip, substantially as and for the purpose set forth.

254,290. HORSE-COLLAR. MARSHALL R. DOWLIN, North Adams, Mass. Filed Oct. 25, 1881. (No model.)



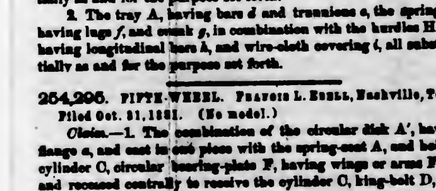
Claim.—1. A horse-collar constructed with the inner layer or leather, *c*, and the two outer layers or leathers, *b b'*, secured together, as shown, by a line of stitches or fastening devices, said outer layers being folded away from the inner layer and back upon themselves, covering the fastening-seam, substantially as shown and described.

2. A horse-collar constructed with the inner leather, *c*, and two outer layers, *b b'*, secured together, as shown, by a line of stitches, said outer layers being folded away from the inner layer and back upon themselves, covering the fastening-seam, and the free ends secured to the rim *a* by the line of stitches *f*, which form said rim, as specified.

3. In an open-top horse-collar, the strap *l*, permanently secured to the under side of one limb of the collar, and provided with straps to secure it to the under side of the opposite limb, in combination with the broad cap-band A, permanently secured to the upper part of the limb opposite to that to which the strap *l* is permanently fastened, and provided with a strap to secure it to the upper part of the latter limb, both the fastening devices of the cap-band being arranged in the hame-recess of the collar, substantially as described, and for the purpose specified

254,291. ELEVATOR. ROBERT DUNBAR, Buffalo, N. Y. Filed Jan. 20, 1883. (No model.)

Claim.—1. In an elevator, an engine, C, and shaft *c'*, provided with winding-drums *c*, in combination with the cables B', pulleys *b*, and tightening-pulleys *d'*, and their connections, for the purpose of giving the vertical adjustment to the elevator, as described.



2. An elevator provided with a frame, A, and a vertically-adjustable supporting-frame, B, and connections, substantially as specified, in combination with a horizontally-adjustable frame, C', for supporting the elevator and its operating parts, substantially as and for the purposes specified.

3. In an elevator, a supporting-frame, B, provided with a horizontally-adjustable frame, C', for holding the elevator, in combination with the pulleys D' *d'*, engine C, and cable D², for giving the horizontal adjustment to the elevator, substantially as and for the purposes specified.

4. In an elevator, a frame, A, vertically-adjustable frame B

and its operating parts, substantially as specified, in combination with the frames E E', tightening-pulleys *d'*, and engine C', provided with driving-pulleys for connecting by cables with the pulleys G, substantially as and for the purposes set forth.

254,292. BARB-HOLDING DEVICE. THOMAS W. HATCH, Chicago, Ill. Filed Dec. 18, 1881. (No model.)

Claim.—The combination, with the cutting-machine for cutting the barb-strips and the portable trays whereon the same are compactly stowed, of the stationary guides D, receiving the strips as they are severed and delivering them to the trays, substantially as set forth.

254,293. TRACE-FASTENING FOR SINGLE-TREES. LUCIUS S. EDELBLUTH, Cincinnati, Ohio, assignor of two-thirds to Rufus P. White and Horace W. Smith, both of same place. Filed Jan. 28, 1881. (No model.)

Claim.—1. In a trace and yoke fastening device, the bolt *d'*, attached to one side of the shank *m*, said shank having the piston G riveted to its opposite side, and being provided with plate *n* and thumb-piece *d*, in combination with the casing B, single-tree A, and spring F, substantially as and for the purposes specified.

2. The combination of the single-tree A, casing B, and fastening device D, constructed substantially as described, and provided with cup or piston G, spring F, and bushing H, substantially as described.

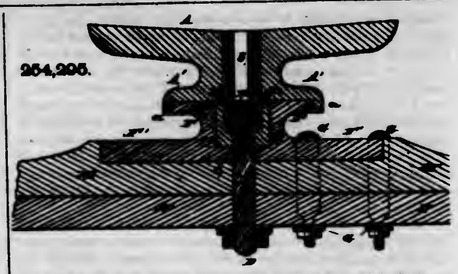
3. In a trace-fastening device, the shank *m*, provided with thumb-piece *d* and bolt *d'* and projection *d''* and piston G, in combination with the single-tree A, casing B, and bushing H, substantially as and for the purposes specified.

4. In a trace and yoke fastening device, the combination of a suitable bolt and devices for retracting the same, and the spring F, bushing H, single-tree A, and casing B, substantially as described.

5. A sliding spring-bolt consisting of the shank *m*, provided with plate *n* and thumb-piece *d* and the bolt *d'* and piston G, said bolt being actuated by a suitable spring, substantially as described.

254,294. CHEESE-TURNER. ANDREAS ENDI, New Glarus, Wis. Filed Sept. 29, 1881. (No model.)

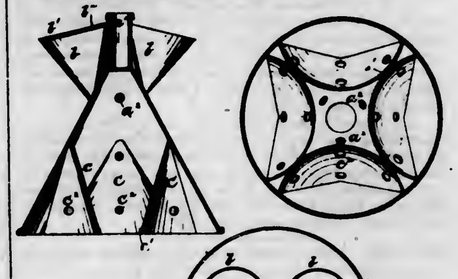
Claim.—1. In combination with the tray A, having block B, the hurdles H H', pivotal bars *d*, springs *e*, and lugs *f*, all substantially as and for the purpose set forth.



2. The tray A, having bars *d* and trunnions *e*, the springs *e*, having lugs *f*, and cleats *g*, in combination with the hurdles H H', having longitudinal bars *h*, and wire-cloth covering *i*, all substantially as and for the purpose set forth.

254,295. FIFTH-WHEEL. FRANCIS L. EUBEL, Nashville, Tenn. Filed Oct. 31, 1881. (No model.)

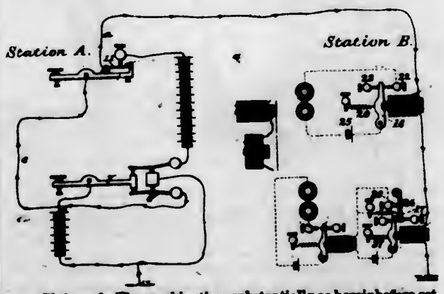
Claim.—1. The combination of the circular disk A', having flange *a*, and cast in one piece with the spring-seat A, and hollow cylinder C, circular bearing-plate F, having wings or arms F' F', and recessed centrally to receive the cylinder C, king-bolt D, and washer E, substantially as and for the purpose herein shown and described.



2. The combined fifth-wheel and spring-seat or head-block,

254,295.

comprising the concaved top A and flanged plate or disk A', having central recess, *b*, provided with apertures *b' b²*, and hollow cylinder C, cast in one piece, substantially as and for the purpose herein shown and specified.



254,296. CLOTHES-POUNDER. LEROY A. FAHLENER, Scandia, Kans. Filed Nov. 16, 1881. (Model.)

Claim.—1. The combination, with the base *a*, having a series of orifices near its upper end, of a series of funnel-shaped water-receptacles secured to the top of the base and opening into the orifices therein, and having their outer ends closed by plates *b'*, having perforations *b²*, substantially as set forth.

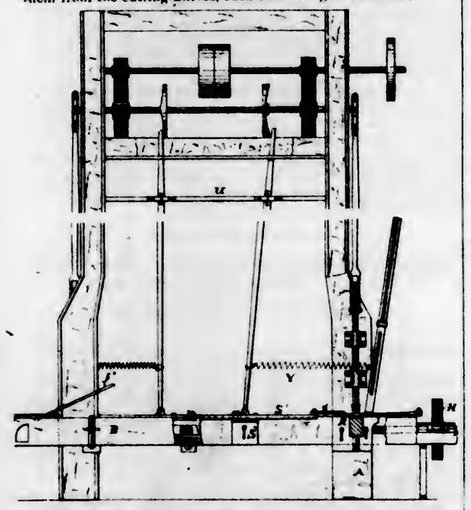
2. The combination, with the conical base *a*, of a series of semi-conical plates, *c*, having a vertical length about half the height of the base, the said plates being placed within and arranged with their rims about flush with the rim of the base, and having their vertical edges secured to the walls of said base and their sides inclined inward and their rims in contact with each other, whereby they brace one against the other and against the sides of said base, substantially as set forth.

254,297. QUADRUPLEX TELEGRAPH. STEPHEN D. FIELD, New York, N. Y. Filed Oct. 20, 1881. (No model.)

Claim.—1. The combination, substantially as herein before set forth, of a key provided with one circuit-spring playing between a resting and a working contact, a key provided with two independent circuit-springs, each playing between a resting and a working

contact, a main battery in two sections of like polarity, the first of which has greater electro-motive force than the second, a main line connected to the circuit-spring of the first key, a branch which unites the resting-contact of the first key with the first circuit-spring of the second key, a branch which unites the working-contact of the first key with the second circuit-spring of the second key and includes the greater section of the battery, an earth-branch connected to both the first resting-contact and to the second working-contact of the second key, and including the lesser section of the main battery, and a branch extending from the first working-contact and the second resting-contact of the second key to the earth.

2. The combination, substantially as hereinbefore set forth, of an electro-magnet, its armature and armature-lever, a yielding contact-lever, an equalising-bar having its extremities attached respectively to said armature and contact levers, and an adjustable retractor attached to and acting upon said equalizing-bar.



3. The combination, substantially as hereinbefore set forth, of two pivoted levers, an equalising-bar having its ends respectively connected with said levers, an electro-magnet for actuating said levers, a retractor attached to said equalising-bar, and a device for regulating the normal tension of said retractor.

4. The combination, substantially as hereinbefore set forth, of two pivoted levers, an equalising-bar having its respective ends mechanically connected with said levers, an electro-magnet for actuating said levers, a retractor attached to said equalising-bar, a device for regulating the tension of said retractor, and means, substantially as described, for varying the point of attachment of the retractor upon the equalising-bar.

5. The combination, substantially as hereinbefore set forth, of a main line, a main battery, devices, substantially such as described, for varying the strength of the current of said battery upon the line, and two independent electro-magnets in the main line at the receiving-station, one of said electro-magnets having cores of a sectional area twice or more times as great as the other, in proportion to the number of convolutions in its coils.

254,298. BUNG CUTTING AND COMPRESSING MACHINE. JACOB FRIESMANN, Cincinnati, Ohio, assignor of one-half to Henry Varwig, same place. Filed May 12, 1881. (No model.)

Brief.—The bungs are cut by stationary tubular cutters, against which the blanks are fed through a covered trough by a screw-follower. They are compressed by reciprocating plungers, to which they are automatically fed from the tube which receives them from the cutting-knives, such tube being removable.

Claim.—1. The combination, substantially as before set forth, of the elongated covered feed-box adapted to receive a number of blanks at a time, the stationary hollow cutter secured at the end thereof, the elongated plunger or follower, and a screw to feed the follower through the box for the purpose of forcing the square blanks through the hollow cutter.

2. The combination of two elongated covered feed-boxes arranged upon each side of a plunger-driving mechanism and adapted to receive a number of blanks at a time, the stationary hollow cutters fixed at the opposite ends of said feed-boxes, with the elongated follower *D*, and a screw to alternately drive said follower from one of the boxes into the other, substantially as specified.

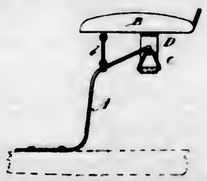
3. In a bung-machine of the character described, the combination of two feed-boxes, B, the plunger-driving mechanism mounted in frame C centrally between the said boxes, with the plunger D, and cross-pieces *d*, secured to the plunger near each end thereof, and the shippers K, having projections in position to be acted upon by the cross-pieces *d*, to automatically stop the mechanism when the plunger has reached the limit of its stroke, substantially as specified.

4. The combination, substantially as hereinbefore set forth, of feed-box B, hollow cutter E, secured at the end thereof, with the screw-follower D, nut G, and driving-wheel H, keyed upon said nut, for the purpose set forth.

5. In a machine for cutting bungs, the combination, substantially as specified, of box B, follower D, changeable hollow cutter E, and the adjustable guide-strips F, to adapt the machine to feed and cut different sizes of bungs.

6. The combination, substantially as before set forth, of the elongated open-top feed-box adapted to receive a number of blanks at a time, the elongated plunger, and suitable mechanism to feed the same back and forth through said box, and the hollow cutter arranged at one end of said box, with the hinged bar *f'*, adapted to be elevated for the purpose of supplying the box with blanks and to be secured upon said blanks to prevent them from being forced up by the plunger as said blanks are fed to the hollow cutter.

7. The combination, substantially as specified, in a bung-machine, of the reciprocating hollow plunger M, fixed rod n, compressing-die M, and fixed die Q, having the annular groove *q*, with feeding mechanism consisting of a sliding frame, *s*, pusher *s'*, actuated by cams T and levers V, and the spring-fingers W, to hold the blanks until acted upon by the compressing-die.

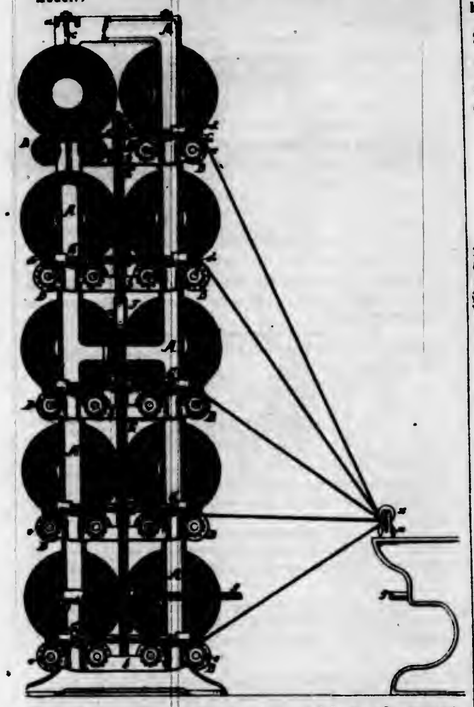


254,299. HAME-CLIP. FRED FRAZER, Syracuse, N. Y. Filed Jan. 24, 1882. (No model.)

Claim.—1. A hame-clip provided with two legs or members perforated at their inner ends to receive the bolt or rivet which fastens the clip to the hame, and connected at their outer ends by a bar which is extended and formed with an eye for the breast-strap ring, the said bar carrying a lug on its under side which is adapted to engage with a slot or aperture in the metallic binding of the hame, substantially as and for the purpose set forth.

2. The combination of a wooden hame having a metal binding, slotted as described, with a clip having two legs which straddle the hame, and secured thereto by a bolt or rivet, said clip having a bar, A, which is extended and formed into an eye for the breast-strap ring, and provided on its under side with a lug to engage with the slot in the metal binding, and a suitable tug-staple, all substantially as and for the purpose set forth.

254,300. MOWING-MACHINE SEAT. JAMES FULTON, Great Bend, N. Y., assignor to Haskel B. Fulton, same place. Filed July 22, 1881. (No model.)

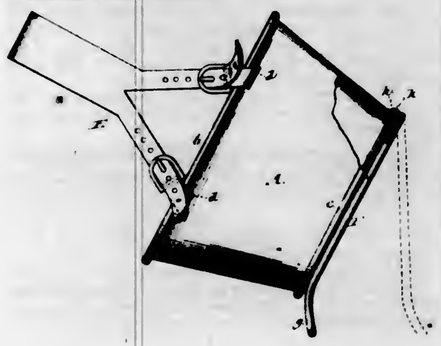


Claim.—1. The combination, with the standard A and seat B, of the support D and links *c*, substantially as and for the purpose set forth.

2. The combination, with the standard A, provided with the bifurcations *a* and the seat B, of the support D, provided with the lateral arms *d*, and the links *c*, substantially as and for the purpose set forth.

3. The combination, with the standard A, provided with bifurcations *a* and the seat B, of the support D, provided with the arms *d*, the links *c*, and the linked tie *b*, substantially as and for the purpose set forth.

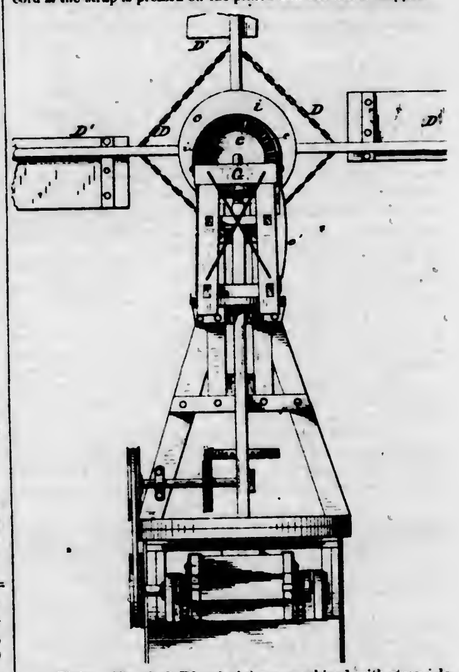
254,301. CREEL-FRAME FOR CARDING-MACHINES. HERMILL A. PERBUSH, Philadelphia, Pa., assignor to himself and Charles A. Perbush, same place. Filed Nov. 28, 1881. (No model.)



Claim.—1. The combination, in a creel-frame, of a supporting-structure and driving mechanism with two sets of spool-supports, each set comprising a number of pairs of horizontal rolls, arranged one pair above another, and the rolls of one set being in the rear of the rolls of the other set, as specified.

2. The combination, in a creel-frame, of a supporting-structure and driving mechanism with two sets of spool-supports, each set comprising a number of pairs of horizontal rolls, arranged one pair above another, and the rolls of one set being in the rear of the rolls of the other set, and so close thereto that a spool can be rolled directly from one set to the other, as specified.

3. The combination of the supporting-structure, the two sets of spool-supporting rolls B D, with worm-wheels *c*, the endless chain E, the shafts G, with wheels F and worms *d*, and the driving-shaft *g*, with wheel K, as set forth.



254,302. MUZZLE. NELSON GALLIVAN, Rapid City, Dak. Filed Jan. 7, 1882. (Model.)

Claim.—The muzzle herein described, consisting of the nose-band A, formed of metal, and having the wired ends *b c*, the straps E, attached thereto at the larger end, and the falling nose-cover F, hinged to the upper edge of the smaller end of the nose-band, and having its lower end turned outward, substantially as specified.

254,303. WIND-ENGINE. PETER GUNDO, Burton, Kans. Filed Dec. 8, 1881. (No model.)

Brief.—The pinion *e* on the wheel-shaft has a strap placed above it, secured to a lever, G, so that by drawing on the lever with cord *m* the strap is pressed on the pinion and the wheel stopped.

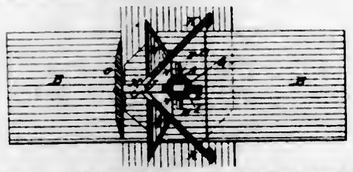
Claim.—The shaft D^1 and pinion *e*, combined with strap *i*, lever G, spring *e'*, and an operating-cord, *m*, as and for the purposes specified.

254,304. FENCE-POST. MIRON T. GLEASON, Brodhead, Wis., assignor of one-half to Eugene F. Warren. Filed Dec. 31, 1881. (No model.)

Claim.—1. The fence-post consisting of the bars A A, having the reversed-curved portions *a a* and substantially straight lower portions, *b*, and united by a clamp at their upper ends and joined together at the points of intersection, substantially as described.

2. The herein-described fence-post, consisting of the bars A A, having the reversed-curved portions *a a* and substantially straight lower portions, *b*, and united by a clamp at their upper ends and joined together at their points of intersection, and having the base-bar, to which the bars A A are connected, substantially as described.

254,305. IMITATION DIAMOND. JULES A. GROSSIORD, Jeuss, Paris, France, assignor to Edward E. Kipling, New York, N. Y. Filed Oct. 28, 1881. (No specimens.) Patented in France Nov. 20, 1880.



Claim.—1. In the manufacture of imitation diamonds, or in the preparation of artificial stones, natural stones, or other like ob-

jects wherein the brilliancy of the object is increased by means of a reflecting-coating at the back, the improvement consisting in depositing a coherent layer of metal over said reflecting-coating, so as to form a protection thereto, substantially as described.

2. An imitation diamond or other like object having a reflective coating applied at the back and a protecting layer of metal deposited over said coating, substantially as described.

3. The combination, with the reflective coating and its protective varnish, of the exterior protective layer of copper or other metal deposited thereon and plated, substantially as described.

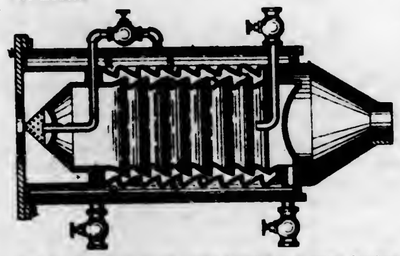
254,306. FRUIT-DRYING SCAFFOLD. WILLIAM S. HALBY Columbia, Tenn. Filed July 28, 1881. (No model.)

Claim.—1. The combination, with a roof, K, of a post having the intersecting slots F G, the pin H, and the ridge-pole having apertured lug I, as and for the purpose specified.

2. In a fruit-drier, the combination of the post having slot G, the ridge-pole having slot I, rounded on its lower end, and the block R, concave at its upper end, for the purpose set forth.

3. In a fruit-drying scaffold, the combination, with the post A, provided with slots F G, and the hinged roof J K, of the separate bearing-blocks R, substantially as herein shown and described, whereby the roof can be adjusted at a higher elevation, as set forth.

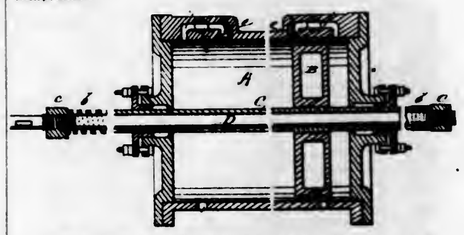
4. In a fruit-drying scaffold, the combination, with the post A, of the detachable roof K, ridge-pole J, arm N, and cap O, substantially as shown and described.



5. In a fruit-drying scaffold, the combination, with the roof K and ridge-pole J, hinged at one end, of the hinging-post, the hinged end M' M, and rope P', substantially as shown and described, whereby the roof can be tilted or raised into an upright position.

254,307. SEDIMENT-COLLECTOR FOR BOILERS. DAVID HANNA, Ogdensburg, N. Y. Filed Oct. 31, 1881. (No model.)

Claim.—The combination of the boiler A, feed-water rose or spraying nozzle B, discharging into the steam-space of the boiler, imperforate funnel C, placed underneath the spraying-nozzle, and blow-off pipe C', having valve or cock *b*, the whole constructed and arranged as and for the purpose herein shown and specified.



254,308. WHEAT STEAMER AND HEATER. CYRUS T. HANNA, Pittsburg, Pa. Filed Aug. 11, 1880. Renewed July 25, 1881. (No model.)

Claim.—The improved grain-heating apparatus having its inner cylinders constructed with circumferential corrugations *b*, which are formed integrally with them and arranged as shown, thus alternating in position, as and for the purpose described.

254,309. STEAM CYLINDER AND PISTON. WM. HANNA, Gilroy, Cal. Filed Oct. 17, 1881. (No model.)

Brief.—To prevent concussion in the operation of the piston when steam is admitted to the cylinder springs are applied to the rod, which relieve it of the full force of steam until the springs are compressed.

Claim.—The combination, with cylinder A and piston-rod D, of tube C, piston B, nuts *c*, and springs *b*, substantially as and for the purposes set forth.

254,310. FURNITURE-SOCKET. CHARLES HARING, Watkins, N. Y. Filed Jan. 6, 1880.

Claim.—The combination of the concaved body *a b*, having the annular bottom shoulder, I, and the elastic disk *c*, held by said shoulder, to form a socket for the rolling-casters that support furniture.

254,311. BUCKLE ATTACHMENT FOR STRAPS. LA FAYETTE HARVEY, Wyoming, Iowa. Filed Dec. 31, 1881. (Model.)

Claim.—A holed strap, tongued buckle, and two rivets combined, with a clip doubled to form two parallel parts apertured at the fold to allow the buckle-tongue to pass through, and having the strap end arranged between and riveted to both of said parts, as shown and described.

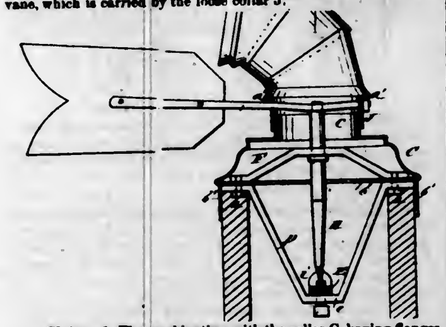
254,312. PRODUCTION OF VITRIFIED COVERINGS ON EARTHENWARE, GLASS, &c. CHARLES W. HEATON, Lodsness Heath, County of Kent, and THOMAS ROLAS, Chiswick, County of Middlesex, England, assignors to Ihlee & Horne, London, England. Filed Dec. 23, 1881. (No specimens.) Patented in England Oct. 31, 1881.

Claim.—1. In the manufacture of enamel or vitrified covering for earthenware or other substances, the combination therewith of phosphorescent powder of the kind above referred to, so as to make said enamel available for the purposes of practical illumination for several hours after exposure to light, substantially as described.

2. The process of manufacturing or producing luminous enamel or vitrified covering on earthenware and other substances, which consists in combining with the other ingredients constituting said enamels, as above set forth, phosphorescent powder having the property of remaining luminous for several hours after exposure to light, and afterward subjecting the mixture to heat of such intensity as to melt, or partially melt, the said mixture, substantially as described.

3. As a new article of manufacture, enamel rendered luminous by addition of phosphorescent powder of the kind above specified, substantially as described.

254,313. FISH-HOOK. WM. E. HEMMING, Redditch, County of Worcester, England, assignor to Charles F. Imbrie, New York, N. Y. Filed Aug. 5, 1881. (No model.) Patented in England Feb. 26, 1881.



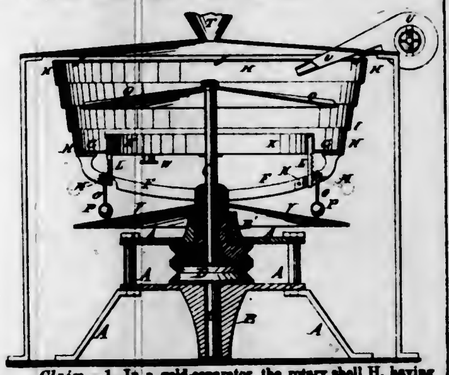
Claim.—1. As an improved article of manufacture, a fish-hook made substantially as herein shown and described, with a baiting-needle, B, attached to the rear portion of its shank, as set forth.

2. The combination, with the hooks A, of the spring baiting-needle B and clasp *b'*, substantially as specified.

3. The combination, with the hooks A and baiting-needle B, of the trolling-spoon C, provided with hooks or staples *d*, whereby said trolling-spoon may be removably attached to and locked next the barbed hooks, substantially as herein shown and described.

254,314. COWL. CHARLES S. HUMPSTEAD, Hagerstown, Pa., assignor to himself and Isaac P. Kendall, same place. Filed Oct. 26, 1881. (Model.)

Brief.—A bar, B, fastened in the chimney by the screws *f* and plates *h*, is supported by a bar, D, crossing it at right angles, both being secured together by a socketed screw, *d*, whose upper end forms a bearing for the spindle H. The bar F, which serves to guide the spindle, and the bar D are both secured to the wall of the chimney at each end by the screws *a*. A metal cap whose flanges embrace the sides of the chimney has a rigid collar at its upper end, around which a loose collar, J, rotates independently of the cowl, with which it forms a connection by means of the joint *a'*, thereby permitting of the adjustment of the cowl relatively to the vane, which is carried by the loose collar J.



Claim.—1. The combination, with the collar C, having flanges *b b'* to hold it to the top of chimney, of the bars D F, provided with end flanges secured by bolts *a* to opposite sides of the flanges *b*, as shown and described.

2. The cross-piece E and the bar D, secured together by the socketed screw *d*, in combination with the spindle H, cross-bar F, and the vane-arm, substantially as and for the purposes set forth.

3. In combination with the cross-bar D, carrying the cross-piece E, provided with the set-screws *f f*, the plates *h h*, substantially as and for the purposes set forth.

254,315. GOLD-SEPARATOR. HORACE E. HENWOOD, Kansas City, Mo. Filed Nov. 10, 1881. (No model.)

Claim.—1. In a gold-separator, the rotary shell H, having offsets I, substantially as herein shown and described, whereby the support of the mercury upon the inner surface of the shell will be facilitated, as set forth.

2. In a gold-separator, the combination, with the base-flange G of the shell H, of the movable rim K and means, substantially as herein shown and described, for raising and lowering the same, whereby the height of the said rim will be graduated to the amount of mercury upon the flange G, as set forth.

3. In a gold-separator, the combination, with the base-flange G of the shell H, of the rim K, the toothed bars L, and the gear-wheels M, having weighted arms O P, substantially as herein shown and described, whereby the said rim is lowered automatically as the mercury passes up the inner surface of the said shell to allow the sand to escape freely, as set forth.

4. In a gold-separator, the combination, with the frame A, the shaft C, provided with the pulley D and carrying the distributer Q on its upper end, of the spider F, carrying the shell H, and the pulley E, having an upwardly-projecting hub, which is attached to the hub of the said spider, substantially as and for the purpose set forth.

5. In a gold-separator, the combination, with the shell H, having offsets *i*, of the fan-blower U, having its discharge-spout projecting into the said shell in a downwardly-inclined direction, substantially as and for the purpose set forth.

6. In a gold-separator, the combination, with the rotary shell H and the rim K, of the rotary discharge-plate V, below the said shell, substantially as herein shown and described, whereby the sand escaping from the said shell over the said rim will be discharged from the machine, as set forth.

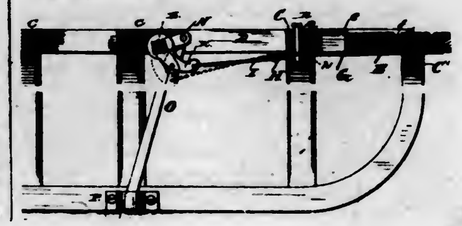
7. In a gold-separator, the distributing-plate Q, made conical in form and provided with radial corrugations or channels on its convex surface, substantially as herein shown and described, whereby a more even distribution of the sand from the said plate is obtained, as set forth.

254,316. CORSET. JULIUS HILDERS, New York, N. Y., assignor to Moritz Cohn, same place. Filed Apr. 26, 1880. (Model.)

Claim.—1. The combination, in a corset having a side section stiffened at each edge from top to bottom of the corset, of front and rear hip gores or sections, substantially as described.

2. The combination, in a corset, of a stiffened side section and stiffened hip-gores at the front and rear of the side section, substantially as described.

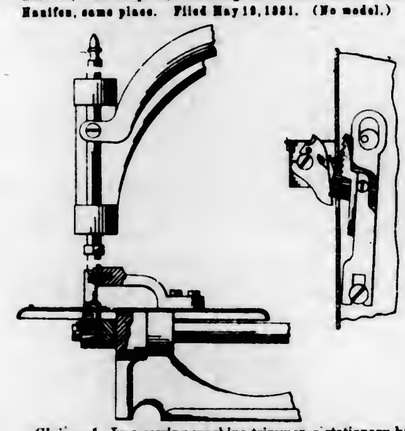
3. In a corset, the combination, with front and rear hip-gores having stiffeners *h h*, of vertical stiffeners or bones above the hip-gores and curved or inclined stiffeners interposed between the vertical stiffeners and the hip-gores, substantially as described.



4. In a corset, the combination of the stiffened breast-section, the stiffened front hip-gore, and the stiffened complex side and front section interposed between the breast-section and the front hip-gore, each of said sections and said front hip-gore having separate and independent groups of bones, substantially as described.

254,317. INSECTICIDE FOR POULTRY, NESTS, &c. ERWIN D. HILL, Marietta, Ohio. Filed Aug. 25, 1881. (No specimens.

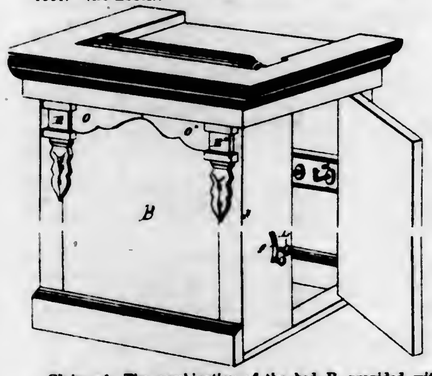
Brief.—The composition before hardening may be molded into the form of a nest-egg, or may be attached to roosts. When hard it may be broken into lumps or ground fine for distribution as a powder.



Claim.—A poisonous compound composed of plaster-of-paris, corrosive sublimate, lard-oil, and white precipitate, or the equivalents of the latter two ingredients—viz., red precipitate and linseed-oil—mixed in the manner and for the purposes set forth.

254,318. SLED-BRAKE. MICHAEL HOFFMAN, Loretto, Pa. Filed Apr. 1, 1881. (Model.)

Claim.—In a sled-brake, the combination, with the automatically-operating or self-setting brake mechanism, composed of the oblique brakes O O, rock-shaft L, having arms N N and K K, connecting-links I I, T-shaped cross-head G H, and sliding tongue E *e*, constructed and arranged as described, of the movable bolt R, inserted vertically through the front bench, C, of the sled, substantially as and for the purpose herein shown and specified.



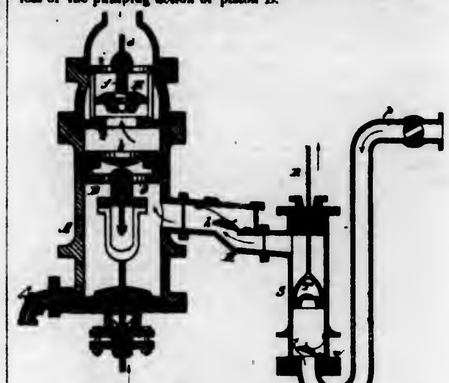
254,319. TRIMMER FOR SEWING-MACHINES. THOMAS J. HOLTON, Philadelphia, Pa., assignor of one-half to John E. Hanifen, same place. Filed May 19, 1881. (No model.)

Claim.—1. In a sewing-machine trimmer, a stationary knife or blade rigidly secured to the cloth-plate, on the upper side of the same, in combination with a knife or blade secured to the feed-bar and operated thereby to effect an upward cut, substantially as described.

2. The combination, with a sewing-machine, of a trimming or cutting attachment composed of a knife or blade secured to the feed-bar and moving therewith, and a bracket sustained on the cloth-plate and carrying a rigid or stationary knife, blade, or cutter-bar, substantially as shown and described.

254,320. COMBINED FOLDING BED AND WARDROBE. JNO. B. HOANN, Chicago, Ill., assignor of two-thirds to Thomas C. Lees and Raglan Cooper, both of same place. Filed Nov. 14, 1881. (No model.)

Claim.—1. The combination of the bed B, provided with grooves *d* and *d'*, with the spindles G and G' and their bearings, substantially as set forth.



2. The combination of the case A, partitions H and H', springs K and K', lovers I and I', platens G and G', and bed B, substantially as shown and described.

3. The hinged leg O, sliding bar P, cross-bar Q, and bed B, substantially as shown and described.

4. The pivoted bed B, case A, and catches E and E', combined substantially as shown and described.

254,321. FEED-PUMP FOR STEAM-BOILERS. JOHN HENRY, Springtown, Pa. Filed Nov. 7, 1881. (No model.)

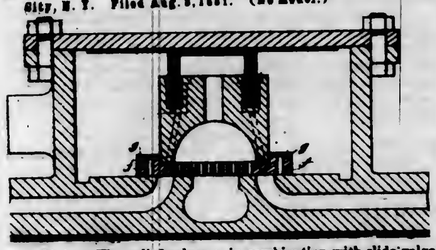
Brief.—The pump and its pipe-connections are provided with check-valves, to allow the hot water to pass into the boiler regardless of the pumping action of piston B.

Claim.—1. In a pump for feeding hot water to steam-boilers, the combination of the cylinder A, piston B, the latter having the relief-valve *b*, the spring check-valve *h* in the supply-pipe, and the outlet-valve in the discharge end of said cylinder, all arranged to operate as shown and described.

2. In a pump for feeding hot water to steam-boilers, the combination, with cylinder A, piston B *h*, and outlet and check valves, of the auxiliary feed-pump consisting of cylinder S, valved piston T, and valve *u*, all as shown and described, to operate, as hereinbefore specified, to produce an artificial pulsation and relieve undue pressure in the cylinder and supply-pipes.

254,322. MEANS FOR RECLAIMING LOW LANDS. GIDEON HOWELL, Philadelphia, Pa. Filed Oct. 4, 1881. (No model.)

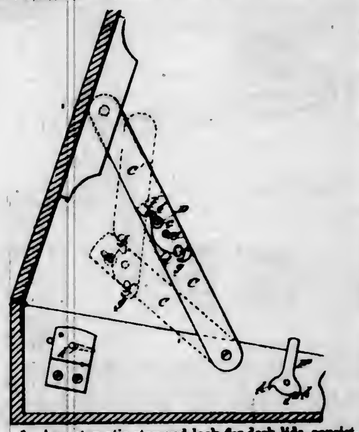
Brief.—An endless conveyer passes over wheels on a vertically-adjustable frame which is anchored in the water and over wheels in a frame secured on land. The mud or sand is dredged from under the water, carried up over the beach, and distributed, the excavated places being resupplied with material by the action of the tide.



Claim.—1. The method herein described for reclaiming low lands lying adjacent to tide-water, consisting in dredging at suitable points along the shore the sand or mud from below high-water mark and beyond the beach, conveying it over the beach to a point above the reach of the tide, and distributing it over the said low lands, the resupply of sand or mud to the excavated places being caused by the action of the tide, substantially as set forth.

2. The combination, with endless apron or conveyer E, of a support, F, carrying a pivoted frame, F', adjustable by means of a screw, M, substantially as shown and described.

3. The combination, with endless conveyer E, of support F, carrying wheels *f*, and anchor H, substantially as shown and described.

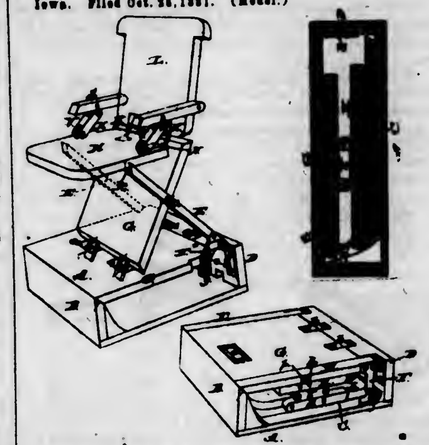


4. The combination, with endless band or conveyer E, of an anchored support, F, carrying a vertically-adjustable frame, F', and pivoted land-support or frame G, substantially as shown and described.

254,323. SLIDE-VALVE. WILLIAM S. HUNTER, Long Island City, N. Y. Filed Aug. 8, 1881. (No model.)

Claim.—The relief-valves *g*, in combination with slide-valve B, provided with apertured flanges *f*, substantially as shown and described.

254,324. AUTOMATIC LOCKING-STAY FOR DESK-LIDS. JOSEPH J. ISLEHART, Columbia, Mo., assignor to himself and Walter W. Barth, same place. Filed Aug. 24, 1881. (No model.)



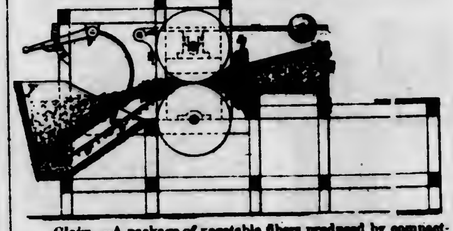
Claim.—1. An automatic stay and lock for desk-lids, consisting of two plates pivoted together at their overlapping ends and provided with a two-fold locking mechanism at the said overlapping ends for locking them together in either an extended position or in a folded position, whereby the lid is adapted to be supported when raised and locked when lowered, substantially as shown and described.

2. An automatic stay and lock for desks, &c., consisting of two plates pivoted together at their overlapping ends, one of the said plates being provided with a locking-pin working in a slot and the other with a locking-socket on each side of the pivot that connects the two plates, substantially as and for the purpose set forth.

3. In an automatic desk stay and lock, the combination, with the stay C, provided with the slot *h*, and the sliding locking-bolt D, of the stay C', provided with the locking-sockets *f f*, and hook *g*, the said plates being pivoted together at their overlapping ends, substantially as and for the purpose set forth.

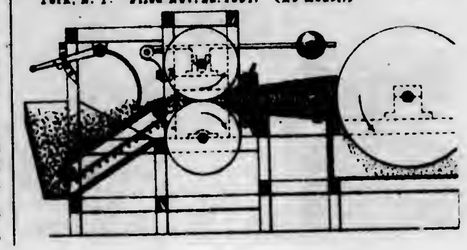
4. The combination, with the desk stay and lock, substantially as herein shown and described, and desk A, of the pivoted stop F, provided with legs A and pin *i*, substantially as shown, whereby the desk-lid may be prevented from locking, as set forth.

254,325. FOLDING OPERA-CHAIR. JOHN JACKSON, Clinton, Iowa. Filed Oct. 26, 1881. (Model.)



Claim.—1. A folding chair having two floor-sections connected therewith, one forming one of the chair-supports and arranged to take position as part of the floor when the chair is folded, and the other forming a portion of the floor when the chair is set up for use, in combination with the floor having a receptacle to receive the chair when folded, substantially as specified.

2. The combination, with the floor or base casing A, of the floor-sections C and G, the cross-legs E, folding seat H, back I, and arms S V, and connecting devices therefor, substantially as specified.



3. In a chair, the combination, with the floor-sections C and G, the cross-legs E, folding seat H, back I, and arms S V, and devices to pivot the chair to the floor-receptacle, whereby the chair may be folded and unfolded, substantially as specified.

254,326. COMPACTING PAPER-STOCK AND OTHER VEGETABLE FIBERS FOR TRANSPORTATION. GUSTAV L. JANSEN, New York, N. Y. Filed Dec. 31, 1881. (No model.)

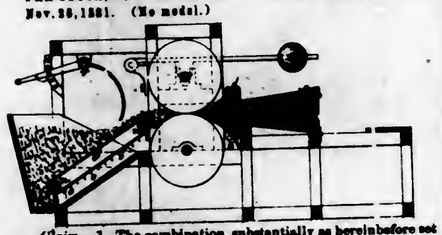
Claim.—A package of vegetable fibers produced by compacting said fibers while in a moist state and then drying the packages so formed, substantially in the manner and for the purpose herein shown and described.

254,327. MAKING PAPER-PULP FROM STRAW, STALKS, AND OTHER FIBROUS MATERIAL. GUSTAV L. JANSEN, New York, N. Y. Filed Nov. 28, 1881. (No model.)

Claim.—1. The process of producing paper-pulp from straw or other stalks, which consists in first compacting the stalks and then subjecting the same to a grinding action, substantially as de-

254,329. METHOD OF AND APPARATUS FOR MANUFACTURING DISTILLED SPIRITS FROM GRAIN. THOMAS A. JESS and WILLIAM T. JESS, Buffalo, N. Y. Filed Jan. 24, 1882. (No

254,331. CORN-PLANTING MACHINE. JAMES HERVA JONES, Rockford, Ill. Filed June 20, 1881. (Model.)



254,333. STEAM-PIPE HANGER. WILLIAM KANE, Philadelphia, Pa. Filed Jan. 12, 1882. (No model.)

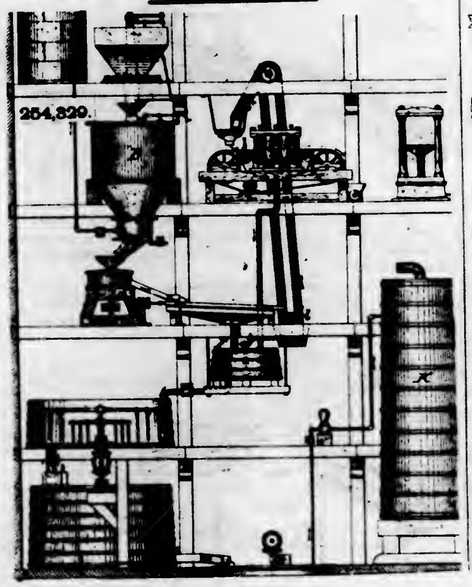
Claim.—1. The process of producing paper-pulp from straw or other stalks, which consists in first compacting the stalks and then subjecting the same to a grinding action, substantially as described.

2. The process of producing paper-pulp from straw or other stalks, which consists in first crushing the stalks, then compacting the crushed stalks, and then subjecting the same to a grinding action.

3. The process of producing paper-pulp from vegetable fiber, which consists in first compacting the fiber and then subjecting the same to a grinding action, substantially as described.

254,328. MACHINE FOR CRUSHING AND COMPACTING PAPER-STOCK, &c. GUSTAV L. JARRAN, New York, N. Y. Filed Nov. 26, 1881. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, of the compacting-rollers arranged to revolve in superficial contact with each other, and the receiver having its mouth arranged opposite to the bite of the rollers.



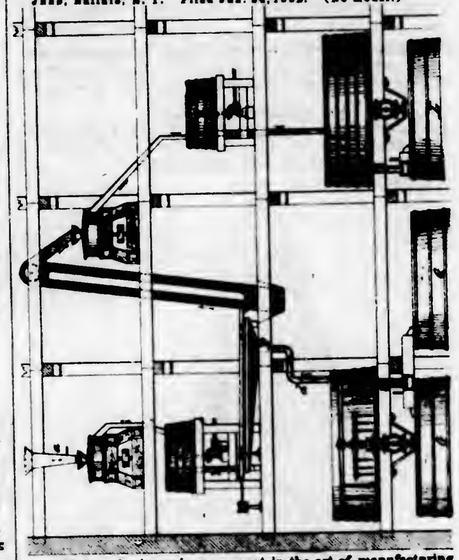
2. The combination, substantially as hereinbefore set forth, of the compound crushing and compacting rollers arranged to revolve in superficial contact with each other, and the receiver having its mouth arranged opposite to the bite of the rollers.

3. The combination, substantially as hereinbefore set forth, of the compound crushing and compacting rollers arranged to revolve in superficial contact with each other, the endless feeder armed with teeth for delivering the material to the rollers, and the receiver having its mouth arranged opposite to the bite of the rollers.

4. The combination, substantially as hereinbefore set forth, of the endless toothed feeder, the adjustable clearing-fork having its tines arranged above the surface of the feeder, the compound crushing and compacting rollers, and the receiver, for the purpose specified.

5. A package of straw or other stalks compacted or solidified, with its component particles laid approximately parallel to each other, for the purpose specified.

254,329.



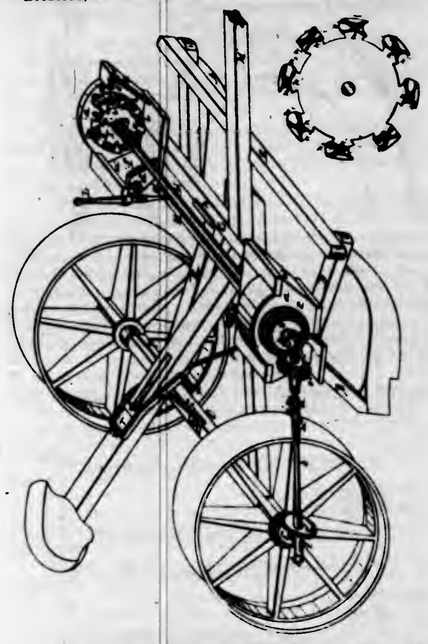
254,329. METHOD OF AND APPARATUS FOR MANUFACTURING DISTILLED SPIRITS FROM GRAIN. THOMAS A. JUDD and WILLIAM T. JUDD, Buffalo, N. Y. Filed Jan. 24, 1882. (No model.)

Claim.—1. As an improvement in the art of manufacturing distilled spirits from grain, the herein-described method, which consists in first moistening the grain, then reducing it, then separating the bran and other coarse offal from the starchy substance, then mashing the separated starch together with a suitable quantity of small grains or malt, and then fermenting the mash and distilling the fermented material, substantially as set forth.

2. In an apparatus for manufacturing distilled spirits from grain, the combination of a moistening or soaking device, a suitable grinding-mill, whereby the grain is reduced, a separator, whereby the bran and other coarse offal are separated from the starchy substances, a receiver in which the starchy substances are collected, a mash-tub in which the starchy substances are mashed, and one or more fermenting-tubs in which the mash is fermented, substantially as set forth.

3. In an apparatus for manufacturing distilled spirits from grain, the combination of a suitable grinding-mill, whereby the grain is reduced, a separator, whereby the bran and other coarse offal are separated from the starchy substances, a receiver in which the starchy substances are collected, a mash-tub in which the starchy substances are mashed, and one or more fermenting-tubs in which the mash is fermented, substantially as set forth.

254,330. METHOD OF AND APPARATUS FOR MANUFACTURING DISTILLED SPIRITS FROM GRAIN. WILLIAM T. JUDD, Buffalo, N. Y. Filed Jan. 24, 1882. (No model.)



Claim.—1. As an improvement in the art of manufacturing distilled spirits from grain, the herein-described method, which consists in first moistening the grain, then reducing it, then separating the starchy portion of the grain from the bran, and then mashing, fermenting, and distilling the starchy portions and the bran separately, as set forth.

2. As an improvement in the art of manufacturing distilled spirits from grain, the herein-described method, which consists in first moistening the grain, then reducing it, then separating the starchy portion of the grain from the bran, then mashing, fermenting, and distilling the starchy portions, then regrinding the bran, and mashing, fermenting, and distilling the ground bran separately, substantially as set forth.

3. In an apparatus for manufacturing distilled spirits from grain, the combination of a suitable grinding-mill, whereby the grain is reduced, a receiving-tub, a separator, whereby the bran and other coarse offal is separated from the starchy substances, a receiver in which the starchy substances are collected, a suitable conveyer for the bran and other coarse offal, a regrinding-mill therefor, and suitable mash and fermenting tubs and connecting-conduits, substantially as set forth.

254,331. CORN-PLANTING MACHINE. JAMES HERVA JONES, Rockford, Ill. Filed June 30, 1881. (Model.)

Claim.—1. The herein-described seed-distributing wheels, having radial arms provided with opposite semi-seed-cups and capable of use on either side of the machine, substantially as and for the purpose hereinbefore set forth.

2. The herein-described seed-distributing wheels, having radial arms provided with opposite semi-seed-cups, varying in size, the respective sizes of said cups being on the same side of the radial arms, and said wheels made in pairs and capable of use on opposite sides of the machine, for the purpose of distributing seed varying in size, substantially as hereinbefore set forth.

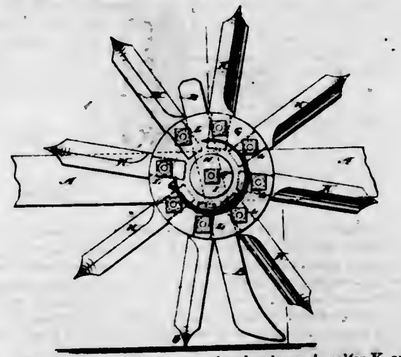
3. The combination, with the fixed disk having the semicircular groove, of the herein-described seed-distributing wheels, mounted loosely on the transverse shaft to revolve therewith, and a spring operating to hold the seed-distributing wheels in contact with the fixed disk, substantially as set forth.

4. The herein-described seed-distributing wheels, having semicircular projections extending from their face side, forming the bottom of the seed-cups, in combination with a fixed disk provided with a semicircular groove adapted to receive the semicircular projections, substantially as and for the purpose hereinbefore set forth.

5. The combination of the herein-described rotary seed-distributing wheels, having semi-cups, as described, with a fixed disk having a semicircular groove on its face, and its upper peripheral portion cut away opposite the seed-conducting spout within the semicircular groove, substantially as set forth.

254,332. BUCKBOARD-WAGON. ISRAEL JEWETT and SYDNEY W. YATTAW, Fort Henry, N. Y. Filed Aug. 6, 1881. (No model.)

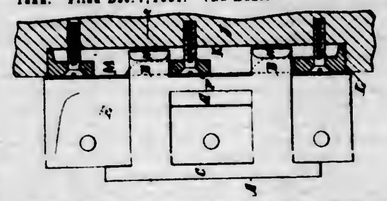
Claim.—The combination, with a wagon-backboard, a, of the stiffening-frame A, having the parallel downwardly-curved slats *k* inserted in the openings between the slats of the backboard, and secured thereto, and provided with the end transverse bars, *l*, adapted to support a wagon-body, substantially as described, and for the purpose set forth.



254,333. STEAM-PIPE HANGER. WILLIAM KANE, Philadelphia, Pa. Filed Jan. 12, 1882. (No model.)

Claim.—1. A steam-pipe hanger in which a hanger-plate, B, is combined with pivoted and laterally-held hooks A, substantially as described.

2. The plate B, provided with lugs *b*, each having a projecting pin, *d*, and with ribs *m*, each having a notch, *n*, in combination with hooks A, adapted to two of the pins *d*, and having at the back a rib adapted to a notch in one of the ribs *m*, all substantially as set forth.



254,334. STALK-CUTTER. ALBERT A. KELLOGG, Chamois, Mo. Filed Dec. 16, 1881. (Model.)

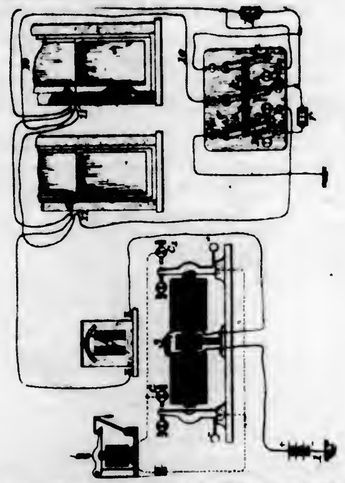
Claim.—1. In a stalk-cutter, the plow-beam A, colter K, and cutter-carrying hub G, combined with and held together by a pivot, I, made to hold the cutter K fast to the beam and to allow the hub to turn on it, as shown and described.

2. The combination, with the plow-beam, of a fixed front-sharpened colter, B, and rear-sharpened cutters K, the latter extending beyond the former, arranged radially in a hub, G, attached, with the colter, to the side of plow-beam, as shown and described.

254,335. BEDSTEAD-HOOK. JACKSON J. KENNEDY, Cleveland, Tenn. Filed Dec. 7, 1881. (No model.)

Claim.—1. The combination, with the side rail, D, of a bedstead, of the frame A, provided with a hook or hooks, B, and of the block or cleat E, substantially as herein shown and described.

2. The combination, with the side rail, D, of a bedstead, of the adjustable frame A, provided with hooks B, and of the block or cleat E, substantially as herein shown and described.



3. The combination, with the side rail, D, of a bedstead, of the frame A, provided with hooks B, and with a flange, C, at the opposite end, and of the block or cleat E, substantially as herein shown and described.

4. The combination, with the side rail, D, of a bedstead, of the frame A, provided with hooks B and a flange, C, and of the cleat or block E, provided with grooves for the longitudinal bars F of the frame A, and with a recess, G, for the end piece, F', of the frame A, substantially as herein shown and described.

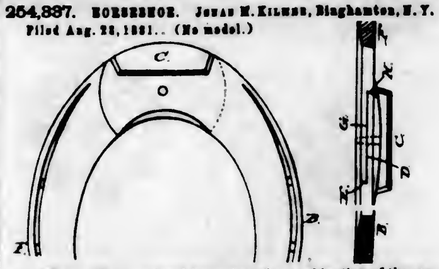
5. The combination, with the side rail, D, and the post or leg J, of the frame A, provided with hooks B and the flange C, the cleat or block E, and the socket-plate L, substantially as herein shown and described.

6. In a bedstead-fastening, the frame A, constructed, substantially as shown, with one or more hooks, B, at one end and a flange, C, at the opposite end, as set forth.

254,336. ELECTRIC BURGLAR-ALARM. MARION H. KERNS, New York, N. Y. Filed Jan. 8, 1882. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, of a main line, a main battery, one or more circuit-closers adapted to shunt a portion of the main line, two independent relays included in the main-line circuit, one of which responds to an increase and the other to a decrease in the normal strength of the current traversing said main line, and a signaling apparatus included in an independent local circuit and capable of being actuated by either of said relays.

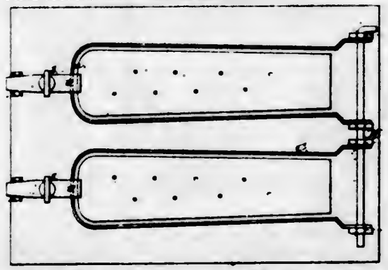
2. The combination, substantially as hereinbefore set forth, of a main line, a main battery, a rheostat included in the main-line circuit, one or more circuit-closers adapted to shunt the portion of said main line including said rheostat, two relays included in the main-line circuit, one of which responds to an increase and the other to a decrease in the normal strength of the current traversing said main line, and a signaling apparatus included in an independent local circuit and capable of being actuated by either of said relays.



3. The combination, substantially as hereinbefore set forth, of a main line, a main battery, a rheostat included in the main-line circuit, one or more circuit-closers adapted to shunt the portion of the main line including said rheostat, a second rheostat placed in a branch circuit and having a resistance either greater or less than that of the first rheostat, a switch for disconnecting the main line from one rheostat and connecting it with the other, and a detecter for indicating the strength of current traversing the main line.

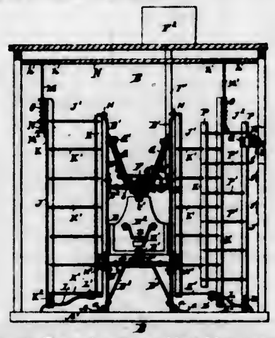
4. The combination, substantially as hereinbefore set forth, of a main line, a main battery, a rheostat included in the main-line circuit, one or more circuit-closers adapted to shunt the portion of the main line including said rheostat, a second rheostat having a resistance greater or less than that of the first one and placed in a branch line, a switch for disconnecting the main line from one rheostat and connecting it with the other, a detecter for indicating the strength of current in the main-line circuit, two relays included in the main-line circuit, one of which responds to an increase and the other to a decrease in the normal strength of the current traversing said main line, and a signaling apparatus under the control of either of said relays.

5. The combination, substantially as hereinbefore set forth, of a main line, a main battery, two rheostats, one or more circuit-closers adapted to shunt one of said rheostats and not the other, and a switch, whereby the resistance of either one of said rheostats may be removed from the main circuit at pleasure, but not both at the same time.



6. The combination, substantially as hereinbefore set forth, of a main line, a main battery, two relays included in the main-line circuit, one of which, having a lesser number of convolutions, responds to an increase, and the other, having a greater number of convolutions, responds to a decrease, in the normal strength of the current traversing said main line, and a signaling apparatus under the control of either of said relays.

254,337. HORSESHOE. JONAS M. KILMER, Binghamton, N. Y. Filed Aug. 21, 1881. (No model.)



Claim.—In a sectional horseshoe, the combination of the section B, having the toe-calk C, rabbet, and under-beveled shoulder E, and the section F, having rabbet G and under-beveled shoulder H, the ends of said sections being convex and the shoulders concave, the said sections being pivoted together through the media of the tapered registering holes I I′ and the tapering pin J, passed up through said holes and upset at its smaller end, substantially as and for the purposes specified.

254,338. PAD-PRESS. EDWARD S. KIDDY, Black Earth, Wis. Filed Jan. 14, 1882. (No model.)

Claim.—The pad-press consisting of the press-plate having elongated, inclined, rounded, and perforated pad-forming projections, band-loops pivoted to bearings on the press-plate and extending around the head and sides of the projections, and fastening devices to secure the band-loops to the press-plate, substantially as specified.

254,339. CATTLE-CAR. JOHN G. KLETT, Brooklyn, N. Y. Filed Dec. 17, 1881. (No model.)

Claim.—1. The series of movable fodder-troughs D, having each a longitudinal central groove, D′, rolls e in said grooves, and recessed ends D^2, in combination with track-plates C′ C^2, as shown and described.

2. The combination, with a cattle-car, of a series of standards connected by transverse bars carrying tracks, and of troughs sliding on these tracks, substantially as herein shown and described, and for the purpose set forth.

3. The combination, with a cattle-car, of a series of standards on which gates are hung, of transverse bars connecting these standards, of tracks supported by these transverse bars, and of troughs adapted to slide on these tracks, substantially as herein shown and described, and for the purpose set forth.

4. The combination, with the cattle-car B, of the plates A on the floor of the same, the standards B′, held by these plates A, and of the gates J, hung on these standards, substantially as herein shown and described, and for the purpose set forth.

5. The combination, with a cattle-car, of plates A, turned up at the adjoining edges, the standards B′, having a bend at the lower ends, the clamping-plates a, and the gates J, hung on these standards, substantially as herein shown and described, and for the purpose set forth.

6. The combination, with a cattle-car, of the standards B′, the transverse bars B^2, the tracks C′ C^2, and the troughs D, adapted to slide on these tracks, substantially as herein shown and described, and for the purpose set forth.

7. In a cattle-car, the combination, with the standards B′, connected by transverse bars B^2, of the tracks C′ C^2, the troughs D, adapted to slide on these tracks, and the water-pipe F, resting on the upper transverse bars B^2, substantially as herein shown and described, and for the purpose set forth.

8. In a cattle-car, the combination, with the tracks C′ C^2, of a series of troughs, D, connected by coupling-bars E^2, substantially as herein shown and described, and for the purpose set forth.

9. In a cattle-car, the combination, with the tracks C′ C^2 and the troughs D, provided with swinging ball-handles E and loops E′, of the coupling-bars E^2, for connecting the troughs, substantially as herein shown and described, and for the purpose set forth.

10. In a cattle-car, the combination, with the tracks C′ C^2, of the troughs D, connected by coupling-bars E^2, and the clip T, attached to the track C′, for holding the coupling-bar E^2 of the end trough, substantially as herein shown and described, and for the purpose set forth.

11. In a cattle-car, the combination, with the tracks C′ C^2, of the troughs D, provided in the bottom with a longitudinal groove, D′, containing rollers e, substantially as herein shown and described, and for the purpose set forth.

12. In a cattle-car, the combination, with the tracks C′ C^2, of the troughs D, provided with longitudinal grooves in the bottom, and with enlarged ends D^2, having recesses d′ in the top, substantially as herein shown and described, and for the purpose set forth.

13. In a cattle-car, the combination, with the standards B′, of the transverse connecting-bars B^2, the braces B^3, turned up at the lower ends, and of the hay-racks G, resting on these braces, substantially as herein shown and described, and for the purpose set forth.

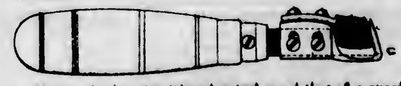
14. In a cattle-car, the combination, with the standards B′, of the transverse connecting-bars B^2, the braces B^3, turned up at the lower ends, the hay-racks G, resting on these braces, and the hooks G′, for holding the upper bars of these racks, substantially as herein shown and described, and for the purpose set forth.

15. In a cattle-car, the combination, with the standards B′, of the transverse connecting-bars B^2, the braces B^3, the racks G, and the pivoted transverse rod G^2, for holding these racks, substantially as herein shown and described, and for the purpose set forth.

16. In a cattle-car, the combination, with the standards B′, of the gates J, provided with a spring-rod, L, at the bottom, and a latch-rod, M′, at the top, which rods L and M′ pass into apertures in the floor and ceiling of the car, and thus hold the gates in the desired position, substantially as herein shown and described, and for the purpose set forth.

17. In a cattle-car, the combination, with the gate J, of the sliding bent spring-rod L, substantially as herein shown and described, and for the purpose set forth.

18. In a cattle-car, the combination, with the gate J, of the bent spring-rod L, passing through a slot, K^2, provided with shoulders g at the bottom of the outer gate-bar K, and of the block L′, sliding on the bottom transverse rod K′ of the gate, and attached to the inner end of the rod L, substantially as herein shown and described, and for the purpose set forth.



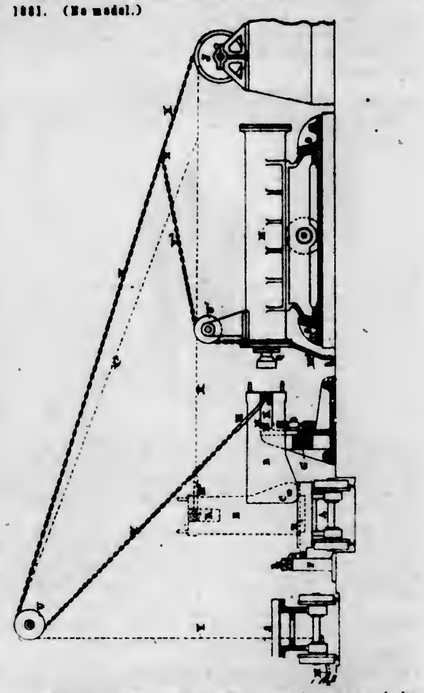
19. In a cattle-car, the combination, with the gate J, of the angle-piece N′, the latch-rod M′, provided with a rectangular bend, M^3, at the lower end, and of the spring O, surrounding and attached to the rod M′, substantially as herein shown and described, and for the purpose set forth.

20. In a cattle-car, the combination, with the standards B′, of the gate-section J′, hung on these standards, and of the gate-section J^3, sliding on the section J′, substantially as herein shown and described, and for the purpose set forth.

21. In a cattle-car, the combination, with the swinging gate-section J′, provided with bottom latch-rod, L, and top latch-rod, M′, of the section J^3, sliding on the section J′, substantially as herein shown and described, and for the purpose set forth.

22. In a cattle-car, the combination, with the swinging gate J, of the block Q, sliding on the outer bar of this gate and pivoted to a U-shaped clip, R, adapted to fit on the horizontal slats of the car, substantially as herein shown and described, and for the purpose set forth.

254,340. EDGE-TRIMMING TOOL. PEDERSON H. LANDER, Lynn, Mass. Filed Mar. 25, 1881. Renewed Jan. 30, 1882. (Model.)



Claim.—1. An edge-trimming tool consisting of a guard, C, having a part adapted to be clamped to the blade, as shown, in combination with a guide-bar adjustably connected to said guard and adapted to be advanced toward the inwardly-turned outer end of guard C and toward the edge of the knife by one movement, substantially as shown.

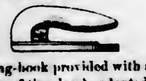
2. The combination of the guard C, having extension adapted to be clamped to the blade, and a curved section of a guide-bar having shank fitted to said curved section and adjustably connected thereto, and a knife-blade and suitable clamps.

3. The combination, in an edge-trimming tool, of the guide C, provided with curved section on the part adapted to be clamped to the blade, a guard having curved shank adapted thereto and provided with enlarged slots and set-screws, whereby the said guard may be connected to the curved section and adjusted laterally and longitudinally, as set forth.

254,341. APPARATUS FOR STRIPPING INGOTS CAST IN MOLDS. LOUIS G. LAUBAUS, New York, N. Y. Filed Nov. 29, 1881. (No model.)

Claim.—1. The ingot-mold B, mounted on a car, A, by a hinged joint having an elongated hole, C, and having lugs or projections K, in combination with stops L, and with the punching-cylinder N and piston O, substantially as and for the purposes set forth.

2. The combination of the hinged mold B with lugs K, the stops L, the movable face-plates M, and cylinder N and piston O, substantially as and for the purposes set forth.

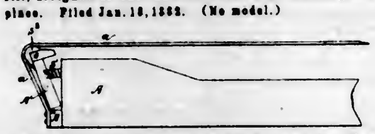


3. The combination of the car A, hinged ingot-mold B, roller-frame F, and lip E, to prevent the tipping of the car, as explained.

4. The combination of the car A, hinged mold B, support O, stops L, hooks H H′, chains X Y, and movable cylinder N and piston O, substantially as and for the purposes set forth.

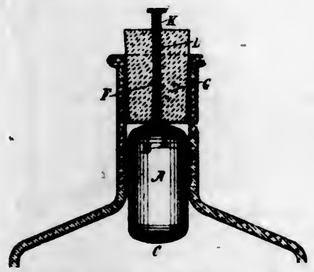
254,342. ARTIFICIAL STONE. CARL F. LEIDHOLDT, Neillsville, Wis., assignor of one-third to Herrman Schuster, same place. Filed Jan. 11, 1882. (No specimens.)

Claim.—As an improved article of manufacture, an artificial stone composed of hydraulic lime, sand, leached ashes, glue-water, and bone-meal in the proportions stated.



254,343. LACING-HOOK. EDOUARD C. LEQUIN, Keokuk, N. Y. Filed Nov. 10, 1881. (No model.)

Claim.—1. The lacing-hook provided with a projecting pin or needle point on the inside of the shank, adapted to prevent retraction of the lacing-cord, substantially as specified.



2. The lacing-hook having the projection *b* on the inside of its shank, and the pin or needle point *c*, fixed in said projection, and adapted to prevent retraction of the lacing-cord, substantially as specified.

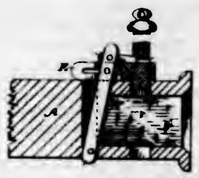
254,344. ELASTIC BED-BOTTOM. JACOB H. LANOW, Chicago, Ill., assignor of one-half to Charles W. Fairrington, same place. Filed Jan. 18, 1882. (No model.)

Claim.—As an improvement in bed-bottoms, the strips *a*, secured to the frame A, in combination with springs a^2 and hinged flexible supplemental rails A′ at the head or foot, or at both head and foot, all arranged to operate substantially as and for the purpose shown.

254,345. BOTTLE-STOPPER ATTACHMENT. BENJAMIN B. LEWIS, West Stratford, Conn. Filed Nov. 10, 1881. (No model.)

Claim.—1. The combination, with the stopper G, having an aperture, F, of the rod D, having the enlargement or valve E, either with or without the spring K, and the vessel A, having the end apertures, B and C, substantially as herein shown and described, and for the purpose set forth.

2. As an article of merchandise, the stopper attachment consisting of the vessel A, having the end apertures, B and C, and the rod D, having the enlargement or valve E, either with or without the spring K, intended for application to a stopper in the manner and for the purpose set forth.

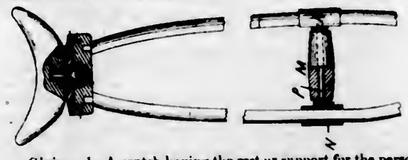


254,346. MOLD FOR CASTING METALS. JOHN L. LEWIS, Pittsburg, Pa. Filed June 16, 1881. (No model.)

Claim.—A mold having a sinking-head cavity with contracted neck and an annular cavity surrounding the said neck, substantially as described.

254,347. CAR-COUPLING. CHARLES E. MACARTHY, Forsyth, Ga. Filed Jan. 11, 1882. (No model.)

Claim.—1. The combination, with a plain draw-bar having a slot in its upper wall back of the pin-hole, of a vertical trigger-bar fulcrumed upon a horizontal pin in the draw-bar, the coupling-pin, and a rectilinearly-sliding device arranged above the top of the draw-bar, and jointed at its rear end to the trigger-bar, and arranged to trip the coupling-pin at its front end, substantially as shown and described.

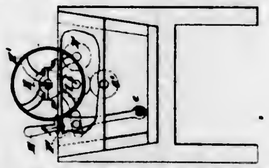


2. The combination, with the coupling-pin and a draw-bar having a slot in its upper surface back of the pin-hole, of a vertical trigger-bar fulcrumed in the draw-bar, and a piece, E, formed with an eye encircling the pin and connected to the trigger-bar above and outside the draw-bar, as and for the purpose described.

3. The perforated tongue H, with hollow socket I, in combination with a link having a shank adapted to fit in said socket, and made adjustable therein, as and for the purpose described.

4. The combination, with the coupling-pin of a car, of a pulley or wheel arranged above the same, a chain connecting with the pin and passing over the wheel to the side of the car, and a second chain connecting with the pin at a point below the wheel, and extending vertically to the top of the car, as and for the purpose described.

254,348. CRUTCH. SERVUS C. MAINE, Boston, Mass. Filed Sept. 16, 1881. (No model.)



Claim.—1. A crutch having the rest or support for the person under the armpit attached to the staff with a single ball-and-socket joint, substantially as described, for the purpose specified.

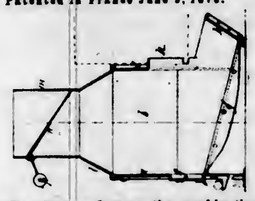
2. A crutch having the rest or support for the person under the armpit made of cork, secured in a suitable shell or casing, substantially as and for the purpose described.

3. The combination, with the branches of a crutch, of the hand-rest M, the pin P, passing through the hand-rest, and screw-threaded at its ends, as set forth, and the sleeves N, having sockets receiving said screw-threaded ends of the pin, whereby by turning said hand-rest in one direction the sleeves will be drawn toward each other, and thereby secured upon the branches of the crutch, substantially in the manner and for the purpose described.

254,349. MACHINE FOR SCALDING AND STICKING FUR-BATS TO FELT HAT-BODIES. CHARLES A. MALLORY, Danbury, Conn. Filed Jan. 9, 1882. (No model.)

Claim.—1. The rollers B C D, arranged to leave a constant space, in which the hat-body can be introduced and removed, in combination with the levers E, adjusting means F therefor, pulleys B^a D^a, belt G, and pulleys K L, arranged for joint operation, as herein specified.

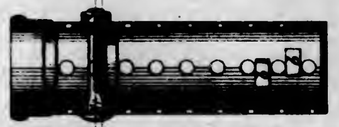
2. The rollers B C D, arranged to provide a space at the top in which the hat-body can be introduced and removed, gears B′ C′, pulleys B^a D^a, levers E, belt G, and pulleys K L, in combination with each other and with the water-tank A and steam-pipes *a*, as herein specified.



254,350. FENCE-POST. CHARLES A. MANN, Buffalo, N. Y. Filed Jan. 17, 1881. Renewed Dec. 10, 1881. (No model.)

Claim.—1. In combination with the iron post A A′, the anchor-base B, riveted to the post, and having the flanges *e e*, the brace loop or lug *h*, and brace C, all substantially as and for the purpose specified.

2. In a fence-post, the combination of the upright post A A′ *b* with an anchor, B, having the upright attaching portions *g e* and an intervening ledge closely fitting into the post, as set forth.



254,351. BAGASSE-FURNACE. MARIE JEAN LÉON MARIE, St. Pierre, Martinique, West Indies. Filed Oct. 29, 1881. (No model.) Patented in France June 9, 1879.

Claim.—In a bagasse-furnace, the combination of the door-plate *a*, the side plates, *b c*, the plate *d*, having flanged throat *k*, the fire-bars *g*, the bridge *h*, the crown-piece *l*, and the valved hopper *m*, all arranged substantially as shown and described.

254,352. PUMP-STRAINER. SAMUEL W. MARVIN, Springfield, Ohio. Filed Dec. 27, 1881. (No model.)

Brief.—This strainer can be readily attached to a suction-pipe by friction, and thus avoid cutting screw-threads on said suction-pipe.

Claim.—1. As a new article of manufacture, the pump-strainer consisting of the perforated body-sections united by a bolt or equivalent fastening device.

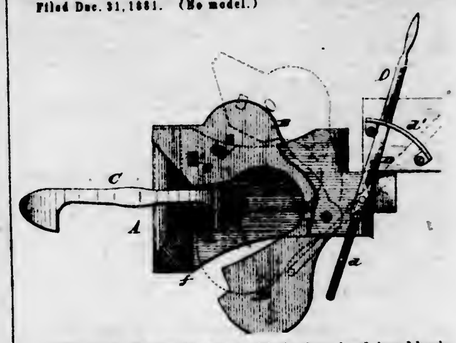
2. In combination with the pipe A, the divided strainer and the bolt or its equivalent, whereby the strainer is secured to the pipe by frictional contact.

3. The improved pump-strainer, consisting of the body-sections having their edges serrated to form openings when united, substantially as described and shown.

4. The perforated body-sections provided with the bolt or equivalent fastening device and the lips, as described and shown.

5. In combination with the pipe, a tubular perforated strainer provided with a clamping device and secured thereto by frictional contact, substantially as described.

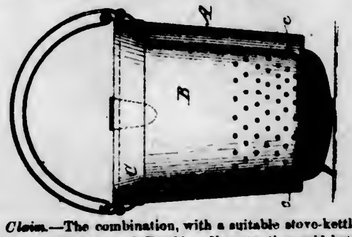
254,353. IRON FENCE. SAMUEL W. MARTIN, Springfield, Ohio. Filed Dec. 27, 1881. (No model.)



Claim.—1. In a metal fence, the combination of a rail, a vertical picket sustained by the rail and provided with a notch or recess and a rosette, substantially as described, engaging with the upper and lower edges of the rail, and also engaging with the upper and lower edges of the recess, whereby the picket is prevented from being raised or lowered.

2. In combination with the perforated rail, the vertical picket passing through the rail and provided with the transverse notch or shoulder, and the rosette adapted to engage around the picket, and provided with shoulders or bearings engaging with the picket and the fence-rail, respectively, in the manner described and shown.

3. The combination of the perforated rail, the picket passing loosely through the rail and provided with a transverse notch or shoulder, and the rosette encircling the picket and engaging with its shoulder, and also engaging with the upper and lower edges of the rail, as described and shown.

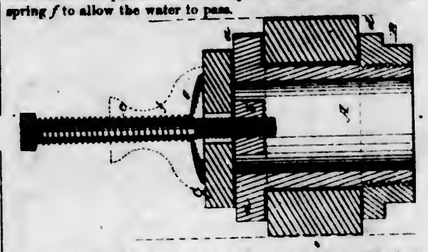


254,354. CAR-COUPLING. THOMAS MCCABE, St. Joseph, Mo. Filed Dec. 31, 1881. (No model.)

Claim.—1. The combination, with the draw-head A and hook C, of the catch B, projecting below the draw-head, the crank-shaft *d*, adapted to operate the catch, and the lever D, and means for locking the lever in any desired position, substantially as shown and described.

2. The combination, with the draw-head A and weighted catch B, of the pins *e* and *e′*, for holding the said catch in position to prevent the accidental disengagement of the link, substantially as shown and described.

254,355. VESSEL FOR COOKING. CHRISTOPHER C. P. MCCOMB, Walnut Grove, Ark. Filed Dec. 15, 1881. (No model.)



Claim.—The combination, with a suitable stove-kettle, A, of an inner perforated vessel, B, of less diameter than said kettle, and provided with a flaring extension, C, and radial pins *c*, extending from the sides of the vessel and adapted to come in contact with the interior sides of the kettle, whereby a continuous closed space is left around the entire outer surface of the vessel and inner surface of the kettle, substantially as and for the purpose set forth.

254,356. MEDICAL COMPOUND. WILLIAM R. MEAD, Fowlerville, Mich. Filed Oct. 31, 1881. (No specimens.)

Claim.—A medical compound for the treatment of epilepsy, composed of tincture of nux vomica, bromide of ammonia, bromide of potash, bicarbonate of potash, tincture of columbo, and distilled water, mixed in about the proportions set forth.

254,357. PUMP-PISTON. GODFREY MILLER, Anita, Iowa. Filed Nov. 11, 1881. (Model.)

Brief.—The flexible material *e* is retained in place by nut B and acts as the piston. Valve *c* is raised against the pressure of spring *f* to allow the water to pass.

Claim.—1. In a pump-piston, the combination, with the tubular casting A, provided with the cross-bar *b* and the piston-rod *e*, of the valve C, sliding freely upon the piston-rod, the washer *g*,

254,358. CAR-COUPLING. JOHN MILLER, Jr., Pittsburg, Pa. Filed Dec. 27, 1881. (No model.)

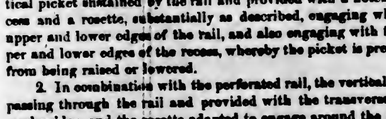
Claim.—1. The combination, with the draw-bar A, having the slot *a* and the pin-hole *b*, of the trigger-bar C, having the lug *c* and the arm *d*, the coupling-pin D, having the head *e* and the arm *f*, and the spring E, substantially as and for the purpose specified.

2. The combination, with the draw-bar A, having the slot *a* and the pin-hole *b*, of the trigger-bar C, having the lug *c* and the arm *d*, the coupling-pin D, having the head *e* and the arm *f*, the spring E, and the guard-plate F, substantially as and for the purpose specified.

254,359. CAR-COUPLING. JOHN MILLER, Jr., Pittsburg, Pa. Filed Dec. 27, 1881. (No model.)

Claim.—1. The combination, with the draw-bar A, having the slot *a* and the pin-hole *b*, of the trigger-bar C, having the lug *c* and the arm *d*, the coupling-pin D, having the head *e* and the arm *f*, and the spring E, substantially as and for the purpose specified.

2. The combination, with the draw-bar A, having the slot *a* and the pin-hole *b*, of the trigger-bar C, having the lug *c* and the arm *d*, the coupling-pin D, having the head *e* and the arm *f*, the spring E, and the guard-plate F, substantially as and for the purpose specified.



254,360. CAR-COUPLING. JOHN MILLER, Jr., Pittsburg, Pa. Filed Dec. 27, 1881. (No model.)

Claim.—1. The combination, with the draw-bar A, having the slot *a* and the pin-hole *b*, of the trigger-bar C, having the lug *c* and the arm *d*, the coupling-pin D, having the head *e* and the arm *f*, and the spring E, substantially as and for the purpose specified.

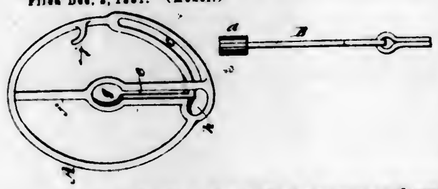
2. The combination, with the draw-bar A, having the slot *a* and the pin-hole *b*, of the trigger-bar C, having the lug *c* and the arm *d*, the coupling-pin D, having the head *e* and the arm *f*, the spring E, and the guard-plate F, substantially as and for the purpose specified.

254,361. CAR-COUPLING. JOHN MILLER, Jr., Pittsburg, Pa. Filed Dec. 27, 1881. (No model.)

Claim.—1. The combination, with the draw-bar A, having the slot *a* and the pin-hole *b*, of the trigger-bar C, having the lug *c* and the arm *d*, the coupling-pin D, having the head *e* and the arm *f*, and the spring E, substantially as and for the purpose specified.

2. The combination, with the draw-bar A, having the slot *a* and the pin-hole *b*, of the trigger-bar C, having the lug *c* and the arm *d*, the coupling-pin D, having the head *e* and the arm *f*, the spring E, and the guard-plate F, substantially as and for the purpose specified.

254,362. CAR-COUPLING. JOHN MILLER, Jr., Pittsburg, Pa. Filed Dec. 27, 1881. (No model.)

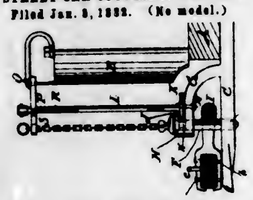


Claim.—1. The combination, with the draw-bar A, having the slot *a* and the pin-hole *b*, of the trigger-bar C, having the lug *c* and the arm *d*, the coupling-pin D, having the head *e* and the arm *f*, and the spring E, substantially as and for the purpose specified.

2. The combination, with the draw-bar A, having the slot *a* and the pin-hole *b*, of the trigger-bar C, having the lug *c* and the arm *d*, the coupling-pin D, having the head *e* and the arm *f*, the spring E, and the guard-plate F, substantially as and for the purpose specified.

and the spiral spring *f*, surrounding the said piston-rod, substantially as and for the purpose set forth.

2. In a pump-piston, the combination, with the tubular casting A, provided with the cross-bar *b*, the radial flange *a*, and the nut B and the packing *c*, of the piston-rod *e*, the spring *f*, and the valve C, substantially as and for the purpose set forth.



254,358. BRIDLE-RING. CHAS. B. HIETLE, Glenwood, Iowa. Filed Dec. 3, 1881. (Model.)

Claim.—1. The ring A, formed with the passages *c* and *e* and with the enlargements *g* and *h*, in combination with the headed hook B, substantially as described.

2. The ring having the diametrical portion *f* formed with the slot or passage *e* and enlargement *g*, and the rim formed with the slot or passage *c* and enlargement *h*, and having the horn *j*, in combination with the headed hook B, substantially as described.

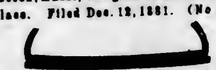
254,359. STREET-CAR COUPLING. OLE A. A. HÖLOAL, Chicago, Ill. Filed Jan. 3, 1882. (No model.)

Claim.—1. In a horse street-car coupling, the combination, with the curved arm G, having recess J, and the coupling-pin F, having annular groove N, of the disk K, having recess O, and the disk-operating rod L, substantially as herein shown and described, whereby the coupling-pin can be readily locked and released, as set forth.

2. In a horse street-car coupling, the combination, with the disk-operating rod L, of the hinged handle R and the guide-bars P S, substantially as herein shown and described, whereby the said rod can be readily operated, locked, and unlocked, as set forth.

3. In a horse street-car coupling, the combination, with the curved arm G, having recess J and lugs V, and the coupling-pin F, having annular groove N, of the dog U, having tongue X and hook Z, substantially as herein shown and described, whereby the said coupling-pin will be securely locked and can be readily unlocked, as set forth.

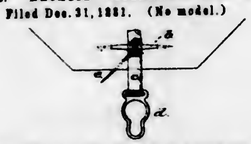
4. In a horse street-car coupling, the combination, with the draw-bar C, of the projection *a*, having a shoulder at its forward side and its rear side inclined, substantially as herein shown and described, whereby the double-tree will be prevented from sliding rearward, while being allowed to slide forward freely, as set forth.



254,360. VENTILATOR. WILLIS E. MOORE, Thorntown, Ind. Filed Dec. 6, 1881. (No model.)

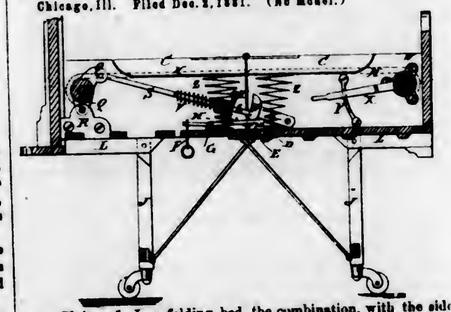
Brief.—The ventilating-pipe B has sliding sections, so that air may be obtained from a higher point, and consequently be more healthful.

Claim.—In a ventilator for dwellings, the combination, with the stationary pipe B, of the telescopic pipe-sections and means for elevating and lowering them, substantially as and for the purpose set forth.



254,361. MANUFACTURE OF BOOTS AND SHOES. ANDREW NICHOLS, Boston, Mass., assignor of one-half to Charles Grant, Jr., same place. Filed Dec. 12, 1881. (No model.)

Claim.—1. The method of soling boots and shoes, consisting in splitting the edge of the sole circumferentially, applying the sole to the last, stretching the upper over the last right side out, inserting the edge of the upper in the circumferential slit of the sole, and securing it there by fastenings which attach it directly to both parts of said split sole, thus forming a complete shoe or boot with a circumferentially split or grooved sole without turning.

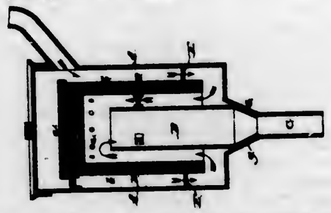


2. A boot or shoe having the margin of the upper inserted in a slit in the edge of the sole and attached thereto by stitches or other fastenings carried through and through both parts of the sole and the upper, substantially as set forth.

254,362. NECKTIE-FASTENER. ISAAC NOLAN, New York, N. Y. Filed Dec. 31, 1881. (No model.)

Claim.—The combination, in a breast-scarf fastening, with the collar-button loop *d* and its elastic, of the tag-fastening *b* and the coil-headed pin *e*, substantially as specified.

254,363. FOLDING BED. JOSEPH NOVAK and JOSEPH STROBEL, Chicago, Ill. Filed Dec. 2, 1881. (No model.)



Claim.—1. In a folding bed, the combination, with the side boards of the bedstead and the bar O, to which one end of the mattress is attached, of the pivoted levers Q, attached to the ends of the said bar, the rods S, and the concaved stop-block U, substantially as and for the purpose set forth.

2. In a folding bed, the combination, with the side boards of the bedstead, the bar O, and the mattress N, of the pivoted levers Q, the rods S, stops U, and springs V, substantially as and for the purpose set forth.

3. In a folding bed, the combination, with the latches D and the catches E, of the rod G, provided with the arms H, the springs F, and the cords I, attached to said arms and passing through the bottom of the bed, substantially as and for the purpose set forth.

254,364. SEWER-TRAP. JAMES F. O'GRADY, Chicago, Ill. Filed Oct. 20, 1881. (No model.)

Claim.—1. In a sewer-trap, the combination, with the receiver A, permanently connected to the drain-pipe C by the conical seat *e*, of the discharging-vessel B, seated therein, and the gas-cap D, substantially as specified.

2. In a sewer-trap, the combination, with the receiver A, having the scraper E and a sediment-chamber below the same, of the discharging-vessel B and the drain pipe C, permanently connected to the vessel A by the conical seat *e*, substantially as specified.

254,365. ARTIFICIAL-STONE COMPOSITION. WILLIAM W. PATTERSON, Corning, Iowa, assignor of one-half to W. H. Hoxie, same place. Filed Nov. 16, 1881. (No specimens.)

Claim.—A composition to be formed into artificial stone, consisting of Milwaukee cement, Portland or other similar cement, unslaked lime in a dry and powdered state, and sand, and then adding thereto a solution made by combining soft water, salt, saltpeter, an alkali, and carbonate of ammonia, the proportions of ingredients used being substantially such as are hereinbefore described.

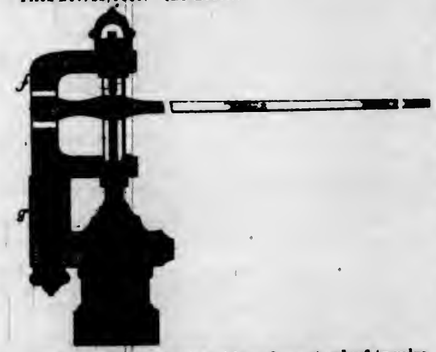
254,366. PAVING AND BUILDING MATERIAL. ANTONIO PELLETIER, Washington, D. C. Filed Dec. 7, 1881. (No specimens.)

Claim.—1. The combination of asphaltam or bitumen with sand or broken rock or stone, and an oxide of any metal or other base, and a chloride of the same base, in varying proportions, substantially as specified.

2. The combination of sand or broken rock or stone, and an oxide of any metal or other base, and a chloride of the same base with any mineral or vegetable bituminous or gluey substance to be used as a binder, in varying proportions, substantially as specified.

254,367. CARRIAGE-BOW IRON. JOSEPH B. PLATT, Cleveland, Ohio. Filed Jan. 10, 1882. (No model.)

Claim.—1. In combination with the slat-iron A, the rods B B, substantially as described.



2. In combination with the slat-iron A and the rods B B, the metal socket C, substantially as described.

3. In combination with the slat-iron A, rods B B, and metal socket C, the wooden filling D, substantially as described.

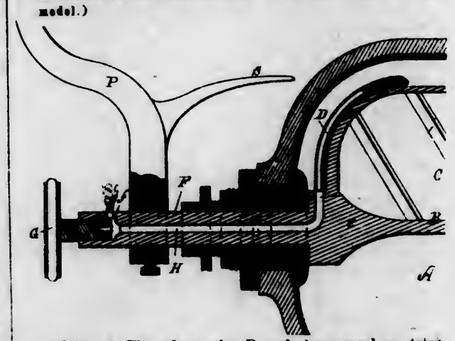
4. The combination, with the slat-iron A, rods B B, metal socket C, and wooden filling D, of the metal strengthening E, substantially as described.

5. The combination, with the slat-iron A, rods B B, metal socket C, and wooden filling D, of the leather covering F, substantially as described.

254,368. SAFETY-VALVE. ALVIN D. PUFFER, Medford, Mass. Filed Nov. 25, 1881. (No model.)

Claim.—1. In combination with a valve-seat and safety-valve, an operating-lever and its support, said lever, valve, and support being adapted to turn horizontally for the purpose of removing said valve from said valve-seat.

2. In combination with a safety-valve and valve-seat and the operating-lever, the fixed part *g* of the supporting-bracket and the part *f* of said bracket, which is pivoted in part *g* and adapted to turn laterally, carrying the lever and valve away from the valve-seat, substantially as stated.



3. In combination with a valve-seat and safety-valve and the operating-lever for the latter, a supporting-bracket consisting of fixed part *g*, pivoted part *f*, and a screw whereby, said parts *f* and *g* may be locked together or released at will.

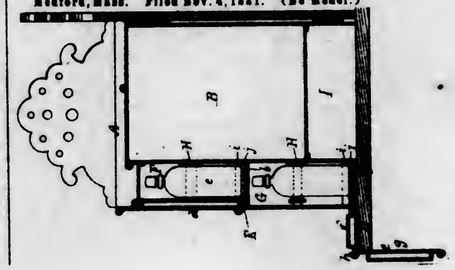
4. In safety-valves containing a vertical drop-valve and a horizontal lever controlling the same, the valve as composed of a cylinder or bar slotted to receive the lever and moving in a vertical plane, and connected with the lever by : joint, which permits the latter to move in the arc of a circle without disturbing the valve in its strictly vertical pulsations.

5. In combination with a notched safety-valve and lever, a pivot or rod, *l*, pointed at both ends and setting into said valve and lever, and the screw *n*, which prevents said lever from separating too far from said valve.

6. The general physical structure of the entire valve consisting of the hollow base or coupling, by which connection is made with the generator or other object, the bracket or standard in two parts hinged or swiveled together to permit the valve contained in its swinging part to be removed from over the valve-seat and swiveled horizontally to the base or coupling to permit of any desired adjustment of the valve-lever, and the lever and valve and their connections arranged substantially as described, whereby the lever moves in an arc of a circle and the valve in a vertical plane, the whole co-operating to produce results stated.

254,369. REVOLVING WATER-GAGE FOR CLOSED VESSELS. ALVIN D. PUFFER, Medford, Mass. Filed Mar. 31, 1881. (No model.)

Claim.—1. The tube or pipe D, arched or curved, as stated, in combination with the agitator having a web or blade which supports said pipe.



2. In combination with a vessel or receptacle for liquids, an agitator-shaft having a tubular outward extension, and a tube which is carried by said shaft within said vessel and communicates with the bore of said tubular extension.

3. In combination with a vessel or receptacle for liquids, an agitator-shaft, a tube carried thereby and affording an outlet from said vessel, and a crank and indicator attached to an external prolongation or extension of said agitator-shaft, substantially as set forth.

4. In combination with a vessel or receptacle for liquids, a shaft provided with agitating devices for said liquid, and having a tubular outward extension which communicates at its inner end with the interior of said vessel, and has an outlet-opening in its side near the other end, substantially as set forth.

5. The bottling-cylinder A and revolving agitator-shaft B, with its enlarged portion F, perforated as described, in combination with the tube D, valve G, and crank P, provided with a marker, S, having its end in proximity to the cylinder and on a level with the open end of tube D, these parts being constructed and arranged for joint operation, as herein shown and specified.

254,370. REFRIGERATING APPARATUS. ALVIN D. PUFFER, Medford, Mass. Filed Nov. 4, 1881. (No model.)

Claim.—1. A case for soda-water-dispensing apparatus containing an ice-chamber, B, in combination with additional chambers, F G, adapted to hold sirup-bottles in tiers one above another, substantially as set forth.

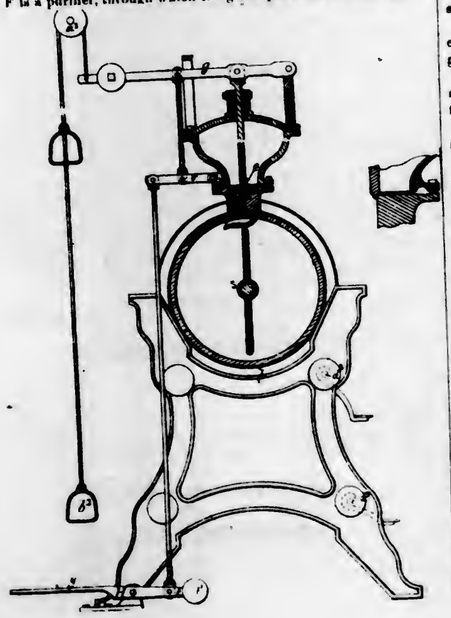
2. In combination with counter D and case A, the door *e*, consisting of sections *f g*, hinged together in order to allow section *g* to drop or fold down vertically against the edge of said counter, and thereby leave the space behind the counter unobstructed when the door is opened.

3. In soda-water fountains or dispensing apparatus, a series of transverse ridges erected upon the floor of each bottle-compartment and dividing such compartment into individual bottle-spaces, said ridges being of inverted-V shape in cross-section to provide inclined walls to each bottle-space for directing the bottle into its proper position, substantially as set forth.

4. In soda-water-dispensing apparatus, a chamber, F, divided into spaces for receiving separate sirup-bottles, and provided in its interior with rubber pads H opposite each bottle, for the purpose set forth.

5. In soda-water fountains or dispensing apparatus, a corrugated, indented, or perforated mat placed in the bottom of each bottle-space, and protecting the bottom of said bottle which rests thereon from injury by the bottom of the apartment or inclosure.

6. In combination with a sirup-bottle, an elastic band which clasps the same, said band having in or on its upper part a trough for receiving leakage or water of condensation.



7. In combination with bottle *c*, the elastic band *l*, having a trough, *l'*, formed in its upper face, for the purpose set forth.

8. In combination with ice-chamber B, supplemental cooling-chamber I below it, and chambers F and G, arranged one above another, immediately behind chambers B and I, for the purpose of holding bottles in tiers during cooling, all of said parts being within one case or inclosure.

9. In combination with the ice-chamber B and a bottle-holding chamber in proximity thereto, a series of inverted-V-shape ridges dividing the spaces for the several bottles one from another, and a series of mats corrugated on their upper faces, which fill the spaces between the ridges, and on which the bottles rest, substantially as set forth.

254,371. GENERATOR. ALVIN D. PUFFER and ALVIN D. PUFFER, Jr., Medford, Mass. Filed Nov. 3, 1881. (No model.)

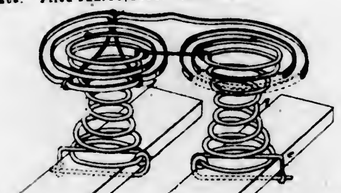
Brief.—The gas-generator A has a chute, *m*, from the acid-receptacle C, to distribute the acid, and the agitator-shaft E has a leaden cover, *s*, to protect it from the acid. An indicator, d^3, on the end of the generator shows the quantity of liquid contained therein. The flanged connections *c*, one side being roughened and the other grooved, are held by bolts and contain packing material. F is a purifier, through which the gas is passed to be cleansed.

Claim.—1. In combination with an acid-pot and a generator, a chute or guide, *m*, which receives the acid from said pot and directs it to one side or both sides of the agitator-shaft.

2. In combination with a purifier and its perforated supply-pipe, a foraminous screen or strainer through which the gas passes on issuing from said pipe.

3. A supplemental strainer, *o*, in combination with the purifier and its supply-pipe, said strainer being arranged to intercept the gas as it rises from the perforations in said pipe and to further subdivide the same.

4. In combination with a generator and its agitator-shaft, an anti-corrosive jacket or tube enveloping that part of said shaft which is most exposed to the action of acid.



5. In combination with the acid-pot, its valve, and suitable connections, a weighted lever operating said valve and a pedal operating said lever in opposition to said weight, substantially as set forth.

6. In combination with a generator or generating-cylinder having a circular scale representing gallons marked on one end, an agitator-shaft which is made tubular for a part of its length, a curved pipe communicating with the bore of said shaft and carried thereby within said cylinder, and an index or pointer carried by the protruding end of said shaft over the aforesaid scale.

7. A generator composed of two sections, flanged at their joint, one flange being grooved and the other flat and roughened, in combination with a ring of elastic packing which sets between said flanges, substantially as set forth.

8. In combination with a generator and its supporting-frame, a pair of steps arranged obliquely one above another, and provided with arms, whereby they are attached to pins or studs on said frame, substantially as set forth.

254,372. SPRING BED-BOTTOM. ADDISON F. PURNELL, Wake Forest, N. C., assignor of one-fourth to Sidney Abernathy, same place. Filed Jan. 16, 1882. (No model.)

Claim.—1. A spring comprising a conical body and a flat or horizontal top formed of coils around the enlarged end of the cone, substantially as described.

2. A twin spring comprising the two conical bodies and flat extension-tops and the connection between said tops formed integral or of one wire, substantially as described.

3. A conical wire spring having the wire in one or more coils at the end flattened vertically to give greater rigidity, the wire in the main body being round, substantially as described.

4. In a twin spring, the connection-wire flattened vertically, substantially as described.

5. The method of giving greater rigidity to the tops of springs and the connection-wires of twin springs by flattening the wire vertically between rolls, or by other suitable means, as set forth.

6. In a twin spring, the connection-wire bent in the middle away from the coils, as explained.

7. The combination, with flat extension-tops of springs for bed-bottoms and like purposes, of stiffening-braces, substantially as described.

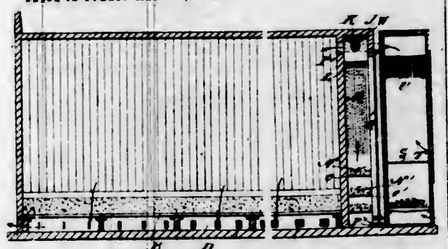
8. The combination, with springs having flat extension-tops, of supporting-braces connecting said springs, and adapted also to stiffen said tops by extending under them, substantially as described.

9. In combination with a twin spring having flat extension-top united by a connection-wire, a supporting-brace connecting the two parts of said twin spring, substantially as described.

10. The combination, with a bed-spring of coiled wire, of a fastener for attaching the same to a slat, connected with a coil of the spring by means of a loop or eye, and provided with two spring-arms to embrace the slat and a coil of the spring, and a hook for joining the ends of said arms, substantially as described.

11. In a bed-bottom, springs arranged in rows, with the springs in one row opposite the spaces between the springs in adjoining rows, and with half-width springs in the ends of alternate rows, substantially as described.

12. The half-width springs of elliptical shape in plan, substantially as described.

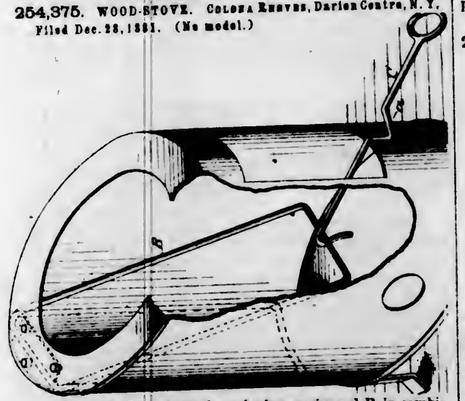


13. A spring bed-bottom comprising springs with flat extension-tops supported, braced, fastened, and arranged substantially as described.

254,373. CAR-COUPLING. J. H. PUTNAM, Tioga, Pa. Filed Nov. 19, 1881. (No model.)

Claim.—The combination, with a draw-head, B, and link *a*, of the bent coupling-rod C *c c'*, swung on easily-movable hangers *d*, and provided with the projection *c''*, located in the portion *c'* of the rod, directly under the link *a*, and adapted to engage therewith, and to serve as an accurate holding and guiding means for said link, substantially as set forth.

254,374. APPARATUS FOR MALTING CEREALS. JULIEN POUPART, Lille, France, assignor to himself and Marcisse Pigeon, New York, N. Y. Filed Mar. 10, 1881. (No model.) Patented in France Mar. 15, 1880.



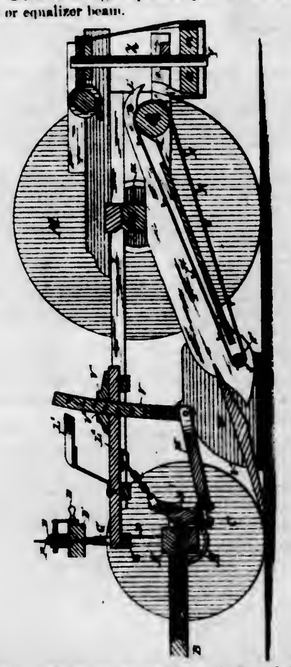
Claim.—1. In a malt-chamber, the floor constructed, substantially as herein shown and described, with alternating strips of wood and of perforated metal, as and for the purpose set forth.

2. The moisture-chambers J, provided with vertical openings Q, extending from top to bottom on the front side, whereby the sponges may be regulated, as described.

3. In a malt-chamber, the combination, with the air refreshing and moistening chamber, of the perforated tube K, and of the atomizing-plate W, arranged above it, substantially as herein shown and described, and for the purpose of atomizing the water, so that the air that passes through the chambers J J will be slightly impregnated with ozone.

4. In a malt-chamber, the combination, with the air refreshing and moistening chamber, of the water-tube K, the atomizing-plate W, the cloth strips U, and the sponges N, substantially as herein shown and described, and for the purpose set forth.

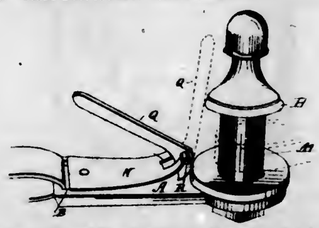
254,375. WOOD-STOVE. COLOSA REEVES, Darien Centre, N. Y. Filed Dec. 28, 1881. (No model.)



Claim.—1. In a stove, the swinging carrier-rod B, in combination with means, substantially as described, for holding said rod extended or at an angle from a perpendicular, substantially as and for the purpose set forth.

2. In a stove, the combination, with the swinging carrier-rod B, of the poker C, substantially as and for the purpose specified.

3. In a stove, the combination, with the swinging rod B, of the poker C, or other similar holding device having the shoulder *e*, substantially as and for the purpose described.

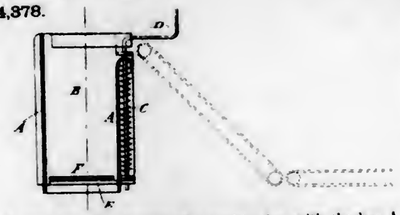


254,376. DITCHING-MACHINE. JOSEPH REINHARD, Celina, Ohio. Filed Aug. 10, 1881. (No model.)

Brief.—The forward end of the ditching-wheel frame is vertically adjusted by it bearing in a saddle that may be raised or lowered by rack and gear. The plow is further adjusted by a bar and pin. Draft is brought upon the plow by a vertically-swinging draft or equalizer beam.

Claim.—The combination of frame L, hinged chute T, having bucket-apron R R', hinged plow U U', setting-bar V, equalizing-bar W, and front carriage, A B C, provided with the balance-yoke I, connected at opposite ends to bar W and chain X, which said chain is fastened in the frame L, substantially as and for the purpose herein shown and specified.

254,377. CHECK-REIN HOOK. CYRUS M. REYNOLDS, Mifflin, Wis. Filed Dec. 1, 1881. (No model.)



Claim.—In combination with the base-plate A, adapted to be secured to or cast with the saddle-tree of the harness, the upright bolt D, secured as described, the roller M, located thereon, the flanged nut H, and the lever Q and spring N, all arranged to operate substantially in the manner specified.

254,378. HARVESTER-DROPPER. IRA RICHARDSON, Lemond, (Meriden P. O.,) Minn. Filed Aug. 24, 1881. (No model.)

Claim.—1. A harvester-dropper constructed substantially as herein shown and described, consisting of the box A, the hinged door B, having handle D and flange E, the spring C, the tilting bottom F, having flange I, and the guard-plate J, as set forth.

254,379. SHIRT. ISAAC SCHERER, New York, N. Y. Filed

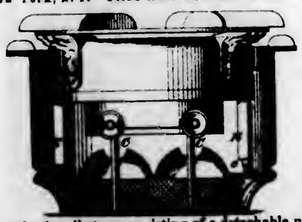
254,378.

2. In a harvester-dropper, the combination, with the box A, of the door B, having arm D and flange E, the spring C, the tilting bottom F, having flange I and spring H, and the plate J, substantially as herein shown and described, whereby the cut grain is received and dropped to the ground in a compact heap, as set forth.

3. In a harvester-dropper, the combination, with the box A, of the door B, having flange E and tilting bottom F, substantially as herein shown and described, whereby the tilting bottom is supported by the door and is released to drop the grain by opening the said door, as set forth.

4. In a harvester-dropper, the combination, with the box A, the door B, and the tilting bottom F, of the springs C and H, substantially as herein shown and described, whereby the said door and bottom are brought back to their places automatically when the grain has been dropped, as set forth.

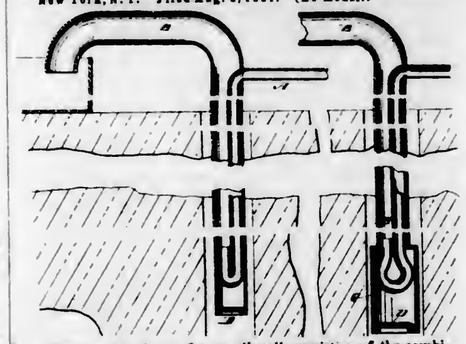
5. In a harvester-dropper, the combination, with the box A and the tilting bottom F, having flange I, of the guard-plate J, substantially as herein shown and described, whereby the tilting bottom is guarded against becoming clogged and the discharge of the grain is facilitated, as set forth.



254,379. SWITCH FOR STREET-RAILWAYS. REUBEN H. RICKER, Boston, Mass. Filed Dec. 23, 1881. (No model.)

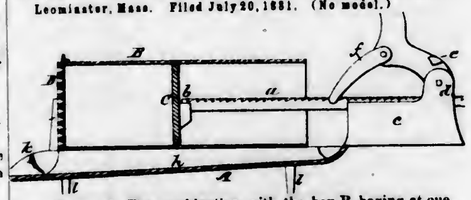
Brief.—The tilting platform which controls the position of the movable-point rail is held against a tendency to rebound through rolling weights in a trough connected to an arm of the platform.

Claim.—In a platform-switch, the combination of the moving weights W W' and the mechanism consisting of the trough L' L, pivot M', and arm H, whereby the said weights are made to change their position whenever the platform is tilted, substantially as described, and for the purpose set forth.



254,380. PETROLEUM COOKING-STOVE. CHRISTOPH RISSMAN, New York, N. Y. Filed Nov. 14, 1881. (No model.)

Claim.—1. An oil-stove consisting of a detachable upper section having a contracted bottom, and provided with an interior wire-gauze cylinder, exterior air-openings, tube-slots in the bottom and cones, in combination with a detachable base-section provided with wick-tubes and supporting recessed posts, the diameter of the said base-section being small enough to be inserted in an inverted position into the top of the upper section, substantially as described.



2. An oil cooking-stove composed of two detachable sections, the lower part of the upper section and the upper part of the lower section being of the same, or nearly the same, diameter, and the top part of the upper section being large enough to receive the top of the lower section in inverted position, whereby space is saved in storage and transportation, the posts E of the lower section resting upon the plate of the upper section above the wire-gauze, the wick-tubes C extending down through the cones, but not below the tube-slots, when inserted in the upper section, substantially as described.

254,381. EJECTOR FOR OIL-WELLS. WILLIAM O. ROBBINS, New York, N. Y. Filed Aug. 5, 1881. (No model.)

Claim.—An ejector for an oil-well, consisting of the combination, with the stand-pipe B, having an inwardly-opening valve, D, of the tube A, contained within the pipe B throughout its length, and having its lower end turned up within the pipe, as described.

254,382. MEAT AND LARD PRESS. THOMAS J. ROCKWOOD, Leominster, Mass. Filed July 20, 1881. (No model.)

Claim.—1. The combination, with the box B, having at one end the removable strainer D, of the follower C, connected to the toothed bar *a* by socket-joint *b*, and the pivoted lever E, with pivoted pawl *f*, substantially as and for the purpose set forth.

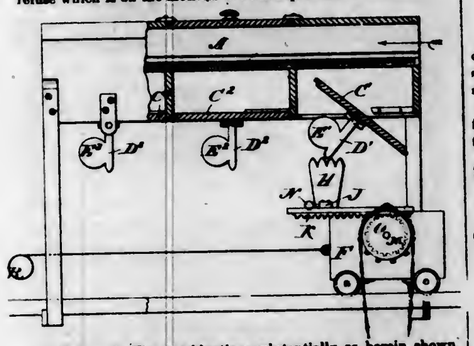
2. The bed A, having guide-plates *c*, in combination with the box B, follower C, connected to the toothed bar *a*, as shown, and the pivoted lever E, carrying pivoted pawl *f*, substantially as and for the purpose specified.

3. The box B, provided at one end with removable strainer D, and the horizontally-operating follower C, in combination with the bed A, inclined longitudinally, as described, and having throughout its entire length the sides *i*, inclined laterally toward and so as to communicate with a groove, *k*, arranged lengthwise in the bed at its middle and opening into a spout, *k*, all being substantially as and for the purpose set forth.

254,383. PORTABLE BURGLAR-ALARM. JOS. H. ROSS, Norwalk, Conn. Filed Nov. 10, 1881. (No model.)

Claim.—1. The combination, with a hanger and an alarm apparatus suspended therefrom by a pivot, and comprising an escapement-wheel and escapement-anchor for operating a bell-hammer, of an arm extending from said anchor, and a catch upon the hanger for engaging with said arm to hold the alarm apparatus inoperative, substantially as specified.

2. The combination of the hanger A, the case B, having the arm B' pivoted to said hanger at *b*, and containing the movement comprising the escapement-wheel F, the escapement-anchor A, and hammer *i*, the arm *j*, projecting from the escapement-anchor through an opening in the case, and the catch *k*, for engaging with said arm, substantially as specified.



254,384. MEDICINAL TONIC. LENA ROUDEBUSH, Louisville, Ky. Filed June 16, 1881. (No specimens.)

Brief.—Unites one quart of wine or other desired liquor with one tea-cupful of strong infusion of wahoo bark, one-third that amount of infusion of valerian, and same amount of infusion of golden seal. The teaspoonful of the strength of two ounces to a pint of water. This is used as a general tonic for debility.

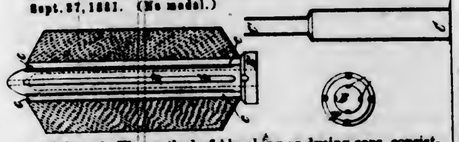
Claim.—The compound or tonic herein described, and consisting of wine or spirituous liquor, wahoo bark, valerian, and golden seal, substantially in the proportions named.

254,385. TRUNK FOR COTTON-OPENERS. PATRICK ROWE and JAMES J. SCARLES, Lowell, Mass. Filed Aug. 18, 1881. (No model.)

Brief.—The floor of the cotton-opener trunk is composed of a series of pivoted sections. A car provided with means for tilting the sections passes beneath the same, and thereby causes any refuse which is on the sections to be dumped into the car.

Claim.—1. The combination, substantially as herein shown and described, with a cotton-opener trunk provided with pivoted floor-sections, of a car adapted to pass under the floor-sections of the trunk and provided with means for tilting the sections thereof and dumping the refuse from the bottom into the car, as set forth.

2. The combination, with the cotton-opener trunk A, of the pivoted sections C' C², &c., the projections D' D², the cam H, and the car F, substantially as herein shown and described, and for the purpose set forth.



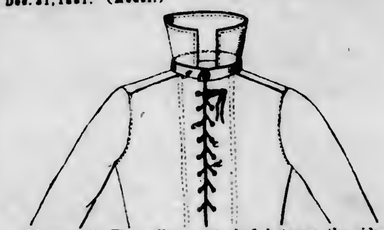
3. The combination, with the cotton-opener trunk A, of the pivoted sections C' C², the projections D' D², having the weights E' E² attached thereto, the cam H, and the car F, substantially as herein shown and described, and for the purpose set forth.

4. The combination, with the cotton-opener trunk A, of the pivoted sections C' C², the projections D' D², the cam H, and means for adjusting the same, and the car F, substantially as herein shown and described, and for the purpose set forth.

5. The combination, with the cotton-opener trunk A, of the pivoted sections C' C², the projections D' D², the cam H, the bar J, the binding-screw N, and the car F, substantially as herein shown and described, and for the purpose set forth.

6. The combination, with the cotton-opener trunk A, of the pivoted sections C' C², the projections D' D², the cam H, the bar J, the racks K, the cog-wheels L, the studded wheel O, and the chain P, substantially as herein shown and described, and for the purpose set forth.

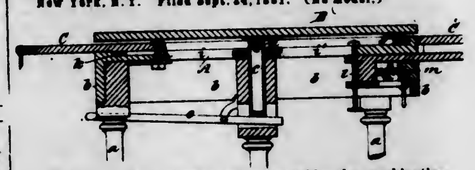
254,386. BLEACHING COTTON IN THE FORM OF COPS. EMANUEL RUSON, Pottendorf, near Vienna, Austria. Filed Sept. 27, 1881. (No model.)



Claim.—1. The method of bleaching or dyeing cops, consisting in placing the cop after winding upon a bleaching spindle or spool which has an external diameter less than that of the hole in the cop, providing for a clear annular space all round between the cop and spindle or spool, and then placing the spindle or spool, with the cop upon it, in a vessel, wherein it is subjected both internally and externally at the same time to the action of bleaching or other liquid, substantially as herein described.

2. The combination, with a cop and its winding-bobbin A, of a bleaching-spindle, B, having a smaller external diameter than said bobbin, substantially as herein described.

3. The combination, with the winding-bobbin A and spindle B, of the tube C, with the extension C', substantially as herein described.

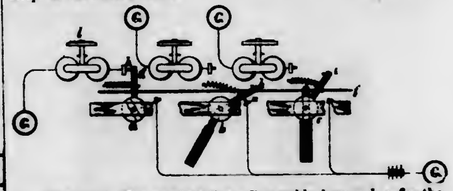


254,387. SHIRT. ISAAC SCHEBER, New York, N. Y. Filed Dec. 31, 1881. (Model.)

Claim.—1. The collar *c*, attached between the sides of a doubled strip forming the band, to enable it to hang inwardly straight below the band or outwardly to serve the purpose of a separate collar, as shown and described.

2. In shirts having open bosoms, the combination of inner flaps, *b*, outer flaps, *c*, having eyelets, and lacing-cord *d*, substantially as shown and described.

254,388. CIRCULAR EXTENSION-TABLE. JOHN F. SCHULTE, New York, N. Y. Filed Sept. 24, 1881. (No model.)



Claim.—1. In a circular extension-table, the combination, with the radially-sliding leaves C, of the intermediate radially-sliding leaves C', movable under the table-top B, and provided with means, substantially as described, whereby when the leaves are drawn out the leaves C' are raised to a level with leaves C, as and for the purpose specified.

2. In circular extension-tables, the combination of sliding leaves C, provided with pins *h*, segments C', having pins *l*, and blocks *m*, with the table A, having a slotted top and apertured rail *b*, substantially as shown and described.

254,389. ELECTRICAL SWITCH-BOARD. CHARLES E. SCRIBNER, Chicago, Ill., assignor to the Western Electric Manufacturing Company, same place. Filed Dec. 22, 1881. (No model.)

Brief.—Each subscriber's line is connected to a vertical pivoted bar which carries an arm which is normally connected with the ground through an annunciator. In another position the arm is connected to a signaling-battery, and in a third position the arm is out of contact, but plug-connection may be made with the cross-strips of the switch-board.

Claim.—1. The combination of movable bars *a b c*, for the subscribers' lines, and transfer-strips *d e f*, having plug-holes at the intersections, contact-arms *g h i*, and two contact-points for each arm, one for closing the circuit through the annunciator to ground, the other for connecting with the signaling-battery, substantially as shown and described.

2. The combination, substantially as herein described, of upright bars intersecting the transfer-strips, with contact-arms, one attached to each bar, and pegs for connecting the line of any given bar to a transfer-strip.

254,390. WICK-TRIMMER. WILLIAM C. SEATON, Quebec, Province of Quebec, Canada. Filed Dec. 23, 1881. (Model.)

Claim.—1. A wick-trimmer made substantially as herein shown and described, consisting of a box or frame provided with a slot through which the wick is passed, which box contains or holds a sliding brush, as set forth.

2. The combination, with the box or frame H, of the sliding

254,390.

box F, containing a brush-wheel, A, substantially as herein shown and described, and for the purpose set forth.

3. The combination, with the box or frame H, of the sliding box F, the brush-wheel A, the pinion E on the shaft of this brush-wheel, and the rack P, substantially as herein shown and described, and for the purpose set forth.

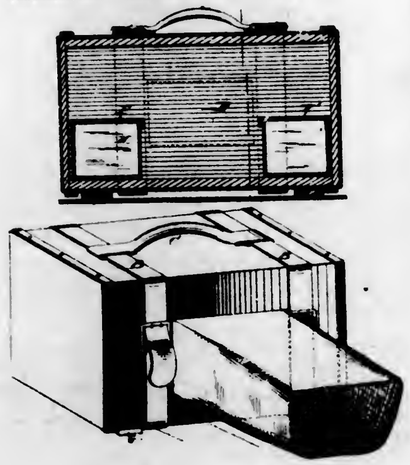
4. The combination, with the box or frame H, of the sliding box F, the brush-wheel A, and the studs F', passing through the slots G in the sides of the frame H, substantially as herein shown and described, and for the purpose set forth.

5. The combination, with the box or frame H, of the sliding box F, the brush-wheel A, and the spring L, attached to the boxes F and H, substantially as herein shown and described, and for the purpose set forth.

6. The combination, with the box or frame H, provided with a slot, Q, of the sliding box F, the brush-wheel A, and the clippers or holder S, substantially as herein shown and described, and for the purpose set forth.

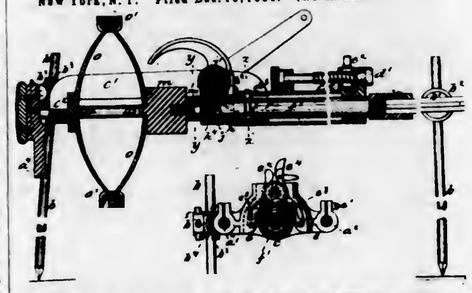
7. The combination, with the box or frame H and the spring L, of the sliding box F, provided with the handle-loop N, having its lower end projecting into the said box, and the rotating brush-wheel A, substantially as and for the purpose set forth.

8. The combination, with the box or frame H, provided with a slot, Q, of the sliding box F, the brush-wheel A, the fixed blade T, the pivoted blade U, and the spring W, substantially as herein shown and described, and for the purpose set forth.



254,391. INHALER. WILLIAM F. SUMPLE, Mount Vernon, Ohio. Filed Aug. 1, 1881. (No model.)

Claim.—1. In an inhaler, the combination, with a container for holding medicine and the vapor thereof and an inhaling-tube attached to said container, of an atomizer located within said container, substantially as set forth.



2. In an inhaler, the combination of the container A, air-pump C, having the pipe I, the pipe K, and the outlet or inhaling-tube F, substantially as and for the purposes shown.

254,392. PORTABLE DARK ROOM. JOHN SRADISKO, New Braunfels, Tex. Filed Dec. 22, 1881. (Model.)

Claim.—A box having the aperture D, the flexible sleeve E, projecting from the inside of said aperture, and the end compartments, H H', provided with swinging lids, as shown and described, whereby the inside may form a dark chamber, in which the plates may be transferred from and to the plate-holder of the camera without being exposed either to light or dampness.

254,393. ROCK-DRILLING MACHINE. ALFRED SEDLOCK, New York, N. Y. Filed Dec. 10, 1881. (No model.)

Claim.—1. In an adjustable leg for rock-drilling machines, a straight supporting-rod adapted to slide through a bolt fitted at right angles on a rod or a bar of the frame, clamping-washers between the straight supporting-bar and said rod or bar, and a nut on the end of the bolt for clamping the whole together, substantially as described.

2. In combination, the straight supporting-rod b, the bolt b', having two holes at right angles through it, one of which is laterally enlarged, the clamping-washers b^2 b^3 b^4, the nut b^5, and the rod or bar of the frame, adapted to pass through the plain hole in the bolt, substantially as set forth.

3. A frame for rock-drilling machines, composed of the two side bars, a' a^2, the one, a', of which is pointed and the other one, a^2, provided with an adjustable point, the end pieces, a, having the three short rods a^3 a^3 a^4, in combination with three adjustable supporting-legs, two adapted to be connected to the short rods a^3 a^3 and the other to the front end of one of the side bars, a', and also to the short rod a^4, substantially as and for the purpose set forth.

4. A frame for rock-drilling machines, composed of a rear end piece and two side bars, on which the body and operating parts of the machine slide, the front end of one of the side bars being pointed and the other one being provided with an adjustable point, substantially as and for the purpose set forth.

5. The body c, composed of a cylindrical shell, in which fits the drill-holding plunger, an end piece, c^2, the connecting-girders c' c', provided with bearings for the driving-shaft, and the bearings c^3 c^4, by which the body c is supported and free to slide on the side bars of the frame of the machine, substantially as set forth.

6. In a rock-drilling machine, a body carrying the operating mechanism and adapted to slide on the side bars of the frame, a hammer, also adapted to slide on the said side bars between one end of the main portion of the body and an end piece connected thereto by girders, and a spring located between the hammer and end piece of the frame, and adapted by its resilience to drive the hammer against the end of a plunger fitted in the main portion or cylindrical shell of the body, substantially as and for the purpose set forth.

7. The combination, with a sliding hammer and end piece of the body, of a spring adapted to be secured to the hammer and end piece and maintain its position between them by reason of its resilience only, substantially as set forth.

8. The curved flat spring q, in combination with the end piece, c^2, having the recess q', and the hammer m, having the recess q', substantially as set forth.

9. In combination, the body c c' c' c^2 c^3 c^4, the hammer m, with the actuating-cams on the shaft i, and the spring q, substantially as set forth.

10. The striking-plug of the hammer, having a concave face, in combination with the plug at the end of the drill-plunger, having a convex end, substantially as and for the purpose set forth.

11. A drill-holding plunger fitted to slide in the body of the machine, and operated to reciprocate to move the point of the drill to and from the bottom of the hole positively in both directions by means substantially as described, and actuated from the driving-shaft.

12. A drill-holding plunger fitted to slide in the body of the machine, and operated to reciprocate to move the point of the drill to and from the bottom of the hole positively in both directions by means substantially as described, and actuated from the driving-shaft, in combination with a compensating-spring.

13. A drill-holding plunger fitted to slide and rotate in the body of the machine, in combination with means, substantially as described, for positively moving the drill to and from the bottom of the hole, and means, substantially as described, for intermittently rotating the same when away from the bottom of the hole.

14. In combination, the plunger f', sliding head A, having bearers h^3 h^3, worm-wheel j, and cams i' i^2, whereby the plunger f' is caused to move to and from the bottom of the hole positively in both directions, substantially as described.

15. In combination, the plunger f', sliding head A, having bearers h^3 h^3, cams i' i^2, worm-wheel j, and worm-cams j', whereby the plunger f' is caused to move to and from the bottom of the hole positively in both directions, and be positively rotated when away from the bottom of the hole, substantially as described.

16. In combination, the plunger f', adapted to receive a reciprocating movement after each blow of the hammer thereon, the worm-wheel j, and worm-cams j', substantially as described.

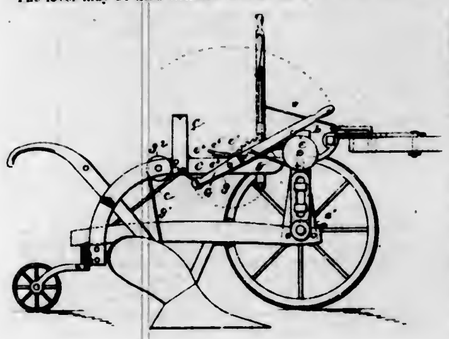
17. In combination, the drill-holding plunger f', sliding head A, cams i' i^2, worm-wheel j, and spring h^4, whereby the head A is allowed to move a short distance after the drill has reached the rock, substantially as set forth.

18. In a rock-drill, a body carrying the operating parts of the machine and adapted to slide on the two side bars of the frame, in combination with the feed-screw fitted to rotate in bearings on the body, and a nut-holding frame adapted to be adjusted in position on and secured to the said side bars, substantially as set forth.

19. A feed-screw for rock-drilling machines, having a ratchet-shaped thread, substantially as and for the purpose set forth.

20. In combination with a ratchet-shaped thread feed-screw fitted in bearing on the body, spring-acting half-nuts carried by a frame connected to the main frame of the machine, substantially as set forth.

21. In combination, the screw d, the toothed wheel d^2, the spring-acting pawl d^3, the yoke f, the roller or stud d^4, and plunger f', substantially as set forth.



22. In combination, the screw d on the body and the half-nuts e^2, provided with the springs e^3, and the nut-frame e, substantially as described.

23. A drill-holding plunger fitted to slide in the body of the machine, and operated to reciprocate to move the point of the drill to and from the bottom of the hole positively in both directions by means substantially as described, and actuated from the driving-shaft, in combination with a compensating-spring and a feeding device constructed and operated to feed the machine forward as fast as the drill cuts, substantially as set forth.

24. A drill-holding plunger fitted to slide in the body of the machine, and operated to reciprocate to move the point of the drill to and from the bottom of the hole positively in both directions by means substantially as described, and actuated from the driving-shaft, in combination with a compensating-spring, a feeding device constructed and operated to feed the machine as fast as the drill cuts, and a spring-acting hammer, substantially as set forth.

254,394. PLOW. NATHANIEL SHAFFSTALL, Flint, Ind. Filed Dec. 7, 1881. (No model.)

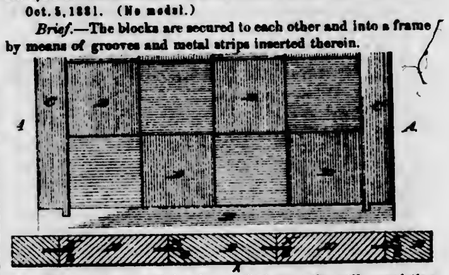
Brief.—The front end of plow-beam is raised by a crank beneath the arch. The crank has a pulley upon it around which a rope passes, both ends of which are fastened to the lever. From the foot of the same lever a cord or chain passes over a sheave to lift the rear end. The pivoted tongue is vibrated by a bell-crank and lever. The lever may be used without the rear chain.

Claim.—1. The combination, in a sulky-plow, of the arched frame b, the crank E, journaled therein, the grooved pulley e, the bar e', connecting the crank to the front end of the plow-beam, and the lever G, provided with a chain, g, substantially as shown and described.

2. In a plow, the combination, with the frame and plow-beam, of the connecting-bar and crank E e e', and the lever G, having its chain g, attached to its lower end, passed around pulley e and secured to the lever above its fulcrum, and also provided with chain g', attached to the rear end of the plow and passing over pulley g^2, substantially as and for the purposes shown and described.

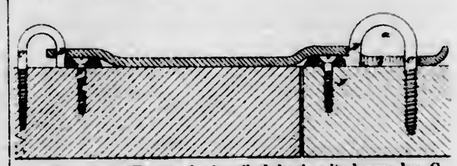
3. The combination of the plow-beam, its vertical bar e', the crank E, and its pulley e with the lever G, chain g, adapted to operate the forward end of the plow, and the chain g', passing over the pulley g^2 and adapted to operate the rear end of the plow, substantially as shown and described.

254,395. BILL AND FILE HOLDER. PALMER K. SHANKLAND and EDWIN A. BROOKS, Jamestown, N. Y. Filed Nov. 14, 1881. (Model.)



Claim.—1. The combination of the two parts of the cover, a clamp composed of two curved jaws which are hinged together, a screw-rod, and a thumb-screw, the parts being arranged to operate substantially as described.

2. The combination of a clamp composed of the two curved jaws, each one of which is provided with a suitable projection or flange, a screw-rod, and a thumb-screw which is placed between the two flanges, with the two parts of the cover, one of which has a groove formed in it, while the other has a suitable thickness or projection formed upon it for the clamp to catch behind, substantially as set forth.



254,396. FLOOR-TILE. JOHN SIEBEL, Oskaloosa, Iowa. Filed Oct. 5, 1881. (No model.)

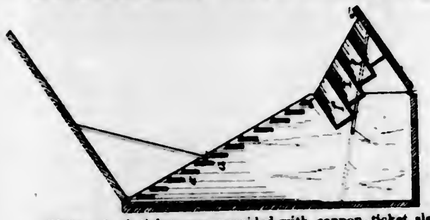
Brief.—The blocks are secured to each other and into a frame by means of grooves and metal strips inserted therein.

Claim.—As an article of manufacture, a floor-tile consisting of a number of blocks, D, arranged within a frame, A, the edges of said blocks and the inner edges of the ends and sides of said frame being provided with recesses or kerfs K for the sheet-metal strips S, which serve to make tight joints and also to secure the blocks in the frame, substantially as set forth.

254,397. HASP-LOCK. CHANCEY SMITH, Chicago, Ill. Filed Nov. 4, 1881. (No model.)

Claim.—1. The staple described, having its longer leg, C, screw-threaded, and its shorter leg, D, provided with a foot, E, apertured to receive a screw, F, substantially as described.

2. In combination with a hasp, the staple described, having one of its legs the longer and screw-threaded and the shorter leg provided with a foot intended to rest on the part to which the staple is applied, and to be arranged to extend beneath the hasp when the latter is in place thereon, substantially as described.



254,398. HOLLOW GRATE. JAMES G. SMITH, Cleveland, Ohio. Filed Sept. 29, 1881. (No model.)

254,398.

Claim.—In a grate for fire-places or open stoves, the combination, with the end and rear flues, B B and D, the former having communications C C and the latter communication E, of the front cross-flue, G, top flue, I, hollow grate-bars F, vertical front flues, H H, hollow angular or curved pipes or flues K, and the sliding damper J, substantially as and for the purposes set forth.

254,399. COMBINED COUPON AND LOCAL TICKET CASE. M. A. SMITH, Elmira, N. Y. Filed Dec. 5, 1881. (No model.)

Claim.—1. A ticket-case provided with coupon-ticket slats arranged in steps and with local-ticket cells arranged in steps, the former located above and oppositely arranged to the latter, whereby the longer coupon-tickets are, when the case is closed, arranged above the lower local tickets, and vice versa, substantially as shown and described.

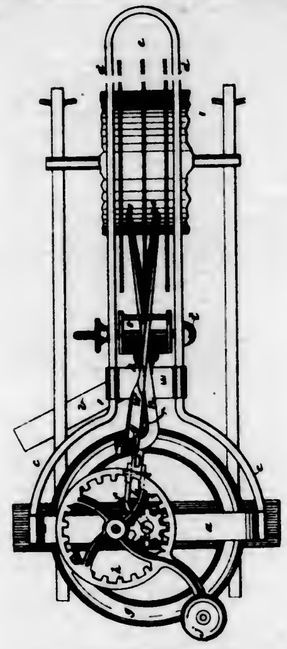
2. In a combined coupon and local ticket case, the combination of an upper series of coupon-slats arranged in descending steps from rear to front, and a lower local-ticket case the cells of which are arranged in descending steps from front to rear, and are adapted to be swung in under and out from beneath said coupon-ticket slats, substantially as shown and described.

3. In a ticket-case, the combination of a slanted coupon-ticket section provided with hooks and a cover, with a tilting local-ticket section provided with eyes and a lock, substantially as shown and described.

4. In a ticket-case, the tilting front E, provided with rigidly-attached ticket-cells the bottoms of which are arranged in steps descending from front to rear, substantially as shown and described.

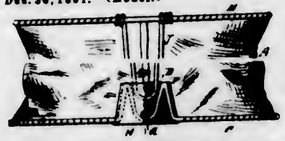
254,400. MACHINE FOR FILING GIN-SAWS. ELIAS WHITFIELD SOUTH, Anderson Court-House, S. C. Filed Nov. 1, 1881. (No model.)

Claim.—1. The combination, with the file-holders *a a'*, provided with a spring, *r*, pressing the files together, and pivoted to each other at their inner ends and crossing each other, and operated by mechanism, substantially as described, to impart a reciprocating and vibratory motion to the files, of the frame *a c d*, substantially as described, and for the purpose set forth.



2. The combination, with the file-holders *a a'*, provided with a spring, *r*, and pivoted to each other at their inner ends, and operated by mechanism substantially as described, of the frame *a c d*, pivoted guide *s*, and strap *u*, provided with a stirrup or treadle, *e*, substantially as described, and for the purpose set forth.

3. The combination, with the file-holders *a a'*, pivoted to each other at their inner ends, crossing each other, and provided with a spring, *r*, of the pitman *l*, crank-shaft *f*, and gears *h k*, whereby a reciprocating and vibratory movement is given the file-holders, substantially as described.

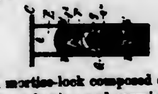


4. The combination of the file-holders *a a'*, constructed as set forth, spring *r*, pitman *l*, crank-shaft *f*, gears *h k*, frame *a c d*, pivoted guide *s*, and strap *u*, provided with a stirrup or treadle, substantially as described, and for the purpose set forth.

5. The combination, with the lower file-holder, *a*, curved at its inner end, and provided with the pin *g*, and also with a hole, *e*, at its curved outer end, of the upper file-holder, *a'*, pivoted to the lower file-holder at its inner end, and provided with a hole at its bent outer end, spring *r*, pressing the files together, and caps *p*, removably secured to the file-holders, substantially as described, and for the purpose described.

254,400.

254,401. COTTON-BASKET. GEORGE W. STARR, Vicksburg, Miss., assignor to himself and Joseph B. Gotthelf, same place. Filed Dec. 30, 1881. (Model.)



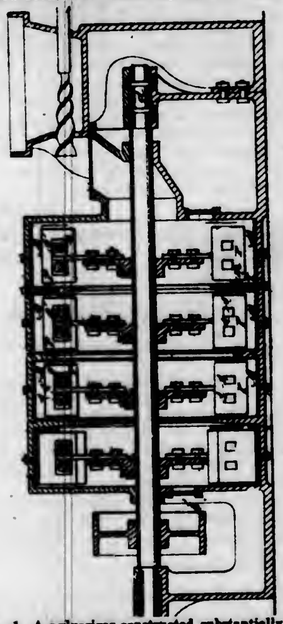
Claim.—1. A folding cotton-basket made, substantially as herein shown and described, of pliable material, and with sockets and swinging bails or arms on its hoops, as set forth.

2. In a cotton-basket, the combination, with the tubular casing A, made of canvas or other pliable material, of the bottom hoop, C, provided with sockets H, the top hoop, B, and the swinging arms or bails J, attached to this top hoop, substantially as herein shown and described, and for the purpose set forth.

3. In a cotton-basket, the combination, with the pliable tubular casing A, of the bottom hoop, C, provided with M-shaped bends F, the U-shaped bent plates D, secured over these bends, the top hoop, B, and the swinging arms or bails J, attached to this top hoop, B, substantially as herein shown and described, and for the purpose set forth.

4. In a cotton-basket, the combination, with the pliable tubular casing A, of the bottom hoop, C, provided with M-shaped bends F, the U-shaped bent plates D, the rivets G, the top hoop, B, and the swinging U-shaped bails or arms J, substantially as herein shown and described, and for the purpose set forth.

254,402. MORTISE-LOCK. SOLOMON P. STODDARD, New York, N. Y. Filed Sept. 3, 1881. (Model.)



Claim.—1. A mortise-lock composed of the inner sheath, B, containing the lock mechanism and carrying the face-plate C, and the outer cylindrical case, A, adapted to receive and hold the said sheath, and having the longitudinal ribs *a*, formed by folding the edges of one half-cylinder about the edges of the other half-cylinder, said sheath and case having coincident keyways, substantially as and for the purpose specified.

2. In a mortise-lock, the combination, with the sheath B, as described, of the bolt E, the side *e'* of which has the rack *e²*, the other side, *e³*, being cut away at *e⁴*, together with the tumblers F, seated on the bottom plate of said bolt, and the pinion G, seated on top of the tumblers, and having the hub *g'* projecting through an opening in the side plate of said sheath, all constructed and arranged to operate as and for the purpose specified.

3. In a mortise-lock, the combination, with the bolt and its rack and the tumblers, of a pinion having a key-slot, which permits the key to make a quarter-turn in said slot and disengage the tumblers before rotating the pinion, substantially as and for the purpose specified.

4. In a mortise-lock, the combination, with the sheath B, the bolt E, and the tumblers F, substantially as described, of the pinion G, having the key-slot *g*, with the two diametrically-opposite inwardly-pointed projections *g'*, constructed and arranged to operate as and for the purpose specified.

254,403. MACHINE FOR PULVERIZING ORES, &c. JACOB J. STORER, New York, N. Y. Filed May 17, 1881. (No model.)

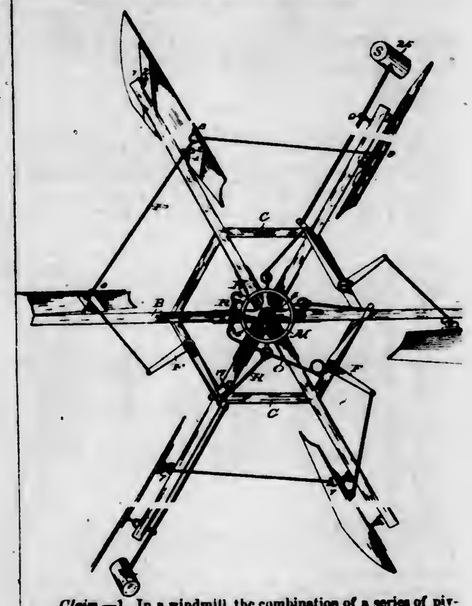
Claim.—1. A pulverizer constructed substantially as herein shown and described, consisting of a fixed horizontal cylinder, in combination with two or more pulverizing-chambers located therein and separated by annular ribs, and a separate discharge or fan chamber communicating axially with said chambers and provided with a peripheral discharge, said cylinder being also provided with a central horizontal shaft carrying pulverizing-paddles and exhaust-fans, the latter of which are of greater area than the former, and having adjustable end air-openings, as set forth.

2. In a pulverizer, the combination of a horizontal cylinder lined with plate-iron and having adjustable air-openings, two or more pulverizing-chambers located therein and formed by ribs and removable diaphragms, and a discharge-chamber communicating axially therewith and having a peripheral opening and containing fans of greater area than the pulverizing-paddles, substantially as shown and described.

3. In a pulverizer substantially as herein shown and described, the combination, with the ribs I, of the annular diaphragms I', substantially as shown and described.

254,404. POCKET-KNIFE. HERBERT SCRAY, Newark, N. J., assignor to himself and James E. Billings, same place. Filed May 12, 1881. (Model.)

Brief.—The invention consists in striking up the handle and spring in one piece from sheet metal.



Claim.—As an improved article of manufacture, a knife-handle struck up from a single piece of sheet metal and formed with sides B and tongue C, as shown and described.

254,404.

254,405. WINDMILL. SAMUEL D. STRAW and ALFRED J. STRAW, Elkhart, Ind.; said Signor assignor to Orville T. Chamberlain, same place. Filed Oct. 6, 1881. (No model.)

Brief.—The sails are connected to a wheel, M, which rotates independently of the main shaft N, and which is controlled by spring O and governors T, whereby the amount of effective sail area exposed is dependent on the force of the wind.

Claim.—1. In a windmill, the combination of a series of pivoted fans, a wheel, M, on the main shaft, adapted to be revolved independently of the main shaft, one or more bell-crank levers connected to the wheel M and to the fans, and a spring, O.

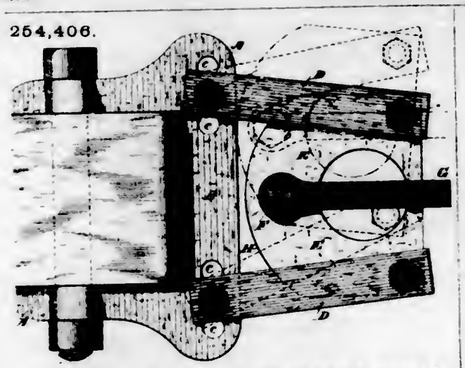
2. The combination of the wheel M on the shaft, the spring O, the bell-crank, and the connecting-rods having double eye attachment to the wheel and to the fans, as described.

3. The wheel M, carried by the main shaft and adapted to revolve without longitudinal motion on such shaft, in combination with one or more bell-crank levers connected to the pivoted fan-sections and one or more centrifugal governors.

4. The wheel M, in combination with a bell-crank lever and a series of two or more fans connected together and operated simultaneously by the revolution of the wheel M.

5. The wheel M, in combination with a bell-crank lever and a pivoted fan operated through such bell-crank by the revolution of the wheel M.

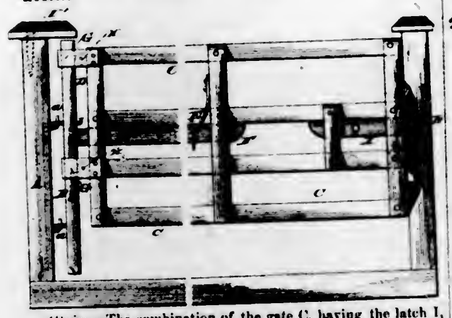
6. In combination with the wheel M and one or more pivoted fans, the bell-cranks and the connecting-rods attached to the said wheel and fan or fans by a double eye joint composed of two connected rings or hooks, both having a free movement, whereby a universal connecting-joint is formed.



254,406. PLOW-GOVERNOR. DAVID B. TAGGART, Logan County, assignor of one-half to Charles D. Campbell and Harold E. Knight, Bellefontaine, Ohio. Filed Feb. 10, 1881. (Model.)

Brief.—Straps or links on each side of a horizontal clevis connect to the front side of a vibrating plate. In the rear of the link-pivots in the plate is pivoted the draft-hook. The oscillation thus provided neutralizes any irregularity in the course of the team.

Claim.—1. In a plow-governor, the sliding plate E, attached at its front end by link-connection to the end of the plow-beam, substantially as set forth.



2. The combination of plate E, links D, adjustable in clevis A, and draft-link G, substantially as set forth.

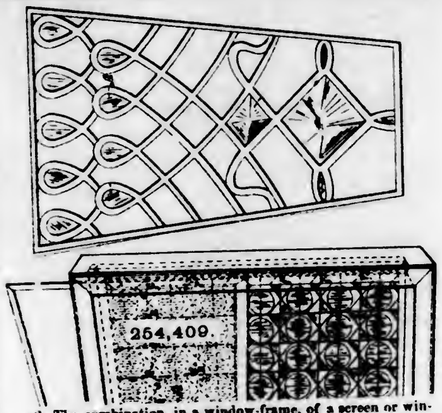
254,406.

3. A plow-governor having a vibrating plate, E, attached by link-connection to the plow-beam, and carrying a draft pin or bolt moving in an arc as the team swerves from side to side, as described.

254,407. SWINGING GATE. WILLIAM B. TATMAN and WILLIAM C. DAVIS, Fairfield, Iowa. Filed Oct. 20, 1881. (No model.)

Claim.—The combination of the gate C, having the latch I, spring-latch F, beveled on its upper side, and the loops G, having frictional rolls H, bar D, having mortises *b*, embraced by the loops G, and hinged to the post A, having the pivoted caps I', overhanging the bar D, and post B, all constructed and arranged to operate as set forth.

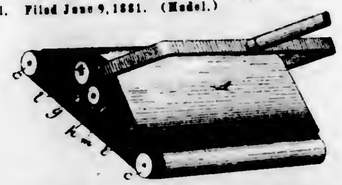
254,408. COTTON-STALK CUTTER. FRANCIS M. THOMPSON, McKinney, Tex. Filed Nov. 12, 1881. (No model.)



Claim.—1. In a cotton-stalk cutter, the combination, with the sled A, provided with a series of holes in its upper surface, of the hinged perforated bars C, the cross-bar D, the pins E, and the knives F, substantially as and for the purpose set forth.

2. In a cotton-stalk cutter, the combination, with the sled A, carrying the hinged perforated bars C, cross-bar D, and knives F, of the platform G, secured to the rear part of the sled, and the standards H, secured to a cross-bar of the sled in front of the platform, substantially as and for the purpose set forth.

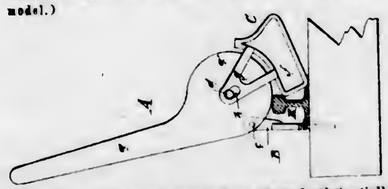
254,409. COLORED-GLASS WINDOW. LOUIS C. TIFFANY, Morristown, N. J. Filed July 26, 1881. (No model.)



Brief.—Consists of a frame-work containing colored panes, forming a pattern of colored glass, and intermediate empty spaces for the passage of direct light. This screen is placed in a window-frame with an ordinary window.

Claim.—1. A window or screen consisting of a frame-work containing colored panes, forming a pattern of colored glass, and intermediate empty spaces for the passage of direct light, substantially as shown and described.

2. The combination, in a window-frame, of a screen or window consisting of pieces or a pattern of colored glass and intermediate empty spaces in a frame-work, with a second window of plain glass, substantially as shown and described.



254,410. CARPET-SWEEPER. CHARLES L. TRAVIS, Minneapolis, Minn., assignor of one-half to Mervin Tabor, Aurora, Ill. Filed June 9, 1881. (Model.)

Claim.—1. In a carpet-sweeper, the combination of the following elements: the closed body, two traction-rolls, each extending the entire length of the body outside thereof, a central rotary brush, pulleys mounted upon the ends of the rolls, a fixed pulley upon the body, a movable pulley mounted upon the swinging arm acted upon by a spring, and a belt extending around the four pulleys, in the manner described and shown.

2. In a carpet-sweeper, the combination of the pulleys *c c*, mounted upon the traction-rolls, the brush-driven pulley *g*, sustained in the vertically-adjustable plate *h*, the pulley *k*, arm *l*, and spring *f*, with belt *i*, as shown, whereby a vertical adjustment of the brush is permitted and the belt kept taut.

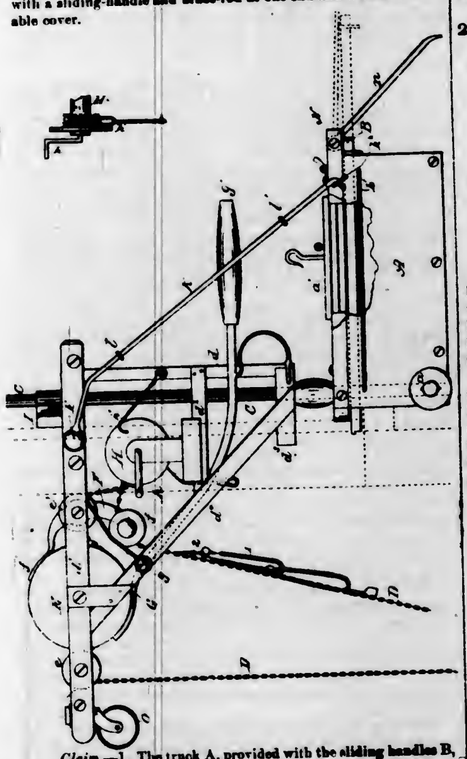
254,411. SPIKE-EXTRACTOR. WILLIAM B. TURNER, Long Island City, and ALBERT P. PROUT, Woodhaven, N. Y.; said Turner assignor to said Prout. Filed June 30, 1881. (No model.)

Claim.—An improved claw-bar constructed substantially as herein shown and described, consisting of lever A, having an enlarged eccentric end, *a'*, provided with central transverse rod, *d*, swinging shoe C, provided with slotted hangers *g g*, and curved on the upper face to conform to the curve of the eccentric end of the lever, and swinging claw B, arranged as set forth.

254,412. SEAT FOR VEHICLES. OLIVER VARDEMAN, Racine, Wis. Filed Dec. 10, 1881. (No model.)

Claim.—1. A frame or support for the end of a wagon-seat, provided with a wide flange upon its top edge, through which the clamping-bolts are passed, and with a strengthening-flange around its other edges, and suitable locks or projections for extending down inside of the wagon-bed, one of which forms a support for

254,412.



the clamping device which fastens the seat in position, substantially as described.

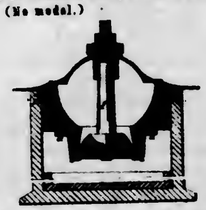
2. A metallic frame or support for one end of a wagon-seat, having the support for the clamping device in a single piece with it and the support braced by the flanges G, substantially as set forth.

254,413. FIRE-ESCAPE. THOMAS J. VINTON, Holly, Mich. Filed Jan. 4, 1882. (No model.)

Brief.—An upright rod removably attached to the truck carries the braced crane, in which the drum holding the endless chain is mounted. The chain passes over pulleys, also mounted in this crane. The center pulley is provided with a lower brake operated from within the room and an upper brake operated automatically by and proportionately to the weight on the chain. A brake-rod fastened to the frame is adapted to hook in the links of the chain to prevent its unwinding, when so desired. Suitable side braces are adjustably fastened to the truck. The truck is also provided with a sliding-handle and brace-rod at one end and with a removable cover.

Claim.—1. The truck A, provided with the sliding handles B, fitted in grooves in the truck, and the pivoted stay-bar *a*, in combination with the operating hoisting apparatus, substantially as shown.

2. The rod C, removably attached to the truck A, in combination with the transverse beam I and the crane *d' d² d³ d⁴*, substantially as described.

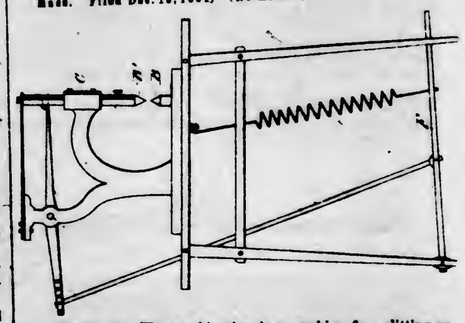


3. The combination of the crane consisting of the vertical beam *d*, horizontal beams *d' d² d³*, and angular brace *d⁴*, with the pulleys *e* E *e'*, pivoted arm F, its brake *f'* and pulley *f*, the drum-crank *h*, and brake G, all arranged to operate substantially as shown and described.

4. The combination of the crane consisting of the vertical beam *d*, the horizontal beams *d' d² d³*, and brace *d⁴*, and provided with pulleys *e* E *e'*, vertical arm F, brake *f'*, and pulley *f*, and drum H, crank A, brake-rod *h'*, and brake G, with the rod C, transverse beam I, and truck A, all arranged to operate substantially as shown and described.

5. The crane provided with the braces consisting of the rods K, pivoted thereto at their upper ends, and having their lower ends removably secured to the truck A, the rods K being held in position by the transverse bars *l l'*, in combination with the supporting-rod C and truck A, substantially as described.

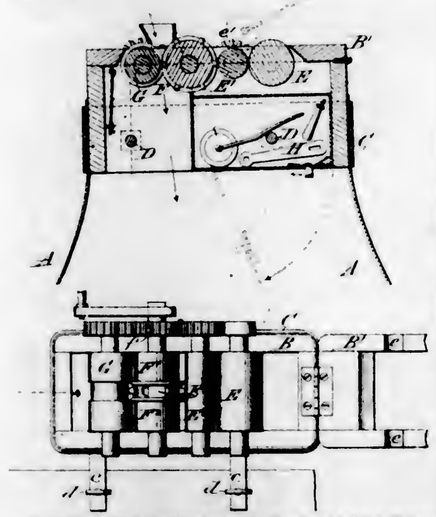
6. The combination of the truck A, having the removable lid *a'*, the sliding handles B, and the pivoted stay-bar *a*, the supporting-rod C, upon which is pivoted the transverse beam I, and crane consisting of the vertical beam *d*, the horizontal beams *d' d² d³*, the said horizontal beam *d'* being provided with the pulleys *e* E *e'*, the pivoted arm F being formed into a brake, *f'*, at its upper end bearing against the pulley E, and having the pulley *f* at its lower end, the brace *d⁴*, having pivoted thereto the brake G, bearing against the under side of the pulley E, and provided with the handle *g'*, the beam *d²*, having mounted thereon the drum provided with the endless chain D and the crank *h*, the chain being provided with suitable detachable stirrups, 1, the crane being braced in proper position by means of the rods K, pivoted thereto at their upper ends, and having their lower ends removably attached to the truck A, and held in position by means of the transverse bars *l l'*, all being combined to operate substantially as shown and described.



254,414. COFFEE-MILL. RODOLPHUS L. WARD, New Britain, Conn., assignor to Landers, Frary & Clark, same place. Filed Dec. 15, 1881. (No model.)

Claim.—1. A box mill having a hopper, C, arranged in the box at its upper edge and secured to the sides of the box, combined with a top having an opening corresponding to the opening in the hopper, constructed to fit upon the upper surface or body of the hopper, and secured to the box independent of the hopper, substantially as described.

2. The combination, in a box mill, of a wood hopper, C, arranged within the box and supported by the sides of the box, combined with a runner-shell upon the under side of the hopper, and a metal top having an opening corresponding to the opening in the hopper, and constructed to fit the body of the hopper and extend and secured to the sides of the box independent of the hopper, substantially as described.



254,415. MACHINE FOR CRACKING OR SPLITTING MARBLE OR OTHER STONE. CHARLES A. WELLINGTON, Lexington, Mass. Filed Dec. 19, 1881. (No model.)

Claim.—1. The combination, in a machine for splitting or cracking stone, marble, &c., of the tool B', its supporting-rod, and actuating-spring with the tool or support B, all substantially as and for the purposes described.

2. The combination of the tool B', its supporting-rod and actuating-spring, the treadle F and connecting mechanism, substantially as specified, and the lower tool or support, B, all arranged so that the upper tool may be reciprocated by foot, all substantially as described.

254,416. COMBINED BALLOT-RECEPTACLE AND SATCHEL. OSBORN WELLS, Newberry, S. C. Filed Oct. 12, 1881. (No model.)

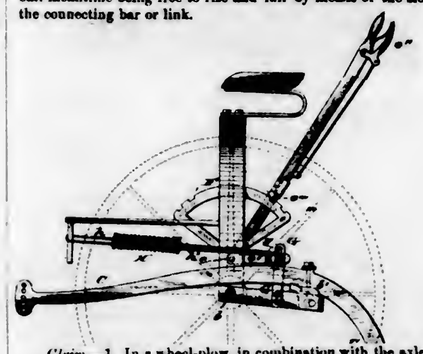
Claim.—1. The combination, with the frame of a ballot-receptacle, of a satchel detachably attached thereto, and provided with fastening devices, substantially as described, whereby the ballots and detached frame may be secured therein, as and for the purpose specified.

2. The combination, with the satchel A and detachable frame B, having hinged open cover B', adapted to be secured within said frame, of the inking-rollers E E', printing-roller F, and pressure or feed roller G, substantially as specified.

3. In a ballot-receptacle provided with devices arranged to print or mark the ballots as deposited, the combination, with suitable inking-rollers, of a feed-roller, G, having a central depressed portion composed of elastic material, and a printing-roller composed of a shaft having the central detachable type-collar, F, and securing-collars F' F², substantially as set forth.

4. In a combined ballot-receptacle and satchel, the combination, with the satchel A, frame B, and band C, having nuts or screw-caps *b b*, of the clamping screw-bolts D D, having jaws *c c* and thumb-screws *d d*, whereby the parts are connected and detachably secured to a suitable support, substantially as shown and described.

5. The combination, with a satchel having a detachable top or frame provided with rollers for printing or marking ballots as deposited, of clamping-bolts adapted to connect the satchel and frame and secure the same to a table or other support, and means, substantially as described, for securing the ballots and detachable frame and contents in the satchel, substantially as specified.



254,417. SHEET-METAL VESSEL. EDWARD H. WHITNEY, Cambridge, assignor to the Dover Stamping Company, Boston, Mass. Filed Dec. 7, 1881. (No model.)

Claim.—A hollow sheet-metal vessel comprising the body A, the bottom B, united to the body, substantially as specified, and the base C, struck up from a ring or disk of metal from which the center has been removed and fastened to the bottom B by rivets, all substantially as set forth.

254,418. WHEEL-PLOW. WILLIAM H. WILDS, Bushnell, Ill. Filed Sept. 29, 1881. (No model.)

Brief.—The elbow-lever is so placed that when locked the spring exerts its force on the lever-arm and its cross-bolt, the plow-bail meantime being free to rise and fall by means of the slot in the connecting bar or link.

Claim.—1. In a wheel-plow, in combination with the axle or frame, bail, and plow, a spring connected with the axle or frame or a projection therefrom at one end, and with the bail at its other end by a slotted connection, whereby it may be utilized in lifting the plow, and may be placed in position to exert no force on the plow when in operation, and permit it to rise and fall freely and independently of the spring, substantially as and for the purpose specified.

2. In a wheel-plow, in combination with the axle, plow, swinging bail, and lifting-lever connected with the plow by a slotted connection, a spring connected with the axle or a projection therefrom at one end and at its other end with the lifting-lever, whereby the lifting-lever may be locked in position and the entire force of the spring will be exerted thereon, and none of its force exerted on the plow, substantially as and for the purpose specified.

3. In combination with the axle, swinging bail having a slotted standard, G, and the lifting-lever having its arm *e'* pivoted in said slotted standard, a spring, H, connected at one end with the axle or a projection therefrom and at its other end with the distal end of the arm *e'*, substantially as and for the purpose specified.

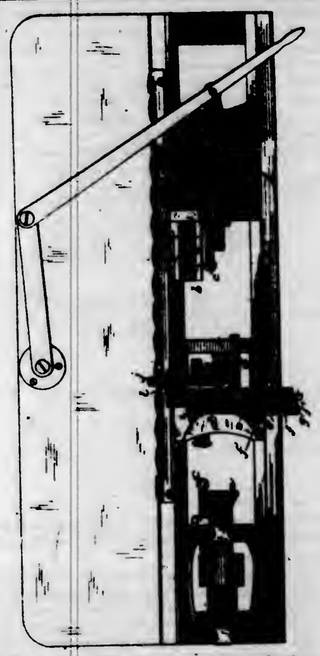
4. In combination with the axle, swinging bail, plow, and lifting-lever loosely connected with the bail by a slotted connection, a spring adapted to be locked from action on the plow by the lifting-lever in one position, and permitted to act in raising the plow with the lifting-lever in other positions, substantially as and for the purpose specified.

5. In combination with the axle, plow, swinging bail, and lifting-lever having an arm, *e'*, connected with the plow, a spring adapted to act on the arm *e'*, and thereby on the plow, substantially as and for the purpose specified.

254,419. WOOD-TURNING LATHE. CHARLES W. WILDER, Fitchburg, Mass. Filed Jan. 25, 1881. (No model.)

Claim.—1. A tool-carriage having an interchangeable ring-rest, through which the stick passes, provided with a roughing-tool which is pivoted to a vertically-adjustable arm, and which is itself vertically adjustable, for the purpose of causing it to bear on said ring, substantially as described.

2. The combination, with the tool-carriage and a removable ring-rest, of a roughing-tool supported by a tool-holder which is adjustable vertically and longitudinally of the lathe on a stud fixed to a vertically-adjustable arm, substantially as described.



3. The combination, with the flanged and throated ring-rest of the tool-carriage, of the vertically-adjustable arm *f* and the adjustable tool-holder, the stud *f'*, and the set-screw *g*, substantially as described.

4. In a lathe of the character described, a tool-holder connected to the wrist-pin of a crank-wheel the hub of which turns about a bearing depending from the tool-carriage, in combination with a retracting-spring, an actuating-lever, and a flexible connection between the crank-wheel and lever, substantially as described.

5. The combination, in a lathe, of a movable tool-carriage, a movable finishing-tool, a knee-lever, a crank-wheel, a flexible connection between the knee-lever and crank-wheel which allows an unvarying leverage and an instantaneous release of the tool from the finished work, and means for retracting the tool when the knee-lever is released, substantially as described.

6. The combination in a lathe of the character described, of the holder of the finishing-tool, the arm rigid thereon, and the

254,419.

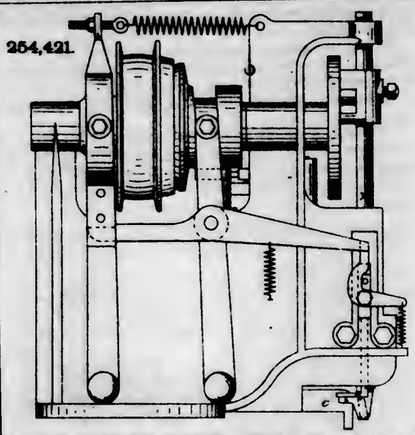
holder of the cutting-off tool, having right-angular intersecting-grooves therein, and the binding-screw for confining the tool and its holder to said arm, substantially as described.

254,420. GAME APPARATUS. VINCENT W. WILSON, Leominster, Mass., assignor to Charles L. Joslin and Albert W. Williams, both of same place. Filed Jan. 16, 1882. (No model.)

Claim.—1. The combination, with a bar or block having annular concavities or sockets in its upper surface, of a series of levers or triggers working in slots, one of which passes centrally through each of said sockets, the lower ends of said levers projecting a suitable distance below the bar or block, substantially as described.

2. The combination of the marble-holders, support therefor, and levers or triggers, substantially as described.

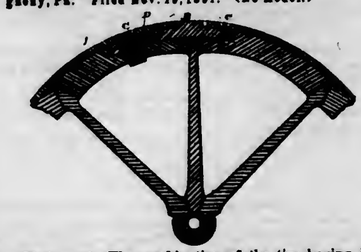
3. The combination, with a block having a number of hollows or depressions, each adapted to hold a marble, of triggers or devices acting when struck to throw the marble out of its socket, substantially as described.



4. The combination of the block or bar having sockets and slotted at intervals, as explained, levers or triggers working in the slots, and folding legs for holding the toy when in use, substantially as described.

5. The combination, with the marble-holders and their support, of a series of pivoted triggers formed of flat strips of metal twisted near their lower ends, so as to present forward their flat sides, substantially as described.

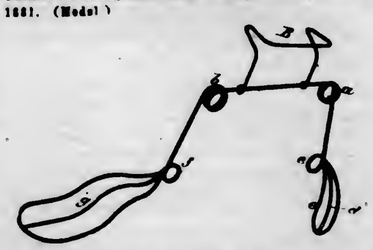
6. A toy or game device comprising a block or bar having a number of sockets or hollows on top, a series of pivoted levers or triggers playing through slots, one of which passes through each of said sockets, a hook-stop or rest for said triggers, and holding pins or wires, substantially as described.



254,421. TACKING-MACHINE. ERASTUS WOODWARD, Somerville, Mass., assignor to the Copeland Tacking and Lasting Company, Paterson, N. J. Filed Jan. 7, 1881. (No model.)

254,421.

Claim.—In a tacking-machine, the combination of the start or start-and-stop motion mechanism with a foot, B, arranged in proximity to the nozzle, and having a horizontal, or substantially horizontal, movement in relation thereto, and connecting mechanism, substantially as specified, whereby upon the horizontal or swinging movement of the work in relation to the nozzle the machine is actuated, all substantially as and for the purpose set forth.



254,422. TIRE FOR WAGON-WHEELS. LEVI YAKEL, Allegheny, Pa. Filed Nov. 19, 1881. (No model.)

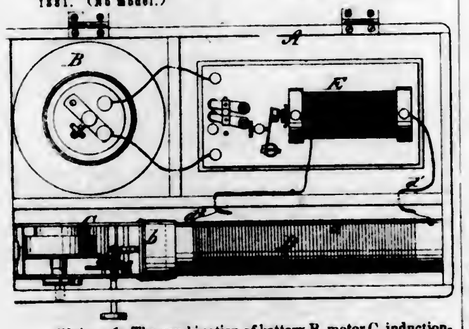
Claim.—1. The combination of the tire having its edges turned down over the sides of the felly and slots made through its free end with the slotted stay B, to which one end of the tire is rigidly fastened, the wedge D, and screws C, substantially as set forth.

2. A tire for vehicle-wheels, by the contraction of which the sections of the felly are drawn together and the outer ends of the spokes held between the sections secured by the downward-bent edges of the tire, substantially as shown and described.

254,423. BOOT AND SHOE EXHIBITOR. WILFORD W. YOKUM, Parkersburg, assignor to William Kegy, Butler County, and Guilford H. Rush, Blackhawk County, Iowa. Filed Nov. 11, 1881. (Model.)

Claim.—1. A device for exhibiting shoes, formed of wire and bent at its front end to form a wide and expanded bearing or lateral extension to conform to the instep, substantially as and for the purpose set forth.

2. A device for exhibiting shoes, formed of wire and bent at its front and rear ends to form wide and expanded bearings or lat-



by means of cog-wheels and worm-gears, substantially as and for

eral extensions to conform to the instep and heel portions of the shoe, substantially as and for the purpose specified.

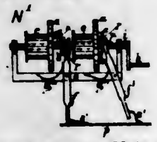
3. The shoe-exhibitor consisting of the wire A, bent so as to form one or more coils to give it the required elasticity, and having the lateral extension or widened ends formed by the wires *d g e h* or their equivalent, substantially as and for the purpose specified.

4. A device for exhibiting boots or shoes, consisting of the steel or spring wire A, bent to form coils *a*, and terminating in the curved extensions *d g*, and having connected thereto the curved wire loops *e h* and the wire hook B, substantially as and for the purpose set forth.

254,424. APPARATUS FOR THE CONTINUOUS PRODUCTION OF OZONE. THEODORE J. YOST, Mahwah, N. J. Filed Dec. 17, 1881. (No model.)

Claim.—1. The combination of battery B, motor C, induction-coil E, ozonizer D, and fan *h*, substantially as shown and described, for operation as set forth.

2. The glass tube *a*, provided with wire *d*, disks *g*, and outer winding of wire d^2, substantially as shown and described, for use as an ozonizer.



254,425. STAPLE. WESLEY YOUNG, Columbus, Ohio. Filed Aug. 15, 1881. (No model.)
